31 308563 ANALYSIS OF THE METROPOLITAN BOSTON TRANSPORTATION SYSTEM DURING THE POSTBLIZZARD WEEK--FEBRUARY 13-17, 1978. On February 6 and 7, 1978, a major blizzard crippled transportation services in the Boston metropolitan area. The disruption was so great that all but emergency vehicles were banned from the streets and highways in most eastern Massachusetts communities during the week after the blizzard. Not until midnight on Monday, February 13, was the ban completely lifted in the densely populated activity centers of the region. In some of these communities an on-street parking ban remained in effect through Tuesday, February 14. In addition to these legal restrictions, large quantities of snow presented additional obstacles to vehicular travel. Because of these legal and physical impedances, state and regional transportation agencies encouraged the use of transit or ride sharing for work trips in the region. In addition, the state recommended staggered work hours for employees in downtown Boston. This paper analyzes the effects of the driving and parking bans on travel in the region. Data pertaining to the volumes and temporal distribution of the various modes of travel during the week after the blizzard were collected and analyzed. These data were compared with travel data from a more typical time period. The analysis indicates that a significant shift to public transportation took place for the commute-to-work trip and that, through a combination of staggered work hours and special suburban transit services, the public transportation system was able to accommodate the great increase in demand. This shift to public transportation was only temporary in nature, however; normal preblizzard travel patterns returned when restrictions on vehicular travel were removed. (Author)

31 308790 PEAK PUBLIC TRANSPORT: AN AREA STUDY. A study of the supply of and demand for peak public transport services in an area centred on the large free-standing town of Northampton is reported. Two publicly-owned bus companies supplied virtually all the stage services within the area while, by contrast, 24 privately-owned bus and coach companies supplied the vast majority of the numerous contract services to schools and workplaces. In the morning peak the two groups of companies ran

comparable numbers of in-service vehicle-kilometres in their respective areas of operation. While the publicly-owned companies carried about twice as many passengers as the private ones they generally catered for shorter journeys so that the numbers of passenger-kilometres carried by the two groups were comparable. A smaller though significant amount of transport was provided for workers by employer-owned vehicles. Fares were not charged at all on the majority of works services and on many of the remainder were only nominal so employers were shown to provide substantial financial support for public transport within the study area, alongside the county councils (who provided the overwhelming majority of school services) and central government. There was judged to be only very limited competition between the stage buses and other services.(a) (TRRL)

31 308823 A WAY TO BETTER BUS SERVICES. The paper begins with a bus operator's view of the principal objectives necessary to attract passengers to his services and indicates some areas where the highway engineer can assist the operator in achieving these objectives. The engineer discusses these points and uses two examples, one the history of a contra bus lane in a Lancashire town and secondly the differing approach to public transport adopted in the new towns of Skelmersdale in Lancashire and Run-corn in Cheshire. The authors have deliberately maintained a general and somewhat non-technical approach to the subject and up to this point the engineer's views have been somewhat critical. In the final section the definition of highway engineer is widened to cover the role of the county engineer as a co-ordinator of public transport and an explanation is given of the highly successful relationship that has developed between Ribble Motors Ltd and Lancashire CC, with special reference to the agency method of bus operation in the area of those district councils that have their own municipal services. 31 308844 DOWNTOWN TRANSIT MALL. PRELIMINARY EVALUATION. This report, prepared by Rice Center, for the City, Office of Public Transportation, describes three design options for a downtown transit mall and documents the results of a comparative evaluation across nine impact parameters. Both the need for a transit mall and general design concepts have been established in a previous study. The intent of this report is to provide sufficient information to the City, the Metropolitan Transit Authority (MTA), and affected downtown groups so that they can select, from the three options presented herein, a final solution to carry forward into detailed design and construction. The next steps include design and costing, specific impact studies such as utility relocation, tunnel access, retail impacts during and after construction, and joint development opportunities, an environmental im-

pact statement, and preparation of the preliminary engineering grant application. This document contains a technical report of three parts and two appendices. The first part of the report documents a summary of findings of the study, the second describes the current situation and design options which were developed. The final part details the evaluation of the design options across nine specific impact parameters. A fixed time reference has been established for each design option to insure timely analysis, evaluation and implementation between 1978 and 1985.

31 308847 URBAN PASSENGER TRANSPORTATION SYSTEMS: SOME SELECTION CRITERIA. This article discusses some of the factors that should be considered when planning on urban passenger transportation system by drawing the experience of metropolitan Toronto. An important factor is the cost and energy intensiveness of a given mode (e.g. the diesel bus is much less energy intensive than rail transit, while the low occupancy automobile is the most energy intensive of all). Another is convenience and travel time for the passenger. Rail transit is generally perceived as providing a superior service to bus systems, but the latter can be upgraded to approach the convenience of rail by providing exclusive rights-of-way and improved stations and shelters. The main factor to consider when the transportation network and designating the land uses is population density. A residential density of not less than 15,000 persons per square mile is considered necessary to make public transit viable. The most economical tool for transportation improvements is a transportation management system designed to make more efficient use of existing highways, streets and transit systems without requiring large capital investments. This concept calls for establishing better balance and coordination among various elements of the urban transportation system in order to contribute to broader local and national goals of energy conservation, economy, environmental improvement, equity for transit dependent persons and the creation of aesthetically attractive urban land forms. This in turn calls for improved vehicular flow, high-occupancy vehicle preference, travel reduction, parking management, ride sharing, transit and para-transit improvements and transit-management efficiency measures.

31 308947 TRAFFIC REORGANIZATION OF UPPSALA CITY CENTRE 1972. SUPPLEMENTARY STUDIES 1978 [Trafikreglering av Uppsala Stadskaerna 1972. Efterstudier 1978]. A traffic reorganization plan for the city centre of Uppsala in Sweden (population 140000) was put into operation for a period of one year in 1972. The aim being above all to: (A) improve conditions for pedestrians and cyclists with regard to safety, noise and air pollution, (b) improve conditions for bus passengers by introducing a faster

and more regular service, and (C) restrict the volume of car traffic in order to avoid increasing the width of existing streets. In order to evaluate the effect of the trial period a comprehensive investigation was carried out (in May and September) before the plan was put into operation, as well as during the year long trial period (mainly during the months of April and May 1973). After the trial period the reorganization plan was established and is still in operation. A similar investigation was carried out in 1978. The aim being to, if possible, clarify the effects which the traffic reorganization would have had over a longer period of time. Effects on traffic flow, journey speed, noise, accidents, parking, shopping and journey habits and retail trade sales were studied. Difficulties which arose were in estimating the extent to which the traffic reorganization contributed to the changes which have taken place in the city centre, and to the changes in traffic to and from the city centre. In this report a general view of the effects is made. However the main aim of the report is to give an account of the findings of the investigations, which can be then used as a basis for further and deeper analysis. (TRRL) [Swedish]

31 309577 DEMONSTRATION CYCLE TRACKS IN THE HAGUE AND TILBURG [Het gebruik van de demonstratie fietsroutes in den Haag en Tilburg]. One of the studies connected with the demonstration projects on cycling in a big city and a middle-sized town in the Netherlands deals with the usage of these cycle tracks. The article gives an introduction on the total study design and the objectives. It specifies the actual stage of implementation and gives major results of traffic counts. The main conclusions are that bicycle usage in both towns has increased especially for non-compulsory trips. The special tracks attract many cyclists from parallel routes, the "catchment area" stretching for about a sixth of a mile both sides of the track. There is only a slight influence on mode choice. There are only minor effects on public transport usage. (Author/TRRL) [Dutch]

31 309755 TWO-WHEELED VEHICLES IN THIONVILLE-1-GENERAL REPORT, 2-DETAILS OF FACILITIES [Les deux-roues a Thionville- 1-rapport general, 2- detail des aménagements]. The authors state four current requirements regarding two-wheelers: to improve safety, to give them a fair share of access to the town's facilities, to give people a real choice of transport mode, and to improve the quality of life and of the environment. This report describes various means of improving two-wheeled vehicle traffic: dense network of cycle tracks, which it is possible to establish in the town of Thionville, with a short-, medium-and long-term policy. It is also possible to take actions as regards the parking of these vehicles. Plans of the whole and parts of the network are appended. [French]

31 309917 A COMPARISON OF STREET-CAR AND SUBWAY SERVICE QUALITY. Replacing a surface streetcar line with grade separated rail rapid transit will often improve operating speeds substantially; but increased station spacing means longer walks to the stops or stations, and rapid transit service is often less frequent. A time cost model is employed to evaluate trips in which service has been improved or degraded by the Bloor subway construction in Toronto. It is found that trips up to four miles in length, and sometimes much more, have become more time-consuming. With the high disutility of walking time, the proportion of travellers experiencing degraded service may be surprisingly large. (a)

31 310249 CITIES AND TRANSPORT IN EVOLUTION. This paper surveys the historical interrelationships between the development of cities and of transport. Factors outlining accessibility of cities are discussed. The result of the continuing improvement of long distance transportation by water, rail and recently air has been an exponentially growing trend towards concentration of activities and population in large metropolitan agglomerations. The introduction of the automobile has brought about a radical

change in urban form, which in turn has affected urban transportation planning. This historical survey points to an increasing shift in the modal split to the automobile. (TRRL) [French]

31 310333 LOCAL BUS SERVICES IN OXTED, A REPORT ON TWO EXPERIMENTS. This report describes two experiments, in which a maximum off-peak fare was applied to a local Oxted bus service, to establish whether a reduced fare would generate an increase in journeys and whether this increase would be reflected as a gain in total revenue, and a shopping service was introduced from outlying villages to see if it could justify itself. An analysis of daily ticket issues/cash income records over two years shows that the fare reduction increased passenger journeys by 35 per cent but reduced revenue by ,1500. The village bus carried 8000 passengers at a further loss of ,1500. Recommendations are given for increased fares which it is hoped would make up for the loss in revenue with the minimum loss of passengers. It was also recommended that revised publicity material should be distributed on a house-to-house basis. (TRRL)

31 310369 THE BENEFITS OF MINIBUSES. THE CASE OF KUALA LUMPUR. The introduction of 400 minibuses in Kuala Lumpur (population approximately one million) makes possible an analysis of the net benefits of this policy change. On conservative assumptions it is shown that the value of benefits was US \$10 million per annum, or US \$17 per head of the adult population-almost 1% of the per capital income. This value is surprisingly large, and suggests that the same policy might show a similar gain in other countries.(a) (TRRL)

31 310384 FACTORS INFLUENCING THE PLANNING AND DESIGN OF BUS TERMINALS. This paper is concerned with the planning of city-centre bus terminals for urban services. The factors which affect the decision to develop a bus terminal are discussed, and the importance of precise location in the heart of the city centre is stressed, related as this is to high land costs, the availability of suitable land and the constraints of the surrounding road network. Peripheral locations are shown to result in disbenefits in terms of increased bus operating costs. The major issues which influence the design of a terminal once the decision to proceed has been taken are reviewed, related to arrangements for segregating bus and passengers within the terminal, bus manoeuvring, type of bus stand and the separation of boarding, alighting and storage stands. Reference is made to recent bus terminals in Britain-Bradford, Huddersfield, Northampton, Preston and Manchester. Alternative configurations associated with the preliminary design of a major bus terminal in

central Dublin and associated statistical data are illustrated and discussed. It is suggested that in the case of city centre locations, there would appear to be substantial merit in seeking to integrate into the design some other development appropriate to the needs of the city centre which can help defray land acquisition costs likely to be involved. 31 310573 MIDDLESBROUGH CYCLEWAYS. A description is given of Middlesbrough's urban cycleway which was completed in 1978, many years before the local authority thought possible. It was decided that any cycleway scheme in Middlesbrough would be based on new routes along the existing areas of open space, or by utilising existing footpaths and carriageways already established. These criteria meant that the expenditure involved in establishing such a scheme would be minimal being based upon minor alterations, signs and new road markings. Any decision to delete the cycleway scheme after an experimental period would result in a useful addition to the existing footpath system and minimal abortive costs. The main philosophy behind the provision of cycle routes was to provide four north/south routes on the lines of established linear parks and to link these routes to residential areas by a number of east/west routes. The theoretical objectives for route location were to provide a direct route more attractive from the point of view of travel time than the existing highway system and that the routes should pass as close as possible to the main traffic generators and with special priority for educational establishments. Details are given of the various routes, design standards and construction details. The innovative traffic regulation orders required to implement the scheme are described together with a note on promotion of the system and costs incurred. A survey on the use of the cycleway and attitudes to it is being made by the Transport and Road Research Laboratory with assistance from the Highway Authority and Middlesbrough Borough Council. 31 311198 TWO PROGRAMS TO EASE AUTOMOBILE CONGESTION AT LOS ANGELES INTERNATIONAL AIRPORT. Two programs that have had a positive impact on alleviating automobile congestion at Los Angeles International Airport are discussed. One program consists of reduced-rate off-airport parking lots and free tram service to the terminal buildings. Two lots that provide a combined total of about

11,400 parking spaces are currently in operation. The other program, the FlyAway Bus, is an express bus service that transports people to and from Van Nuys, a large suburban community 32 km (20 miles) north of the airport. The service includes low-cost parking for up to 15 days at the suburban bus terminal. The success of both programs is significant not only because of their current impact on airport congestion but also because of their potential for expansion to broader uses in the future and because they prove that the public can be persuaded to trade the privacy and control of the automobile for the efficiency and convenience of public trams and buses. (Author).

31 311245 DESIGN FOR PASSENGER TRANSPORT. The book is based on the proceedings of the Conference "Design for Passenger Transport" held at the University of Nottingham in 1978. The aim of papers included in the book is to examine ways in which standards of design, particularly related to the environment, could be improved to enhance the psychological and psychological well-being of passengers and staff. Aspects of design in the fields of air, rail, road and water passenger transport are studied. Parts 1 and 2 of the book deal with passenger handling design while parts 3 and 4 examine various forms of vehicle design with an emphasis on passenger comfort. The following papers are included: Airports, railway stations and people (Roberts, ERC); Interchange design (Wood, AA and Downs, IC); Design policy for greater Manchester transport (Evans, PR); Passenger behaviour and expectations at an airport (Deighton, R); TWA corporate identity (Rondepierre, J); Aircraft, trains, buses and people (Waterhouse, R); Vehicle suspension systems and passenger comfort (Pollard, MG); Boeing jetfoil (Shultz, W); The interior design of wide bodied aircraft (Molony, G); Bus interiors-with particular reference to the Leyland Titan (Burnicle, DS and Heath, M); and, Inter-city trains (Cousins, JS). 31 311822 WEST YORKSHIRE-A NATIONAL BUS COMPANY. This book presents a detailed history, with numerous photographs, from 1906 to the present day, of the West Yorkshire Road Car Co Ltd. A description is given throughout the book of the gradual expansion of the company to become the major operator serving both urban and rural areas in central Yorkshire. The changes in public service vehicle design are traced, the changeover during 1934-39 from petrol to diesel oil as fuel is noted, and a section included on the company's wartime operations. The post war buildup of the bus and coach fleet is considered, with a major change from front-to-rear-engined buses. The final main section covers fleet modernisation 1976-77. Information is also included on service and preserved vehicles, and on the company's depots and offices. (TRRL)

31 312007 THE STOCKHOLM CYCLE PLAN 1978 [Cykelplan 1978 foer stockholms kommun]. This report presents a plan for the development of the Stockholm cycle road network. The plan is presented in text and on maps describing the planned cycle road network. The text describes previous plan proposals, views from organizations and authorities involved, the principles of the plan, connections with other planning, standard, costs and implementation. On the maps the planned parts of the network are described in three categories: (1) new cycle tracks/footways projected in connection with routes, street reconstruction or exploitation, (2) new cycle tracks in parks under the city park administration, (3) new cycle tracks/footways projected with special funds from the budget of the city street department. Total cost for the measures according to category 3 was calculated to 104 milj swcr (1978). From 1977 there is a special grant of 5 milj swcr per year. Consequently the implementation will take 20 years. State subsidies and temporary cycle tracks on the carriageway separated by road markings may reduce implementation time to 15 years. Background factors concerning bicycle use and possibilities are compiled in an appendix. This is intended to produce a basis for a discussion on cycle track construction. (TRRL) [Swedish]

31 312114 ITALIAN COMPANY STRUCTURE: A GUIDE TO THE COMPLEX. Intermetro, an Italian consortium formed in 1969, is principally engaged in the design and construction of underground railway networks in Italy and abroad. It forms part of an intricate mesh of Italian financial, commercial and technological interests. Covering the whole metro field, and surface railway construction as well, IM carries out research, design, construction and equipping of all types of guided transport systems (including rubber tyred metro systems). The company presents an example of the complex structure of Italian industry and commerce, and the interrelationships that exist between companies and the government of that country. A profile of Intermetro, Italy's answer to the "total approach" to metro and railway construction, is given in the article.

31 312124 FLOATING TRAFFIC CONTROL FOR TRANSPORTATION SYSTEM. This paper proposes "Floating Traffic Control", which is a dynamic scheduling with no fixed time table, for a public transportation system with high density traffic. Traffic models and evaluation functions are formulated for the control. Applying Linear Regulator Theory, the optimal control for the model is derived. Dynamics of the model and characteristics of the control have been investigated with several examples. To apply this method to actual traffic system, sensitivity analysis to system disturbance and simplification of calculating logic have been investigated.

31 312273 BUSES GET PINT IN HALF-PINT POT. Manchester's new Arndale bus station, which can handle over 1000 buses a day, was originally designed in the 1960's as part of a shopping centre. The author describes the new design which had to accommodate much larger buses within the same dimensions. To make the best use of the space "available, two "saw tooth" island platforms have been provided, each with eight boarding and alighting points. Buses can also use entrance and exits in both directions. Pedestrians have a segregated perimeter walkway providing all the necessary facilities for passen-

gers. Precautions to combat vandalism are described. With only a 450 mm clearance for buses, fluorescent lighting is reflected off the tyrolean rendered roof to make the ceiling appear higher. Photo-electric cells control the light intensity at the entry and exit points to match internal and external conditions. The concrete floor slab has been waterproofed with an epoxy resin mortar, but rubber from the buses' tyres has caused difficulties with cleaning. A special ventilation system has been devised to cope with problems caused by the low profile of the building. (TRRL)

31 312839 LUXURY EXPRESS COMMUTER COACH SERVICES. This report describes the performance of three luxury express coach services offering travel to and from the centers of cities to commuters living in outlying towns or suburbs. The services were offered at premium prices and catered for journeys between 7 and 15 miles in length. They aimed to attract managerial and professional workers from their cars. None of the services was successful. Average loadings varied between 7 and 20. The proportion of allocated costs recovered was at best 39 percent and at worst 23 percent. Discussion of the findings centers on possible reasons for this lack of success. These are believed to be fares which were high in relation to the perceived costs of motoring, the inflexible service timings, the problem of attracting sufficient patronage from limited catchment areas containing a low density of potential users and, in one case, the method of fare collection which required payment for unmade journeys. There was no evidence to suggest that services of the kind considered offered scope for success in other locations. (Copyright (c) Crown Copyright 1979.)

31 314362 RECREATIONAL TRANSIT SERVICE TO THE CALIFORNIA SANTA MONICA MOUNTAINS [D]. This is a report on first year operations of a weekend subscription transit service to a recreational area outside a major metropolitan area. In this demonstration, the feasibility was tested of providing a seasonal recreational transit service from inner city areas of Los Angeles to Malibu Creek State Park and Tapia County Park located in the Santa Monica Mountains 35 miles west of downtown Los Angeles. The demonstration service offered access to outdoor recreational opportunities for a large portion of the region's population who are heavily dependent on public transportation. The project was intended to measure the demand for such a service and to demonstrate its economic and operational feasibility.

31 314616 TRANSIT ACCESS STUDY: EXECUTIVE SUMMARY. This report summarizes the major findings and recommendations of the D.C. Transit Access Study, conducted by the District of Columbia's Office of Planning and Development. The study has been reviewed by and received valuable guidance from the staffs of the Council of Governments, Washington Metropolitan Area Transit Authority (WMATA), the D.C. Department of Transportation, as well as numerous public interest groups. The study provides an indepth overview of the access problems that may arise from the opening of Metrorail stations in the city. This overview forms the base for the recommendations, contained herein, to improve the access to many of the current and proposed Metro stations. In most cases, it is recommended that minor improvements and modifications be made to existing streets and bus routes servicing the stations to make access easier and safer. But in a few cases, major modifications are necessary to improve access. (Author)

31 314617 TRANSIT ACCESS STUDY: VOLUME I--CAPITOL EAST STATIONS, UPPER NORTHEAST STATIONS, FAR NORTHEAST STATIONS. This report is Volume I of a three volume study analyzing access to and from Metrorail stations in the District of Columbia. It covers the Capitol East, the Upper Northeast and Far Northeast stations. These stations are part of the Blue Line, Red Line and Orange Line, respectively of the regional Metrorail system. Although some of these stations are currently in operation, this study does not concentrate on existing conditions since changes will occur as more segments of the system are opened. Rather, the report attempts to focus on long range conditions in the year 1990 and beyond, the time period to which available patronage projections are pegged, and by which time the entire Metrorail system should be completed. It should be noted that patronage projections contained herein assume a 100-mile regional rail system and are predicated on a specific fare structure. Changes to either of these will affect patronage to all stations. The report is divided into 11 sections, one for each station discussed in this volume. Station facilities are described and analyzed for each of the 11 to assess the ability of these facilities to handle projected patronage. Types of facilities looked at include station entrances, the number of bus bays and shelters, park-and-ride and kiss-and-ride areas, pedestrian linkages, and the availability of bicycle racks and lockers. The access pathways to the stations are analyzed to determine their ability to function as conduits to the station. The street system around each station is analysed to assess its capability of handling additional automobile and bus traffic. Bus routes are studied to ensure sufficient station area service. Possible pedestrian links are investigated to make certain walk access is provided. Existing and proposed bicycle routes are examined to determine the feasibility of connecting them to Metro stations. In addition, existing land use and development potential are examined in an effort to assess the impact of these factors on station patronage and access. Finally, access issues and problems are identified, and, where feasible, recommendations made for improvements. (Author)

District of Columbia, Government Nov. 1979, 174p, Photos.

31 314618 TRANSIT ACCESS STUDY: VOLUME 3--DOWNTOWN WEST STATIONS; DOWNTOWN EAST STATIONS. This report is Volume III of a three volume study analyzing access to Metrorail stations in the District of Columbia. It covers the Downtown West stations (Farragut West, Dupont Circle and Foggy Bottom/GWU) and Downtown stations. Farragut North and Dupont Circle are part of the Shady Grove or Red Line of the regional system now in operation. The Farragut West and Foggy Bottom/GWU stations are on the Huntington or Blue Line and were opened to the public in July, 1977. Downtown Washington, the city's original commercial area, is an especially important section of the city. It is the city's and the region's major retail center, a cultural and entertainment center, a tourist center, the headquarters for the District government, and the home of thousands of city residents. Downtown is generally defined as the area between Massachusetts and Pennsylvania Avenues, 15th and Third Streets, N.W.

However, for purposes of this analysis, the definition has been expanded to include a portion of the "Monumental Core" south of Pennsylvania Avenue with Union Station on the east. The following seven Metro stations are within the area: McPherson Square, Metro Center, Gallery Place, Judiciary Square, Federal Triangle, Archives, and Union Station. Downtown is, in fact, the center of the regional system, with all lines radiating from either the Metro Center or Gallery Place stations. In this report, station facilities are described and analyzed for each of the 11 stations to assess the ability of these facilities to handle projected patronage. Detailed recommendations are made for improving access to each of the Downtown West stations. The report then examines the special nature of access planning in downtown. Next aspects of access are analyzed including the street system and vehicular traffic, bus service, the pedestrian environment, and underground links between stations and adjacent buildings. These elements are then related to overall planning for downtown redevelopment. Finally, Metro access considerations are viewed in relation to an overall transportation strategy for downtown. 31 314672 SOUTH SUBURBAN AREA TRANSIT STUDY. This report documents the findings of an 18-month study of the Chicago South Suburban Areas's public transportation needs. It presents a five-year program designed to meet those needs. Over 500,000 persons reside in the area's 200 square miles. Two carriers provide commuter railroad service to downtown Chicago and a third provides subregional and regional bus service. Over 60,000 trips are made by transit each weekday, to, from, and within Chicago's southern suburbs. The recommended bus plan reinforces and expands upon the existing network of services. Regional express service to downtown Chicago is maintained and route coverage is expanded. Subregional service is improved significantly through increases in frequency and the addition of new routes. Community services are also strengthened. Rail system recommendations focus on the maintenance and improvement of suburban stations and their access systems. Many suburban stations are 50 years old, obsolete, deteriorated, and have insufficient capacity or inadequate accessibility. To correct these deficiencies, a long-term program of station reconstruction is recommended. For those stations not included in the initial construction phase, immediate action improvements are identified. In addition to the improvements in bus and rail services, this study presents a plan for coordinated, substi-

itized taxi service for the elderly and handicapped and several proposals for improving transit operations through traffic engineering actions. (Author)

31 315169 BUS STATIONS [Estaciones de autobuses]. The various aspects of bus stations are discussed: general principles, legislation in Spain, requirements, suitable location, installation, economic efficiency, number of stations for each town, capacity of stations, types of station as a function of use, carrying of luggage, construction, lighting. Details are given of bus stations in Valladolid, Avila and Salamanca with regard to: influence of the terrain, urban development in each town, environmental characteristics, construction and equipment. The three examples cited fulfill the policy of the Ministry of Public Works which tries to prevent cars from crossing the town centre and to create stations of adequate capacity in a number of regional capitals. 31 316506 BUS NETWORKS AND SETTLEMENT IN TOWN CENTRES IN MEDIUM-SIZED URBAN AREAS [Busslinjenät och bebyggelse i medelstora tätorters centrumområden]. This project deals with the following questions: (1) what possibilities are there to reduce journey times by improving change possibilities for travellers within given resources, (2) what are the effects on various groups of road users, residents, bus companies, trade and authorities of alternative line strategies within a town centre. The alternatives were compared by means of case studies in 3 Swedish towns (Malmö, 250000 inh, Umeaa 80000 inh, Halmstad 50000 inh). (a) Malmö. 3 alternatives were studied, a conventional route with a central change stop and mainly radial lines, an axis system and a pole system with three poles. The differences in journey times were small. In total the pole system was found more favourable than the other alternatives. Considering other effects the pole and axis systems are better than the conventional. However, the axis and pole systems show higher construction costs. (b) Umeaa. 2 alternatives were studied. A partly developed axis system and an axis system with 3 axes. The alternatives were found equal considering both journey times and other effects. (c) Halmstad. 2 alternatives were studied. An alternative with a central change stop and radial lines and an axis system. The comparison shows that the axis system throughout is the most favourable. (TRRL) [Swedish]

31 316588 NEARLY OPTIMAL PARAMETERS FOR A RAIL/FEEDER-BUS SYSTEM ON A RECTANGULAR GRID. An approximate analytical model of a rail plus feeder bus system that is serving a peak-period many to one type demand is presented. The underlying highway grid is assumed to be rectangular with the railway parallel to one axis. A simple graphical solution procedure is given for the general case when all the relevant rail/feeder-bus parameters are free. Explicit analytical solutions are given for the lower and upper bounds and for two special cases in which the station locations are pre-determined and the feeder-bus routes are relatively long, respectively. The model is applied to the Calgary (south corridor) LRT system.(a) (TRRL)

31 316738 THE HEATHROW AIRPORT UNDERGROUND LINK-ONE YEAR ON. The objectives of this link were first to reduce passenger's journey times; second to divert traffic from road to rail and so help to contain the demands both for new road provision and for local parking space; third, to earn money. Following points are also examined: the traffic evaluation and repartition; the effect of the opening on the airport itself on its users and on the road traffic; the financial aspect and success, some operating experience.

31 316796 PARKING POLICIES [Políticas de estacionamiento]. Parking, as an integral part of highway matters, has been regulated in the United States and Europe since the 1920's. The most advanced countries require that every new building provides adequate parking facilities. The author cites examples of public service parking in many important world cities, emphasizing Mexico City, and concludes that highway planning must no longer consider the road only, but also the storage of vehicles at the end of each trip. The city that does not provide for public and private parking will be increasing the problem of congestion and increasing operating costs to the road user. Parking places will give better service precisely where the demand exists. Cities which have opted for integral plans for parking in the commercial center have less traffic congestion and more commercial business. If private industry is not sufficiently responsive to the demand for parking facilities, the government must take over the responsibility. (Author) [Spanish]

31 316992 ALTERNATIVES ANALYSIS FOR ARTERIAL STREETS. The purpose of this article is to describe a series of impact analysis methodologies and an evaluation technique useful for answering two central questions. 1. What will be the major impacts of any given improvement to an arterial street? 2. Given a set of alternative improvements for a specific street, which one is best? The first section presents a series of impact analysis methodologies and the second describes a simple, but useful evaluation technique.

31 318784 HIGHWAY RAMP CONTROL, 1964-JUNE, 1980 (A BIBLIOGRAPHY WITH ABSTRACTS) [Rept. for 1964-Jun 80]. The bibliography contains citations of reports on ramp design, merging control, ramp metering, and ramp use. Studies are documented of freeway collector lanes, exits into city streets, traffic bottlenecks, express bus lanes, vehicle collisions, road curves, freeway entry control—all involving ramp engineering. Computerized simulations and freeway corridor models are presented, along with traffic models, ramp control strategies, optimization procedures, and studies of freeway traffic flow. A few cases in which accident incidence has been linked to faulty ramp design, thereby calling for improved vehicle monitoring has been included. (This updated bibliography contains 142 abstracts, 12 of which are new entries to the previous edition.)

31 322810 THE PARK-AND-RIDE CORRIDOR STUDY [De corridorstudie parkeer-en-reis]. From Amsterdam a major railway line leads north into the province of North-Holland. Along this line some suburbs are situated. The authors report on a study which was carried out in 1979 by means of counts and interviews among commuters in this corridor. They are particularly interested in commuters who for their home-work trips can choose between car and train. Some conclusions are as follows: many employees are free to choose and this group already often takes the train; a quarter of the non-captive train commuters use park-or kiss-and-ride. The study leads to the conclusion that parts of major cities outside the CBD area should also be serviced by rail. [Dutch]

31 322812 TRAVELLING TO WORK. REPORT OF THE WORKING PARTY SPONSORED BY THE CITY OF WESTMINSTER CHAMBER OF COMMERCE. The various aspects of the journey to work which give cause for concern are examined. They include the extent to which the commuter is captive, the standard of service provided by the transport authorities, the gradually diminishing supply of suitable workers ready to take employment in central London, decrease in freedom of movement, and advantages and disadvantages of car usage. The transport systems of Belgium, France, West Germany, the Netherlands, Norway, Sweden, Denmark, Japan and USA are compared to that of the United Kingdom. Data are presented on rises in the cost of travel in the UK, British rail, underground and bus services, rise in incomes, and changes in pattern of travel to work. Results are given of a survey conducted among those who use public transport to get to work. Recommendations are put forward.

31 323233 AIRPORT RAIL LINKS TAKE OFF. As air travel continues to grow so does the problem of providing reliable and efficient transport between airports and the regions they serve. A number of cities have built airport rail links of one kind or another. While some have been successful, others have not--yet the number of links planned or under construction continues to rise. Good access to both in-town and airport stations is of prime importance, but high speeds are not as important as frequency. It is often better to plug the airport into the metro, so offering the widest possible spread of destinations, rather than providing a faster and perhaps more costly non-stop link to a city terminal which less than a third of air passengers will want to use.

31 325210 BEEP DEMONSTRATION PROJECT. The Bus Express Employee Program (BEEP) currently being demonstrated in the El Segundo, California area is an efficient subscription-type commuter operation that can serve essentially all commute distances. The unique aspect of the concept is the methodology for scheduling a system of buses to terminate at an employment center and match staggered shift hours. This methodology is presented along with descriptions of the techniques used in planning and operating the demonstration project, a history of the patronage, and the requirements for computer aids for an expanded service.

31 325418 THE BICYCLE IN SHORT DISTANCE TRANSPORT. MEASURES FOR A SAFE AND MORE ACTIVE USE OF THE BICYCLE [Das Fahrrad im Nahverkehr. Massnahmen fuer eine Sicherere und Staerkere Benutzung des Fahrrades]. This report is intended not only to show the importance of bicycle traffic and to increase this but in addition to give important guidelines for the formation and realisation of bicycle traffic facilities. It is shown that the bicycle contributes considerably in reducing

poor transport infrastructure for the traffic objectives school, shopping and work and it makes possible the mobility of broader sections of the population and of groups with disadvantages. Safety in traffic for the cyclist is the most important factor which influences readiness to use a bicycle. Accident statistics show that in the last 15 years the cyclist has generally become exposed to greater danger as a result of the greatly increased number of vehicles on the road. The following measures are recommended as some of the ways the situation could be improved: improving cycle tracks, intensifying the network of tracks, wider "cycle-track-roads", uniform design, separation of the cycle-tracks from the roadway, traffic division using grassed areas, a reduction in the number of points of conflict bicycle/vehicle and more comprehensive information on the subject. (TRRL) [German]

31 325871 BURY INTERCHANGE. A study is made of the Bury interchange, a terminal complex providing an all-weather passenger interchange between the British Rail electric railway service to Manchester and local bus services. Although the railway line to Bury was threatened with closure at one time, the area has since developed and now rail and bus services have been combined to give an overall 11% increase in journeys made. The interchange has an island platform long enough for six-car trains and also features a heated passenger waiting room. Stairs and an escalator link the platform to the bus area where there is room for nineteen buses as well as parking space. The success of the interchange terminal has proved that by providing ease of interchange between the two transport modes additional passengers will be attracted away from private transport.

31 326248 CAMDEN COUNTY COORDINATED MASS TRANSPORTATION SYSTEMS STUDY. PHASE II. The 1970s set in motion a continuing transportation planning program that would provide an efficient and cost effective system of public transportation services for Camden County. Camden County initiated a systematic planning effort--the Coordinated Mass Transit Systems (CMTS) Study--to analyze the transportation needs of the county residents and subsequently to develop a transportation improvement program. Phase I of the CMTS study was completed in July 1977, and it focused on specific transportation issues such as an assessment of the quality of service; evaluation of public information programs; and the role of the county in public transportation. Phase II work was completed in June 1979. Phase II study, this report, focused on three areas: (1) feasibility of park-n-ride express bus service between the future PATCO Berlin Station site and the Lindenwold Station; (2) analysis of all paratransit services; and (3) analysis of all fixed-route transit services

in the county. This report documents the evaluation steps and the recommendations of the CMTS Phase II study. It also contains an Executive Summary that highlights the principal conclusions and recommendations of both Phase I and Phase II study efforts. The CMTS Phase II study has recommended a specific implementable plan to improve mobility in Camden County. The recommendations developed during this study are summarized herein as well as the discussions of each of the three study areas. This study recommended that Camden County establish a program to improve coordination between services operated by municipalities, TNJ (Transport of New Jersey), PATCO, and Social Service Agencies.

31 326303 ACCESSIBLE BUS SERVICE IN ST. LOUIS. The Bi-State Development Agency (BSDA), the transit operator for metropolitan St. Louis, Missouri, became the first public transit system in the country to operate buses equipped with hydraulic lifts for boarding persons in wheelchairs in August of 1977. This was the first large scale accessible bus project in transit history. One-hundred fifty-seven lift equipped buses were put into revenue service over a three and one-half month period. Seventeen routes were selected for accessible bus service (Phase I and II). This evaluation is primarily concerned with the 12

1/2 months of Phases I and II (August 1977-August 1978). The evaluation covers the development planning, the implementation process, operations, service and equipment reliability, travel behavior, productivity, economics, and service impacts. This report discusses the results of the St. Louis accessible service and the implications for other operators.

31 326328 FEASIBILITY OF A SEPARATE SHORT RUNWAY FOR COMMUTER AND GENERAL AVIATION TRAFFIC AT DENVER. An analysis is made of the feasibility of a short, separate runway for general aviation at Denver's Stapleton International Airport and how it may be facilitated by FAA Engineering and Development products. General aviation is defined as private, corporate, and fixed base operators (flight schools and air taxis), and commuter airlines. The analysis is for Instrument Meteorological Conditions using current ATC procedures and consists of: runway placement, obstacle clearance, location of navigational aids, airspace design to segregate aircraft by type to two separate parallel runways, and the design of taxi patterns to allow unimpeded movement of ground traffic. Details of ILS siting such as terrain and multipath problems are not addressed. (Author)

31 329516 DESIGN GUIDELINES FOR PARK-AND-RIDE LOTS. A list of guidelines is presented to aid in the development of park-and-ride site design. Included in these guidelines are considerations for streets leading to the lot, convenient movement by all modes within the lot, amenities for the passengers, environmental impacts of the facility, the use of proper design standards, and similar considerations for joint-use facilities. Local examples of park-and-ride sites are presented to illustrate how design principles outlined can be used in actual practice.

31 330172 TRANSIT CENTERS: A MEANS OF IMPROVING TRANSIT SERVICES (ABRIDGMENT). The role of transit centers in improving the overall effectiveness of an urban bus transit system is defined and assessed. Transit centers are defined as physical facilities that facilitate the movement of buses and, thus, of bus patrons. Transit centers are more than park-and-ride lots because they can be located in high-visibility locations, even in the downtown core, and thus can serve to increase the attractiveness of transit. They are major transfer points at which several types of routes can come together. Express and local routes, as well as pulse-scheduled circulators, can thus provide the bus user with many potential destinations and greatly reduce transfer time. Transit centers can be located in the central city, on freeways, or in

suburban activity centers. Planning guidelines are developed to assist in the successful planning and implementation of transit centers. These guidelines address general locational considerations, bus berths, parking, accessibility, and potential joint-development opportunities. These planning guidelines are used to locate and conceptually design a potential transit center for the Salt Lake City area. It is concluded that the impact of current pioneer transit-center projects in the United States should be closely monitored. (Authors)

31 330249 SEPARATION OF TRAMS AND MOTOR TRAFFIC USING SAFETY BARS: NICHOLSON STREET. The report was prepared for the Melbourne City Council, Melbourne and Metropolitan Tramways Board and the Road Safety and Traffic Authority, Victoria.

In May 1978, safety bars were installed along the northbound carriageway of Nicholson Street, Melbourne, to provide separation of trams and motor traffic. The bars are made of precast reinforced concrete and are spaced at 4.5M intervals. This report describes the results of this trial, including how the safety bars have performed as a separator, their effect on car performance along Nicholson Street, accident rates in Nicholson Street, tram travel times along the street, and the effect on cars in Nicholson Street. In general the study has indicated (I) that the safety bars have established a physical median which car drivers are reluctant to cross and so effectively separate trams from motor traffic. (II) the separation has had a statistically insignificant effect on motor vehicle operations along Nicholson Street and little effect on the travel times of motor vehicles approaching Nicholson Street at intersections. (III) the major effect on motor traffic and pedestrians appears to be in regard to safety in providing a facility for pedestrians which is akin to a central refuge and also physically separating opposing streams of traffic. (IV) no statistically significant tram journey time improvement can be attributed to the installation of the safety bars.

32 082728 SOME CONSIDERATIONS FOR DETERMINING DIAL-A-RIDE FEASIBILITY IN THE WASHINGTON L'ENFANT AREA. Dial-A-Ride (DAR), according to the author, is a viable transportation system for the Washington, D.C. L'Enfant area. The relatively high DAR demand density of the area (average of 50 demands per square mile per hour) suggests that DAR may be more desirable than the present taxi system and should complement existing public transportation by providing feeder service to the fixed route facilities. Completion of the first phase of the METRO subway system will reinforce the DAR feeder system concept. The L'Enfant DAR system size can be estimated from the simulation results reported in this document. A rough estimate of the economic feasibility of the system is possible based on the number of vehicles and cost per trip. Conclusions are based primarily on cost considerations although the utility of a system should also consider aspects such as relief of traffic congestion and improvement of urban environment. This report attempted to identify some of the needs of the area disadvantaged which could be aided by DAR implementation. It was concluded from the high demand density of elderly and handicapped that DAR is necessary and might be initiated solely to support their needs. Even assuming a low modal split for the low income people, enough demand would be generated to make DAR suitable for mobilizing this group to suburban job opportunities. Therefore, indications encourage DAR implementation in the L'Enfant area for use as either a feeder system or as a service to the disadvantaged. /IMTA/

Gale, JE (George Washington University); Consortium of Universities, (UTC-06-74) UMTA-DC-11-0003-74-2, June 1974, 53 pp; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-236897/AS

32 083961 THE DIAL-A-RIDE R&D PROGRAM. This report discusses the role and the economics of Dial-A-Ride, a modern concept of public transportation particularly well suited for suburban areas. The following five roles are identified: (1) suburban feeder service to line haul transit; (2) suburban local transit; (3) small urban area transit; (4) night and Sunday service; and (5) transit for the handicapped, senior citizens and other groups with special needs. It is found that by bringing all residents of an area within the reach of the transit system, higher patronage is realized than with conventional service in the same area. Also, the use of Dial-A-Ride service as a feeder to line haul bus or rapid rail service provides a transit system that is a true alternative to widespread private automobile usage. The cost of Dial-A-Ride service is reflective of the cost of any transit services in areas of low, widely dispersed demands. Annual subsidies have been required for transit services in such areas. The subsidies of Dial-A-Ride service are comparable to the costs of other public services such as garbage collection and police protection.

32 084229 DIAL-A-RIDE IN MAIDSTONE. This evaluation of the many-to-two Dial-a-Ride Service in Maidstone, considers the degree to

which the scheme has achieved the goals of operational viability, social equity and consumer satisfaction. Details of the Maidstone experiment (initiated in 1972) are given. The assessment of service consisted of a before survey of the catchment areas to ascertain its travel characteristics, an appraisal of the operational strategy, and a survey of the user section of the community. The survey details are described and pre-trial survey data are included in the appendix. This evaluatory study generated data on operational procedures and passenger requirements which should prove useful in ensuring better results in future trials.

32 084755 OPERATING POLICIES FOR PERSONAL RAPID TRANSIT. Personalized Rapid Transit (PRT) systems development is concerned with the more complex new generation of PRT systems that will utilize small automated vehicles closely spaced on an exclusive right-of-way to achieve a higher lane capacity and non-stop service, along with reduction of traffic congestion and pollution. The author perceives a need to carefully define and study operating policies relating to vehicle separation, and velocity as the capacity of the system increases. This report describes and evaluates operating policies for PRT systems and illustrates their implementation in a PRT vehicle autopilot. The vehicles frequency of passage and other considerations that contribute to the selection of such frequencies are the major topics of the report. Also studied are the various effects on system parameters and performance that follow the selection of an operating policy. The report examines 3 potential operating policies for PRT systems and defines the necessary limitations on headways resulting from design parameters and the effects of maneuvers. The operating policies considered are constant separation, constant K factor, and constant headway operation. A longitudinal control system was devised for the purpose of testing implementation of each operating policy. This test was accomplished by a digital computer simulation of a string of PRT vehicles controlled by the longitudinal control system models and operating according to the various policies. /UMTA/

32 090032 SOCIOECONOMIC AND TRAVELING CHARACTERISTICS OF DIAL-A-RIDE USERS. Ten socioeconomic characteristics of the average daily users of the Dial-A-Ride system in Haddonfield, New Jersey have been obtained and compared with the characteristics of the residents of the entire service area. Five questions were asked on the trip characteristics, including frequency of Dial-A-Ride use during the week and weekend, trip purpose, trip distance, and the usual means of transportation. Ratings and rankings of seven Dial-A-Ride system characteristics were obtained using a seven-part semantic scale. This information was obtained by means of two 1973 on-board surveys.

32 090451 DEMAND RESPONSIVE TRANSPORTATION SYSTEM FOR THE EAST/NORTHEAST AND WATTS MODEL CITIES NEIGHBORHOODS. The project was designed to demonstrate that a demand-responsive public transportation system using subscription techniques could be a successful and important service in supplementing existing fixed-route bus operations. Service priorities of the program were: (1) Persons requiring access to health and related facilities within the 2 Model Cities service areas; (2) elderly persons requiring transportation within the service area; (3) persons without autos to shopping facilities; (4) youth to Model Cities programs. A fleet of 12-passenger radio-dispatched vans would provide low fare transportation (15 cents). Operating data describing ridership, revenues, travel characteristics, performance of system in terms of wait and travel times are discussed. Funds expended and estimated monthly operating costs are presented.

32 090951 DIAL-A-RIDE PILOT PROJECT. The report discusses the Dial-a-Ride pilot project that began operating in late 1971 in the Southwest area of Ann Arbor, Michigan. Among topics covered are project scope, including objectives, basic design features, project organization, and management. Following is a detailed description of the service area, destinations, service hours, and fare structure. The next section covers system

design and operation, including the basic dispatching algorithm, dispatching modifications, the possibility of computer assisted dispatching, vehicles used, communications system, personnel, marketing, and data collection. Costs and revenues of the system are discussed next. A chapter on ridership includes overall figures plus breakdowns by season, month, day of week, hour of day, and geographic trip patterns.

32 090991 DIAL-A-RIDE IN NORTH AMERICA: REPORT OF A STUDY TOUR IN DECEMBER 1973. Visits were made to seven dial-a-ride systems, one taxi operator, Ford Motor Co (Transportation Planning and Research Office), Urban Mass Transportation Administration of DOT, and MITRE Corporation. The report describes the extent of dial-a-ride in North America, the ways in which it is being used, vehicle reliability, radio and telephone use, dispatcher selection and training, system design, computer applications, demand prediction, evaluation methods and government support policy. It is concluded that small dial-a-ride systems are no longer experimental in USA but that research and development is needed before systems of more than about 15 vehicles become practical. The limit to system size is at present set by the work-load on the dispatcher and the capacity of the radio channel. Computerized dispatching is not yet available as a routine technique but should become available within 2 to 3 years. Taxi-based dial-a-ride systems appear to be economically viable at fares of about \$1.00/passenger. Bus-based systems charge lower fares and achieve revenues which are 25 percent to 70 percent of cost.

32 091475 CARPOOL INCENTIVES AND OPPORTUNITIES. REPORT OF THE UNITED STATES CONGRESS PURSUANT TO SECTION 3(E) PUBLIC LAW 93-239. EMERGENCY HIGHWAY ENERGY CONSERVATION ACT. The report includes (1) a description of methods and programs used to promote carpooling, (2) a discussion of the success of these methods, (3) an evaluation of a broad range of incentives to promote carpooling, and (4) recommendations on government actions to encourage carpooling. The report recommended that the Federal Government broaden its efforts to encourage carpooling to set an example as a major employer. The report also recommends that State and local governments expand efforts to encourage carpooling through (1) the development of highway projects providing preferential treatment for carpools, and (2) assistance to employers in promoting carpooling among their employees.

32 091903 THE NBS COMPUTERIZED CARPOOL MATCHING SYSTEM: USERS' GUIDE. The report includes flowcharts, input/output formats, and program listings for the programs, plus details of the manual process for coordinate coding. The matching program produces, for each person desiring it, a list of others residing within a pre-specified distance of him, and is thus applicable to a single work destination having primarily one work schedule. The system is currently operational on the National Bureau of Standards' UNIVAC 1108 computer and was run in March of 1974, producing lists for about 950 employees in less than four minutes computer time. Subsequent maintenance of the system will be carried out by the NBS Management and Organization Division.

32 092401 ADVANCED DIAL-A-RIDE ALGORITHMS. Purposes of this report are to develop advanced dial-a-ride control procedures based on the experience gained in Haddonfield, NJ and to explicitly investigate the problem of controlling integrated dial-a-ride fixed route transit services. Objectives of this project can be subdivided into four tasks: (1) evaluation of simulation effectiveness and upgrading of simulation capabilities; (2) evaluation of the present dial-a-ride control algorithm used in Haddonfield, and identification of shortcomings and areas for improvement; (3) development of advanced computer control algorithms in the context of single module dial-a-ride systems incorporating better utilizations; and (4) definition, description, and evaluation of roles for computer scheduling which incorporate interfaces to each other and to existing conventional modes of transportation. This report describes work accomplished to date.

32 092440 CARPOOLING: STATUS AND POTENTIAL. The report contains the findings of studies conducted to analyze the status and potential of work-trip carpooling as a means of achieving more efficient use of the automobile. Current and estimated maximum potential levels of carpooling are presented together with analyses revealing characteristics of carpool trips, incentives, impacts of increased carpooling and issues related to carpool matching services. National survey results indicate the average auto occupancy for urban work-trip is 1.2 passengers per auto. A model was developed to predict the maximum potential level of carpooling in an urban area. A technique was developed for estimating the number of participants required in a carpool matching service to achieve a chosen level of matching among respondents, providing insight into tradeoffs between employer and regional or centralized matching services.

Kendall, DC ; Transportation Systems Center Final Rpt. DOT-TSC-OST-75-23, June 1975, 119 pp; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-244609/4ST

32 092447 AN APPROACH TO REGION-WIDE URBAN TRANSPORTATION. The evolving trends of our urban areas indicate a need for a new kind of urban system in which point-to-point, region-wide service is provided by a mix of conventional transit and flexible route paratransit elements acting cooperatively instead of competitively. In concert with improved automobiles and automobile utilization and management, there appears the promise of improved mobility for both the driver and the non-driver through reduced congestion and increased transportation options, overall reduced energy consumption, and cleaner air. The principal unknown is how to bring about the evolutionary and incremental implementation of these integrated systems over time. Their operational characteristics appear to be such that increasing ridership and reducing the peak/off-peak ratio will bring about both cost reduction and service improvement. A framework for an implementation strategy is presented. The implications for federal RD&D are noted for both system development implementation.

32 093015 SHARED RIDE TAXI SYSTEMS: AN ANALYSIS IN SUMMARY. Two privately owned demand-responsive transportation systems, one in Davenport, Iowa, and the other in Hicksville, New York, were studied to determine the economic feasibility and marketability of

these systems and the roles they play in small and medium-sized urban areas. The systems analyzed offer door-to-door service on a shared-ride basis using six-passenger automobiles. The overall objectives of the study were to: (1) Determine the cost, revenues, ridership, and other benefits of providing public transportation service with privately owned demand-responsive systems; (2) analyze the market demand for each level of service; (3) analyze the contribution of each level of service for providing mobility for specific segments of the urban community; (4) measure the economic viability of the different levels of service; (5) measure the demand for service as a function of level of service and pricing scheme; (6) determine the effectiveness of automatic scheduling and monitoring on system performance, costs, and revenues, if put into operation; and (7) determine the economic feasibility of these systems.

32 093017 AN ORGANIZATIONAL AND ENVIRONMENTAL REVIEW OF TWO PRIVATELY OWNED, SHARED RIDE TAXI SYSTEMS. The report has been based primarily on data from two privately owned demand-responsive public transportation systems operating in two different urban environments. Both are radio-dispatched shared-ride taxi systems, one in the industrial-agricultural city of Davenport, Iowa, and the other in the residential-commercial city of Hicksville, New York. Secondary data concerning national averages were obtained to enable generalized statements. Organizational aspects of these systems are discussed in terms of functional structure and methods of providing operational services. Requirements for and characteristics of taxi system's managerial personnel, dispatchers and drivers are examined. Regulatory issues confronting taxi systems are delineated. Meter, zone, multi-zone, and trip length pricing are discussed as alternative pricing mechanisms for taxi service. The data lead the authors to the major conclusion that the most important factor to be considered in the use of shared-ride taxi services is the needs of the various market segments in the urban public transportation market. It was also concluded that a taxi company under a highly innovative manager is an effective public transportation service.

Heathington, KW Davis, FWJ Griese, SC Symons, RT Alford, RW ; Tennessee University, Knoxville, Urban Mass Transportation Administration, (UMTA-TN-06-0004) Final Rpt. UMTA-TN-06-0004-74-1, Oct. 1974, 133 pp; Paper copy also available in set of 6 reports as PB-245 099-SET, PC\$27.00.; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-245103/7ST

32 093018 ECONOMIC CHARACTERISTICS OF PRIVATELY OWNED SHARED-RIDE TAXI SYSTEMS. The report presents an analysis of costs, revenues, and investment requirements associated with two privately owned,

demand-responsive transportation systems in Davenport, Iowa, and Hicksville, New York. Objectives of this report were: (1) determination of the costs, revenues, ridership characteristics, and benefits of providing public transportation with two privately owned systems; (2) measurement of the economic viability of the different levels of service; and (3) determination of the economic feasibility of combining the transportation of goods and people into a single operation. Primary sources of taxi revenue are identified and driver and vehicle productivity are evaluated. The financial analysis of taxi operations includes both capital costs and operating expenses for each of the four operational areas (vehicles, garage, dispatching, and administrative). A generalized model for predicting shared-riding investment requirements is presented. A comparison of privately owned, shared-ride taxi systems and publicly owned dial-a-bus systems is offered on the basis of cost, investments and revenues.

32 093019 AN ANALYSIS OF THE DEMAND FOR BUS AND SHARED-RIDE TAXI SERVICE IN TWO SMALLER URBAN AREAS. This report is a study of the demand for the publicly owned, fixed-route, fixed-schedule bus service and the privately owned, demand-responsive transportation service in two smaller urban areas--Davenport, Iowa, and Hicksville, New York. The objectives of the report were to compare the travel patterns and markets of the bus and shared-ride taxi systems, to compare the travel patterns and markets of the shared-ride taxi systems in each study area, to analyze factors and circumstances underlying the choice of either the bus or the shared-ride taxi, and to measure the public sentiment toward each form of public transportation. Information was gathered through on-board surveys, mail surveys, home interviews, and dispatching records and drivers' logs maintained by the taxicab companies. Users as well as non-users of public transportation were interviewed. A bibliography is furnished. Appendices contain Customer Data Record, Vehicle Data Record, and the bus passenger, taxi passenger and household survey questionnaires.

32 093020 AN ANALYSIS OF TWO PRIVATELY OWNED SHARED-RIDE TAXI SYSTEMS: EXECUTIVE SUMMARY. The report is the executive summary of a comprehensive study of the markets, economic characteristics and operation of two privately owned, demand-responsive transportation systems in op-

eration in Davenport, Iowa, and Hicksville, New York. Objectives of the study are stated and the study areas examined. In terms of the characteristics of bus and shared-ride taxi usage, the level of ridership, roles of bus and shared-ride taxi service, level of service, market composition, frequency of use, and modal choice determinants are addressed. Revenue, goods movement, and costs are presented in the section on economic considerations. Attitudes toward public involvement, management and organization, and the potential of shared-ride taxi service are discussed.

32 093078 DIAL-A-RIDE IN CARTERTON, A REVIEW OF RESIDENTS' TRAVEL PATTERNS. The report examines the travelling behavior of the residents of Carterton subsequent to the implementation of a local Dial-a-Ride service which started operations in November 1973. The data presented here is part of a combined TRRL/Cranfield assessment program designed to quantify the overall impact of the new mode on the township. The service is carrying 3.2% of all the in-town motorized trips that take place during its hours of operation. Knowledge of the service and its facilities is widespread. The main characteristic of those households which use the service is their lack of car ownership. They also tend to be from the lower income groups.

32 093289 CITY OF ANCHORAGE DEMONSTRATION TRANSPORTATION GRANT. The objective of the demonstration project was to develop a fixed route transportation system in an area of limited mass transportation services, the city of Anchorage, Alaska. Groups served by this project include the elderly, handicapped, Indians, Native Eskimos, poor, unemployed, and youth. Several concepts of the demonstration were: (1) Inner-city circulation which would enable transit users to travel between different areas of the city. These routes provided resident access to health, employment, business and social service facilities. (2) Home-to-work and work-to-home services within the area served by the project. The effectiveness and benefits of the operation were measured and evaluated. Elements of the demonstration included: A take-home passenger survey to determine passenger attitudes, trip origins and destinations; a monthly bus pass, at reduced fares; and a shuttle service from a parking lot to the downtown core area.

32 093364 IMPLEMENTING SHARED TAXI-CAB SERVICES. A CASE STUDY IN ARLINGTON, VIRGINIA. Recent research has suggested that significant improvements in urban mobility could be achieved by allowing taxicabs to offer a variety of shared-ride services, for which passengers with different trip origins or destinations can share the same taxicab. Local regulations in most urban areas in the U.S. have historically discouraged or prohibited such services, however. Arlington County, Virginia, recently decided to introduce shared taxicab services on an experimental basis, with a view to their eventual implementation as a permanent new form of public transportation for the county. This paper discusses the motivation for this experiment, the issues and problems encountered in designing it, and the specific service provisions and fare structure adopted. The paper also outlines measurement procedures designed to assist Arlington County in evaluating the experiment.

32 093478 PORTLAND METROPOLITAN AREA CARPOOL PROJECT. The Interim Report of the Portland Metropolitan Area Carpool Project describes the development and success of carpool promotional efforts undertaken in Portland during 1974. Elements that contributed to the success of the program include: extensive marketing activities, carpool matching services, employer support, and identification of park-and-ride facilities. Based on followup surveys the report estimates that more than 22,000 persons, or nearly 7 percent of area employees, were induced to carpool as a direct result of project activities. The report also describes the institutional and financial arrangements for area-wide carpool promotion in Portland.

Davis, FWJ ; Tennessee University, Knoxville, Department of Transportation Final Rpt. TCUT-1-75, Aug. 1975, 313 pp; Contract DOT-OS-40096; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-247146/4ST

32 093606 RIDESHARING AND THE KNOXVILLE COMMUTER. EXECUTIVE SUMMARY. The report gives a detailed analysis of the Knoxville commuter, identifies the current commuting methods and their relative importance to members of the Knoxville work force, studies the relative importance of sharing rides for work trips

in the firms observed and analyzes employee attitudes towards various aspects of shared rides. The report also outlines the current rate of travel within various corridors of the Knoxville community and offers a detailed summary of the benefits of ridesharing in terms of congestion, fuel consumption, present and future highway capacity, and public acceptance of ridesharing. The report examines the legal and institutional constraints which are currently inhibiting the development of various ridesharing alternatives and offers recommendations for improving public transportation in Knoxville.

32 094011 OPERATING PROCEDURES MANUAL FOR AN AUTOMATED SCHEDULING SYSTEM FOR DEMAND-RESPONSIVE PUBLIC TRANSPORTATION (HADDONFIELD DIAL-A-RIDE). No abstract available.

New Jersey Dept. of Transportation, Trenton. *Urban, Mass Transportation Administration, Washington, D.C. Oct. 1974, 355p-in 2v; Set includes PB-248 568 thru PB-248 569; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, NTIS Price; PB-248567-SET/ST

32 094012 OPERATING PROCEDURES MANUAL FOR AN AUTOMATED SCHEDULING SYSTEM FOR DEMAND-RESPONSIVE PUBLIC TRANSPORTATION (HADDONFIELD DIAL-A-RIDE). PART I. CONTROLLER FUNCTIONS. The two-volume manual is a user's guide for a computer-controlled, demand-responsive transportation system (Dial-A-Ride). The goal of the manual is to provide the information needed by the Dial-A-Ride Control Center personnel to operate an automatic Dial-A-Ride transit service using a Westinghouse 2500 mini-computer, its associated peripheral devices, and its software. The user of the manual should have a thorough knowledge of the operation of a manually scheduled demand-responsive public transportation system. With the exception of the Introduction (which is needed by all Control personnel), this manual is sectioned functionally. The personnel involved will find within their sections all the information necessary for them to do the tasks connected with their functions. Persons operating in a certain function should be aware of sections of the manual, but they will not need them for their day-to-day guidance. Part I contains the telephonist, dispatcher and supervisory functions. Part II encompasses the computer operator's function and the appendices--scheduling function, computer hardware, and glossary of terms.

32 094013 OPERATING PROCEDURES MANUAL FOR AN AUTOMATED SCHEDULING SYSTEM FOR DEMAND-RESPONSIVE PUBLIC TRANSPORTATION (HADDONFIELD DIAL-A-RIDE). PART II. COMPUTER OPERATOR FUNCTIONS. The manual is the product of the Haddonfield Dial-A-Ride Demonstration sponsored by the New Jersey Department of Transportation. The purpose of this volume is to explain the Computer Operator's tasks in using an automated scheduling system for demand-responsive public transportation.

New Jersey Department of Transportation, Urban Mass Transportation Administration, Mitre Corporation, LEX Systems, Incorporated, DAVE Systems, Incorporated, Massachusetts Institute of Technology, (UMTA-NJ-06-0002) UMTA-NJ-06-0002-74-7, Oct. 1974, 144p; Paper copy also available in set of 2 reports as PB-248 567-SET, PC\$12.00; Contract NJ-06-0002; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS, NTIS Price, /MF\$2.25; PB-248569/6ST

32 094053 SYSTEM PERFORMANCE DATA PROCESSING FOR A DEMAND-RESPONSIVE PUBLIC TRANSPORTATION SYSTEM. The report is intended to be a guide for transit operators and managers interested in operating a demand-responsive transportation system and for programmers who maintain the data processing programs. In the broad evaluation of the Haddonfield, New Jersey Dial-A-Ride Demonstration Project, extensive data are required, including attitude data from personal interviews, cost data, and system performance data. The processing of system performance data is the topic of this report. The Haddonfield system was scheduled manually from the start of the demonstration in February 1972 until February 1974. During the latter part of this period, the automated system was the primary scheduling system. The procedures used in collecting and processing data from the manual scheduling system are described. Also discussed are manual system data files and tabulations. The computer programs that process automated system data and the automated system tabulations are presented.

Hartzler, RE ; Mitre Corporation, Urban Mass Transportation Administration, (VA-06-0012) MTR-6794, UMTA-VA-06-0012-74-3, Nov. 1974, 119 pp; Contract DOT-UT-40003; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-248921/9ST

32 094127 SUMMARY EVALUATION OF THE HADDONFIELD DIAL-A-RIDE DEMONSTRATION. The Haddonfield, New Jersey Dial-A-Ride demonstration was instituted in February 1972 to determine public attitudes toward DRT, measure its public acceptance, evaluate its technical and economic feasibility, and measure the impacts of the DRT concept on the community. The purpose of the report is to summarize the preliminary evaluation of the Haddonfield demonstration in terms of what was learned from the experiment while attempting to achieve the stated objectives. The concept had favorable public acceptance, and the improvements in the system parameters, such as increase in service area, introduction of shuttle service, and

reduction of fares, caused increases in ridership and productivity. Ridership, productivity, and quality-of-service parameters of the Haddonfield system compare favorably with DRT systems operating in other U.S. cities.

32 094198 TRAVEL HABITS AND PATTERNS. VOLUME 1. 1964-1973 (A BIBLIOGRAPHY WITH ABSTRACTS). Travel habits and patterns in the U.S. are cited in this bibliography of Federally-funded research. The majority of the studies cover urban transportation including carpools, subways, buses, dial-a-ride, and private automobiles. Disadvantaged, disabled, student, and various age groups are discussed as are recreational data. Some aircraft and rail studies are included. (Contains 83 abstracts)

32 094560 DEMAND RESPONSIVE TRANSPORTATION STATE-OF-THE-ART OVERVIEW. The document presents a state-of-the-art overview of demand responsive transportation. It is designed to make more accessible the knowledge which constitutes the state-of-the-art and is enhanced by the inclusion of a supplementary materials source book for further reference. The document further presents information on 80 demand responsive transportation services known to be operating in North America as of May 1, 1974. Color illustrations reproduced in black and white.

Transportation Systems Center, Department of Transportation Aug. 1974, 118 pp, 12 Fig., 8 App.; See also PB-243 878.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-250108/8ST

32 095032 ROLE OF TAXICABS IN URBAN TRANSPORTATION. This report documents and integrates a number of taxicab related studies. It contains a general description of the taxicab industry, trip and rider characteristics, fare structure, operations, users, potentialities and issues. As one of the "para-transit" modes, taxicabs make an important contribution to urban transportation. It is recommended in this report that careful study should be given to making the entire spectrum of urban public transportation modes-including taxicabs-eligible for capital and operating assistance. A number of recommendations for specific courses of action are made.

Webster, AL Weiner, E Wells, JD ; Department of Transportation Dec. 1974

32 095033 IMPLEMENTATION AND OPERATION OF A DEMAND RESPONSIVE PUBLIC TRANSPORTATION SYSTEM (HADDONFIELD DIAL-A-RIDE). This publication describes features of the installation and operation of the manually scheduled Haddonfield, New Jersey Dial-A-Ride system. Considerable interest has arisen in providing Dial-A-Ride

service to other localities. The purpose of this document is to provide guidelines from the experience in the Haddonfield project to assist others in procuring and operating a Dial-A-Ride system. Included are sections on: the facility and equipment, operations, handling of and accounting for revenue, communications, personnel training, and sales promotion. In order to serve as a guide for implementing a similar system, information for ordering and building equipment as well as actual operating procedures and forms are reproduced. The appendices explain the logic and rationale behind the development of certain procedures. This information should be useful in adapting those procedures to different situations.

New Jersey Department of Transportation, (NJ-06-0002) UMTA-NJ-06-0002-74-3, Mar. 1974, 224 pp; This project also consists of a summary report and 6 supplements.; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-233380/LK

32 095034 SUMMARY OF A REPORT COVERING THE IMPLEMENTATION AND OPERATION OF A DEMAND RESPONSIVE PUBLIC TRANSPORTATION SYSTEM (HADDONFIELD DIAL-A-RIDE). This report is an executive summary of Report No. UMTA-NJ-06-0002-74-3, Implementation and Operation of a Demand Responsive Public Transportation System (Haddonfield Dial-A-Ride). The subject report is a guide to installing and operating a manually operated Dial-A-Ride System, covering both the physical and functional aspects of the system, i.e., required equipment, furniture, and forms, and people and what they do to operate the system. The subject report is based on manual operation and control of the Haddonfield Dial-A-Ride Project, covering the period from February 1972 through January 1973.

New Jersey Department of Transportation, (NJ-06-0002) Summary UMTA-NJ-06-0002-74-3, Mar. 1974, 23 pp; This project also consists of a subject report and 6 supplements.; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-233379/LK

32 095035 CONTROLLER'S CLASS NOTEBOOK FOR IMPLEMENTATION AND OPERATION OF A DEMAND RESPONSIVE PUBLIC TRANSPORTATION SYSTEM (HADDONFIELD DIAL-A-RIDE). This report is a supplement to "Implementation and Operation of a Demand Responsive Public Transportation System (Haddonfield Dial-A-Ride)." This controller's class notebook is presented as an aid to training Control Room personnel in all phases of Control Room operation of a manually controlled Dial-A-Ride. Its purpose is to guide and direct those who are responsible for operating Dial-A-Ride system in Haddonfield, New Jersey, and surrounding service areas. It contains the necessary policy and procedures to operate the system. It is also used for training control room staff and the vehicle operators. As an adjunct to the operating portion there is also a section on personnel policies and procedures. Staff is discussed in terms of such issues as personnel selection and training, wage and pay policy. Another topic presented is on contingency/emergency procedures. Radio communications are discussed. Definitions are presented for ease in understanding.

New Jersey Department of Transportation, (NJ-06-0002) Supplement UMTA-NJ-06-0002-743A, Apr. 1974, 147 pp; This is one of 6 supplements to the subject and summary reports.; ACKNOWLEDGMENT: UMTA, NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-233381/LK

32 095036 DRIVER'S CLASS NOTEBOOK FOR IMPLEMENTATION AND OPERATION OF A DEMAND RESPONSIVE PUBLIC TRANSPORTATION SYSTEM (HADDONFIELD DIAL-A-RIDE). This report is a supplement to "Implementation and Operation of a Demand Responsive Public Transportation System (Haddonfield Dial-A-Ride)." This Driver's Class Notebook is presented as an aid to training drivers for a Dial-A-Ride type operation. Since attainment of the purpose of Dial-A-Ride is largely in the hands of the vehicle operator, such topics as public relations, pickup and delivery etiquette, stop procedures, handling cash fares and tickets, vehicle scheduling and driver assignment are discussed under the heading of vehicle operations. Contingency/emergency procedures to follow in case of illness or breakdown are presented. Radio communication is examined. Appendices present the phonetic alphabet and an example of the radio exchange when a vehicle makes a stop.

New Jersey Department of Transportation, (NJ-06-0002) Supplement UMTA-NJ-06-0002-743B, Apr. 1974, 90 pp; This is one of 6 supplements to the subject and summary reports.; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-233382/LK

32 095037 DRIVER'S CLASS DESCRIPTION SHEETS FOR IMPLEMENTATION AND OPERATION OF A DEMAND RESPONSIVE PUBLIC TRANSPORTATION SYSTEM (HADDONFIELD DIAL-A-RIDE). This report is a supplement to "Implementation and Operation of a Demand Responsive Public Transportation System (Haddonfield Dial-A-Ride)." These description sheets are presented as a detailed aid in preparing an hour-by-hour training program for drivers. The sheets have the following format: subject, content, what is to be learned, technique(s), references, visual and other aids, handout(s), and tests(s). Among the subjects covered by the class description sheets are orientation, personnel policies, area familiarization, public relations, vehicle operations, emergency procedures, simulation, mobile radio operation and driving instruction review. Lectures are given and tours arranged.

New Jersey Department of Transportation, (NJ-06-0002) Supplement UMTA-NJ-06-0002-743D, Apr. 1974; This is one of 6 supplements to the subject and summary reports.; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-233384/LK

32 095038 CONTROLLER'S CLASS DESCRIPTION SHEET FOR IMPLEMENTATION AND OPERATION OF A DEMAND RESPONSIVE PUBLIC TRANSPORTATION SYSTEM (HADDONFIELD DIAL-A-RIDE). This report is a supplement to the report entitled "Implementation and Operation of a Demand Responsive Public Transportation System (Haddonfield Dial-A-Ride)." Control-

ler's class description sheets are presented as detailed aids in preparing hour-by-hour training program for Control Room personnel. The description sheets are arranged in the following format: subject, content, what is to be learned, technique(s) references, visual and other aids, handout(s), and tests(s). Among the subjects covered by these description sheets are orientation, personnel policies, area familiarization, control map familiarization, public relations; dispatcher, scheduler and telephonist functions and control staff functions. Lectures are given and tours arranged.

New Jersey Department of Transportation, (NJ-06-0002) Supplement UMTA-NJ-06-0002-743C, Apr. 1974, 113 pp; This is one of 6 supplements to the subject and summary reports.; ACKNOWLEDGMENT: UMTA, NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-233383/LK

32 095039 MANUAL CONTROL OPERATING PROCEDURES MANUAL FOR IMPLEMENTATION AND OPERATION OF A DEMAND RESPONSIVE PUBLIC TRANSPORTATION SYSTEM (HADDONFIELD DIAL-A-RIDE). This report is a supplement to "Implementation and Operation of a Demand Responsive Public Transportation System (Haddonfield Dial-A-Ride)." This particular manual is presented as an aid to the operation of a manually controlled Dial-A-Ride. Personnel policies toward the vehicle operators and control room staff (i.e., public contact, wage and pay policy) are presented. In terms of vehicle operations, discussion includes pickup and delivery etiquette and vehicle scheduling. Contingency/Emergency procedures are related. Functions of telephonist, scheduler, dispatcher and supervisory activities and responsibilities are delineated. Radio communications are discussed. The appendices contain interim instructions.

New Jersey Department of Transportation, (NJ-06-0002) Supplement UMTA-NJ-06-0002-743E, Apr. 1974, 290 pp; This is one of 6 supplements to the subject and summary reports.; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-233385/LK

32 095040 PROCEDURE LOGIC DESIGN FOR IMPLEMENTATION AND OPERATION OF A DEMAND RESPONSIVE PUBLIC TRANSPORTATION SYSTEM (HADDONFIELD DIAL-A-RIDE). This report is a supplement to "Implementation and Operation of a Demand Responsive Public Transportation System (Haddonfield Dial-A-Ride)." This particular report on the procedure logic design is presented to show the logic flow of all phases of a manually controlled Dial-A-Ride. The logical design of the Dial-A-Ride Control System is the heart of the system design. From it stem the procedures and training materials. The diagrams shown here are after the initial simulation task was completed. The shorthand notational system employed is presented. Arrow flow diagrams show that time sequence and events in the system. With use of these diagrams, questions of timing, branching to new procedures, flow of documents and information storage can be studied. Personnel and equipment requirements can be determined. Results of time studies made during simulation are presented.

New Jersey Department of Transportation, (NJ-06-0002) Supplement UMTA-NJ-06-0002-743F, Apr. 1974, 87 pp; This is one of 6 supplements to the subject and summary reports.; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-233386/LK

32 095366 SOCIO-ECONOMIC AND TRAVELING CHARACTERISTICS OF DIAL-A-RIDE USERS. Ten socio-economic characteristics of the average daily users of Dial-A-Ride (DAR) in Haddonfield, N.J. were obtained and compared with characteristics of residents of the entire service area. Five questions were asked about trip characteristics, including frequency of DAR use during the week and weekend, trip purpose, trip distance and the usual means of transportation. Data were obtained from 2 on-board surveys in July '73 and Sept. '73.

Mitre Corporation VA-06-0012, July 1974; Abstract in UMTA Abstracts, Feb/March 1975, p. 4.; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB 238-163/AS

32 095527 CARPOOLS: HOW SUCCESSFUL? Carpools are probably the most effective methods of mass transportation offering comfort and convenience while at the same time reducing traffic congestion air pollution, and conserving fuel. A study of the data on carpool matching programs for 1973 shows that automobile usage declined 23.5%. The recent rise in employer-sponsored carpools indicates the popularity of this form of urban transportation. This article briefly describes several examples of successful carpools started in cities across the country. The 3M company in St. Paul initiated the "commute-a-van" program, operating vans that accommodate 12 persons. This ride-sharing program saved money on a proposed parking facility, as well as saving gasoline. The Connecticut Department of Transportation developed a UNIVAC computer program to provide carpool matching services. Most employers participating in such programs give priority parking privileges to carpools. Several agencies in Knoxville joined together in forming an urban-wide pooling program, which was not a reaction to the energy crises but a positive step toward resolving problems such as traffic congestion and decreasing transit ridership. Express buses have also proven to be effective in attracting riders away from their automobiles. From various programs working successfully, it has been shown that a computer matching service encourages people to join or form carpools, and that encouragement and incentive from employers is beneficial in continuing effective carpool programs.

32 095821 ANALYTIC EQUILIBRIUM MODEL FOR DIAL-A-RIDE DESIGN. Dial-a-ride is a demand-responsive transportation system in the experimental stages of development. Previous analyses of the system have been dominated by relatively expensive, supply-oriented simulation models and crude, insensitive demand predictions. This paper presents an analytic equilibrium model that has minimal data and computational requirements and is suitable for use in

designing future dial-a-ride systems. The model is used to test the sensitivity of level of service and net operating cost to changes in demand model parameters and fares. The results demonstrate the important effects of decisions such as fleet size, service area, and fare levels on the economic and noneconomic prospects of a potential dial-a-ride system. In dial-a-ride as in many other transportation systems, the inter-relations between design parameters and demand response are so complex that only an equilibrium model can predict the impacts of a specific design.

32 095822 DEMAND-RESPONSIVE TRANSPORTATION SYSTEMS IN THE PRIVATE SECTOR. Two privately owned demand-responsive transportation systems were investigated to determine the economic feasibility and marketability of these systems and the roles that they play in small-to medium-sized urban areas. The 2 systems are operated by innovative taxicab companies that offer door-to-door service in 6-passenger automobiles on a shared-ride basis. This paper summarizes the results of preliminary analyses of some of the basic information collected on the daily operations of these systems. The 2 companies differ in terms of fleet size, service area, fare structure, types of service offered, market strategies, and goals. Those differences are reflected in ridership, level-of-service, and economic characteristics. Preliminary results reveal the systems to be economically viable, marketable, and important components of the total public transportation system.

32 097923 SUBSIDIARY TRANSPORTATION: ITS ROLE IN REGIONAL PLANNING. Transportation planning in cities and metropolitan regions can contribute directly to meeting the transit needs of special groups and communities now being overlooked by generalized transit systems, without relying on expensive nationally funded studies. Improvements in transportation development can arise from application on a broad scale of experiments already under way that are demonstrating some effective new arrangements for transit service. This article suggests how an examination of existing subsidiary transit services, such as car or bus pools and subscription buses, which are designed to complement primary/secondary systems, might be organized as a useful input to transportation planning; describes the kinds of transit operations that

might be included in such an examination; and outlines the types of information that should be obtained about them. The objectives of the proposed approach are to speed transportation innovation and introduce greater flexibility in urban development.

Perloff, HS Connell, KM *American Institute of Planners, Journal of* Vol. 41 No. 3, May 1975, pp 170-183

32 097979 CARS FOR THE CAR-LESS. The article states that, in economic terms, the successful operation of a dial-a-ride bus service is dependent on the demand. The criterion for economic success used by Ford Motor Co. in the US is a demand of 10 trips/sq mile/hr. Research at MIT suggests however that the cost per trip can only rival that of a taxi service when the demand density is 20 trips/mil/hr. Demand itself is reported to be dependent on low fares, high residential density and accessibility to telephones. In Britain only 4 in 10 households have a telephone but the rate of increase of subscribers is high. In an attempt to develop the market for dial-a-ride, one firm in the US is reported to be negotiating contracts with local shopkeepers to provide a free dial-a-ride bus service. A brief report is given of investigations in Ann Arbor, Michigan, which are directed at providing a service between any 2 points in the town with a minimum of 2 transfers, using a fleet of 45 dial-a-buses and 15 fixed route express buses. /TRRL/

32 097985 THE RE-BIRTH OF THE BUS. This article notes the fact that, though the bus has a bad image, it is still important in most towns and cities in Britain, but that increasingly cars are used in response to the development of dispersed origins and destinations of trips. The author argues that many people are forced into buying cars and he identifies many more that do not have access to cars. The necessity to develop public transport services is described, and the advantages of the bus, particularly its capacity and its use for express services, are outlined. Examples are given of situations where reserved lanes on ordinary roads and motorways and contra-flow lanes contribute to large increases in speed. A number of towns are suggested in England that could give buses special motorway lanes, priority at junctions, and the use of dis-used (or under-used) rail tracks. These would apply to both radial and ring services. A variety of demand-responsive schemes are described which would collect people from low density suburbs. Provision for car-pool cars on reserved lanes is also suggested. The various modes would form an integrated system, with proper interchanges which would have associated shopping facilities. The system would require minimal investment. /TRRL/

32 098542 SAVING HIGHWAY FUEL: THE ENGINEER'S ROLE. It is one of the responsibilities of highway engineers and officials to see that the most efficient use is made of transporta-

tion in order to conserve fuel while at the same time preserving mobility. The greatest consumption of gasoline occurs in the work trip. An effective conservation measure is carpooling. The Highway Users Federation along with other employers has sponsored carpooling programs and they have proved a success in many instances. Innovative programs such as the vanpool organized by the 3M Company in St. Paul have prospered, and they continue to save fuel and reduce vehicle mileage. Incentives must be provided for more increased use of carpools. Economics can be an incentive since carpools can be more economic and efficient than many forms of public transit. Priority treatment such as exclusive and bypass lanes, traffic control systems that reduce delay thereby saving fuel, and reduced speeds are also good incentives. In considering a shift to transit, the relative energy efficiencies of each mode must be taken into consideration. Urban area size and development affect this greatly. Some energy, of course, can be saved, but not that much transit diversion can be expected to occur without altering basic lifestyles. Conservation depends upon what each individual is willing to give. Highway and traffic professionals, by creating new methods and enhancing old ones, can contribute toward a national, as well as personal, conservation goal.

32 098964 HADDONFIELD DIAL-A-RIDE. The Haddonfield (New Jersey) Dial-A-Ride Project is one of about 60 demand-responsive transportation systems currently being used throughout the U.S. and Canada. The Haddonfield Project was designed, implemented and operated as a research and development project to determine the feasibility of a demand-responsive door-to-door transportation service. The prime objective of the Project was to obtain accurate and reliable data for evaluation of the Dial-A-Ride concept. This final report delineates project direction, beginning February 19, 1972 and ending June 30, 1974. It details ridership trends, vehicle productivity, service quality, revenues and costs of operation. The report includes a quantity of graphs, charts, and tables that show the effects of zonal mode of operation, and the elimination of the shuttle service. The main objectives of the Project covered by this report were to: (1) provide accurate data for demand and cost analysis; (2) determine the degree of public acceptance of demand-responsive transit systems; (3) determine limits of a manually controlled

scheduling system; (4) determine system parameters for a computer-controlled scheduling system; and (5) test the developmental computer-controlled scheduling system. Appendices contain a list of Haddonfield Dial-A-Ride reports and data collection and analysis procedures. /UMTA/

32 099241 A PARATRANSIT PERSPECTIVE ON EVALUATION OF URBAN PUBLIC TRANSPORTATION. This paper points to the need to provide transportation service that responds to the articulated needs and demands of the traveling public, and states that formal evaluation cannot do much to improve this aspect of urban mobility. A marketplace evaluation mechanism is proposed, whereby the public by its consumption choices will provide an evaluation that reflects the true needs and demands of the traveling public. The traveling public is divided into three fundamental groups: the transportationally disadvantaged; individuals who have ready access to private automobiles and whose travel does not involve travel to a major activity center; and the large population group who drive their automobile as commuters between home and a major activity center in the morning and return in the evening, referred to as the RAC/MAC group. This latter group is viewed as the fundamental challenge to the public transportation system, and the need is seen for a much richer variety of possible ride-sharing arrangements or paratransit services. It is suggested that an evaluation of new paratransit modes be conducted by the marketplace process. Those that attract RAC/MAC passengers can be judged to be successful; those that fail to do so, regardless of their performance on explicit evaluation criteria, cannot be considered successful.

32 125093 POST BUS TRAVEL CAN BE THE ANSWER. This brief article describes the introduction of a post-bus service in a rural area around Dorling. Details of the appearance and special fittings of the van are presented and the author notes what sort of passengers are most common. The service operates three return journeys on weekdays and one on Saturdays. The advantages of the service are spelt out: it is not in competition with stage services, it is a personal and friendly service, and the minibus stops on demand. The service is flexible and the post-bus guarantees not to leave people stranded. Both shoppers and visitors to both friends and the countryside can take advantage of the service. /TRRL/

32 126150 DEMAND-RESPONSIVE TRANSPORTATION SYSTEMS & SERVICES. The forty two papers presented at the conference on demand-responsive transportation (DRT) are oriented toward a number of significant issues that are still unresolved and will impact the future of

DRT. Three papers on the state-of-the-art of DRT examines the services and techniques used to provide those services. The role of DRT service in larger metropolitan areas with significant fixed route service is discussed and the importance of integrating DRT and fixed route systems is considered. Four papers cover aspects of planning for new and integrated DRT systems, and 2 papers discuss the implementation and operation of integrated transit services. Six papers describe the implementation and operation of new DRT services. Service for the elderly and handicapped (should it be combined with general DRT; and special vehicle design) is discussed in 2 papers, presented at the session devoted exclusively to taxicabs, examined the role of taxi companies in DRT operations, as well as the more general issues of taxicab operations. Research and development in DRT is covered in 4 papers. The role of automation is discussed and the issue of whether dispatching should be computer aided or computer controlled is examined. Four presentations on marketing and promotion of DRT, cover aspects such as fare structures, price-demand elasticities and marketing techniques and programs. Presentations were also made on system evaluation (2 papers) and political and public policy issues related to DRT (3papers). The panel and general discussions following the presentation of some papers are also included.

Transportation Research Board Special Reports Proceeding No. 154, 1975, 177 pp Proceedings of the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126152 STATE OF THE ART OF DEMAND-RESPONSIVE TRANSPORTATION. SPEAKER 1. The techniques used to provide the services of demand-responsive transportation (DRT) are examined and illustrated with reference to the small system in Batavia, N.Y. and the larger system in Rochester, N.Y. The vehicles used for DRT have evolved from 10-passenger vehicles to 20-and 25- passenger vehicles (some powered by diesel fuel). A battery-powered Electrobuss is the most recent innovation. Key-punched information from telephone operators is used with digital communication equipment to relay instructions to drivers. A radio voice message system serves as a backup. Permanent records from digital communication equipment can be based in analysis and reporting. Many to-on service, services provided for senior citizen housing units, and subscription service are now offered by DRT. The slowly developing small package delivery has been found to be profitable for DRT and compatible with passenger service. Small systems such as Batavia dispatch manually, but systems such as Rochester will include computer dispatching and the interface of the computer with digital equipment. The Rochester System will be integrated with the existing fixed-route system. Operating costs in the Rochester system has decreased from \$5.00 per passenger in August 1973 (first month of operation) to \$2.54 per passenger in August 1974.

Aex, RP (Rochester-Genesee Regional Transportation Auth) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 3-5

Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126157 PLANNING FOR NEW AND INTEGRATED DEMAND-RESPONSIVE SYSTEMS. SPEAKER 3. The implementation of various demand-responsive transportation (DRT) services is discussed (with emphasis on funding at the state and federal levels), and the DRT activities of several state transportation departments are reviewed. It is emphasized that the need for a service must first be established and then state administration must be approached to obtain funds to meet that need. Work in California is progressing on those lines. Funds for operating and capital expenses are available through federal programs such as Title 3 of the Older Americans Act. Capital assistance from UMTA is available for services designed for the elderly/handicapped and programs may be established to fit the fund. The importance is noted of combining services (eg services for the handicapped, meals services and other social services). DRT can serve a variety of riders, but the market segments must be identified and then the service marketed to that segment. Institutional constraints should be identified and resolved before the DRT service is implemented. Information is presented that was provided by 4 states involved in DRT activities. In Oregon, three demonstration projects incorporating DRT services were established in a cooperative program to improve mobility for the disadvantaged; funds from federal programs were combined with local and state funds. Data on these systems are tabulated. A non-fixed-route subscription, DRT system for the elderly and handicapped is in operation in St. Petersburg, Florida. The DRT system being planned and implemented in Wisconsin will be the first system open to the general public (other DRT services in the state are provided for elderly and handicapped). The Dial-A-Ride Transportation program in Michigan as well as the DRT services in 9 cities are briefly outlined. In California, funds provided by a 1971 Transportation Act are being used or planned for use in the provision of DRT.

Gray, G (California Department of Transportation) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 27-31, 1 Tab.; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126168 TRANSPORTATION FOR THE ELDERLY AND THE HANDICAPPED. SPEAKER 2. The history is outlined and the operations are briefly described of a transportation service (Handicabs) for the elderly and handicapped in Milwaukee. The service offers

door-to-door, low-cost, safe transport of passengers by employees trained in handling wheelchairs and disabled passengers. For the success of the system, it is considered that the users must become aware of the type of service offered. The commission arrangement with the driver is considered essential for the efficiency and economics of a demand-responsive service. The operator must keep the turnover rate as low as possible. Detailed and accurate information (does passenger have a wheelchair or must it be provided? is the passenger on the second floor? etc.) is critically important. Correct billing information (Medicaid information) must be obtained on the initial order. Good dispatching is as important as good information gathering. Adequate 2-way radio control, and drivers efficient in wheelchair handling and ambulatory assistance are also considered essential. To better serve the health community, handicabs has developed a nonpaid advisory group of representatives of the health care community, a consultant group from the private agency field to advise on agency matters, and user input aids such as addressed evaluation forms.

Lovdahl, JL (Handicabs of Milwaukee, Incorporated) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 66-68; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126174 TAXIS AND OTHER PRIVATE TRANSPORTATION SERVICES. SPEAKER 1. The benefits that could result to the taxi operator and the municipal government from the integration of privately owned and publicly owned transportation systems is discussed, and plea is made for a change in the manner in which financial support is provided to various public transportation services. A comparison of the shared-ride taxi operation with several demand-responsive transportation (DRT) systems reveals that the levels of service of the taxi operations are higher although productivity is low. The demand for service is also higher for the shared-ride systems. Taxi operations are, however, not generally subsidized. DRT services are costly because of low demand, capital intensive-ness, high labor rates, restrictions on work rules, and few economic incentives. A publicly owned system that used federal money under a 13-C agreement cannot easily change its type of operation. It has been suggested that efficient services at low operating costs can be provided better by private enterprise. Private operations could receive financial assistance but difficulties in obtaining the assistance was so great that almost no private system did receive assistance. Recently, however, the 2 groups (private and public) have begun discussion on the potential that exists for cooperative venture of the 2 groups.

Heathington, KW (Tennessee University, Knoxville) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 84-86, 2 Tab., 6 Ref.; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-spon-

sored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126175 TAXIS AND OTHER PRIVATE TRANSPORTATION SERVICES. SPEAKER 2. Certain features and problems are discussed of the taxi industry which has 190,000 vehicles, carries 25 percent of the commuter traffic and serves 3,400 cities of all sizes. An important feature of the industry is the group riding or demand-responsive transportation service. Contracts have been entered into with schools, and special education schools. Service is provided for welfare recipients and handicapped persons requiring wheelchair service. Package delivery and jitney service are also provided. One of the problems faced by the industry is retention of accumulated revenues. Ninety five percent of the money from the taxi meter goes to employees. During the past 10 years, the industry has moved from employer-employee businesses to a lessee relation in when the company provides licensed system insurance, dispatching, and coordination and rents the car to the driver. The frequent entry-exit problem is illustrated by the service in Washington, D.C. which has 8,000 licensed taxis and an estimated 1,500 on the streets in the best of times. Central coordination will improve the situation.

Boynton, C (Salt Lake City Taxicab Association) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 86-87; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126176 TAXIS AND OTHER PRIVATE TRANSPORTATION SERVICES. SPEAKER 3. In the field of demand-responsive transportation (DRT), government regulation at every level must be reviewed to permit the inclusion of more modern concepts of the 3 major areas of regulatory concern: chauffeurs, vehicles and service. This review must come soon because the thrust of current recommendations is to provide additional DRT service rather than to provide the means for existing business to meet the problem. In the area of chauffeur regulation, adequate and reasonable regulation must be enforced everywhere because too many licenses depend entirely on the licensing procedure to screen chauffeurs. Research indicates that the regulation of the design and construction of vehicles other than limitation of seating capacity is practically nonexistent. The regulations concerning age and condition of vehicle is generally left to administrative judgment. The van type vehicle is often omitted, and as a result vehicles rendering jitney and DRT services are unregulated. The point is made that taxicabs, which have historically been the vehicles for the private transportation of one or more persons, must have the opportunity to provide any additional or new DRT services that may be needed. The average DRT vehicle load is well within taxicab capacity. The latter is also suited

to package delivery. Partnership with public transit is also a possibility. Improvement in the regulations concerning the limitation of the number of vehicles to be licensed is long overdue. Regulations related to the requirement of financial reliability need to be updated. The enactment of no-fault insurance legislation will reduce accident costs. A further major regulatory feature of DRT industry is the fixing of rates of fare. The rate structures must be revised so that any new DRT service can be provided at the outset at least, by taxicabs or limousines of existing operators or other vehicles provided by the operators.

Samuels, R (Yellow Cab Company) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 87-91, 2 Ref.; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126177 TAXIS AND OTHER PRIVATE TRANSPORTATION SERVICES. SPEAKER 4. The successful operation is described of a demand-responsive transportation (DRT) system in Huntington Park, California, and the opinion is expressed that DRT operation is entirely compatible with taxicab operation. The employees of the taxicab company (the successful bidders for the city's DRT operation), took only 3 hours for adjusting to the new operations. The city which uses federal revenue sharing funds to buy the services, is supplied with drivers, vehicles and vehicle maintenance. The cost to the city is \$8.25/hour. Rates are 25 cents for children, adults and senior citizens alike. Two buses are operated from 9:00 a.m. to 6 p.m., and carry an average of 95 passengers/day/bus. The vehicle used is a 16-passenger van. A third bus is now needed (to meet the growing ridership) with a lift for handling of the handicapped, particularly those in wheelchairs. After 9 months of operation, it is concluded that no matter how high the ridership is, at the current rate structure, the operation will never be profitable.

Greynshock, DG (All American Cab Company) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 91-92; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126178 TAXIS AND OTHER PRIVATE TRANSPORTATION SERVICES. SPEAKER 5. This paper pursues the proposition that a demonstration program is needed to evaluate the potential for taxicabs for providing various paratransit services, and specifies, in general terms, a program of empirical investigation and experimentation designed to test and evaluate promising service innovations for taxicabs. Regulations seldom deal adequately with the various shared-ride services (jitney, dial-a-ride, hail-a-ride, subscription) that taxicabs can provide. Taxicab operations by the private sector have not

been eligible for the UMTA Capital Grant Program. A promising subsidy mechanism is one in which the public body negotiates a contract with a transportation provider to offer certain specified services at reduced fares; public funds are paid to the operator to supplement fare revenues. A second subsidy mechanism is the use of tickets sold to target group travellers at reduced rates and redeemed at the full fare value by the transportation provider (variations of this mechanism are also suggested). Benefits and potential problems with these services (jitney, dial-a-ride, hail-a-ride, subscription) and subsidy mechanisms are discussed. Transforming innovations in taxi services from ideas to implementation involves 2 major steps: broadening the knowledge base, and the dissemination of information relating to these factors to planners etc. Analyses conducted on the lines outlined here could provide a basis for the development of planning guidelines and demonstrations.

Kirby, RF (Urban Institute) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 92-98, 3 Ref.; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126179 TAXIS AND OTHER PRIVATE TRANSPORTATION SERVICES. SPEAKER 6. This paper expresses the opinion that the nations need for demand-responsive transportation (DRT) could be met by independent taxi-paying businesses, and deplores the current tendency toward socialization of transportation. For more than 25 years Long Island's taxicab industry has, in fact, been a DRT system. It has paid its way while fares have been maintained low. It has accomplished this within the confines of the existing socioeconomic system and without any direct subsidy through transit bills, tax relief, or price support for inequitable fuel costs.

Hirsch, S (Orange and White Taxi Systems) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 98-99; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126180 RESEARCH AND DEVELOPMENT IN DEMAND-RESPONSIVE TRANSPORTATION. SPEAKER 1. Electronic data processing (EDP) equipment used by the Yellow Cab Company of Los Angeles has demonstrated that the use of such equipment in dispatching demand-responsive vehicles is technically and economically feasible for an operation handling a minimum of 2,700 orders per day. The equipment receives and validates all types of incoming orders. Orders are automatically routed to the appropriate sender, and the first, second, and third alternate stand calls are displayed along with the address. The system automatically dis-

plays advance calls before the required service time. Call backs, repeat calls, cancellations, special and emergency calls are all handled appropriately. Several business-oriented reports monitor the total communications operation and the individual performance of the operators. The computer hardware consists of 2 Data General Nova series minicomputers of 32K each, 2 dual disk driver units, 1 line printer, 1 teletype, 14 Hazeltine CRTs, and appropriate switching gear to enable the system to be fully backed up in case of computer hardware failure.

Davidson, JH (Yellow Cab Company) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 103-104; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126181 RESEARCH AND DEVELOPMENT IN DEMAND-RESPONSIVE TRANSPORTATION. SPEAKER 2. Two research efforts devoted to the potential use of computers in the control of demand-responsive transportation (DRT) systems are reported: a computer simulation model to test alternative computer control algorithms and to predict system performance; and a set of control procedures in which (a) the immediate assignment of each request was made to the current 'tour' of the best vehicle, (b) the assignment was based on feasibility conditions, under which each user receives service within specified bounds, and (c) the determination of the best assignment was based on the minimization of total service times for current and future passengers. These control procedures were tested by a simulation model and were found to perform well in intuitive grounds and relative to other proposed algorithms. However, since no optimal solution algorithm has been developed, absolute statements about performance were not possible. A demonstration project of the concept was mounted in Haddonfield, New Jersey, to obtain a market test of the service concept and to obtain data on the potential of computer dispatching. The assumptions and simplifications of the real-world system required in the design of the simulation model are discussed, and the findings on modeling assumptions are described. Areas in which improved performance might be achieved are: inflexibility of hand constraints, objective function as a true reflection of utility, handling of advanced and periodic requests, constraint of vehicle position at future time, restriction of certain vehicles to given zones, preassignment capability, scheduling at start and end of driver and vehicle shift, and gearing of algorithm to underused system. The study shows that the simulation model can accurately predict system performance providing that vehicle in-service times are used. The lower demand densities at Haddonfield suggest that the economies of scale possible with these systems cannot yet be realized-and that productivities of 5 to 8 passenger trips per vehicle hour are more realistic than previously cited ranges of 9 to 13. Current research suggests that it is both feasible and desirable for the computer algorithms to achieve better service and to allow the operation of large

integrated DRT and conventional transit systems.

Wilson, NHM (Massachusetts Institute of Technology) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 104-109, 1 Tab.; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126182 RESEARCH AND DEVELOPMENT IN DEMAND-RESPONSIVE TRANSPORTATION. SPEAKER 3. Defects in current demand-responsive transportation (DRT) technology are examined, and a way in which these defects may be corrected are described. DRT has paid little attention to the economic efficiency of vehicle use, and current technology is unable to provide practical DRT services to a large geographic area where, for example, door-to-door service could be as long as 2 hours. Another weakness is the poor accuracy of current scheduling methods. Technology based on low-cost, highly reliable minicomputers have been developed to assist with scheduling. Adaptive control methodology has also been developed which is based on a management information system (MIS). MIS is an automatic feedback by-product of a computer-assisted scheduling and dispatching system. MIS records operational transit statistics. The MIS also identifies when and where trips begin and end by each zone or reference point in the service area. A second level of control technology that has been programmed is the automated adaptive control process which can precieve a problem and reset the controls. This system is useful when heavy demand makes reliance on 15-minute pickup times infeasible. A truly integrated DRT and express bus system in which multiple demand-responsive trips are coordinated with the express bus schedules, requires substantial computerization of the entire bus operation. Computerization of a DRT system is not as previously thought. Typical cost figures generated from the paratransit model and simulation service in Santa Clara County are tabulated. The advent of microprocessor electronics makes the outlook for adaptive DRT computer-controlled systems look better than the current economics indicate.

Murphy, RE Paisley, PL Siersema, JN (LEX Systems, Incorporated) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 109-112, 1 Tab.; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. 32 126183 RESEARCH AND DEVELOPMENT IN DEMAND-RESPONSIVE TRANSPORTATION. SPEAKER 4. Evaluatory study of the Haddonfield, New Jersey demand-responsive transportation (DRT) demonstration is

briefly summarized. The study was designed to determine public attitudes toward the DRT concept, measure public use of the system, forecast demand for DRT, determine the economic feasibility of a DRT system, test and evaluate the technical feasibility of such a system, and to measure and evaluate the impact of DRT on the community. A series of surveys prior to and during the demonstration also provided information on trip-making behavior of residents under different operating conditions. A comparison of users perceptions of the influence of DRT characteristics and of their former modes of transportation indicated that automobile users were not strongly influenced to use the DRT system. Surveys also indicated the reason why DRT was not used. The monthly ridership trends of the system have been changing as a result of changes in operating characteristics and seasonal effects. Three area expansions resulted in different effects on ridership. The introduction of a shuttle service and the reduction of fare from 55 to 25 cents also affected ridership. A comparison of the Haddonfield system with other DRT systems in the U.S. and Canada reflected favorably on the local system. The evaluation of the economic feasibility of the DRT concept as demonstrated in Haddonfield included analyses of costs, revenues and financing, and the results include the effects of experimentation and local conditions. The technical feasibility of the DRT concept has been evaluated in terms of the effects of the operating parameters on the quality of the service and vehicle productivity. The study reveals that the DRT concept was well received by residents, and that it was not used more often for work trips because it did not reach the desired destination. Area expansion caused increased ridership but quality of service decreased.

Mouchahoir, GE (Mitre Corporation) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 113-121, 4 Fig., 1 Tab., 11 Ref. Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126184 MARKETING AND PROMOTION OF DEMAND-RESPONSIVE TRANSPORTATION. SPEAKER 1. The fare changes made in the Haddonfield, New Jersey demand-responsive transportation (DRT) system, their impact on public attitude, and their effect on ridership are briefly described. Basically, two fare structures and a free-fare day have been in operation since the inauguration of the demonstration. A substantial increase in daily ridership, and a 26 percent increase in vehicle supply occurred during the free-fare day. The average productivity increased by 50 percent and the quality of service, as measured by promised pickup time, decreased. The number of cancellations and no-show customers (another measure of service quality) during the free-fare day was 3 times higher than the normal. The effect of fare reduction from 60 to 30 cents per ride could not be isolated because of the parallel changes in the mode of operation (shuttle, zonal, computer scheduling) and, possibly, the energy crisis. However, the effect of fare reduction

and improvement or additions to the service resulted in high elasticity of demand. This observation conforms with experiences of conventional transit systems, whose riders are more sensitive to service quality or travel time changes than to fare changes. The comparison of the DRT systems with conventional transit systems indicates that the riders of DRT respond to fare changes (at the 60-cent fare level) similarly to riders of conventional transit systems.

Mouchahoir, GE (Mitre Corporation) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 122-131, 11 Fig., 8 Ref.; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126187 MARKETING AND PROMOTION OF DEMAND-RESPONSIVE TRANSPORTATION. SPEAKER 4. The acceptance and use of a personal transit (PERT) Dial-a-bus service was achieved by a marketing and promotional campaign which attempted not only to sell a service but also to persuade these who would use it to change their habits and life-styles. The various types of service (by the PERT system) each of which required specific marketing techniques are: home-to-work service, home-to-school service, feed-bus service and dial-a-bus service. The two basic approaches employed were the rifle approach (most successful) directed exclusively toward service area residents, and the 'shotgun' approach which used advertisements in the mass media. The initial plan called for 3 phases encompassing a period of 5 months. Phase I centered on direct contact with the various publics involved. In Phase II, the major preservice promotion, direct mail took a major part of the budget. A series of newspaper advertisements were placed, and a "Lunch by Bus" invitation was issued to news media representatives and public officials. During phase III, newspaper ads were continued, contact was established with school officials and PTA groups, incentive programs were worked out with half-fare coupons. Special citizen programs were implemented, and industrial and school charter work has been explored. A strong foundation of support from the various maintained on a constant basis.

Gates, HW (Rochester-Genesee Regional Transportation Auth) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 136-141; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126188 EVALUATING DEMAND-RESPONSIVE TRANSPORTATION SYSTEMS. SPEAKER 1. This discussion of the important elements in the evaluation of a demand-responsive transportation (DRT) system, focuses on the

groups of individuals who are potentially affected by implementation of a service, and the type and degree of impact. The broad categories of affected groups are identified as users of DRT services; non-users of DRT; operators of DRT; operators of other transportation services, and managers of other business and activity centers in the area. It is recognized that evaluation is and must remain primarily a local issue. Decisions on whether to provide DRT service, who is to operate the service, the quality of service, and the financing of the operation will all be resolved at the local level. Users benefit either from the new service allowing them to take advantage of urban activities previously unavailable (induced demand) or from the new service being preferred to the one previously used. Nonusers are affected in a number of ways through externalities (air pollution, congestion, etc.) associated with the system. A basic decision is whether the operator of the service should be public or private transit based or taxi based. There may be significant negative impacts on other transportation services which must be recognized. The impact of DRT on other businesses and activities will be such that positive benefits will accrue to the activities previously poorly served by transportation and decreasing benefits associated with previously well-served activities. Research and operation experience indicate that more productive operations can be provided at higher demand densities; to achieve the higher demand density, however, requires subsidy.

Wilson, NHM (Massachusetts Institute of Technology) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 142-146, 1 Fig.; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126189 EVALUATING DEMAND-RESPONSIVE TRANSPORTATION SYSTEMS. SPEAKER 2. Development trends in cities and their implication for urban transportation systems are briefly reviewed. The CBD-focused, fixed-route transit systems are mismatched to the evolving needs of increasingly low-density and multinucleated cities. Regionwide door-to-door systems such as those in Orange and Santa Clara counties, in Rochester and in Ann Arbor, overcome this mismatch. Conjectures as to how these regionwide systems might evolve are presented, and some criteria for their success are listed (double current transit ridership; achieve full decongested traffic flow without car disincentives; achieve mostly decongested flow with some car disincentives; increase current transit ridership 10 times; and provide 99 percent availability in time and space) are discussed. A figure is presented which compares a flexible-route system with a fixed-route system offering the same level of service, defined as the ratio of walk, wait, and trip time to the best no-wait direct route. Figures also show that the higher the service level, the greater the proportion of flexible-route elements in a total system. The two-phase evolution of the system over time is described; the first phase is that in which coverage of the low-density suburbs is

being added, and the second is that after complete coverage is achieved. Experience suggests that these new systems cannot pay for themselves while at the same time attracting a higher level of use. Apart from the problem of overall subsidy, there should be an internal-to-the-system cross subsidy between high-and low-productivity elements. Private taxi operators lead to the issue of private capital and public subsidy. These systems are seen to lend themselves ideally to incremental planning and implementation.

Ward, JD (Department of Transportation) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 146-153, 10 Fig., 2 Ref.; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126191 POLITICAL AND PUBLIC POLICY ISSUES RELATED TO DEMAND-RESPONSIVE TRANSPORTATION. SPEAKER 1. The role played by the state in cooperating with local and federal agencies in sharing the risks that fall to innovators of DRT will be debated by the legislature, which will seek to develop a means of bridging the needs of local jurisdictions and the strengths of the federal government with state resources and thereby share in the risks that innovations in service and technology will entail. Demand-responsive transportation (DRT) is seen as an attempt to solve some of the problems of congestion and pollution, and the immobility of the poor and the elderly. It must, however, be realistic and efficient in implementation. It must be realized that most DRT systems have not generated demands greater than 10 requests/square-mile/hour; ridership surveys show that the majority of rides have not replaced automobile trips. Concern for efficiency is an important factor; the California legislature opposed DRT because of its labor-intensive nature and the resulting costs. Several communities in California are developing contracts with the private sector to transport the immobile. In Los Angeles, positive steps are being taken with respect to the private sector; the supply of taxicabs has been increased in its franchise areas and jitney services are being experimented. In Santa Clara county, an experimental countywide DRT and arterial bus system is being inaugurated.

Ingalls, WM (East Riverside, County of, California) *Transportation Research Board Special Reports* Conf Paper No. 154, 1975, pp 160-161; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

32 126284 EXECUTIVE SUMMARY. CAR-POOLING SEMINAR. The seminar which was convened to answer specific questions related to particular situations encountered by attendees,

and to aggregate commonalities between systems with regard to approaches taken and methods evolved, was formatted in 5 sessions. The first session covered the recent history of carpooling (with emphasis on current activities and vehicle utilization factors), and institutions and funding. In this session, several specific common points were brought out particularly those related to the Los Angeles experience. The session (2nd) on relationships with employers emphasized that employer cooperation in carpooling is the greatest single contributor to the success of the program. Car/Bus pooling and local transit policy (the subject of the 3rd session) was discussed with specific reference to the Knoxville experience. The session concluded that the long-range success of transit depends on the effectiveness of the Transit Authority in: making the public aware of the capabilities of traditional transit, realizing the limitations to effectiveness of traditional carpooling, encouraging new modes and ownership of public transportation, recognizing the need for park-and-ride lots, and eliminating the resistance of public-spirited groups. The session (4th) on promotion and incentives agreed that it is important to secure early involvement of the local media representatives, employers and government agencies, and that a practice of credit sharing will benefit all parties. A wide array of promotional techniques were discussed and a general procedure was outlined. Evaluation was the subject of the fifth session which covered common points related to evaluation of program effectiveness. The potential of carpooling (near-term and future), community support, and selling the program were some aspects covered. The final (6th) session was devoted to summation and the review of the following topics: maintaining communications with and between company carpooling program managers; dealing with media in the area of promotion and incentives; and liability problems encountered in vanpooling.

32 126381 THE 3M COMMUTE-A-VAN PROGRAM. The 3M Commute-A-Van Program is a system whereby the 3M Company furnishes a standard 12-passenger van to an employee willing to take at least 8 other employees to and from work. The employee driver is compensated with free rides, personal use of the van at a reasonable mileage rate and the excess fares for any passengers over the minimum of 8. The program began as a 6-van pilot operation at 3M Center in April 1973. Since that time, the program has expanded to include as of May 1974, a total of 57 vans. Further expansion of the program at 3M installations both in St. Paul, Minnesota, and elsewhere is anticipated. Many transportation, environmental, and energy benefits have been achieved as a direct result of 3M's Commute-A-Van Program. In addition, a substantial amount of ramp-type parking construction at 3M Center has been delayed. Many other van pooling programs have been started by other firms as a result of the 3M experience. It is felt that van pooling can certainly make a significant contribution towards solving many of our perplexing urban transportation problems. /Author/

Owens, RD Sever, HL ; 3M Company Status Rpt May 1974, 50 pp, 7 Fig., 15 Tab., 2 App.

32 126848 THE TAXI'S ROLE IN URBAN AMERICA: TODAY AND TOMORROW. People who work in large metropolitan areas tend to live within the city limits and be the biggest users of public transit. This is contrary to the assumption that the majority of downtown workers live in the suburbs and an ironic contradiction to the massive networks of commuter rails around big U.S. cities. Within the city, the number of households owning automobiles has declined. Also transit ridership has dropped. The downtown commuter wants door to door, comfortable and private transportation. The taxicab, for that reason, dominates in use in some large cities. The taxicab should be recognized as a public transit vehicle. Fleet taxicabs handle almost forty percent more passenger than all U.S. Rapid rail transit systems, and, about sixty percent as many as bus transit in spite of the fact that the cost for the passenger is almost three times as high. If regulations governing the number and use of taxis in major cities were removed, the taxi would become an even more efficient and widespread form of public transit. It should be considered too, that they operate at a profit without government subsidy.

Wohl, M (Carnegie-Mellon University) *Transportation (Netherlands)* Vol. 4 No. 2, June 1975, pp 143-158, 9 Ref.

32 127467 RECREATION ACCESS STUDY. This study was conducted from the perspective of the user, to learn the role which transportation plays in recreation decisions, and from the perspective of the recreation area, to see how current access affects the areas. An inventory of regionally significant recreation resources under the jurisdiction of Federal and State governments was developed. In examining access to sample of these recreation areas, the following recurrent problems were identified: congestion at approaches to recreation sites at peak times; inadequate internal circulation systems; lack of adequate public transportation access; haphazard private development; and degradation of the physical environment with overaccommodation of the heavy reliance on private automobiles. In accordance with current energy, environmental, and economic concerns, several recommendations, none of which involve new legislation or new programs, are made. Briefly, these recommendations are directed toward the following objectives: increased attention by transit operators to opportunities to provide routes, schedules, and marketing efforts to increase recreational tripmaking by transit; reduction of Federal, State, and local regulations which impede efficient, profitable, and attractive transportation service by motor bus operators and other private interests; and development by land management and recreation agencies of investment and management practices which foster alternatives to auto access.

Office of the Secretary of Transportation Aug. 1975, 18 pp

32 128655 CURRENT FAD: ELECTRIC RENTAL CARS. The Witkar Cooperative Assn. in Amsterdam has introduced an experimental form of alternative public transportation: electric rental cars. The second stage of operations is completing the phasing-in of the computer system which will handle all the procedures involved in the rental process. The first stage tested the design of the cars and stations, and involved a marathon

with 2 electric cars. Only 214 kilowatt-hours of electricity were needed to recharge both cars, which resulted in an energy cost of only \$4.28 for 280 miles. Some design changes were implemented in this stage, and the effort now is aimed at increasing membership and number of rides paid for. Witkar is a nonprofit association and all costs are paid for by membership fees, advertising, and rental fees. The inauguration of the program is occurring simultaneously with Amsterdam's effort to reduce parking spaces and overall traffic density in the city. Since the program began in March 1974, transportation experts from all over the world have come to inspect the technical aspects of the system. The city government has provided only a small amount of financial assistance thus far, since the third stage, which will complete the network with 15 stations and 105 cars, must be implemented before licensing will be given. Despite this fact however, the program has progressed steadily, and membership has increased during its initial stages of operation.

Senger, WM *Automotive News* Vol. 51 No. 4571, Nov. 1975, p 12

32 128950 PARATRANSIT-EXISTING ISSUES AND FUTURE DIRECTIONS. Basic characteristics of paratransit services and fundamental issues unique to paratransit are examined, existing problems that are constraining paratransit development are described, and ways to overcome or minimize existing difficulties are suggested. A taxonomy of paratransit services is proposed so that these systems can be better related to each other, and the institutional environment of paratransit is examined from the viewpoints of planning, operation and regulation. Emphasis is placed on the integration of various paratransit services and of paratransit and conventional fixed route services. Several proposals are made relating to improvements in existing services, new service concepts, new institutional arrangements and service integration.

Roos, D (Massachusetts Institute of Technology) Alschuler, D (ECI Systems, Incorporated) *Transportation (Netherlands)* Vol. 4 No. 4, Dec. 1975, pp 335-350, 1 Fig., 1 Tab., 16 Ref.

32 128951 SOME PROMISING INNOVATIONS IN TAXICAB OPERATIONS. Several promising innovations in taxicab service provisions are presented and subsidy mechanisms which have been implemented or proposed are discussed. Well designed experimentation with such innovations could be a means of stimulating greater interest on the part of planners, policy-makers, regulators and public transportation operators in broadening the role of taxicabs in urban transportation. Four types of shared rider services are identified (dial-a-ride, hail-a-ride, subscription, and jitney) and specific operations are described. Removal of restrictions imposed by state or local regulations would increase the scope and variety of taxicab services. It is argued that taxicabs should be given greater consideration as potential providers of publicly subsidized transportation services.

Kirby, RF Miller, GK (Urban Institute) *Transportation (Netherlands)* Vol. 4 No. 4, Dec. 1975, pp 369-386, 11 Ref.

32 128952 SUBSCRIPTION SERVICE IN THE UNITED STATES. Several types of subscription bus and subscription van services are described, cost and revenue data are presented for comparison purposes, and recommendations are made for the improvement of the climate for the growth of such services. Subscription services have been proven to be attractive transportation services that can carry a significant number of peak period commuters. Although the demand for the service appears enormous, legal, regulatory and institutional constraints act as obstacles to the implementation of such service. It is recommended that urban transportation services (fixed route transit, subscription etc.) should be coordinated by a public transportation provided who will have the authority to provide the most appropriate service to meet an identified need.

Bautz, JA (Urban Mass Transportation Administration) *Transportation (Netherlands)* Vol. 4 No. 4, Dec. 1975, pp 387-402, 3 Tab., 6 Ref.

32 129372 PARATRANSIT: STRATEGIES FOR ENERGY CONSERVATION. Taxi and dial-a-ride operations are paratransit modes which could increase their fuel efficiency more than six times if steps were taken to deal with the regulatory financial and administrative problems, and by implementing strategies designed to capture a larger portion of the transportation market. Taxi industry regulations should be changed to achieve more productive service operations and higher occupancy. Productivity levels of many-to-one and many-to-few dial-a-ride operations are higher than those of many-to-many operations. Wait-time policy, hours of operation and selective expansion of the service area are other factors which affect energy efficiency. Three categories of strategies for increasing energy efficiency of these modes are identified: individual-those in which the modes are implemented by themselves in an energy-efficient manner; supporting-those which enhance the individual implementations by encouraging high occupancy or increasing the level of service; and integrated-those which coordinate operations with other high-occupancy modes. Some selective implementation strategies are summarized in a table.

Arrillaga, B (Urban Mass Transportation Administration) *Traffic Engineering* Vol. 45 No. 11, Nov. 1975, pp 39-43, 2 Tab., 2 Phot.

32 129946 PARATRANSIT: THE COMING OF AGE OF A TRANSPORTATION CONCEPT. The nature and potential of paratransit is examined, and the question of what accounts for its growing popularity is considered. The family of services known collectively as paratransit arose in the 1960's with rapid suburbanization and the need for transportation services that would approximate the convenience and ubiquity of the automobile, yet preserve the inherent economy and efficiency of public transportation. The concept of multipurpose community paratransit services are of special promise. Outstanding examples of such services are to be found in El Cajon, California, and Westport, Connecticut. In central cities paratransit can serve as a valuable complement to regular transit. The use of taxis to replace buses on routes that are little frequented, has been successful in German cities such as Munich, Stuttgart, and West Berlin. Potentially, the most far-reaching opportunity for paratransit lies in the concept of paratransit/transit opera-

tions. Although paratransit is not an alternative to the traditional transit services, it represents a viable mode in the current search for energy-saving transportation systems.

Orski, CK (Urban Mass Transportation Administration) *Transportation (Netherlands)* Vol. 4 No. 4, Dec. 1975, pp 329-334, 7 Ref.; Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research, and sponsored by the Urban Mass Transportation Administration.

32 129948 THE CHARACTERISTICS, USES AND POTENTIALS OF TAXICAB TRANSPORTATION. Taxicab transportation is a significant segment of urban transportation. Taxicabs, along with other "paratransit" type systems, provide service with characteristics between the automobile and mass transportation. Consequently, they are well suited to a number of special purposes. Taxicabs currently serve a wide range of trip purposes by travellers with varied socio-economic characteristics. Taxicab transportation is most attractive for serving lower density area and off-peak travel particularly where there is only minimal mass transit service. In this regard, taxicabs are a supplement to conventional mass transit. The use of taxicabs for collection and distribution functions for both passengers and freight is gradually being realized. The multiple use of taxicabs offers advantages of increasing taxicab productivity and reducing individual trip costs. Many of the problems related to taxicabs are regulatory and institutional in nature. Unless these constraints are eased or removed, wider application of taxicab transportation, including productivity gains, will be limited. /Author/

32 130533 WEDDING THE NEW TO THE TRADITIONAL IN BUS TRANSIT: DOOR-TO-DOOR AND FIXED-ROUTE SYSTEMS COMBINED IN CALIFORNIA. Details are given of the integrated transit system adopted by Santa Clara County, USA which had to provide a service to 1.07 million people spread of 1300 square miles by means of 200 buses. It was decided to use 110 of the buses for a fixed route service operating on major arterial roads only, and linking all important centres of activity, and to use the other 90 buses to provide a door-to-door service which would supplement the fixed route service; a control system was then selected which would integrate the entire bus fleet. Details are given of the computer assisted scheduling system adopted for the control of the door-to-door service. It is estimated that the combined system reaches 97 per cent of the population. Public response to the service has been very favourable. /TRRL/

32 131477 BUS DEMONSTRATION PROJECT. SUMMARY REPORT NO. 5 LEEDS. MINIBUS AND PEDESTRIANISATION IN THE CENTRAL SHOPPING AREA. This project consisted of, firstly, the introduction of a minibus service to connect the bus and railway stations via the central shopping area and, secondly, the pedestrianisation of certain streets within the shopping area. The purpose of the demonstration project was to test the feasibility and economics of operating a small bus within a central area and to assess the practicability of allowing these buses to penetrate at low speed into a pedestrian precinct. A comprehensive study of the effects of the scheme on conditions in the central shopping area was undertaken and the results and conclusions are listed in this report. Some brief details of a comparable project in Birmingham are included as an appendix. The project showed that it was quite feasible for a minibus to provide a useful service in a city centre where it would be inappropriate to use a larger bus and that it was quite practical to allow the bus to pass through pedestrian streets. There were disadvantages due to slow speed involved in city centre operations; firstly, the cost per mile was quite high and, secondly, excessive clutch wear seems to occur. Surveys of both pedestrians and minibus passengers showed that most people felt the minibus concept was good and that its main value was for those who could not walk far. It was found, not surprisingly, that a majority of passengers were in favour of the minibus going to stops inside the pedestrian precinct but pedestrians were marginally against this. It had been thought that shoppers laden with their purchases would have used the minibus for their homeward journey but it was found that most passengers made the journey into the centre and about a quarter made the complete journey from one station to the other. There was some evidence that the service had generated some additional shopping trips into Leeds, but in total there were not enough passengers using the service to make it economically viable. Environmental conditions in the shopping area were greatly improved and almost every pedestrian preferred the paved area to the original layout. The number of vehicles and the visual intrusion that they caused was reduced to a minimum and there was a significant drop in the number of accidents. There was also some evidence of a shift in the centre of gravity of the shopping area towards the paved streets and the number of pedestrians increased by about 9% compared with a fall of around 6% at a control point outside the precinct. /TRRL/

32 131484 HOW DOES DIAL-A-BUS WORK?. Two dial-a-bus systems are examined, one at old Harlow and the other at Hampstead. Brief details are given of the mode of operation of the systems, the fare structure, ridership, and of passenger opinion. Results of a survey of passengers at Harlow suggest that journey-to-work users are in the minority and that use of the service by car-owning households has steadily risen since the service started. Cost, revenue and subsidies are discussed. The report concludes that both services are reliable and have attracted travellers from the private car. /TRRL/

32 131727 DIAL-A-BUS THREE YEAR'S EXPERIENCE IN ONTARIO. Dial-a-bus is a personalized type of transit service which responds directly to the user's demand for transportation by picking him up at his doorstep rather than requiring him to walk to a bus stop. It may have some, or no, fixed routes or schedules, but in any event usually requires the intending user to request service in advance. The level of service offered falls somewhere between that of a taxi and conventional fixed route transit. This paper looks at the history of dial-a-bus in Ontario. It reviews the experience gained by implementation in various Ontario centers and also gives a general prediction to the future development of a dial-a-bus system. /RTAC/

32 132227 TAXIBUS IN LINKOEPING: A SIMULATION STUDY [Taxibuss i Linkoeping en simuleringsstudie]. This report deals with a new concept in public transport, the taxi bus. A simulation model for the study of this new system has been developed. Details are given of a major application example performed with this model in relation to a large urban area of 90,000 population, comprising areas of varying development density. The simulations show that, outside rush periods, 15-seater taxi buses can cope with up to 1000 passengers per hour. The number of vehicles required for this is double that in present bus services, but the standard of service is greatly improved, since the taxi bus collects passengers at their homes and takes them directly to their destinations. The system can also be used with advantage during rush periods as a complement to conventional bus routes, in order to cater for "odd" journey requirements. It would seem that the introduction of taxi bus traffic on a large scale will result in a greater degree of equality between different traffic users, not only between car owners and non-owners but also between urban and rural dwellers. /TRRL/ [SWEDISH]

32 132633 DIAL-A-RIDE IN BRITAIN: EXPERIENCE TO MID-1974 AND RESEARCH PROGRAMME. The results of small-scale operations of dial-a-ride systems in Maidstone, Harrogate, Abingdon, Carterton and Eastbourne are reviewed. Despite institutional restrictions on the services two of the operations are close to financial viability when all revenue is included in the balance. The plans for an experimental dial-a-ride system in Harlow are described, and the programme of research and evaluations of dial-a-ride to be undertaken by Cranfield Centre for Transport Studies is summarised. /Author/TRRL/ Mitchell, CGB (Transport and Road Research Laboratory) Slevin, R (Cranfield Institute of

Technology, England) ; Planning and Transport Res and Computation Co Ltd Proceeding No Date, pp 203-244, 9 Fig., 9 Tab., 10 Ref.; ACKNOWLEDGMENT: TRRL (IRRD-216423)

32 133206 SMALL CITY TRANSIT CHARACTERISTICS: AN OVERVIEW. The report is based on information and operating data from thirteen small community transit systems which were studied as part of a larger project on small community transit and its potential. It summarizes organizational, institutional, and operational aspects of the case studies and contains an analysis of some of the relationships among service, cost and community response. Hypotheses are offered regarding the types of trips which are served, the cost and service trade-offs which are relevant when choosing between fixed-route and demand-responsive modes of operation, the critical variables such as labor agreements and maintenance arrangements which affect operating costs, the level of subsidy which may be anticipated, and the trade-offs between single-ride fares and transit passes as a means of fare collection. A number of conclusions are offered which bear on these topics, but the uniqueness of each community situation is stressed as an often dominant factor. The thirteen communities used for this study are: Amherst, Massachusetts; Ann Arbor, Michigan; Bremerton, Washington; Chapel Hill, North Carolina; East Chicago, Indiana; El Cajon, California; Eugene/Springfield, Oregon; Evansville, Indiana; Merced, California; Merrill, Wisconsin; Sudbury, Massachusetts; Westport, Connecticut; Xenia, Ohio.

32 133208 SMALL CITY TRANSIT: ANN ARBOR, MICHIGAN, PILOT DIAL-A-RIDE PROJECT IN A SECTOR OF THE CITY. Ann Arbor, Michigan, is an illustration of a pilot dial-a-ride project implemented to test the feasibility of a coordinated dial-a-ride/fixed route service. This case study is one of thirteen examples of a transit service in a small community. The background of the community is discussed along with a description of the implementation process and operational characteristics of the transit service. The process through which the community responds to the specific needs for transit service within the local context is stressed.

32 133323 TAXICAB USER CHARACTERISTICS IN SMALL AND MEDIUM-SIZE CITIES. In-taxi interviews were conducted with 6176 taxi users in eight small and medium-size cities in North Carolina to determine taxi usage characteristics in these cities. The interviews were conducted in each city both early and late in the month in order to test the effects of early month ridership peaking. One half of the sample cities have transit service. The data were used to test twelve hypotheses regarding the variation of taxi usage with user characteristics, time of the month, and transit. The results show the taxi users: To have substantially lower incomes and car availability rates than do large city taxi users; to be more nearly homogeneous than are large city taxi users; and to seldom use transit. The results point clearly to the need to distinguish between large and small city taxi operations.

32 133443 TWO STOCHASTIC SIMULATORS FOR TESTING FIXED ROUTE AND DEMAND ACTUATED TRANSPORTATION SYSTEM ROUTING AND SCHEDULING POLICIES. Stochastic models for both fixed route and demand actuated transportation systems were developed in this dissertation. Event driven simulators based on these models were constructed and their operation verified. Several example simulations studies were performed. The fixed route transportation system model developed describes the movement of buses over a specified route, the generation of riders for the buses and the boarding and alighting of passengers at the various stops on the route. A computer program which simulates the operation of the model was written and its operation verified by hand checking its operation as the program processed a large number of events and by constructing the program so that it monitors the self-consistency of its operation.

32 133496 A TECHNICAL REVIEW OF RIDERSHIP FORECASTING METHOD: DIAL-A-BUS IN SMALL URBAN AREAS. This report is a technical review of the method used by the New York State Department of Transportation to predict the potential ridership of the dial-a-bus service in small urban areas. The method was applied to the City of Oneonta (population: 16,000), New York, in early 1974. A follow-up survey was undertaken in that city in the fall of 1974--three months after the dial-a-bus transit service was in operation. Based on the information obtained from this survey, both the

analytical basis and the predictive accuracy of the forecasting methodology are examined in this study by comparing the observed transit usage and also the after-service community sensitivity to fare policies with those predicted prior to the existence of the service. In addition, other aspects of the methodology and its application such as the adequacy of sample representation and the demand computation procedures are also examined from a critical viewpoint. Results of the study indicate that the method is sufficient in providing "ball park" estimates for the transit planner as it produces plausible prediction in terms of the overall system ridership. On the other hand, it is not a rigorous demand estimation tool at lower aggregation levels such as the subgroups stratified by traveller socio-economic characteristics (e.g., sex, age) and trip purpose (e.g., work, shop). The study further indicates that the main reason for the unstable transit usage estimation at some of the sub-groups appears to be the inadequate sample representation of these sub-groups. Finally, a number of suggestions are offered concerning possible improvements of the methodology for future applications.

Liou, PS ; New York State Department of Transportation RR 73, Feb. 1975, 42 pp, 12 Fig., 8 Tab., 6 Ref.

32 133706 DEMAND RESPONSIVE TRANSIT AND THE INTEGRATION OF D/R SYSTEMS WITH TRADITIONAL TRANSIT. This paper provides a background of the development of demand-responsive transit in small communities in the U.S.A. It also backgrounds traditional transit in metropolitan areas of the United States and outlines its deficiencies in terms of today's urban sprawl and in terms of today's society in metropolitan areas. Urban sprawl has developed city-like areas around big cities, but with lower population densities. Highways and roads were built. Cars were mass-produced. These new populations have never had an alternative to the private car. Today's society includes an ever-increasing number of senior citizens and handicapped persons. Senior citizens find it difficult to get to fixed-route bus stops; handicapped persons have difficulty in boarding regular buses and wheelchair persons cannot even get on board. Particular emphasis is placed upon the examination of the development of demand-responsive transit in metropolitan Rochester, U.S.A. And a demonstration project, sponsored by the Urban Mass Transportation Administration of the United States Department of Transportation. The paper also examines and makes reference to the results of integrated transit in Regina, Saskatchewan, Canada. The demonstration project has several key objectives, the principal one of which is the integration of demand-responsive transit with the fixed-route element of traditional transit. Other important objectives of the demonstration are the balancing of peak and off-peak service so as to improve the overall utilization of resources, increase transit coverage, regular (not special) service for the elderly and the handicapped, the utilization of a computer in dispatching, digital communications, and marketing and promotional techniques. Aex, RP (Rochester University) *Transportation (Netherlands)* Vol. 4 No. 4, Dec. 1975, pp 419-428, 3 Tab., 2 Ref.; ACKNOWLEDGMENT: TRRL (IRRD-217022)

32 134011 A STUDY OF PARA-TRANSIT OPERATIONS IN RHODE ISLAND. A descriptive analysis is presented of a portion of para-transit services in Rhode Island, which, for the most part, are provided for the transportation disadvantaged, elderly, an handicapped. The modes considered are predominantly dial-a-ride in nature. The services offered by various social service agencies were identified and quantified; and a narrative of each paratransit operator surveyed is presented. Identified operators are providing 612,400 to 627,400 passenger trips annually to elderly, handicapped, low income, mentally retarded and others through the state. The greatest need for demand-responsive transportation is with the elderly. These needs are only partially fulfilled. A state-wide demand-responsive system utilizing mini-buses was recommended in 1974. The consolidation of the demand-responsive system into a subsystem operating within the public transit system is advocated. Funding for such a system could come through section 5 of the National Mass Transportation Assistance Act of 1974.

32 134233 OXFORDSHIRE LEADS WAY ON SELF-HELP TRANSPORT. This brief article describes two of the schemes used in Oxfordshire to counteract the phasing out of public transport subsidies: car pooling and the use of school buses for wider local purposes. Mention is made of two other possible solutions: a luxury bus and the staggering of working hours within the county council. The latter schemes are not implemented yet. /TRRL/

32 134525 THE ADELAIDE DIAL-A-BUS STUDY. The results of a study of dial-a-bus public transport and of its possible application in metropolitan Adelaide are discussed in this paper. The study involved a review of theoretical research, feasibility studies and demonstration projects conducted overseas. It also included extensive market surveys and investigations into possible applications of dial-a-bus in specific areas in Adelaide. Both many-to-many and many-to-one applications were considered. A field experiment was subsequently conducted in which 12 buses were used to operate a many-to-many service over a large part of the Adelaide metropolitan area. (A) /TRRL/

Keal, PD Foley, SP Morris, RWJ *Australian Road Research Board Conference Proc* Vol. 7 No. 2, 1975, pp 320-335, 5 Fig., 5 Tab., 5 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 218034)

32 134528 SHORT-DISTANCE CENTRAL AREA BUS SERVICES. This paper examines the usage of the minibus as a means of improving the quality of movement within the central area while causing the minimum intrusion on the environment. The literature on this subject is reviewed and the results of two surveys carried out in Leeds are reported. It is concluded that the minibus used should be designed for a particular class of passenger; the most important features of a short-distance service are the frequency of the buses and their routing relative to the desired destinations; the extent to which the minibus will

compete with other transport modes cannot be quantified at this time; a successful service is not necessarily one that is financially viable; and the success of the service is better ensured if it is given extensive and effective publicity. (A). /TRRL/

32 134671 AN EVALUATION OF CARPOOL MATCHING SYSTEMS. This evaluatory report covers such aspects as establishing personal and spatial compatibility, domain extension techniques, the relative advantages of conformant and non-conformant-area domains, considerations in choosing the appropriate basis of conformant-area domain definition and geo-coding procedure, temporal compatibility, operation of the matching systems, pooling campaign strategies, and desirable features of many-to-one and many-to-many matching systems. The system requirements of computerized car pool matching systems, particularly as these relate to applications to Canadian cities, is established. Existing matching software and procedures are evaluated, and the matching systems best suited to Canadian Cities are identified. Future research requirements related to car pooling in general and future modifications of the recommended systems are identified.

32 134677 COMPARISON OF PRIVATELY AND PUBLICLY OWNED DEMAND-RESPONSIVE SYSTEMS. Urban transportation planners usually agree that urban systems can be put into 3 categories. One of these, multiple or shared-ride, demand-responsive systems, has received comparatively little investigation and consideration as a workable form of urban public transportation. This paper deals with this form of urban transit. Six publicly owned shared-ride systems are compared with 2 privately owned systems. Similar variables are observed, and conclusions are drawn from the observations. The information indicates that the private systems are servicing a large area with a smaller seating capacity. Both are attracting the same market segments, but the private systems are obtaining a higher average fare. This, coupled with the lower costs of the private operation, enables the private systems to operate at a profit while the majority of public systems operate at a deficit.

Davis, FW Heathington, KW Alford, R Symons, R Middendorf, D (Tennessee University, Memphis) *Transportation Research Record* No. 559, 1976, pp 11-20, 3 Fig., 4 Tab., 6 Ref.; ORDER FROM: TRB Publications Off, Orig. PC

32 134678 SUMMARY OF ORGANIZATION AND ENVIRONMENTAL REVIEW OF 2 PRIVATELY OWNED, SHARED-RIDE TAXICAB SYSTEMS. Steadily decreasing ridership on traditional urban transportation modes has prompted concern about urban transporta-

tion systems. This paper deals with 1 level of such a system—privately owned, shared-ride, demand-responsive services. The intention of this paper is to provide an introduction to some of the basic characteristics and concepts of taxicab service in urban areas. It has been written primarily for the use of those who are generally uninitiated in the subject area but who are nevertheless interested in alternative methods of providing urban public transportation service. The paper serves as a starting point for more detailed study of taxicab systems and services, and it serves to develop an awareness of the operating environments and functional structure that have proved fundamental to the success of any organization. Thus it follows that the way in which a privately owned, demand-responsive taxicab system organizes itself, provides itself with the necessary personnel, equipment, facilities, and services, and formulates and follows an operating strategy will be the fundamental factor in making the system a workable enterprise. This paper, then, examines the functional structures of taxicab systems, the requirements and characteristics of the people who operate them, the regulatory environments in which the systems operate, and the various pricing strategies that the systems may follow.

Heathington, KW Davis, FW Alford, R Symons, R Middendorf, D (Tennessee University, Memphis) *Transportation Research Record* No. 559, 1976, pp 21-32, 9 Ref.; ORDER FROM: TRB Publications Off, Orig. PC

32 135032 COMPANY-PROVIDED INCENTIVES BOOST RIDE SHARING. The use of incentives to increase employee participation in company-sponsored ride-sharing programs is discussed, and the efforts of 2 companies that have introduced incentives to increase participation in pooling are described. Free parking or reimbursement of parking fees for carpools, reimbursing transit fares, and savings bond and TV prizes are some of the incentives used. The United Gas Pipe Line Company in Houston, Texas initiated a Busing and Carpool Subsidy Program that pays employees to use the Houston's mass transit system and carpools. The transit rebate program works two ways, either with a company-provided bus pass or through reimbursement of bus fares. Free parking is provided for carpools of 4 or more. As well as offering reimbursement, the company pays taxes due on such income. A commuter club started by the Jones and Laughlin Steel Corp. in Pittsburgh, Pa. is described. As an incentive, a monthly drawing is sponsored for bus passes which permit employees to ride the bus free for a month, and provides 15 car washes and fill-ups.

Pool it News No. 6, Jan. 1976, pp 1-3

32 135034 LEGAL AND INSTITUTIONAL ISSUES IN IMPLEMENTING PUBLIC OR PRIVATELY SPONSORED CARPOOLING PROGRAMS IN CANADA. This study of 4 different types of carpooling (car pools, dynamic car pools, van pools, and bus pools) considers aspects related to implementation, regulations, and liability, and discusses specific case studies. In the conventional carpool, passengers and drivers are known to each other; dynamic carpooling can be arranged by radio, TV or the newspapers, and involves picking up passengers at designated stops; poolers may also combine to purchase a van or the van may be purchased by

the employer; bus pools are run at specified times between a community and an employment center. The study concludes that the question of who should implement a carpooling program should be considered after the program is drawn up. Driving license requirements and taxi regulations vary, and the attitude of the transit authorities to exclusive franchise rights of transit systems are also known to vary. The liability of the driver of a carpool vehicle to the passenger, the liability of passengers to injured third parties, employer liability, and taxation are also discussed.

Glasbeek, S ; Transportation Development Agency Oct. 1975, 116 pp, 1 Tab.; ACKNOWLEDGMENT; ORDER FROM: Roads and Transportation Association of Canada, 1765 St Laurent Boulevard, Ottawa, Ontario K1G 3V4, Canada

32 135928 PARATRANSIT IN THE FAMILY OF TRANSIT SERVICES. The need is indicated for a mixture of conventional transit and paratransit to provide a family of services that can be designed to fit the market needs of different portions of the urban community. In rural America and areas of exurban development, paratransit may be the only form of transit. Establishing paratransit service will require new approaches to the organization of the management of public transportation services in a region. Coordination is critical to the achievement of maximum benefits from the transportation system. This is most effectively accomplished where a single agency is responsible for all service types. The transit agency's role in planning for paratransit is examined. Planning must be preceded by local feasibility studies which must evaluate the benefits and negative results of such service, and the impact of paratransit operations upon the rest of the transportation system. The observation is made that where paratransit produces sufficient public benefit, the use of public funds to supplement user charges is justified. Constraints to implementation of paratransit are examined and the fragmentation of the funding process is considered one of the greatest constraints. Paratransit performance to date is reviewed, and various paratransit concepts are outlined in an appendix.

Transit Journal Vol. 2 No. 2, May 1976, pp 5-26, 1 Tab., Refs., 1 App. Prepared by the Task Force on Paratransit, American Public Transit Association.

32 136508 AN ANALYSIS OF TAXICAB OPERATING CHARACTERISTICS. The purpose of this report is to present the results of a survey of taxicab operating characteristics conducted during the fall of 1974. It presents the most extensive effort undertaken to date to gather statistics for the taxicab industry. Prior to this time studies were based upon small specialized samples, so there is no basis for comparison with previous studies which, according to the authors, probably tended to underestimate the total taxicab population in the United States. A mail questionnaire was sent to active operators, of whom 696 (10.8%) responded. In spite of this rather low response rate, the sample provides broad geographic coverage and represents all sizes of operations. General industry characteristics are examined. Fare structures are also studied.

32 136509 DIAL-A-RIDE: THE NEW YORK CITY EXPERIENCE. AN ALTERNATIVE TRANSPORTATION SYSTEM FOR THE ELDERLY. Dial-A-Ride was set up to design, initiate, operate and conduct research on a demonstration low cost car service for the elderly and handicapped to see whether there is a latent demand for such a service among elderly and handicapped; whether providing demand-activated transportation would improve the quality of life for the elderly by improving access to medical and social service facilities and social contacts, and whether such a service, based on group-riding and tied to existing private transportation facilities could become self-supporting. The demonstration area consisted of 2.9 square miles in the north-west Bronx. All elderly 60 and over and ambulatory handicapped 21 and over were eligible for the service. Evaluation of the impact of the system on the social and psychological well-being of program users indicated that although there were problems in service delivery, most users felt the program saved them money and gave them a sense of security. The primary purpose for which the program was used was obtaining medical services. A major implication was that subsidization is necessary for the operation of any model of an alternate transportation system.

Cantor, MH Harris, J Rosenthal, K Stratton, J Shatzkin, K ; New York City Office for the Aging, Administration on Aging Final Rpt. May 1975, 197 pp; Prepared in cooperation with Administration on Aging, Washington, D.C.; Grant SRS-93-75148; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-251135/OST

32 136802 AN ANALYSIS OF COMMUTER VAN EXPERIENCE. The report analyzes the planning, organization, and operation of commuter van programs (often called van pools) in the U.S. and Canada. More than 30 existing operations have been examined and classified by considering the major organizational arrangements for providing the service. The potential benefits van commuting generates for the users, employers and community are discussed, and the paper presents guidelines on the demand environment and indicates the service characteristics that are likely to be important in attracting riders. Major legal issues including public regulation, competition with bus transit, liability and insurance, and implications of driver compensation are also reviewed. The potential for widespread van programs and the proposals for large-scale, area-wide van service are also discussed.

Miller, GK Green, MA ; Urban Institute, Urban Mass Transportation Administration, (UMTA-DC-06-0120) Final Rpt. UI-5050-2-2, UMTA-DC-06-0120-76-1, Feb. 1976, 41 pp; Paper copy also available in set of 2 reports as PB-252 303-SET, PC\$8.00.; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS, NTIS Price, /MF\$2.25; PB-252304/1ST

32 136803 GUIDELINES FOR THE ORGANIZATION OF COMMUTER VAN PROGRAMS. The document describes the major stages in the development of a company spon-

sored commuter van program including: the investigation of program feasibility, the promotion and organization of the service, and the operation and administration of an ongoing operation. These guidelines are based on the experience of several successful programs and potential sponsors should find them useful for their particular situation. Seven detailed case studies which are representative of the major types of commuter van services are also presented.

32 136915 A COMPENDIUM OF PROVISIONS FOR A MODEL ORDINANCE FOR THE REGULATION OF PUBLIC PARATRANSIT. This report comprises a complete set of provisions for the regulation of various types of public para-transit transportation. Its preparation consisted for five stages: Collection and analysis of the statutes of every state, the ordinances of some 600 municipalities and several multi-state compacts; the compilation, comparison, and the organization and drafting of the sections; considerations of varying attitudes concerning several philosophies of regulation as revealed by the existing regulations; research into the needs which would appear from the implementation of new forms of public para-transit transportation; and the assembly of the COMPENDIUM. On the pages opposite the text are cross-references, comments by the authors, some legal warnings, and generalizations intended to assist the user in the selection process. The sections of the COMPENDIUM are: Definitions; ambiguities; the licensing authority; operating licenses; vehicle licenses; chauffeur's and attendant's licenses; fees and penalties; financial responsibility; inspection of vehicles; books and records; reports; service of notice, etc.; hearings; affiliates; taxicabs; liveries and limousines; non-transit buses; jitneys; ambulances and cabs; criminal offenses; police powers not infringed; amendments; and, partial invalidity.

Samuels, RE ; International Taxicab Association, Urban Mass Transportation Administration, (UMTA-IL-06-0029) UMTA-IL-06-0029-76-1, Feb. 1976, 235 pp; Contract IL-06-0029; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS; PB-253182/OST

32 136916 THE GRAND RAPIDS DIAL-A-RIDE. A DEMAND RESPONSIVE COMMUNITY SERVICE TRANSPORTATION PROJECT. This is the final report of a demonstration project, conducted in Grand Rapids, Michigan, from June 1971 through August 1974. The purpose of the project was to develop a demand-responsive public transportation system which would supplement the existing fixed-route, fixed-schedule transit operations. The system was primarily oriented to the inner-city poor and elderly residents and their needs for travel to jobs, health and social service facilities, and cultural and recreational activities. The chapters of the report are: introduction; operating plan summary; dispatching and evaluation design; operations and training; interim results from summer

operation; final results from 13 month full operation; and conclusions. Appendices are 'Transportation Inventory Survey of the Grand Rapids Model Neighborhood' and 'Model Cities Evaluation Report.'

Grand Rapids City Demonstration Agency, Urban Mass Transportation Administration, Ford Motor Company, (UMTA-MI-06-0004) Final Rpt. UMTA-MI-06-0004-74-1, Aug. 1974, 118 pp; Prepared in cooperation with Ford Motor Co., Dearborn, Mich.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-253195/2ST

32 136978 DEMAND RESPONSIVE TRANSPORTATION SYSTEM FOR THE EAST/NORTHEAST AND WATTS MODEL CITIES NEIGHBORHOODS. The report documents the activities and operations of a Demand-Responsive Transportation Project in the East/Northeast and Greater Watts Model Neighborhoods of Los Angeles for the period of May 1, 1973 to April 30, 1974. Included are a chronology of events, a summary of operations, cost and performance data as well as an evaluation of the system performance. The project was undertaken to determine if demand-responsive public transportation, using subscription techniques, could be a successful and important service in supplementing existing fixed bus route operations within an inner city area. The study was to identify socio-economic, urban planning and transportation criteria, which, if successful, could be used in adopting similar dial-a-bus programs on a city or nationwide basis. The following were the program priorities in terms of provision of service: (1) persons requiring access to health and related facilities within the service areas; (2) elderly persons requiring transportation within the area; (3) persons without autos to shopping facilities; (4) youth to facilities and services available under Model programs; and (5) other priorities defined on the basis of project experience.

Smith (Wilbur) and Associates, Los Angeles, City of, California, Urban Mass Transportation Administration, Department of Housing and Urban Development Tech. Rpt. UMTA-CA-06-0017-74-2, June 1974, 81 pp; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS; PB-253181/2ST

32 137053 ADVANCED DIAL-A-RIDE ALGORITHMS RESEARCH PROJECT. The work builds upon the algorithms and the computer control procedures developed under the CARS Project between 1967 and 1971, and upon the findings of the Haddonfield, New Jersey, dial-a-ride demonstration project which ran from February, 1972 to October, 1974. The purpose of the Advanced Dial-A-Ride Algorithms Research (ADAR) Project was to develop advanced dial-a-ride control procedures based on the experience gained in Haddonfield, and to investigate the problem of controlling integrated dial-a-ride/fixed route services. Another demonstration project in Rochester, New York, began in April, 1975, which also provided significant input to the ADAR Project research. This document is structured so as to be readable by nontechnical persons not familiar with dial-a-ride algorithms research, as well as by more technical transportation planners. The first chapters contain background material---what a control algorithm does, who it serves, and various general elements of algorithms planning. Later chapters describe the new work

performed under the ADAR Project, and lessons learned from the demonstrations.

32 137322 OPERATIONAL IMPLICATIONS OF A MAJOR MODAL DIVERSION TO TRANSIT. PROGRAM USERS' GUIDE. The study has examined the implications of dramatic increases in transit patronage on system structure and performance. Models were developed to examine the cost and service attributes of a variety of system components, including express bus, exclusive lane operation, subscription service, dial-a-ride, and several route-based feeder options. These models were applied in a regional context over a range of patronage assumptions to evaluate both the individual components and the synergisms resulting from various service combinations. The analysis has provided insights into the structure of integrated transit systems and the expansion of these systems to serve increasing shares of urban travel.

Batchelder, JH Englisher, LS Sobel, KL; Multisystems, Incorporated, Department of Transportation Final Rpt. DOT-TST-76/73, Apr. 1976, 149 pp; Contract DOT-OS-50266; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-254749/5ST

32 137426 URBAN DESIGN AND USAGE FACTORS OF PARATRANSIT VEHICLES AND FACILITIES. The study explores history and future of equipment and facilities for paratransit usage, focusing particularly on facilities for demand responsive services. Relevant technology development programs are discussed along with safety, human factors and operators' concerns, with special attention to boarding considerations of the elderly and handicapped. A spectrum of vehicles is conceptualized for single and multi-party service in both near and mid-term time frames, and in specialized versions to accommodate elderly/handicapped and general population. Local, line-haul and terminal facilities for paratransit vehicles are examined including ubiquitous treatments to support elderly/handicapped access, integration in high traffic, multi-modal terminal facilities; priority and exclusive rights-of-way with the long-term prospect of wayside power to overcome limitations of chemical battery storage; introduction of electric-powered vehicles.

Adams, R Hildebrand, G; Pratt Institute, Urban Mass Transportation Administration, (UMTA-NY-11-0011) Final Rpt. UMTA-NY-11-0011-76-1, Apr. 1976, 150 pp; Contract NY 11-0011; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS; PB-255541/5ST

32 137437 OPERATIONAL IMPLICATIONS OF A MAJOR MODAL DIVERSION TO TRANSIT-A MACRO-ANALYSIS. The study examined the implications of dramatic increases in transit patronage on system structure and performance. Models were developed to examine the cost and service attributes of a variety of

system components, including express bus, exclusive lane operation, subscription service, dial-a-ride, and several route-based feeder options. These models were applied in a regional context over a range of patronage assumptions to evaluate both the individual components and the effects resulting from various service combinations. The analysis provided insights into the structure of integrated transit systems and the expansion of these systems to serve increasing shares of urban travel.

32 137751 THE OPERATIONAL CHARACTERISTICS OF THE CARTERTON DIAL-A-BUS SERVICE. The whole of the free-standing Village of Carterton in Oxfordshire is served by a single-vehicle between-peaks dial-a-bus service. This report provides a detailed description of the service and the way in which it operates in practice. After one year of operation, the regular patronage is roughly 7-800 trips per week. Over 90 per cent of the adult trips are made by women, and the purpose of two-thirds of the trips is shopping. There are about twice as many trips out from the village centre as into it. In the absence of the service, nearly 80 per cent of the trips would be made on foot. The service has assumed a mode of operation which is essentially that of a fixed-route minibus, with only about 4 per cent of trips being initiated by telephone. The service has succeeded in attracting new bus patronage from areas already served by conventional buses apparently as a result of its simple timetable, its good adherence to schedule, and its central waiting room, which has become a sociable meeting place. In its original form the service covered little more than one fifth of its total costs, but modifications are planned to both increase revenue and curtail costs. /Author/TRRL/

Watts, PF; Transport and Road Research Laboratory Lab. Rpt. 694, 1976, 40 pp, 15 Fig., 19 Tab., 4 Phot., 2 Ref.; ACKNOWLEDGMENT: TRRL (IRRD-219279)

32 138150 FORECASTING DIAL-A-BUS RIDERSHIP IN SMALL URBAN AREAS. A method is developed for estimating potential demand for innovative transit services such as dial-a-bus and park-and-ride in small urban areas and suburban communities currently lacking such services. The method assumes that the rate of usage of a particular type of service is similar for particular population groupings, regardless of their geographical location. The rate of usage is presumed to depend on factors such as age, sex, and service attributes rather than characteristics of the community under consideration. The procedure is applied in the analysis of demand for dial-a-bus service in Oneonta, New York, by using the existing system in Batavia, New York, as the base for determining actual rates of response to such a service. Results indicate that the method gives reasonable estimates of demand and demand sensitivity to policy variables such as fare and gasoline price.

Hartgen, DT Keck, CA (New York State Department of Transportation) *Transportation Research Record* No. 563, 1976, pp 53-62, 3 Fig., 7 Tab., 5 Ref.; Report prepared for the 54th Annual

Meeting of the Transportation Research Board.; ORDER FROM: TRB Publications Off

32 138154 OPERATIONAL PLANNING OF FIXED-ROUTE AND DEMAND-RESPONSIVE BUS SYSTEMS IN THE GREATER LAFAYETTE, INDIANA, AREA. Many small urban areas in the United States are evaluating implementation of a demand-responsive transportation system in addition to the conventional bus system. This paper suggests the proper combination of the two modes, fixed-route and demand-responsive systems, that best serves the demand at a level of service required by the customer. The greater Lafayette area is used as a case study. A simplified procedure was developed to design the fixed route of the bus system of the greater Lafayette area. The level of service was measured by the total time the users spend on the bus system. Computer simulation was used to duplicate the operations of the demand-responsive system in the real world. The system operates on a many-to-many basis, i.e., many origins to many destinations, and is dispatched by computer. Cost comparisons of the two systems provided the feasible operation of the two bus modes for various demand levels under the same level of service. The results show that the fixed-route system best serves the high demand, i.e., more than 90 persons per hour. The demand-responsive system best serves the lower demand. No generalization of the results could be reached at this point in time, except for small urban areas similar in size and in structure to the greater Lafayette area.

32 138439 PARATRANSIT: SOME PRELIMINARY OBSERVATIONS FROM THE TRANSIT INDUSTRY. General comments are made on the transit situation in the last decade, the current situation is examined, and recommendations are presented. It is emphasized that paratransit applications must be promoted in full coordination and cooperation with the transit operators in an area, and the aim must be to complement the services offered by bus and rail facilities. This type of coordination is exemplified in the Minneapolis-St. Paul area, where the Transit Commission operates express and local buses as well as promotes car pools and van pools. It is also desirable to coordinate all financial programs to achieve common objectives. Attention must also be directed toward equipment. Comment is made regarding labor problems and section 13c of the Urban Mass Transportation Act. Much work needs to be done concerning licensing and regulating paratransit. The relaxation of regulations should not be extended to the point of jeopardizing the safety of passengers, or of permitting the return of illegal jitneys. Potential paratransit applications must be submitted to the same rigorous cost and social-effectiveness examinations that UMTA is applying in the field of conventional transit.

Stokes, BR (American Public Transit Association) *Transportation Research Board Special Reports* No. 164, 1976, pp 27-30; Paratransit:

Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138440 TAXICABS IN MULTIMODE PARATRANSIT OPERATIONS. The history of taxicab operations in the paratransit mode is briefly reviewed, and comments are made with regard to its future. The statistics for taxicab operations (the number and types of vehicles, and employee level) are noted. The major concern of the industry at the present time, are maintaining and expanding ridership, controlling costs, diversifying operations, and integrating services with other modes. To provide an equitable arrangement in public transportation, the industry advocates the following: subsidize the rider; enter into contractual arrangements for public transportation with private companies which are the most cost efficient; and provide direct subsidies for capital improvements and operations to private companies that are currently providing services below replacement and operating costs of a new system. Areas for future research are: ridership characteristics; liability insurance rates and alternatives such as self insurance; the termination of demonstration projects; comparative studies of various transportation modes, and measures of productivity.

Gallagher, RV (International Taxicab Association) *Transportation Research Board Special Reports* No. 164, 1976, pp 31-34, 6 Ref.; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138441 PARATRANSIT: A STATE-OF-THE-ART OVERVIEW. Various paratransit forms are grouped according to their major service characteristics (vehicles which are hired or rented on short-term basis; vehicles which are called or hailed; and vehicles in which ride sharing is pre-arranged, such as carpools etc.), and examples of existing paratransit services are presented to illustrate the potential of these forms of transport for meeting urban travel needs. The main obstacles to widespread adoption of paratransit are also identified. Paratransit services can be provided by private individuals, volunteer drivers, private operators, and by public of private operators of conventional transit services. The role of paratransit in urban transportation systems is greatly influenced by state and local public service commission regulations. Regulations often severely limit the kinds of services the existing services could offer. Regulation of fare levels has also encountered problems. UMTA's encouragement of the use of federal subsidy funds for paratransit is discussed, as well as the availability of public funds for research and development projects. Questions are considered which have been raised by attempts to expand paratransit services in the following areas: the high density house-to-work travel, low density travel demand, access trips to line-haul transit, and travel within business and commercial areas. Suggestions are made for the resolution of problems relating to the implementation of paratransit in U.S. cities.

Kirby, RF (Urban Institute) *Transportation Research Board Special Reports* No. 164, 1976, pp 37-44, 3 Ref.; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138443 KNOXVILLE AND PORTLAND: TWO SUCCESSFUL COMMUTER POOLING PROGRAMS. The operational characteristics are examined of programs involving car pools, van pools and express bus services, and the findings are generalized to make them applicable to a number of U.S. urban areas. An innovative concept implemented in Knoxville is that of the urban transportation broker. This broker unites buyers and sellers, as well as has the goal of providing a level of service acceptable to the commuter at an unsubsidized fare the commuter will accept. Details are also briefly described of the express bus system, the van pooling venture at the Tennessee Valley Authority, and commuter ride-sharing programs in Knoxville. The major conclusions are listed of an extensive analysis of the commuting needs of Knoxville workers in which their use of public transportation and the economics of alternative forms of transport were examined. Portland's carpool program which consists of 3 phases (employer-based programs, general public promotion and matching, and incentives) is outlined. Issues centering on legality have suppressed the potential of pooling programs. Until social and legal institutions are altered, traffic can be accommodated by 2 methods: construct new facilities and increase vehicle occupancy. The latter approach offers the best return on investment and excellent door-to-door service.

Pratsch, L (Federal Energy Administration) *Transportation Research Board Special Reports* No. 164, 1976, pp 55-62, 2 Tab., 2 Ref.; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138444 OVERCOMING INSTITUTIONAL BARRIERS IN SPECIALIZED TRANSPORTATION. The Delaware Authority for Specialized Transportation's (DAST) mission is defined and some of the problems encountered by DAST are identified and discussed. Attention is focussed on the enabling legislation that created the authority, planning requirements, funding and budget development, liaison with other transportation providers and administrative agencies, labor and grant problems, and equipment availability. The transition between the Delaware Interagency Motor Service Inc. (DAST's predecessor) and DAST occurred smoothly. DAST is exempted from state taxes but not from federal liabilities. A formal mechanism was initiated so that DAST could apply for capital and operating assistance grants and also be certain the legislative mandate against competition with other private or public providers is fulfilled. The meeting of planned requirements at the state and federal level is discussed. Funding problems are discussed and the suggestion is made that existing and planned transit services should explore fund-

ing potentials of the health and social service programs within their service areas along with the traditional UMTA and state and local services. DAST not only is a service provider but a mandated transportation broker and coordinator. DAST will seek the most cost-effective method of meeting the specialized transportation needs of the transportation disadvantaged. DAST is a nonunion transportation property, but its bus drivers are unionized represented by the Amalgamated Transit Union (ATU). The implications of section 13C of the National Mass Transportation Act of 1974 which requires labor protection assurances are also discussed.

Povlitz, T (Delaware Authority for Specialized Transportation) *Transportation Research Board Special Reports* No. 164, 1976, pp 63-69; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138445 INTEGRATION OF PARATRANSIT AND CONVENTIONAL TRANSIT: PROBLEMS AND POSITIVE DIRECTIONS. This discussion of the problems underlying the integration of conventional and paratransit alternatives in urban areas notes that legislation and the current regulatory framework severely constrain innovation, and points out the folly of expansion of the conventional peak-time transit fleet by traditional methods. A change from the homogeneous origin-destination type to a heterogeneous market-oriented process is encouraged, and a restructuring of the urban public transportation system is advocated. Policy decision-making must seek to change conventional private transit systems to meet consumer demands for mobility. The integration with paratransit alternatives provides the only possibility for attracting sufficient ridership to public transportation to permit the achievement of desired urban transportation goals. The organization (transit management, transit officials, private suppliers, and transit users) of the conventional systems and the federal role in such systems are discussed, and comments are made. The organization for regional public transportation is reviewed, and figures are used to illustrate the traditional planning process, the target market approach to urban transportation, the organization of metropolitan regional transportation authority, and the product and functional orientation of regional transportation authority.

Mundy, RA (Tennessee University, Knoxville) *Transportation Research Board Special Reports* No. 164, 1976, pp 73-80, 5 Fig., 6 Ref.; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138446 MARKETS AND ROLES FOR PARATRANSIT SERVICES IN AN INTEGRATED URBAN TRANSPORTATION SYSTEM. This paper which seeks to define appropriate areas of integration of all forms of conventional paratransit services by comparing and contrasting conventional and paratransit markets and service characteristics, discusses the urban transportation market and the nature of both conventional and paratransit service op-

tions, comments on the basic services provided by these forms of transport, and presents potentially beneficial integration concepts. The characterization of the urban transport market presented here highlights those aspects that affect roles of the conventional transit and paratransit services with respect to each other and the automobile. These aspects include origin-destination patterns, regularity of trip making, congestion, and auxiliary transport of goods. The characteristics are listed of environments in which paratransit and conventional transit perform well. Whether the potential benefits of service integration concepts presented will be realized, will depend on the ability of transportation planners to identify and analyze the potential innovations.

Kullman, BC (ECI Systems, Incorporated) *Transportation Research Board Special Reports* No. 164, 1976, pp 81-88, 1 Fig., 5 Ref.; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138447 THE FEDERAL GOVERNMENT AND PARATRANSIT. This exploratory effort to identify several federal policy issues and to review significant experience, discusses the issue of taxi-transit competition, the legal aspects of "transit", and the integration of taxicabs into transit planning and subsidy policy. Issues raised by paratransit innovations are considered, and the application of section 13c is discussed. The questions are discussed about the precise boundary between private and mass transportation, about how to integrate taxis into transit planning, about the eligibility of shared-ride taxi service for transit subsidies, and about public policy with respect to the fair treatment of private companies harmed by publicly subsidized competition. Paratransit poses significant issues of potential competition with conventional transit, particularly with respect to van-pool and special services. Paratransit also poses issues in the area of labor protection (section 13c).

Altshuler, A (Massachusetts Institute of Technology) *Transportation Research Board Special Reports* No. 164, 1976, pp 89-104, 12 Ref.; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138448 INSTITUTIONAL CHANGES NEEDED TO FOSTER THE DEVELOPMENT OF PARATRANSIT. The institutions that affect the provision of paratransit service are examined (from 4 viewpoints: planning, funding allocation, regulation, and operations), shortcomings and conflicts with existing institutional arrangements are analyzed, and changes to overcome existing problems are proposed. The paratransit sector suffers from fragmentation; operations are small, with limited capital and management expertise. Few organized groups of operators exist, and no organized constituencies or lobbies have developed. Regulations that are outdated, conflicting, and inconsistent must be updated. The regulatory, funding allocation and planning functions should be closely coupled but separated from operational functions. Paratransit

provides the opportunity both to increase available options with respect to the service that is provided and to allow more of a free market situation to develop. With new and improved institutional and regulatory frameworks, the mix of service can be successfully integrated, at one level by interfacing paratransit services with each other and at a higher level by interfacing paratransit with conventional fixed-route transit in a complementary manner.

Roos, D (Massachusetts Institute of Technology) *Transportation Research Board Special Reports* No. 164, 1976, pp 105-113, 1 Ref.; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138449 REGULATIONS AND PARATRANSIT. This discussion of the regulations that affect paratransit applications, focuses on institutional changes necessary to foster the development of paratransit and outlines a specific approach for accomplishing those changes. The profile of the regulatory framework is reviewed from the point of view of rationale and justification for regulation and the determination of who is to be regulated. The profile chart of the regulatory framework including regulators and their characteristics and areas subject to regulation is also reviewed. An outline of the regulatory framework in relation to paratransit modes and the provision or lack of provision of adequate treatment under the existing regulatory framework for such modes identifies and discusses certain practical problems. The principal areas that require further review are the jurisdictional matters, the areas that are subject to regulation, and the degree of enforcement of such regulations. Recommendations are presented with regard to the options available to facilitate the development of paratransit.

Wolffington, VA (Carey Corporation) *Transportation Research Board Special Reports* No. 164, 1976, pp 114-119, 1 Tab., 2 Ref.; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138450 PRIVATE CARRIERS AND URBAN TRANSPORTATION. This paper considers the current role of private carriers, discusses the issues facing private carriers, and makes recommendations with regard to research in this area. Variations in the kind of service provided by private carriers turn largely on the degree of privacy desired by the passenger first hiring the vehicle, the capacity of the vehicle, and the control over the points of origin and destination of the trip and the route travelled. The spectrum of vehicles employed are listed, and the characteristics of prospective passengers are briefly described. The financial potential of demand-responsive transportation is considered and the regulation of such transportation is discussed. Many improvements in practice would have been implemented if they were not inhibited by local regulations, some of which may also inhibit the development of paratransit. The industry is faced with cost increases that result from legislative acts that go beyond the ability of the

industry to recoup by greater fares. This creates financial problems that must be met by subsidy. Relation between operators and the federal government is discussed. A major area of research is in the area of implications and problems underlying the exposure of all public carriers to liability arising from the operation of the various vehicles employed in paratransit.

Samuels, RE (Yellow Cab Company) *Transportation Research Board Special Reports* No. 164, 1976, pp 120-126; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138451 LABOR IMPLICATIONS FOR PARATRANSIT SERVICE. Labor arrangements unique to transit are discussed, collective bargaining which is influenced by industry characteristics is reviewed, section 13c of the Urban Mass Transportation Act is examined, and the need is indicated for a consistent labor policy and an organizational structure designed to effectively deal with labor issues. The hourly wage rate, hours of work and working conditions in mass transit are briefly discussed. Labor questions are crucial for dial-a-ride and subscription services. Some work and operating rules in paratransit are outlined. Then there are several transit firms in an area, bargaining is on a company-by-company basis. The management organization for bargaining is similar for both private and public systems. When a transit system becomes publicly owned, its collective bargaining is no longer under the jurisdiction of general federal labor legislation. The provisions of section 13c of the Mass Transportation Act are discussed. The point is made that the 2 goals of primary importance to any transit of paratransit labor policy are the distribution of income on some equitable basis and the preservation of free collective bargaining. A discussion of labor policy focuses on 3 issues: fare regulations and operational deficit funding; work rules and system efficiency; and technological changes and employment.

Smith, JA, Jr (University of North Florida) *Transportation Research Board Special Reports* No. 164, 1976, pp 127-136, 10 Ref.; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138452 ROLE OF PARATRANSIT IN RURAL TRANSPORTATION. Rural travel characteristics are briefly discussed and comments are made on the growth of public transportation in such areas. The economic efficiency and consolidation of resources related to rural transportation are described. The need for effective managers with entrepreneurial skills is indicated, and the question of whether to focus on special services for subgroups of the population or to provide a variety of services for the general public is considered. Small, person personalized systems providing door-to-door service were first developed in rural areas by community action agencies. Although the cost per passenger trip is high (very long trips are being serviced; and the average load factors are more than 65 percent) for rural transit,

2 important factors indicate that these systems are being operated at reasonable cost and are quite efficient. The greatest impact on transportation in rural areas will come from finding ways to more efficiently use equipment and labor that various agencies currently use to provide paratransit services. Regulations that do not allow flexibility in the use of currently available transportation funds must be changed. The need is indicated for an academic option at universities that would train students in planning and managing specialized transportation services.

Saltzman, A (North Carolina Agricultural and Technical State U) *Transportation Research Board Special Reports* No. 164, 1976, pp 137-142, 6 Ref.; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138453 SERVICE AND COST CHARACTERISTICS OF SMALL-COMMUNITY TRANSIT: A TENTATIVE OVERVIEW OF OPERATIONAL RESULTS.

Thirteen small-community transit systems were studied in an effort to describe and interpret local transit projects to enhance transferability of the lessons learned for other localities considering the initiation of similar service. The case studies illustrate not only a range of service options and results, but also a variety of community settings, service objectives, financing mechanisms, and political environments. The range of goals that may motivate the initiation of transit service in a small community and the service characteristics that can usually be achieved are discussed and it is noted that the role of transit in small communities is different from that in large urban areas. A particular target group is the youth market. The factors that determine operating cost and those that are subject to management and control are reviewed, and fare structures, fare collection procedures, subsidy levels, and the relation between ridership and revenue collection are examined. Several tentative conclusions based on the case studies are listed and it is emphasized that all results related to ridership, revenue and productivities, are subject to different influences in each particular setting (much more than in a larger urban area). Costs are greatly affected by the entrepreneurial skills of the operator, and ridership is influenced by the ability to get both the employees and the residents personally involve in the system's success.

32 138454 PARATRANSIT IN SMALL COMMUNITIES AND NONURBANIZED AREAS.

This overview which focuses on the interrelation of Urban Mass Transportation Administration (UMTA) policies that promote paratransit and that foster mobility improvements in small towns and rural areas, contrasts various federal programs with one another and with nonfederal efforts. Federal guidelines that are currently being formulated for a new small-town assistance pro-

gram are introduced. Legislation is being considered to permit UMTA to provide operating assistance in nonurbanized areas having fewer than 50,000 residents. Precedents for waiving costly labor protection agreements have been established, especially those pertaining to paratransit programs involving nonprofit organizations. The proposed guidelines for UMTA'S small-community program, relate to funds, the apportionment of resources, the administration of the funds, the availability of capital funds, and the requirements for eligibility. Questions that arose during the development of the preliminary guidelines are listed.

Gurin, DB (Urban Mass Transportation Administration) *Transportation Research Board Special Reports* No. 164, 1976, pp 154-156; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138457 OPERATIONAL ISSUES FOR PARATRANSIT: OPERATOR'S PERSPECTIVE.

This review of the activity of a taxicab operator in the paratransit field, discusses labor, vehicle selection and maintenance, control and dispatching issues. Comments are made on the overall management structure, marketing and promotion, and paratransit services. Vehicle productivity and cost of operations are also discussed. The ability to recruit and maintain a sufficient force of taxicab drivers is the key to the success of a taxicab operation. Experimentation with vehicles not normally used in service (van configurations and diesel-powered standard stock cars) has been underway, but no ideal vehicle to meet paratransit needs has been developed. Dispatching practices and vehicle control are integrally related in taxi industry. In the specific operation described here, a system of geographical separation of channels in mobile 2-way radio communication was used to obtain maximum productivity. Several computerized and automated radio communication systems are available. The lack of middle management positions is seen as a serious problem, and the need is indicated for the expansion of marketing and promotion efforts. Vehicle productivity is noted to improve upon diversification of operations into other modes of transportation. A new format on industry expenses which will generate economic and statistical information hitherto unobtainable, is outlined. In this new format, fuel costs, insurance, vehicles, parts and service are adjusted upward on a weekly basis.

32 138458 COORDINATION AND CONTROL OF PARATRANSIT SERVICES.

This resource paper which summarizes the current state of development of coordination and control procedures and raises issues relating to future developments, has as its basic premise, the concept that paratransit services should be designed

to complement one another as well as other transportation services. The more significant technological developments are reviewed and issues relevant to their evaluation are raised. The principal areas in which work has reached the point of implementation are computer control and communication. The potential of automatic vehicle location systems is also reviewed. The coordination of paratransit services is viewed at 2 levels: the coordination problem for a single operator; coordination among several operators. Fully coordinated service implies optimization of the total trip with an explicit attempt to minimize transfer times. The best approach to coordination among different operators is to create a nonoperating authority with regulatory control over all the operating agencies. In the area of cost effectiveness and vehicle productivity, the principal avenues for effort are in improved control and evolution of service concepts. The control issues are the range of systems providing efficient combinations of service quality and productivity, and the extent to which they can take advantage of the economies of scale conceptually feasible by attracting the sizeable support of the public.

Wilson, NHM (Massachusetts Institute of Technology) *Transportation Research Board Special Reports* No. 164, 1976, pp 174-182; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138459 ROLE OF PARATRANSIT IN SERVING THE NEEDS OF SPECIAL GROUPS.

Four transit-dependent groups, the elderly, the handicapped, the youth, and the poor, are discussed in terms of definitions and subgroups, and UMTA projects directed toward resolution of some of their problems are outlined. Confusion is noted as to whether the need is for a single system to handle all travelers including the handicapped, a 2-tier system (a basic system and a special paratransit operation for the handicapped) or 3-tier system (includes a special system for the wheelchair handicapped). Problems are discussed of organization, UMTA legislation, certification of those eligible to use the second and third tiers of paratransit, and the application of the labor protection clause of the act to UMTA grants for services for special groups. Key ongoing projects in the UMTA Service and Methods Demonstration (SMD) Program, are those in Chicago, Danville, Cleveland, Portland and Albuquerque. Solutions to the problems of transportation for the transit dependent include the following: modification of buses and rapid transit stations to accommodate the handicapped; demand-responsive of dial-a-ride systems; organizational approaches (charter services, operations contracted to social agencies, etc.); financial approaches which organize a continuing flow of funds (e.g. the Golden Gate Bridge Highway and Transit District System in the San Francisco area).

Crain, JL (Bigelow-Crain Associates) *Transportation Research Board Special Reports* No. 164, 1976, pp 183-190, 2 Tab., 7 Ref.; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138460 ROLE OF PARATRANSIT IN AN INTEGRATED URBAN TRANSPORTATION SYSTEM--WORKSHOP 1. The principal conclusions and observations are listed of the workshop which addressed the potential for improved service through cooperative and coordinated operation of paratransit elements and conventional transit. The workshop sought to ascertain the opportunities for and potential roadblocks to such integrated systems, and to identify mechanisms and strategies needed to bring the systems into operation. The workshop identified the spectrum of urban transportation markets and needs and determined the kinds of paratransit or conventional transit service best suited to them. The potential synergisms between and among the different kinds of transit services are discussed, and problems and solutions in the planning and implementation of all transit services are identified. Some of the conclusions listed here relate to: the ideal mix of the various paratransit and conventional transit; the unimodal approach; transportation for the transit-dependent; integrated systems; ridership densities; organization and organizational criteria; planning; the need for information; and the need for reliable forecasts of total equipment needs.

Ward, J (Department of Transportation) *Transportation Research Board Special Reports* No. 164, 1976, pp 193-196; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138461 EFFECT OF GOVERNMENTAL CAPITAL AND OPERATING ASSISTANCE ON THE DEVELOPMENT OF PARATRANSIT--WORKSHOP 2. The workshop discussion focussed on how federal money will be spent on paratransit in the next few years, particularly UMTA money, and how the precedents established by the expenditure of these funds will shape the future development of this field of transportation. The workshop noted that where new services are being created (particularly demonstrations), potential conflicts can be reduced by dealing directly with uncertainties. User-side subsidies for approved paratransit and transit seem least likely to adversely impact labor and private operators and most likely to benefit target groups with specific unidentified transportation needs. The workshop also found that mechanisms of cooperation that render the greatest efficiencies of all available resources are to be preferred to the creation of numerous isolated projects that have separate client groups and paratransit equipment. Emphasis on services rather than suppliers ought to foster the fuller use of private sector resources, existing transit systems, and centralized paratransit systems for specialized client needs. Areas for further study as well as recommendations made by the workshop are listed.

Burco, RA (Oregon Department of Transportation) *Transportation Research Board Special Reports* No. 164, 1976, pp197-200; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138462 INSTITUTIONAL CHANGES NEEDED TO FOSTER THE DEVELOPMENT OF PARATRANSIT--WORKSHOP 3. The workshop which sought to examine the roles of organizations responsible for the planning, funding, implementation, operation and coordination of various paratransit and transit services, described the type and impact of regulation on the provision of paratransit service, as well as institutional and legal changes. Labor arrangements for different paratransit services were examined, and the current and potential roles of private paratransit providers were reviewed. A first step in assisting new services would be to get adequate representation for paratransit operators in metropolitan planning organizations (MPO). Possible actions in the field of regulations are listed, and suggestions are made regarding insurance of paratransit vehicles. Courses of action are also suggested regarding the initiation of new paratransit services, and the UMTA section 16b2 program for providing capital funds for selected private non-profit transportation projects. Guidelines are presented for coordinating transit and paratransit. Other issues covered include: ombudsman for paratransit operators; the substitution of paratransit operations in low-volume routes; the redirection of public policy; fares; and integration with urban transportation services.

Shiatté, KW (New York State Department of Transportation) *Transportation Research Board Special Reports* No. 164, 1976, pp201-205; Paratransit: Proceedings of a conference held November 9-12, 1975 conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138463 PARATRANSIT IN SMALL COMMUNITIES AND NONURBANIZED AREAS--WORKSHOP 4. The findings and recommendations are presented of the workshop which sought to identify paratransit services that can be used in small communities which do not generally have planning staffs and often do not have regular access to planning information, and ways that these services can be implemented. The workshop also considered the development of regulations, and the roles of federal and state governments. The workshop found that paratransit services are appropriate for serving the transportation disadvantaged, but identified problems stemming from the low trip density of rural areas, lack of coordination in service, management and financing, legal and contractual barriers, and poor management. A major need exists for specific information on performance characteristics of paratransit systems. This information should include operating costs, productivity levels, fare structures, methods for estimating demand and procedures for project evaluation. The recommendations presented here relate to the need for a national advisory committee, operating subsidies, implementation of the nonurbanized area program, incremental implementation, planning, coordination, role of the states, and the collection and dissemination of information.

32 138464 OPERATION ISSUES FOR PARATRANSIT: PRODUCTIVITY, VEHICLES, DISPATCHING, MANAGEMENT--WORKSHOP 5. This effort to examine the existing and new ways of provision of paratransit service, particularly the coordination of complementary services to improve the overall levels of service and productivity, outlined 3 major areas (costs, financial considerations, and problem resolution), and amplified 2 major areas: cost reductions (vehicles, labor, organizational structure) and increased productivity. Recommendations are presented related to the following issues: reporting costs and operating statistics; dissemination of information to taxi operators and paratransit organizations; consumer information system; personnel training programs; and ways of reducing costs and increasing productivity.

Reading, JE (Denver Regional Transportation District) *Transportation Research Board Special Reports* No. 164, 1976, pp 210-213, 1 Tab.; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138465 ROLE OF PARATRANSIT IN SERVING THE NEEDS OF SPECIAL GROUPS--WORKSHOP 6. Seven issues are discussed which were covered by the workshop which sought to identify the mobility needs of the special groups, determine the advantages and disadvantages of various paratransit options in meeting those needs, the barriers to the implementation of promising options, and the mechanisms and strategies for overcoming those barriers. The question of whether the emphasis in serving special groups should be on modifying existing services or in providing special services, is discussed in relation to each of the groups (and subgroups) of the transportation disadvantaged. Car pools and vanpools are indicated for the poor and the handicapped. Recommendations for the most feasible operators of the various types of special and general paratransit forms are tabulated. Other issues covered here include the following: the subsidizing of such services or the users of the services; certification of eligibility of individual users; the structure of demonstration projects; the synthesis of information from such demonstration projects; and the role of federal, state, and local government.

Pignataro, LJ (Polytechnic Institute of New York) *Transportation Research Board Special Reports* No. 164, 1976, pp 214-218, 3 Tab.; Paratransit: Proceedings of a conference held November 9-12, 1975, conducted by the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration.; ORDER FROM: TRB Publications Off

32 138466 CONFERENCE SUMMARY. Salient points discussed at the conference are noted, critical issues are examined and future directions of paratransit are considered. Implementation problems associated with labor, insurance and regulations (particularly the last) were much discussed, and it is noted that regulations that are outdated, conflicting and inconsistent should be updated. The need is also noted for adequate

education and information transfer at several levels including transfer at the microlevel. The question of how to ensure that paratransit alternatives will be given consideration in the planning and resource allocation process is considered, and it is suggested that UMTA and other federal agencies should be more involved in the planning process. The transportation system management element can be an effective mechanism to ensure that urban areas consider paratransit alternatives, regulatory issues, and alternative providers of transportation. The issue of using private operators to implement new paratransit services is considered and the primary responsibility for coordination of transportation is discussed. The development of an integrated system using both conventional and paratransit services, and the federal role in such services are also discussed.

32 138852 INTERMEDIATE FORMS OF URBAN PUBLIC TRANSPORT IN DEVELOPING COUNTRIES. This paper describes intermediate forms of public transport devised in developing countries to meet demands of rapidly-growing urban populations. Such systems are frequently composed of individually-controlled vehicles carrying more people than a taxi but less than a bus, thus achieving flexibility in routing and scheduling without sacrificing entirely the efficiencies of large-scale operation. Examples given include the jeepneys of manila converted vans and trucks in Africa and Asia, and shared taxis of various kinds, including the dolmus of Istanbul and ankara, the jeepneys of manila, and the cycle rickshaws of the far east, the betjak of indonesia.(a) /TRRL/

32 138914 ALTERNATIVE TAXICAB SYSTEMS. A LONDON CASE STUDY. The specific objectives of this study were:-(1) to establish the pattern and level of demand for alternative taxicab systems; (2) to consider the feasibility of alternative taxicab systems, and (3) to examine such systems in terms of quality and convenience, operating costs, and fare levels. The London taxicab trade is examined in relation to legislative and institutional background, cost structure, revenues and drivers' earnings. Data on trip patterns by licensed taxi in London are presented and analysed, and taxicab services of several large cities in western Europe are reviewed and discussed. Dial-a-ride systems are discussed, including details of their cost and revenue characteristics. Potential changes in the existing pattern of London taxicab services are examined and legislative constraints to such changes are discussed. /TRRL/

32 139343 TRANSPORTATION IMPROVEMENTS: A MULTIAGENCY EFFORT. This cooperative effort of local, state, federal and regional governments which places primary emphasis on public transportation, covers such items as carpooling, public transit information, priority treatment for high occupancy vehicles, traffic operation, legal considerations and intersystem transfers, with primary emphasis on express transit service with interim park and ride facilities. The project, which is of a transportation system management nature, has incorporated all possible citizen participation, and consists of 2 phases. Phase I will provide transportation improvement within the corridor (on I-5) and is oriented to physical action and actual improvement. The project not only analyzed and proposed solutions but also addressed, emphasized and assisted in implementation. Through study and field review of the major causes of congestion, low-cost solutions to reduce the impact of the existing problems were determined and identified. The results are outlined of an origin/destination study, and the details are briefly discussed of the area's transit service. The analysis of the areas problems resulted in the development of a number of low-cost improvement recommendations in the existing transportation system. These include an express bus service, interim park and ride facilities, and a program that would provide intersystem transfers.

32 139593 ANATOMY OF A SYSTEMS FAILURE: DIAL-A-RIDE IN SANTA CLARA COUNTY, CALIFORNIA. Late in 1974 and early in 1975 the Santa Clara County Transit District initiated, operated, and then discontinued a demand responsive dial-a-ride system within a 5-1/2 month span. This systems failure was primarily the result of poor systems planning. Specifically, four major mistakes were made that led to the death of the system. They were: (1) Inadequate Customer Communication System, (2) Starting the Entire System at Once, (3) Inadequate Number of Vehicles, and (4) Taxicab Buyout. Each of these four mistakes is discussed in detail. Recommendations for instituting dial-a-ride systems are made. Getting through the difficulties of the start-up period is emphasized. Costs are discussed, and some relevant cost data are presented. /Author/

32 141071 A SIMULATION MODEL FOR PLANNING DUAL-MODE BUS SYSTEMS. This paper presents the outline of a dual-mode simulation model which will be helpful in the planning and design of such systems. The planning requirements for dual-mode bus systems are discussed in the context of the urban transportation planning process, and the adequacy of the existing tools are evaluated. It is concluded that the current software for transit planning-UTPS (UMTA Transportation Planning Systems)-Which is designed for fixed route and fixed schedule systems, can be utilized for a coarse analysis of dual mode networks, but is not

adequate for simulating the demand responsiveness and station operations; further analytical tools are needed for such purposes. The simulation model is presented as a means of supplementing the current planning techniques. There is a detailed discussion of the assumptions built into the model and careful consideration is given to the process of implementing the simulation. For illustrative purposes, results of sample runs of the simulation are included in the paper. /Author/

Heintz, TJ (Marquette University) Chatterjee, A (Tennessee University, Knoxville) *High Speed Ground Transportation Journal* Vol. 10 No. 1, 1976, pp 31-46, 3 Fig., 9 Tab., 8 Ref.

32 141272 COMPARISON OF AUTOMOBILE EMISSIONS BASED ON TRIP TYPE IN TWO METROPOLITAN AREAS. Estimates of the distribution of automobile emissions among various trip types in the Washington, D.C. area are developed and compared with analogous estimates previously reported for Allegheny County, Pennsylvania. Work trips produce approximately equal proportions of emissions in both regions. However, trips to and from the central area and short trips are of considerably lesser importance in Washington than in Allegheny county. In addition, cold starts and evaporations produce a smaller proportion of emissions in the Washington area than in Allegheny County. These results suggest several ways in which measures that are effective in reducing automobile emissions in Washington are likely to differ from measures that are effective in achieving the same objective in Allegheny County. For example, improved suburban transit service and disincentives to suburban automobile travel are likely to be of greater importance in the Washington area than in Allegheny County. Jitney service or other measures oriented toward short trips may be of greater value in Allegheny County. In both regions, however, control of emissions from trips with one or both ends in the suburbs is necessary to achieve substantial reductions in regional automobile emissions.

Horowitz, JL (Environmental Protection Agency) Pernela, LM (Alaska University) *Transportation Research Record* No. 580, 1976, pp 13-21, 2 Fig., 11 Tab., 7 Ref.; ORDER FROM: TRB Publications Off

32 141385 HEY-TAXI. The hybrid vehicle created by Volkswagen for New York's City Taxi Project is a part electric, part gasoline powered vehicle. It looks like a conventional microbus, but its capacity can accommodate up to four passengers and a driver, and there is a space for wheelchairs or shopping carts and a luggage compartment in the rear. Despite its interior capacity, it is only inches longer than the regular subcompact car. The best feature of the City Taxi, of course, is its ability to run totally on electric power, thereby producing no gaseous pollutants. In low emission areas, it can switch to both electric motor and gasoline engine operation. When the gasoline engine's output is more than adequate for driving needs, the electric motor acts as a generator, storing the excess power in the batteries as electrical energy. When operating on hybrid power, the vehicle has lower emissions than the standard internal combustion engine. Because the electric motor provides all the driving power when the vehicle first starts up, as the gasoline engine takes over the throttle valve is

allowed to open slowly, causing low emission rates. The comfort and convenience offered by this prototype city taxi far surpass the usual New York taxi service.

Electric Vehicle News Vol. 5 No. 3, Aug. 1976, pp 14-15, 5 Phot.

32 141404 LESSONS FOR TRANSPORTATION POLICY DRAWN FROM PUBLIC HOUSING, URBAN RENEWAL, AND OTHER FIELDS. Goal achievement in transportation programs appears more likely if policy-makers, program analysts, and educators learn from the experiences of people in nontransportation programs. Expensive mistakes, dead-end approaches, and negative impacts that can be avoided in transportation policies are illustrated with analogies to the implementation problems and program impacts of public housing and urban renewal. Evaluations of public housing programs suggest that the mere provision of new mass transit facilities and services is unlikely to change the basic values and behavior preferences of many population segments despite the hopes of planners, environmentalists, and mayors. The transformation of large-scale, impersonal public housing programs to smaller scale, personalized, and home-owner rehabilitation programs has transportation analogies in pedestrian and private vehicle access improvement programs. Subregional transit services run by managers sensitive to community and traveler needs appear likely to improve population mobility more than investments in costly downtown-oriented linehaul systems. Evaluations of urban renewal programs suggest that urban transportation system management policies must consider the nature, extent, and incidence of negative social, psychological, and economic impacts associated with various strategies to reduce automobile ownership and use. As with relocation housing, comparable public transportation services must be available to affected car users, or adequate financial compensation should be made available. The paper concludes by specifying the institutional implications to reflect lessons from nontransportation fields. New services are suggested to help transportation suppliers and the traveling public. Professional transportation education improvements are recommended.

32 142142 ALTERNATIVE TAXICAB SYSTEMS. A LONDON CASE STUDY. VOLUME 2: APPENDICES. This volume comprises the following 5 appendices: appendix a. A comparative description of taxi operation in 6 European cities. The 6 cities involved in this study are Amsterdam, Brussels, Copenhagen, London, Madrid and Paris; appendix b. Variations in the geographical distribution of the private car hire trade in greater London. The main concern of this appendix is to attempt to establish whether there are any significant differences in the distribution and size of private hire firms between London boroughs and, if so, what factors appear to cause those differences; appendix c. An analysis of taxi hirings at central London rail terminals. These

patterns of taxi usage are investigated with particular regard for the distribution of taxi journeys by destination, by time of day and by the number of passengers who are conveyed on each trip. Since the available data are only a sample of taxi journeys it is necessary to derive factors whereby the sample size could be grossed up to represent the true population; appendix d. A mathematical model of a two-class taxicab system. The model used in the differentiated fare taxi system is formulated; appendix e. The legal framework for taxicab and bus operations in London. The concern of this appendix is to investigate the legal standing of and distinctions between the various conventional branches of the public road transport industry in London (notably taxis and buses), and to provide a detailed background for chapter 7. The appendix is divided into two parts: 1. Legal definitions of road passenger transport modes; 2. Similarities and differences in the regulation of road passenger transport modes. For abstract of volume 1 of this report see IRRD no. 219909.

Doganis, RS Lowe, SR ; Polytechnic of Central London, England Monograph No. 2, Res. Rpt. No. 2, Apr. 1976, 128 pp, Figs., Tabs.; ACKNOWLEDGMENT: TRRL (IRRD 220811)

32 142146 SOME PRELIMINARY RESULTS OF THE HARLOW DIAL-A-BUS EXPERIMENT. An experimental dial-a-bus service has been running in harlow since August 1974. It connects the residential neighbourhood of old harlow to a number of destinations in harlow new town between the hours of 07.00 and 23.30. After six months the service was carrying over 4000 passengers per week at an average load factor of 50 per cent. Lack of a telephone had not proved a significant deterrent to using the service. About 75 per cent of passengers were booking journeys and/or receiving doorstep service. Survey results are given that indicate the purposes for which journeys were made and the mode that would have been used if dial-a-bus were not available. The experimental results are found to compare well with predictions made using a conventional modal choice model. The cost of the experimental service is 4.86 per bus hour and the gross revenue covers about 30 per cent of this cost. It is estimated that a non-experimental service could cost 3.9 per bus hour and achieve revenue to cover 60-70 per cent of its cost. (a) for the covering abstract of the conference see IRRD abstract no. 220828. /TRRL/

Mitchell, CGB Martin, PH (Transport and Road Research Laboratory) ; Planning and Transport Res and Computation Co Ltd Analytic, ANALYTIC P126, July 1975, pp 88-144, 9 Fig., 11 Tab., 1 Phot., 3 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 220832)

32 142176 DRAFT MODEL FOR BALANCE BETWEEN DEMAND RESPONSIVE AND ROUTE BOUND BUS TRAFFIC IN BUILT-UP AREAS [Foerslag til modell foer avvaegning mellan anropsstyrd och linjebunden bustrafik i taetorter]. This study is performed within the project optkolt (optimization of public transportation in urban areas, IRRD no 601276) and is a first stage in developing a mathematical model to find the optimum balance between demand responsive bus traffic and route bound bus traffic in a built-up area. The model includes costs of vehicles, drivers and journey time and

level of service in both systems. In this study is also included a test and an adjustment of a computerized method for solving the model. A few calculations were performed and the following results were obtained:-in periods of low demand of journeys the demand responsive system is most advantageous especially concerning long journeys,-if a higher value is placed on journey time the share of demand responsive traffic increases,-if requirements on maximum journey time are decreased the share of demand responsive traffic decreases. /TRRL/ [Swedish]

32 142360 DEMONSTRATION OF POTENTIAL FOR IMPROVED USER-ORIENTED TRANSIT TO MAJOR TRIP GENERATOR (ABRIDGMENT). The results of a demonstration project, the UBUS, which provided a direct user-oriented service to a major trip generator, the campus of the University of Wisconsin-Milwaukee, are described. Major trip generators provide a large concentration of trip-making activity around which specialized transit service can be centralized. Project description and project objectives are reviewed as changes in mode choice; and parking use. Conclusions are drawn as to the successfulness of the UBUS service and the potential for widespread user-oriented transit service to major trip generators are examined.

32 143034 A MULTI-ORIGIN/DESTINATION TAXI SYSTEM. VOLUME 1, EXECUTIVE SUMMARY. PRELIMINARY DESIGN FOR SINGLE-ORIGIN/DESTINATION TRIPS. The long range goal of this research project is to design, develop and implement an experimental demand responsive multi-

origin/destination taxi system. The overall research program consists of information acquisition, studies of deployment and allocation of equipment, development of pricing mechanisms and operating procedures. The work is divided into three stages: (1) Preliminary design for single-origin/destination trips; (2) prototype design for shared rides; and (3) experiments and evaluation of technology, pricing mechanisms and operating procedures. Although development of the experimental system initially involves only standard taxi services, the resulting hardware and software packages are applicable to other types of paratransit systems. Hence, the entire project is referred to as the Ride-Shared Vehicle Paratransit System or RSVP System. This report contains the results of the first stage of RSVP System development.

32 143036 CASE STUDY EVALUATION OF THE BOSTON AREA CARPOOLING PROGRAM. The report evaluates a carpooling program in operation in the Boston, Massachusetts area from August, 1973 through August, 1974. The program, entitled the WBZ/ALA Commuter Computer Campaign, was the first program in the nation to promote and organize carpooling on a regional scale. It consisted of a free computer matching service for prospective carpoolers supported by an intensive multi-media promotional effort. The evaluation was structured around a two-pronged survey effort. The WBZ/ALA Follow-Up Survey was administered to a sample of program participants to determine participant demographic and travel characteristics; their reasons for wanting to carpool; the extent of carpool formation as a result of, or independent of, the WBZ/ALA program; and participant experiences and attitudes toward the program. The Eastern Massachusetts Survey, the second survey, was designed to measure the penetration of the WBZ/ALA Program as well as provide data on the level of carpooling in the region and the characteristics and attitudes of carpoolers, non-carpoolers, and potential carpoolers.

32 143194 SCHOOL/REGULAR ROUTE COORDINATION SERVICE. The study demonstrates, both operationally and financially, the feasibility of expanding routes in suburban re-

gions of Erie County, Pennsylvania, through coordinated school/regular route bus service. The initial phase of this report contains a review of school transportation laws and existing transportation services in the County including those provided by the Erie Metropolitan Transit Authority (EMTA), the school districts and private carriers. This review indicates the feasibility of the school/regular route coordinated service concept. Two corridors in the County were chosen and three joint-use routes were defined which expand EMTA regular route service to about 20,000 residents in Erie County who at present have no transit service available. About 430 students from three School Districts would be served by the coordinated school/public transit routes. Finances of the project are discussed as well as fleet size and manpower quotas.

32 143224 DATA BASE DESIGN FOR DEMAND-RESPONSIVE TRANSIT. A data base for demand-responsive transit operations has been designed to provide for systematic reporting and to be a standard of comparison between transit operations. The data base design is presented in the form of data sheets that may be used directly for recording information about transit operations. Subjects included in the data base include urban characteristics, ridership, costs, and services. Steps necessary for the complete development of a data base include design test, analytical validity, design revision, and development of reporting procedures and maintenance. The result will be a source of information for communities to plan new systems, to restructure existing systems, and to develop new system guidelines. This manual data base system is structured so that it may be automated at a future time.

Thurlow, VS Winchester, S ; Mitre Corporation, Urban Mass Transportation Administration, (UMTA-VA-06-0024) MTR-7254, UMTA-VA-06-0024-76-2, July 1976, 93 pp; Contract DOT-UT-50016; ACKNOWLEDGMENT: NTIS, Federal Highway Administration; ORDER FROM: NTIS; PB-256820/2ST

32 143230 HADDONFIELD DIAL-A-RIDE DEMONSTRATION, THIRD HOUSEHOLD SURVEY. The Haddonfield, New Jersey Dial-A-Ride (DAR) System operated from February 1972 to December 1974. The overall objective of the project was to determine the public attitudes, economic and technical feasibility, and community impacts of the Demand-Responsive Transportation concept. The household survey discussed in this report was conducted in September 1974 in the dial-a-ride service areas of Haddonfield, Barrington, Lawnside, and Cherry Hill, New Jersey. The Haddonfield Dial-A-Ride had been in service for 20 months. This survey was administered to obtain data on the socioeconomic profile and travel characteristics of the users of Dial-A-Ride and the users of taxi, fixed-route bus and auto modes. Tabulations of the responses collected were made for each of four

samples on a household, person and trip basis. Among conclusions reached was that the use of Dial-A-Ride for travel between home and work was higher than that shown by previous surveys.

Winchester, SA ; Mitre Corporation, Urban Mass Transportation Administration MTR-7168, UMTA-VA-06-0024-76-1, Mar. 1976, 70 pp; Contract DOT-UT-50016; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS; PB-257033/1ST

32 143930 THE EVOLUTION OF INTEGRATED TRANSIT-THREE PARABLES. In the past decade, a desire for expanded urban public transportation has been generated by increased environmental and energy awareness, and by the negative impact of extensive freeway construction in the nation's major cities. More recently, increasing transit operating deficits have kindled interest in the more efficient use of existing transportation facilities and in finding more cost-effective means of improving and expanding public transit service. Restructured conventional and para-transit services, operated as a comprehensive regional transit system integrated operationally, physically, and institutionally, offer a promising solution. This study examines the implications of embarking on a ten-year strategy to implement such a system. Three levels of ridership response are assumed which affect system scale and operating policy decisions at biennial intervals. The operating cost and deficit implications of these three response parables are then traced, yielding insight into the feasibility of an evolutionary strategy.

Sobel, KL Batchelder, JH ; Multisystems, Incorporated, Office of Systems Development and Technology Final Rpt. DOT/TST-76T/4, June 1976, 38 pp; Contract DOT-OS-50266; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-257160/2ST, DOTL NTIS

32 143982 DEPLOYMENT SCENARIOS FOR INTEGRATED REGIONAL TRANSPORTATION NETWORKS. The report describes the cost and service implications of alternative scenarios for the deployment of an integrated regional transportation system in a hypothetical city. The impacts of various levels of user acceptance are investigated. For the selected study area, a limited expansion of integrated transit service to suburbs, and the improvement of off-peak suburban service through the use of flexible-route systems appears desirable. In view of the large areas and low suburban population densities characterizing the study region, full coverage of the entire suburbs appears to be economically feasible only at reduced service frequencies.

Billheimer, JW Bullemer, R Holoszyk, M ; Systan, Incorporated, Department of Transportation Final Rpt. Systan-D147-1, DOT-TST-76T-7, Aug. 1976, 145 pp; Contract DOT-OS-50265; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-257742/7ST, DOTL NTIS

32 145318 HOW TO CALL THE BUS-TAXI [Hoe roep ik een bustaxi op]. One of the efforts to meet the demand upon public transport is the development of the bustaxi-system. The customer supplies the following data to a control centre: (1) the address of destination (2) the time of arrival and (3) the number of co-travellers. By means of an algorithm this control centre allots the cus-

tomers to the most appropriate bustaxi. The customer is able to communicate with the control centre by means of a terminal. To allow proper functioning, it is convenient to split this terminal in two parts (1) a part concerned with transmission and reception and (2) a part that enables the customer to enter the required data and to receive the data returned from the control centre. The design for the latter part of the terminal is discussed. /TRRL/ [Dutch]

32 145337 DEMAND RESPONSIVE TRANSPORTATION: AN INTERPRETIVE REVIEW. The problems and potential of several demand responsive transportation (DRT) modes are examined in this paper. The analysis provides suggested recommendations to decision makers, as well as policy analysts and transportation planners. Included in the definition of DRT are the auto, taxi, rent-a-car, jitney, dial-a-bus, car pool, and subscription bus. The main conclusions are: (1) decision makers should not focus on taxis, rent-a-car, jitney, dial-a-bus, car pool, or subscription bus to reduce congestion and pollution without disincentives to auto use; (2) jitneys can help the transit poor, and jitney development by the private sector should be encouraged, particularly along routes currently overloading public transit where resistance from transit operators is likely to be the least. Or, jitneys might be encouraged to feed public transit, if this proves politically feasible. (3) Since the greatest potential of dial-a-ride is in helping the poor and elderly rather than reducing congestion, decision makers should consider providing vouchers to the poor and elderly for use on taxis before considering the public provision of an entire dial-a-ride system. (4) Local decision makers, as well as state agencies supporting local demand responsive transportation, should support efforts to increase the supply of taxis. Recognizing the political difficulties involved in increasing the supply, compromise solutions aimed at encouraging incentives for competition, such as leased cabs, should also be encouraged. /Author/ /TRRL/

32 145400 REGIONAL CARPOOL MATCHING SYSTEMS: A SIMULATION OF THE BOSTON EXPERIENCE. In August of 1973, WBZ, a Boston radio station, launched one of the nation's first regional carpooling programs in affiliation with the Automobile Legal Association (ALA), an auto and travel firm. The author explains that the motivation of these organizations in starting the program was to provide a useful service to their main public constituency, commuters, in the face of the impending fuel shortage which was to reach near-crisis proportions in New England during the winter of 1973-74. The concept of the program involved soliciting names and work-trip data from car commuters in eastern Massachusetts and matching them with others who had similar commuting characteristics so that they might form a carpool. Over a million questionnaires were distributed.

The process of commuter matching is described and discussed, leading to important implications for carpooling policy-makers. The experience of such a low ratio of applications received, some 13000 leading to the matching of about 3800 people, for example could, it is felt, indicate commuter disinterest with regional carpooling programs. /TRRL/

32 145588 DIAL-A-RIDE SOFTWARE INSTALLATION GUIDE. The Demand-Responsive Scheduling Software Package is a set of procedures and computer programs designed to assist researchers, agencies, and transit operators in the operation of demand-responsive transportation systems. This package is being tested and is currently operating on a PDP-10 time-sharing system in Rochester, New York. The package includes program documentation, descriptions of input data file preparation, operators' guides, and program source code. The manual contains preliminary guidelines for installing the on-line portion of the software package at a user site. It outlines such steps as obtaining and organizing resources, constructing data bases, and starting and operating scheduling operations.

32 145620 USER DOCUMENTATION FOR THE FHWA CARPOOL MATCHING PROGRAM (SECOND EDITION). The full documentation for the computerized FHWA Carpool Matching Program is divided into two reports: user documentation and program documentation. This report only covers the user portion of the documentation and is intended to be used as a guide and set of instructions for operating the program. On October 1, 1974, the Federal Highway Administration released the latest, improved version of the program. This second edition of the user documentation includes a description of all the improvements and additions that have been added to this latest version of the program. The FHWA program is written in American National Standard COBOL and thus should be readily transferable to environments other than the IBM 360/65 (OS) under which it has been developed and tested.

32 145621 PREFERENTIAL FACILITIES FOR CARPOOLS AND BUSES-SEVEN REPORTS. These seven reports on preferential facilities for carpools and buses have been assembled and reprinted by the Federal Highway Administration. The reports provide information on several recent projects to increase the person-moving capacity of the highway system by designating facilities for preferential use by high-occupancy vehicles. The reports cover many different types of priority treatment. Some of the reports analyze and evaluate the effectiveness of

particular projects. Other reports emphasize the project design and operational features; others simply describe the current operation of unique or unusual projects.

32 145623 NATIONAL CONFERENCE ON AREAWIDE CARPOOLING PROCEEDINGS (1975) HELD AT HOUSTON, TEXAS, DECEMBER 8-10, 1975. Activity toward increasing commuter ridesharing has been steadily increasing throughout this country over the past several years. As the number of programs involved in stressing ridesharing across the country increases, the need for coordination and information also increases. In response to this demonstrated need, the 1975 National Conference on Areawide Carpooling was envisaged. Sponsored jointly by the Houston Carshare Program, the Federal Highway Administration and the Federal Energy Administration, the conference had one paramount objective: to exchange experiences and to heighten the knowledge and effectiveness of area-wide ridesharing programs. The 3-day conference was organized around workshop sessions covering a gamut of topics from marketing and promotion to legal and regulatory issues. The attendees, numbering over 130, were representative of all regions of the United States, from a wide range of private and public agencies, institutions and organizations actively involved in promoting increased ridesharing. The proceedings presented in this document will help to fill the great need for information and concern for transportation alternatives.

32 146500 FEASIBILITY STUDY OF THE EMPLOYMENT CENTER BUS SERVICE CONCEPT. A new approach to commuter-oriented bus operations is studied. Advantage is taken of the spread in working hours in an employment center by having each bus make multiple trips during peak periods. Buses serve the first shift and then return with additional passengers to serve subsequent shifts. Groups of buses are assigned to make trips of various

lengths. The service resembles subscription bus service; however, the increased productivity results in breakeven fares which should attract a large segment of non-transit dependent travelers almost irrespective of commuting distance. Procedures for developing and applying the service are provided, particularly using trip combinations of various lengths which can serve two to four staggered shifts. As a concluding test of feasibility, the service is applied to an actual employment center.

32 147043 THE HARLOW DIAL-A-BUS SERVICE: SOME OPERATIONAL STATISTICS.

The report provides some information about the practical operation of the Harlow experimental dial-a-bus service. Demands upon the control arrangements and the response of the system are analyzed in considerable detail, and some more general operational statistics are also reported. The system is found to be coping comfortably with the present level of demands upon it. A good quality of service is evidenced by prompt attention to requests, accurately estimated pick-up times, a high level of doorstep service, and reasonable journey times.

32 147056 PROPOSED ENERGY CONSERVATION CONTINGENCY PLAN; EMERGENCY COMMUTER PARKING MANAGEMENT AND CARPOOLING INCENTIVES. ECONOMIC IMPACT ANALYSIS. ENVIRONMENTAL IMPACT ASSESSMENT CONTINGENCY PLAN NO. 2.

This report describes the economic impact of a plan whose objective is to reduce demand for gasoline by restricting the availability of auto parking for commuters and encouraging commuters to form carpools or use mass transit during a supply interruption.

Federal Energy Administration FEA/H-76/431, Sept. 1976, 214 pp; Also available in set of 5 reports as PB-258 623-SET, PC E99/MF E99; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-258625/3ST

32 147303 UNIVERSITY AREA TRANSIT STUDY. A PRELIMINARY DESIGN.

Situations and events of the past ten years in the University Area of the West Bank, East Bank and St. Paul Campuses of the University of Minnesota, generated discussions of the need for a transit circulation and distribution system and the need to define the relationship between the circulation system and the regional transit system. The University Area Study was conducted in two parts: Part (1) System selection--The work completed (goals, objectives, culture and performance requirements, identification of potential users, transit system alternatives, and summary report) resulted in the definition of a conceptual transit system for the University Area. Part (2) Preliminary design--This work refines the concep-

tual transit system, defines system performance specifications, estimates capital and operating costs, and includes an implementation schedule.

32 147374 DEMAND RESPONSIVE TRANSPORTATION PLANNING GUIDELINES (1976).

Demand Responsive Transportation (DRT) is a type of transit operation providing 'on-demand,' door-to-door service with small buses. More than forty DRT services are now operating in the U.S. These systems provide the data base for a set of relationships which can be used for planning and design of new DRT systems. In addition, the experience of active operators emphasizes a number of important steps in developing successful DRT services.

32 148131 TRANS-CAB: A DEMONSTRATION OF SHARED TAXIS FEEDING FIXED ROUTE TRANSIT SERVICE.

The purpose of this paper is to describe transit demonstration programs which may be classified as follows: DEVELOPMENT (EXPERIMENTAL): To develop, with transit properties, innovative transit strategies which show promise of being of value to the industry. While benefits may be expected, their value may not be identifiable or quantifiable prior to implementation. DEMONSTRATION (EXEMPLAR): To demonstrate, through transit properties, innovative strategies for which benefits can be identified and quantified with an acknowledged degree of certainty. This paper deals specifically with the Trans-Cab Demonstration Project as an example of new transit programs. /RTAC/

32 149260 FARE COLLECTION AND TICKETING CONSIDERATIONS AT DUAL-MODE STATIONS.

Dual-mode transit system concepts are now being developed to provide demand-responsive transportation in metropolitan areas. Since these systems combine the features of demand-responsive service and shared, multiple origin and destination vehicle usage, their ticketing and fare collection functions will be more complex than those of conventional transit systems. Fares are likely to be related to trip distances; fares may also depend on the time of day and characteristics of the traveler. The reservation request and confirmation process

associated with demand-responsive systems will result in additional functions. It may also be necessary to verify or control (or do both) the passenger loading of each vehicle. Finally, the possible implementation of a dual-mode transit system in an evolutionary manner, beginning with a single-mode dial-a-bus service, requires that both interim and final goals be considered when the initial ticketing and fare collection concept is designed. This paper explores these new and expanded functions of ticketing and fare collection for dual-mode transit systems. A case is made for integrating the design of reservation, ticketing, and fare collection functions with the overall design of a dual-mode transit system. Careful integration of these functions will produce a high level of passenger service and economies resulting from shared vehicle use and extensive automation.

32 149499 WISCONSIN TAXICABS: VOLUME I, EXECUTIVE SUMMARY.

The 3-phase study reported here consisted of the compilation of an inventory of taxicab firms, a survey of cities and villages regarding taxicab regulations, and a survey of taxicab firms. The taxicab inventory (Vol. II) includes 109 firms headquartered in 78 cities and villages. Volume III of this study analyzes the regulatory structure within which the taxicabs operate. It is reported that taxicabs are subject to more intense local regulation than are other public transportation modes, and receive more favorable tax treatment from the state government. Volume IV describes the results of the survey of taxicab firms and contains information about hours of operation, fares, vehicles, work force etc. Nine taxi firms serve elderly and handicapped persons, 6 firms offer reduced fares, 8 firms offer subsidized programs, and 4 firms operate specially equipped vehicles. A bibliography with over 100 recent references is presented in Volume V.

32 150485 INTEGRATION OF PARA-TRANSIT WITH CONVENTIONAL TRANSIT SYSTEMS.

This is one of eight information bulletins developed on pressing transportation problems for the Urban Consortium for Technology Initiatives. The bulletin explores the problems associated with integrating paratransit services into more general transit operations. Areas covered include markets, planning, regulation, operating concepts, labor issues, financial issues, the role of other providers, and maintenance.

32 150521 A MARKETING APPROACH TO CARPOOL DEMAND ANALYSIS. SUMMARY REPORT. The report presents an overview of the major findings, conclusions and recommendations of a study initiated by the Office of Transportation Policy Research, in its program effort to determine policy incentives and to encourage people to alter their travel habits in favor of more energy-efficient modes. The carpool policies examined in this study are well known to transportation personnel, but the use of a marketing approach in estimating changes in carpool demand is new. The use of a specially designed survey of commuters in three major areas, which is the key tool developed for this research, has resulted in a sizeable new data base on respondents' socioeconomic and worktrip characteristics, travel perceptions, and travel preferences. Of particular interest is the survey's use of trade-off questions requiring respondents to weigh commuting alternatives and define the conditions under which they think they would switch from solo-occupant automobiles to carpools.

32 151158 STUDY OF FUTURE PARATRANSIT REQUIREMENTS. SCENARIO REPORT. The overall objective of the study is to define the future dimensions and characteristics of paratransit and the requirements for testing innovative transportation services for the development of new vehicles, and for ways to overcome legal and institutional constraints. The analysis is based on urban scenarios projected into the 1980-95 time frame and representative of a large number of locations. The report describes how these scenarios were constructed and evaluated and how the findings were aggregated for the entire U.S.

32 151722 JOINT EPA/UMTA/FEA STRATEGY FOR URBAN TRANSPORTATION AND AIR QUALITY. VOLUME 3. THE POTENTIAL OF DUAL MODE. Interdependence of goals of the three agencies, EPA, UMTA, and FEA generates this four-volume study. The common issue around which all three agencies' policies revolve is the use of the private auto involving both incentives and penalties to catalyze a change in existing urban travel characteristics. This third volume expresses INTERPLAN's judgment about the applicability, timing, and impact of dual mode urban transportation technologies. A three-system, three-phase, gradual evolution of demand for dual mode is suggested. The dual mode essay is prefaced by a short overview and comparison of the propulsion and energy use characteristics of conventional and future urban transportation modes.

32 151824 STUDY OF FUTURE PARATRANSIT REQUIREMENTS: 1980-1995. The report examines a range of paratransit service concepts in context with a set of typical urban settings under three alternative 1995 futures. These alternative futures are described in terms of energy cost and degree of automobile disincentives. Integrated transit and paratransit systems are defined and match a combination of transit and paratransit services with forecasted transportation needs for each individual setting. Using estimated representativeness factors for each setting, the setting results are expanded to provide order-of-magnitude nation-wide estimates of potential future paratransit activity. These estimates are presented in terms of passenger demand, subsidy requirements, and vehicle requirements.

32 151953 COMMUTER VAN POOLING OPERATIONS GUIDE FOR EMPLOYERS. The background information and operating procedures are described as well as the experience gained in launching and operating van pool programs at Chrysler's corporate facilities. The program provides that the employer will furnish 12-passenger vans to employees who elect to participate in the program. The launching and administration of the program should be under the general supervision of the personnel manager or administration manager. The requirements for both the driver/coordinator and backup driver are listed. The program should receive the support and encouragement of top management. The ways in which van pooling may be promoted are discussed, and details of fare calculation are set forth. Comments are also made on the evaluation of the program. Six exhibits which include a manual and computerized employee matching techniques, solicitation folder, orientation guide, and operating agreement for driver/coordinator are included.

32 152922 THE EFFECTIVENESS OF CAR POOLS IN URBAN AREAS. A car pool is a means of transport whereby a number of commuters travel in a single vehicle, a taxi, instead of each commuter using his own vehicle. The effect of car pools on vehicle distance travelled in the entire city is calculated for several different models. These models take into account the distribution of people's homes and workplaces, the routing system in the city, and the rules used to decide who will share the taxi. /TRRL/

32 153167 ASSESSING DEMAND FOR RIDE-SHARING SERVICES. A relatively simple, quick and inexpensive method is proposed for estimating the demand for ride-sharing services. The method which resembles the sketch-planning methods suggested for more capital-intensive public transportation projects, can be used by planners to assess demand for particular modes of ride sharing within large generalized areas of the city. Appropriate areal units are first identified, followed by the identification of transportation-related variables to stratify the study area into similar socioeconomic groupings. A formula is presented for estimating the demand for ride sharing. The testing of the proposed method in Knox County Tennessee is described in detail.

32 153309 ZONAL TAXI SYSTEMS: AN IMPROVEMENT IN LOCAL MOBILITY. Details are given of a zonal taxi service, the aim of which is to improve the local mobility of low-income groups, and old and handicapped people, especially those without telephones. The scheme proposed is as follows: taxis would be allocated to a residential area, operating from a local centre, and travelling according to predetermined routes and schedules. The passengers would board or alight on a hail-stop basis, sharing a taxi as necessary. For the old and disabled particularly, route diversion could selectively be allowed so as to enable them to be picked up or set down as close to their homes as possible. Based on Greater London transportation survey data for the London borough of Camden, an investigation is made into the possible number and costs of journeys; a flat rate fare of 5p per person in a high-density area and 21p in a low-density area would make the scheme attractive to both taxi drivers and passengers. This scheme has many similarities to dial-a-ride systems, but, by eliminating the need for a high proportion of telephone ownership, it is especially suitable for less affluent zones. It is suggested that such a scheme, offering an inexpensive pleasant method of making short local journeys and operating in areas currently without public transport, would generate new public transport demand, which, rather than divert from existing services, might feed into them. /TRRL/

32 153964 ORGANIZING AND OPERATING A VANPOOL PROGRAM: FEASIBILITY OF VANPOOLING IN VIRGINIA. The report identifies the various elements of passenger transportation vanpool programs and describes the procedures necessary for employers and agencies to implement a vanpool program, based on Virginia conditions. The concept of vanpools is introduced and benefits to management and employees are identified. Among these are reduced needs for parking, reduced traffic congestion, lower commuting costs and conveniences. Employer concerns about vanpool implementation are discussed, such as legal aspects and insurance costs. In Virginia there are no serious legal problems to prevent vanpooling. Experience with vanpools elsewhere in the U.S. indicate that methods for managing and operating programs differ from one company to another although the basic concept is similar to that selected by the 3M Company in its pioneering effort.

32 154019 SMALL BUS PROGRAM: VEHICLE OPERATION EFFICIENCY REPORT. PART I. EXPERIMENTAL BUS PROGRAM (15-20 PASSENGER BUSES). PART II. VAN CONVERSIONS FOR DIAL-A-RIDE SERVICE (12 PASSENGER BUSES). The Michigan Department of State Highways and Transportation, Bureau of Urban and Public Transportation, has prepared the report describing operational experience with some 15 vehicles produced by a variety of manufacturers. The report consists of a series of individual driver's and mechanic's reports on the actual performance of the vehicles in different Michigan communities. Each vehicle is evaluated on the basis of its economy, capacity, dependability, durability, and the general impression made on the public, drivers, and mechanics. The information was gathered as part of the Michigan transportation agency's experimental bus program (15-20 passenger vehicles) and its Dial-A-Ride Transportation (DART) program which uses converted vans (12 passenger) and is operating in some 28 Michigan communities.

Fletcher, PB Hewitt, CH Pellonpaa, CV Woodford, JP ; Michigan Department of State Highways & Transport, Federal Highway Administration FHWA/PL-77/007, Nov. 1976, 170 pp; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-265131/3ST

32 154400 CARPOOL INCENTIVES: EVALUATION OF OPERATIONAL EXPERIENCE. The report reviews both the published and un-

published literature with respect to various incentives that could increase carpooling and to determine, where possible, the effects of these incentives on carpooling. The coverage included theoretical and analytical work, as well as empirical observations of programs in operation both in this country and abroad. The primary focus is on the identification of actual examples of possible carpooling incentives, their description and implementation characteristics, applicability, institutional/legal barriers, public acceptability, and their effects on travel behavior and energy use. The relevant literature, applications, and existing data sources were canvassed and used to evaluate both the technical potential and the feasibility of implementation of the various policies selected for study.

32 154626 ATTITUDES OF LOWER NAUGATUCK VALLEY HEALTH CARE PRACTITIONERS AND PROGRAMS TOWARD THE VTS DIAL-A-RIDE PROGRAM. The attitudes of health care practitioners and programs toward the Dial-a-Ride component of the Valley Transit System (VTS) in the Lower Naugatuck Valley area of Connecticut are investigated. The study was designed to obtain information about each respondent's knowledge of the VTS, attitudes about the VTS, and suggested changes for improving the VTS. The survey was limited to direct care practitioners, e.g., physicians, dentists, chiropractic physicians, optometrists, and podiatrists. Programs were identified as inpatient facilities (hospitals, long term care facilities, and convalescent facilities) and community agencies (health department, Visiting Nurses Association, and Homemaker Agency). Two approaches were used to obtain data. The first technique involved mailed questionnaires sent to all direct care practitioners in the valley. The overall response rate for the questionnaire was 63 percent (71 of 113 practitioners). The second approach was an interview with representatives of community health agencies and inpatient facilities. The total number of persons interviewed was 22. The majority of respondents had a favorable attitude toward the VTS. As viewed by respondents, a need was identified in the valley for a transportation program designed specifically for the elderly and handicapped. A number of those who felt the VTS did not meet all needs offered suggestions for improvement. These suggestions were concerned primarily with the number and kind of buses, scheduling and the fare system, and the expansion of the service area. Most respondents favored a combination of funding for the VTS from such potential sources as valley towns and agencies, riders, and the State of Connecticut.

32 154812 STUDY OF FUTURE PARATRANSIT REQUIREMENTS. EXECUTIVE SUMMARY. The overall objective of this study is to define the future dimensions and characteristics of paratransit and the requirements for testing innovative transportation services for the development of new vehicles, and for ways to overcome legal and institutional constraints. The analysis is based on urban scenarios projected into the 1980-1995 time frame and representative of a large number of locations. This Executive Summary report examines a range of paratransit service concepts in context with a set of typical urban settings under three alternative 1995 futures. These alternative futures are described in terms of energy cost and degree of automobile disincentives. Integrated transit and paratransit systems are defined and match a combination of transit and paratransit services with forecasted transportation needs for each individual setting.

32 155060 CARPOOL INCENTIVES: ANALYSIS OF TRANSPORTATION AND ENERGY IMPACTS. The report quantitatively analyzes the impacts of carpooling strategies on travel behavior and energy consumption. It details the effects of 18 candidate strategies on the utilization of different transport modes for work trips and the resultant effects on non-work travel patterns, household auto ownership, and total fuel consumption. Five specific objectives governed the work performed: (1) To collect information on carpooling behavior and analyze existing experience with strategies that may encourage ride-sharing; (2) to predict, by using behavioral travel-demand models, the changes in travel patterns that might result from implementation of such strategies; (3) to translate increased carpooling (or other changes in travel patterns) into decreased fuel consumption; (4) to evaluate the feasibility of implementing particular strategies; (5) to recommend strategies for increasing carpooling and reducing fuel consumption that will be both feasible and effective.

32 156100 AN INNOVATIVE PUBLIC TRANSPORTATION SYSTEM FOR A SMALL CITY: THE MERRILL, WISCONSIN, CASE STUDY. This paper describes a recently implemented innovative transportation system which can serve as a prototype for similar systems in other areas. The system was implemented in Merrill, Wisconsin, a city of 9500 persons that has had a long history of public transportation, but has been unable to maintain high-quality transit service in recent years. A point deviation bus system, a form of demand-responsive transportation that has seen little experimentation, has been introduced in

Merrill with the help of a state demonstration grant. The system uses two vehicles which make scheduled stops at checkpoints located around the city, but also respond to requests for doorstep pickups or drop-offs between checkpoints. A higher fare is charged for the premium doorstep service. With operating data for the first 7 months of service available, it appears that the point deviation concept is operationally valid. The service has been of high enough quality to attract a significantly greater number of passengers than has been using the transportation services that previously existed in Merrill. The higher cost, doorstep service option has been chosen by almost 40 percent of the adult ridership. Cost per hour has been below the cost of many other demand-responsive transportation systems. The system has demonstrated how high-quality transportation service can be provided in a small city. /Author/

Flusberg, M (Multisystems, Incorporated) *Transportation Research Record* No. 606, 1976, pp 54-59, 3 Fig., 6 Ref.; ORDER FROM: TRB Publications Off

32 156101 INTEGRATED URBAN TRANSPORTATION SYSTEMS: CHALLENGE FOR THE FUTURE. Paratransit has been described as a bridge between the conventional automobile and conventional transit. Certain concepts, such as taxi and car pooling, have developed from the automobile side, and other concepts, such as subscription bus service and dial-a-ride, have developed from the transit side. As service concepts continue to develop and there is movement from both sides toward the center, certain conflicts are inevitable. Two major cultures, privately operated taxi companies and publicly operated transit companies, that have previously operated independently and differently must now learn to understand each other's environment and work together. However, to view the problem simply as taxi versus transit or public versus private is naive. As in all situations involving the assimilation of different cultures, patience, time, and understanding are required. Paratransit is a melting pot of different approaches, in which gradual assimilation will occur while fundamental differences remain. Paratransit provides the opportunity to increase available options with respect to both the service that is provided and the providers of service. Service can be successfully integrated—at one level by interfacing paratransit services with one another and at a higher level by interfacing paratransit with conventional fixed-route transit in a complementary manner. /Author/

32 156103 DEMAND-RESPONSIVE TRANSPORTATION IN ANN ARBOR: PLANNING AND ADMINISTRATION. Since its formation in 1968, the Ann Arbor Transportation Authority (AATA) has made significant strides in shifting the emphasis from private automobiles to public transportation. This paper details the implementation of a system that has grown from ground zero in 1968 to 1,600,000 riders in fiscal year 1974-75. The attendant growth of AATA's capital equipment and annual operating budget is similarly impressive. Funding has been derived from federal and state grants and a local property tax adopted by the voters in 1973. The local funding support is important because it demonstrates a high level of community support for the transit system and furnishes the required matching funds for larger state and federal grants. The AATA system is truly demand responsive since it includes planning and service revisions as well as the dial-a-ride service. It is anticipated that the respective importance of dial-a-ride and line-haul service will shift as the system matures and ridership reaches a much higher level. Long-range growth can be ensured only because AATA continues to monitor public response to its service and to implement required changes. /Author/

Drake, WD (Michigan University, Ann Arbor) *Transportation Research Record* No. 608, 1976, pp 16-19; ORDER FROM: TRB Publications Off

32 156104 DEMAND-RESPONSIVE TRANSPORTATION IN ANN ARBOR: OPERATION. Ann Arbor, Michigan, has had a dial-a-ride service operating since 1971. Since passage of a special property tax for transit in 1973, dial-a-ride has expanded its role and ridership. It is now totally integrated with line-haul bus service within the Ann Arbor Transportation Authority's operation. Weekday service provides for coordinated transfers between dial-a-ride collector-distributor vehicles and line-haul buses at several points within the system. Dial-a-ride has helped the Ann Arbor Transportation Authority secure a dramatic increase in ridership over the past two years. The transit system is operating within budget. Staged incremental implementation has allowed the introduction of dial-a-ride with a relatively high degree of reliability and minimal disruption. A great deal of operational fine tuning has been done within each small implementation. Satisfactory results are being obtained with dial-a-ride vans and with a semiautomated computer-assisted dispatching system. Cost and productivity data are provided. /Author/

32 156105 DIAL-A-RIDE IN THE CONTEXT OF DEMAND-RESPONSIVE TRANSPORTATION: A CRITICAL APPRAISAL. Dial-a-ride service has become one of a number of possible demand-responsive small-bus transportation systems. A comparison of several systems suggests that a well-marketed fixed-route bus system can be far more cost effective than dial-a-ride in low-density areas. The concept of

demand-responsive public transportation should be broadened to include well-planned fixed-route transit. Dial-a-ride appears to have greater value for special-need groups (e.g., elderly, handicapped) and at times when fixed-route transit would be uneconomical. Better integration with fixed-route elements is essential. /Author/

32 156107 EVALUATION OF DRT SYSTEMS IN RICHMOND AND SANTA BARBARA. This study evaluated system performance and the economics of a publicly operated demand-responsive transportation system in Richmond, California, and a privately owned and operated demand-responsive transit service in Santa Barbara, California. The systems were evaluated from the viewpoint of users, nonusers, and system operators. The major conclusion from the research was that ownership and operation of demand-responsive transit by the private sector demonstrate significant potential and should be given serious consideration by policy makers. By subsidizing a private operator at approximately \$1.00 per passenger-trip, it should be possible for a local government to provide increased mobility to transit-disadvantaged sectors of the population with a greater degree of efficiency and equity than would be possible if the service were operated by a transit district. /Author/

32 156108 DIAL-A-RIDE SERVICE IN SANTA CLARA COUNTY. Late in 1974 and early in 1975 the Santa Clara County Transit District initiated, operated, and then discontinued a demand-responsive dial-a-ride system within a span of 5 1/2 months. This system's failure was primarily the result of poor systems planning. Specifically, four major mistakes led to the death of the system: an inadequate customer communication system, starting the entire system at once, an inadequate number of vehicles, and taxicab buyout. Each of these four mistakes is discussed in detail, and recommendations are made for instituting dial-a-ride systems. Getting through the difficulties of the start-up period is emphasized. Costs are discussed, and some relevant cost data are presented. /Author/

32 156118 AUTOMATION OF PARATRANSIT FARE COMPUTATION AND DISPATCHING. This paper examines the historical evolution of paratransit services and discusses a generalized fare-calculation system for paratransit operations. The prototype system is designed to reduce or eliminate a number of software and hardware constraints that have hampered the taxi industry's efforts to provide a full spectrum of paratransit services. Software constraints are analyzed in terms of regulatory and political processes that have evolved with the taxi industry. Hardware constraints are analyzed in terms of a lack of incentive for product improvement, since at present there is not a sufficient U.S. market for metering and dispatching systems and only a small market for specialized vehicles. In addition, innovations in hardware are hampered by the fact that implementation depends heavily on the relationship

between new technologies and existing regulations. The purpose of this paper is to discuss the need and mechanisms for change and to describe a prototype fare-calculation and dispatching system currently being developed at Carnegie-Mellon University. /Author/

32 156124 PARATRANSIT DEVELOPMENT: SEARCH FOR AN APPROPRIATE LABOR POLICY. The potential of the various paratransit modes for serving urban transportation needs is as yet largely undetermined. An informed and equitable labor policy would greatly assist all current efforts to explore the market potential of paratransit. Group ride-sharing paratransit forms, such as car-pool incentive program, van pooling, shared-ride taxi service, and special services to the handicapped provided by sources other than conventional transit, raise difficult issues of labor policy. Where shared-ride services are to be integrated into the regional multimodal public transportation system in accordance with current planning requirements and policy directive, an appropriate labor policy should minimize political confrontation and labor conflicts. Labor ought to be involved at the outset in the planning and policy-and decision-making process. A good labor policy requires recognition of existing job equities and wage standards for transit labor. A successful labor policy will minimize unfair labor competition and jurisdictional conflicts between unions and groups of workers and require continued collective bargaining without government intervention. When adverse effects on the existing labor forces in the public transportation industry are unavoidable, they should be cushioned by job allowances, including job retaining and relocation expenses. /Author/

32 156125 PAST ACCOMPLISHMENTS AND FUTURE DIRECTIONS OF PARATRANSIT: A DISCUSSION. The major topics discussed with respect to paratransit include the following: The three most significant accomplishments to date regarding paratransit, APTA's view of paratransit and the potential for public and private cooperation; the role of ITA in paratransit; the role of the federal government in paratransit; and, the three most important short-term objectives with respect to paratransit, and how to achieve them. The major accomplishment of paratransit is the identification of the wide range of available services that fall between the driver and his private automobile and buses. As a result of the government and academic's interest in taxicabs, the ITA has become more active in determining its role vis a vis the federal government. Paratransit has demonstrated that the present transportation system must be considered a multidimensional system in which services are going to be better tailored to individual needs. UMTA, in cooperation with APTA should share in a definitive program of planning for paratransit, striving for efficiency and implementing paratransit in ways which would compliment the existing transportation system. UMTA is seen as facilitating innovation at both the local and state levels of government. Through research and demonstration programs UMTA has been able to examine the various aspects of paratransit services as well as the delivery and integration of these services. Also, UMTA must assure that there be equity in the distribution of services within the urban area. In the short-run, each urban area should seek to establish effective coordination of its transit services, including the many facets of paratransit; UMTA must assure that there are effective laws to protect existing institutions that are providing transportation; and lastly, the existence of privately owned paratransit services and the removal of regulations that prevent those privately owned paratransit services from functioning on a shared-ride basis must be recognized.

32 156329 FARE CALCULATION AND VEHICLE COMMUNICATION MODULES FOR PARATRANSIT SYSTEMS. This paper discusses the design and development of fare calculation and vehicle communication hardware and software for the experimental Ride-Shared Vehicle Paratransit System. Key components include: a new electronic taxi meter which functions as a remote display for computer calculated fares and which has back-up metering capabilities for use when the computer or radio malfunctions; and a Data Base Management System which performs fare calculations and which will eventually provide real-time monitoring capabilities for the RSVP System. Design issues are analyzed in terms of hardware engineering, software engineering, and system integration. Descriptions of Control Center hardware, vehicle hardware, and RSVP operating procedures are presented.

32 156443 THE HARLOW DIAL-A-BUS EXPERIMENT: COMPARISON OF PREDICTED AND OBSERVED PATRONAGE. This report provides a preliminary validation of the demand model used in the TRRL programme of research into dial-a-bus. It compares the observed ridership of the experimental Harlow dial-a-bus system with predictions obtained from a modal split model. It is shown that the predicted patronage was about one-third too high but that the predicted distributions of the age of the passengers, their journey purposes and the modes foregone, were in reasonable agreement with the observations. These results indicate that the basic structure of the demand model is sound, but that, in the modelling, too low a generalised cost had been assumed for dial-a-bus. (a) /TRRL/

32 156472 MOVING IN CITIES. In this book, the author proposes practical solutions to the problems of urban mobility, and in doing so, draws on a whole range of new public transport systems resulting from modern technology. The book also explores what is being done to enable existing transport modes to work more efficiently, and how simple pleasures such as walking in cities and cycling are being made more enjoyable. Topics covered include the following: strategies for public transport; movement in the city centre; pedestrian movement systems (walking, conventional mechanical systems, conveyors, vehicular); passenger interchanges including park and ride, kiss and ride; goods movement (pneumatic pipelines for materials transport, canals, etc.); transport in residential areas; recreational trips (accessibility to the countryside, swimming pools, sports facilities etc.); moving pavements; continuous systems; rail and guideway systems (rapid transit tramways, automatic guidance systems, group-rapid transit, personal rapid transit); bus transport (operation, control, fares, design, infrastructure, dual-mode operation); dial-a-ride; car hire; cycling and cycleways. /TRRL/

32 157172 BETTER NEIGHBORHOOD TRANSPORTATION. This study explores opportunities to improve neighborhood transportation. An effort is made to simultaneously evolve a fleet of small neighborhood vehicles, a sequestered roadspace environment carved out of the existing street system, and a new set of regulations governing the licensing and operation of special-purpose vehicles. This multiple strategy is referred to as vehicle/roadspace/control-system evaluation. The work completed focuses on the neighborhood level of transportation. The study explores several key facets of the idea of differenti-

ated neighborhood transportation; or "aid to walking" (ATW) systems. The study next explores the implication of ATW systems as a catalyst for improving the livability of neighborhoods. It concludes that ATW transportation is an attractive instrument of both a high level of residential amenity and neighborhood accessibility. The social need for the transportation service offered by ATW systems is also explored. Generic mobility disadvantaged groups are identified and discussed relative to ATW: the poor, the young, the elderly, and the handicapped. The major problem with the ATW innovation is that its implementation requires coordinated and comprehensive decision-making concerning vehicles, guideways, and controls. Three major decision-makers must be coordinated: governmental institutions that supply guideways and regulate drivers and vehicles, firms that supply and repair vehicles; and local communities which are the sites and major clients of implementation. A final section of the study describes evaluation methodology to be applied to a more mature specification of an ATW system.

Garrison, WL Clarke, JF, Jr ; California University, Berkeley Intrm Rpt. Report 76-3, Oct. 1976, 113 pp, 9 Fig., 3 Tab.; Prepared for the Department of Transportation.; Contract DOT-OS-50237.

32 157276 INCREASED TRANSPORTATION EFFICIENCY THROUGH RIDESHARING: THE BROKERAGE APPROACH, VOLUME I. Ridesharing is the process of improving transportation efficiency by increasing vehicle occupancy. Brokerage is the process by which ridesharing is promoted, coordinated and implemented. Brokerage is built on the concept of matching specific individual needs with a broad array of transportation services. This report defines the brokerage concept, describes benefits, assesses market potential, describes mechanisms for determining needs, outlines methodology for comparing costs of alternative types of service, identifies institutional barriers to program implementation and develops strategies for increasing ridesharing. /Author/

32 157784 PARA TRANSIT. Policies and strategies adopted by the Urban Mass Transportation Administration, the Regional Transportation Policy Plan, and the Metropolitan Transit Commission are set forth, the paratransit demonstration and continuing programs are described and research studies in this field are outlined. The report notes that a major effort must be made to increase the use of carpools, van programs and bus services, especially in areas outside of the downtowns and university where ridership is closer to or exceeds the goals. Effort must be made to examine the potential for paratransit services, coordinated with each other and with the regular scheduled transit service. Attention must also be given to those activities such as the adoption of parking practices which could increase the use of transit and paratransit. The need

is indicated for the provision of a specific appropriation of state funds by the Metropolitan Transit Commission with which to carry on paratransit operations, separate and apart from funds available for regular transit operations.

32 158058 1975 NATIONAL CONFERENCE ON AREAWIDE CARPOOLING "EXPANDED TRANSPORTATION SERVICES" (PROCEEDINGS). Activity toward increasing commuter ridesharing has been steadily increasing throughout this country over the past several years. As the number of programs involved in stressing ridesharing across the country increases, the need for coordination and information also increases. In response to this demonstrated need, the 1975 National Conference on Areawide Carpooling was envisaged. Sponsored Jointly by the Houston CarShare Program, the Federal Highway Administration and the Federal Energy Administration, the conference had one paramount objective: to exchange experiences and to heighten the knowledge and effectiveness of areawide ridesharing programs. The 3-day conference was organized around workshop sessions covering a gamut of topics from Marketing and Promotion to Legal and Regulatory Issues. The attendees, numbering over 130, were representative of all regions of the United States, from a wide range of private and public agencies, institutions and organizations actively involved in promoting increased ridesharing. The proceedings presented in this document will help to fill the great need for information and concern for transportation alternatives.

32 158115 FACTORS INFLUENCING THE SUCCESS OF COMPANY-BASED CARPOOLING PROGRAMS. This study reports the results of two successive interviews with selected companies in Greensboro, North Carolina which undertook to review workers' interest in carpooling before, during and after the energy crisis. Companies are compared for extent of carpool formation. It is observed that companies which actively encouraged participation in carpool matching programs ended up with higher rates of carpool formation than companies which maintained a passive stance on carpooling. Carpooling appears slightly more prevalent among older workers, and among white collar workers. However, the sample of companies is biased in favor of white collar companies; therefore the relationship between occupation and carpooling remains unsettled. No difference appeared by sex. Social segregation in carpools is indicated by the relatively few (11% of total) carpools which carry both blue white collar workers. Corporate executives in some of the larger manufacturing concerns in Greensboro were unwilling to promote carpool matching efforts by the firm, because they do not want to invade workers' privacy, because they felt the majority did not want to carpool, and because they did not wish to interfere in the workers' mode choices. Of interest is the fact that in four out of the five companies studied, the

percentage of workers carpooling rose after the end of the energy crisis. New patterns of commuting by ridesharing evolved during the days of the gasoline lines, and continued thereafter, spreading to other workers over time. Companies reported with satisfaction the increased availability of parking spaces, and the continued good environmental effects of increased carpooling.

32 158386 VANS UNSNARL COMMUTER TRAFFIC. Knoxville, Tennessee, will be the first city in the country to act as a transportation broker for a commuter service that has shown it can sharply reduce inner city traffic, fuel consumption, and air pollution with low capital costs and operating fees. Knoxville's solution is van pooling. Since July, 1975, the Transportation Center at the University of Tennessee has conducted a demonstration brokerage program, funder with a \$1 million grant from the Service and Methods Program of the Urban Mass Transit Administration (UMTA), with a fleet of 51 12-passenger vans. /GMRL/

ACKNOWLEDGMENT:

32 158400 PARA-TRANSIT: EXPERIENCE AND POTENTIAL IN THE USA. The study has identified four major applications of para-transit services which could contribute substantially in the near future to improving the efficiency and effectiveness of our urban transportation system. For the immediate future, perhaps the most important para-transit application is the increased use of high occupancy par-transit modes such as car pool, subscription bus, and jitney for high density home-to-work travel. A second important application of para-transit services is in serving low density travel demand, particularly when that demand is uneconomical for conventional transit. Third, the effectiveness of conventional transit services can be greatly increased by para-transit feeder services designed to collect and distribute transit passengers in areas of low demand density. Fourth mobility within business and commercial districts can be greatly improved by well regulated para-transit services, particularly taxi, dial-a-ride, and jitney. /GMRL/

32 158418 COMMUTER VANS CATCH ON AT CORPORATIONS. A new type of mass transit network is quietly taking root around the U.S. Unlike the space-age systems proposed for many cities in recent years, it is based on a

mundane vehicle: the small 10-or 12-passenger van. A growing number of companies and groups are setting up fleets of such vans to haul employees-and in some cases the general public-to and from work. Despite the pedestrian image of such an approach, transit planners are beginning to think that "van pooling," as it is called, offers major hope for unsnarling the tangle of urban transportation. Van pooling's most significant test is shaping up in Los Angeles, where a program that will soon be the nation's biggest got under way last month. /GMRL/

32 159006 INTEGRATED DIAL-A-RIDE AND FIXED ROUTE TRANSIT IN ANN ARBOR, MICHIGAN. The report describes the development, implementation, and current status of the Teltran system as it existed in the spring of 1976. In particular, this evaluation provides a detailed description of Teltran system configuration (and changes in that configuration by time of day and day of the week), system dispatching and operation, and the effectiveness of an incremental implementation process. In addition, the effect of Teltran on improving transit level of service and ridership is examined as well as the productivities achieved.

32 159691 EMPLOYER-BASED COMMUTER RIDE-SHARE PROGRAM IN A MEDIUM SIZE URBAN AREA. The authors describe an employer-based commuter ride-share program that has been very successful in Knoxville, Tennessee. The program, consisting of express buses, carpooling and vanpooling, has attracted professionals of medium and high income groups who traditionally are not transit riders. The key factors for the success of the program include citizen participation, the support of employers and the city administration.

32 163336 CAR POOLING BY PRIVATE VEHICLES [Samaakning i privata fordon]. This publication suggests a program for investigation of the possibilities of increasing the degree of car pooling journeys to and from work. The first part of the study is a theoretical preparation for the second practical part in which a number of demonstration projects are to be carried out. The first stage contains an inventory and analysis leading to the formation of hypotheses. The hypotheses are to be tested by an investigation into traveller experience and attitude in the test areas to be used in the second stage. The demonstration projects are to be carried out on the basis of a car pool organization with resources to administer and support the tests. The activity is coordinated with the local authority and public transport company planning. The results of every subproject are to be evaluated and the consequences analysed, after which the overall results are to be systematized. /TRRL/ [Swedish]

32 163573 PARATRANSIT SERVICE IN THE WASHINGTON METROPOLITAN AREA. CASE STUDIES. Home-to-work, campus, or neighborhood specific systems which were established in response to a specific transportation need were studied. Of 13 services, 7 are primarily neighborhood oriented, operating between home and traffic generators in small communities; 3 are connector services supplementing regular transit routes; 2 serve university campuses to alleviate parking and traffic flow problems and provide personal security; and 1 service is a long distance commuter haul into downtown Washington. Of these services, 4 have failed or been discontinued, 2 are in danger of failing, and 1 is projected to begin service in the near future. The cause of failure in all cases is the high per-mile and per-passenger operating costs which place these modes beyond the deficit limit which sponsors are willing to subsidize. In some cases, paratransit systems are either self-supporting or low-deficit operations. It is noted that paratransit should be established to meet the needs of a constituency which cannot adequately be served by intra-regional bus and subway lines.

Metropolitan Washington Council of Governments Mar. 1977, 27 pp, 5 Fig.; The preparation of this report was financially aided through grants from the District of Columbia Department of Transportation, the Maryland Department of Transportation, the Virginia Department of Transportation, the U.S. Department of Transportation, Federal Highway Administration and through a grant from the U.S. Department of Transportation, Urban Mass Transportation Administration, under the Urban Mass Transportation Act of 1974, as amended.

32 163603 DUPLICATION BETWEEN DEMAND-RESPONSIVE SYSTEMS AND FIXED-ROUTE SYSTEMS. The purpose of this study was to determine the degree to which a specialized door-to-door transit service for the elderly duplicated existing fixed-route service in Cedar Rapids, Iowa. The analysis measures the proportion of elderly who could use the existing fixed-route system for their trip making and

therefore do not need the door-to-door system. The study proposes alternatives that can be implemented to increase service and to ensure service to those who need it. /Author/

32 163925 NATURE OF EQUILIBRIUM IN THE MARKET FOR TAXI SERVICES. This paper reports an investigation of the mechanism by which demand and supply are equilibrated in the regulated taxi market. A simple model is developed in which the demand for taxi trips, as measured by the passenger arrival rate, is a function of a set of exogenous variables, including fares, and of the endogenous variable, taxi availability, is developed. The profitability of taxi operations is determined by exogenous factors and by an endogenous variable, taxi utilization. The number of taxi vehicles supplied is determined by the profit function and by the industrial structure. Taxi availability, which is measured by expected waiting time, and utilization, which is measured by the expected proportion of time the vehicle is occupied, are determined by both the passenger arrival rate and the number of taxi operating. The complexity of the taxi market, particularly its spatial and temporal aspects, makes considerable idealization necessary for its analysis. Even the simple model developed here does not admit a closed form solution for its equilibrium conditions, thereby constraining the work to a numerical example. The most striking feature of the model is its demonstration that in the taxi market supply generates demand and vice versa since an exogenously caused increase in the number of taxis operating will decrease waiting times and thus increase the passenger arrival rate, which will increase the taxi occupancy rate and thus increase profits and, hence, the taxi supply. This supply-demand interaction can be explosive but eventually must damp out. /Author/

32 163927 PARATRANSIT PLANNING FOR URBAN ACTIVITY CENTERS (ABRIDGMENT). An experimental questionnaires-based planning program was developed to comprehensively address the transit and paratransit needs of employee commuters working in the major employment centers of Seattle. The study area chosen was a downtown hospital service node in Seattle. The experiment had three objectives: To develop detailed information about work related transportation needs and interests of individual employees. Attempt the operational application of survey information in planning improved transit service, employer shift and parking management, city controlled neighborhood parking and access, and the development of paratransit alternatives. And, to develop and enroll hospital employees in operational paratransit programs. Data analysis

suggests that the survey questionnaire was effective and the responses provided insight into a relatively extensive, latent market for transit and paratransit development. The planning appear for service development was only marginally feasible because those agencies operating existing transit services were limited in their ability to immediately participate in paratransit planning. A publicly financed survey planning approach that leads towards specialized transit and paratransit services was found to be an economical alternative.

32 163996 THE BUSTAXI, A SYSTEM FOR DEMAND ACTUATED PUBLIC TRANSPORT [De bustaxi, een systeem voor oproepgestuurd openbaar vervoer]. The bustaxi is a demand actuated public transportation system, using a small computer for system control. An algorithm allots the demands for transportation in a way that total discomfort (the sum of waiting time and detour time for all passengers together) is minimized. An incoming demand is provisionally allotted to a bustaxi, whose provisional route may be changed. Because of this, an earlier allotment can be reassigned to another bustaxi. The allotment is finalized at the moment that the relevant route instruction is given to the bustaxi. Limitation of waiting time and detour time for the individual customer is not achieved, as is usual, by the use of fixed upper limits (hard constraints), but by the introduction of soft constraints, based on a disutility function (cost function), non-linear, depending on waiting time, detour time and if desired also on other parameters such as origin and destination of the demand. The practical character of the system is emphasized by the use of the street network and the demand distribution of an existing city. [Dutch]

32 164246 THE LEVEL OF SERVICE PROVIDED BY TAXIS IN JULY, 1974. This report presents the results of a survey of the level of service provided by taxis in July 1974 and also, by comparison with the results from a similar survey carried out in February of the same year, seeks to establish the effects of the revision of taxi legislation which came into force on the 10th March 1974. Though the new legislation abolished the distinction between Hong Kong island and Kowloon taxi, the relationship between the level of activity in both areas showed little change (few taxi drivers appear to have made use of their new freedom to ply for hire on the opposite side of the harbour) and the factor which has had the greatest influence on the taxi trade was the increase in fares. The most obvious result of the fare increase, from the prospective passengers point of view, was the improvement in the availability of taxis for hire, but the study indicates that this increase in availability was the end result of a complex readjustment of the taxi trade to the new situation. With the increase in fare there was a 20% fall in demand to which the taxi trade reacted by a reduction of 10% in activity. Due to the very high level of taxi utilisation before the fare increase the subsequent changes in demand and activity resulted in a net increase of more than 50% in the number of taxis available for hire. However, the relationship between demand, taxi activity and taxi availability was not constant across the colony and, in general, the level of service improved in the down-town areas on both sides of the harbour to the detriment of the outlying districts. /TRRL/

32 165550 PORT AUTHORITY CARPOOL PROGRAM. In the summer of 1975, The port Authority of New York and New Jersey introduced a carpooling program by inviting motorists using its six tunnels and bridges to participate in a matching program simple by completing a short

questionnaire (attached). The program was designed to encourage the use of high-occupancy vehicles in order to increase the efficiency of the Port Authority facilities and the highways they serve, and also to assist motorists in forming carpools so they could take advantage of cost savings including a reduced toll rate for autos with three or more people. More than 150,000 questionnaires were given out to motorists; 4,100 were returned. The computer program--a modified version of the Federal Highway Administration (FHWA) Carpool Program--was able to match 1,400 respondents, while the remaining 2,700 were informed that they could not be matched at that time with anyone making a similar work trip. In order to ascertain the success of the matching program, the Port Authority conducted a telephone follow-up survey in which a 25 percent sample of the 1,400 people matched were polled. The respondents were stratified by residence so that a geographically representative sample was obtained. Results indicated that 36 percent of those matched did make an effort to form a carpool by calling someone on their list (or being called by someone), and that 10 percent were successful in joining or forming carpools. This follow-up survey also elicited the respondents' reasons for failing to form a carpool after contacting someone on their list, as well as the reasons given by the 64 percent of respondents who made no effort to form a carpool after receiving a list. /Author/

32 165572 INTEGRATED DEMAND-RESPONSIVE URBAN PASSENGER AND FREIGHT TRANSPORT. This paper discussed how the temporal and spatial variations in the demand for urban passenger and freight capacity could be used to increase the productivity of existing manpower and vehicles in urban public transport operations through co-ordination of passenger and courier type parcel freight operations. Likely problems in the conversion of vehicles and drivers from one role to the other are discussed from an engineering, labour-management, institutional and potential user point of view. Advantages are seen in terms of improved levels of service, especially in off-peak periods when services operate in a demand-responsive manner, and in decreased subsidies. Integration of freight and passenger transport is not seen as a panacea to the urban transport problem, but as one step in the restructuring of the urban movement system to help align it with existing urban geography in an environmentally responsible manner. A possible application in Canberra is outlined. /TRRL/

32 165600 DIAL-A-BUS SYSTEM IN TRAFFIC SEPARATED AREAS [Stadsplanetekniska foerutsaettningar foer taxi-bus i trafikseparerade omraaden]. In many new housing areas, public transport is remote from the users. One way in

which this situation can be improved is introduction of a telebus system, i.e. a demand responsive public transport system. The aim of this study was to examine the criteria for a telebus system, to examine the feasibility of the system in areas with traffic segregation, and to plan possible routes and pick-up points in such areas. The following conclusions and recommendations are made: (1) level of demand is very important for economical operation, and should be 8-25 journeys/square km/hour. Areas with less than 4000 population/square km are recommended. (2) layout of street network appears to be of secondary importance; cul-de-sacs should however be few and short. (3) the system is very flexible and can operate even in areas with traffic segregation, provided that housing density is low and accessibility is not unduly bad. (4) telebus operation should be allowed for in planning a traffic network for low-density areas. In traffic-segregated areas also, telebus operation is possible if some modifications are made. (5) the system can be introduced in many areas in Sweden, particularly in view of the increase in the number of old people and detached houses. /TRRL/ [Swedish]

32 165749 EVALUATION OF SERVICE AND METHODS DEMONSTRATION PROJECTS: PHILOSOPHY AND APPROACH.

The Urban Mass Transportation Administration's Service and Methods Demonstration (SMD) Program has the objective of improving existing transit operations by sponsoring the development and implementation of new techniques and services on a nation-wide basis. The SMD Program pursues demonstration projects and studies in four major program areas: Traffic management, Paratransit, Service for Transit Dependents, and Price and Service Improvements. This document contains a summary description of the philosophy and technical approach underlying the evaluation of SMD projects. It describes the supply-demand framework for performing urban transportation impact evaluation and the application of this framework to the following demonstration topics: background and settings; project implementation and operations; level of service (supply) changes; travel behavior (demand) changes; operator impacts and productivity; and non-travel impacts. The SMD Program attempts to maximize the quality and utility of information gained from the demonstrations by developing and employing a consistent, carefully structured approach to demonstration evaluation. Each evaluation is built around the basic analytical framework described in this report, with emphasis placed on using state-of-the-art data collection and analysis techniques which are consistent from the standpoint of efficiency, accuracy, and output. /UMTA/

32 166436 REGULATING AND INSURING PRE-ARRANGED RIDE SHARING.

The report describes possible approaches to regulating

and insuring pre-arranged ride sharing (inc. carpools, vanpools, subscription buses), and summarizes the arguments which have been put forward on behalf of various approaches. Also it surveys the approaches actually being adopted in a cross section of the states. The possible regulatory approaches described vary from no regulation to comprehensive regulation covering entry, fares, service, safety, insurance, and competition with other operators and other modes. The arguments pro and con are found to center on the question of protection of pre-existing conventional transit operators. The survey results (from a 12 state survey undertaken in cooperation with the Federal Energy Administration and the Federal Highway Administration) indicate that carpools are not regulated in any state while subscription buses are regulated as common or contract carriers in 11 of the 12. The situation with respect to vans is varied with four states not regulating any vanpools four states regulating all types of vanpools and the remainder regulating some types of vanpools, generally those operated by third parties. The general trend is found to be toward de-regulation with all four of the states not regulating vans adopting this stance since 1973.

32 166439 TAXICAB UTILIZATION BY LOWER INCOME GROUPS.

The study investigates the propensity of poor persons to use the taxicab. Data from previous studies are used to analyze the relative use of taxicabs by different income groups. It is shown that lower-income groups, particularly in small and medium size urban areas, display a relatively high rate of taxi utilization. A survey of taxi drivers in Greensboro, N. C., and an analysis of the origins of taxi trips is used to support this conclusion.

32 166459 EVOLUTION OF THE KNOXVILLE TRANSPORTATION BROKERAGE SYSTEM.

A demonstration project designed to explore the feasibility and transportation service impacts of the transportation brokerage concept is currently underway in Knoxville, Tennessee. The transportation broker seeks to identify and match transportation supply and demand across a wide range of users, providers, and modes. The report describes the brokerage system concept and documents the activities leading to the implementation of the brokerage system in Knoxville. Included is a discussion of the various institutional and regulatory barriers to participation by private providers and how some of these were overcome. The Knoxville pre-operational experience is potentially of interest and applicability to other locales.

32 166712 EVALUATION OF TRANSIT SYSTEM COORDINATION AND FUTURE SERVICES IN THE CHARLOTTESVILLE URBANIZED AREA [Final rept]. The report results from a ten-month study that focused on how bus service could be improved to accommodate the future transit needs of the city of Charlottesville. Among the alternatives considered were strategies such as changing routes and schedules on the present system, coordinating the city service with the University of Virginia bus system, and expanding bus service into Albemarle County. The 123-page report contains an overview of all public transportation in Charlottesville, provides an in-depth analysis of present Charlottesville Transit Service ridership based on an on-board survey conducted in April, 1976, examines the operating characteristics of both the city and university systems, tests alternative routing concepts to determine the effectiveness of each in providing public transportation, and analyzes future transit demands in the city-county-university regional area.

32 167021 A MULTI-ORIGIN/DESTINATION TAXI SYSTEM. VOLUME 2. PROTOTYPE DESIGN FOR SHARED RIDE SERVICES.

The long range goal of this research project is to design, develop and implement an experimental demand responsive multi-origin/destination taxi system. The overall research program consists of information acquisition, studies of deployment and allocation of equipment, and development of pricing mechanisms and operating procedures for a multi-origin/destination taxi system. The work is divided into three stages: (1) Preliminary design for single-origin/destination trips (exclusive rides); (2) prototype design for shared rides; and (3) design improvements and experimental operations in an urban environment. This report describes the second stage of development which includes (1) a fare calculation procedure for shared rides which has been filed as a tariff under the Certificate of Public Convenience for a common carrier and approved by the Pennsylvania Public Utility Commission, (2) a base station located at a taxicab company which is equipped with computer, auxiliary storage, terminal and radio transmitter, and (3) a taxicab equipped with the RSVP System for testing technological capabilities and conducting experimental operations.

32 167307 COM-BUS: A SOUTHERN CALIFORNIA SUBSCRIPTION BUS SERVICE. The evolution and operations of the COM-BUS Subscription Commuter Bus Service are documented. COM-BUS is a privately owned organization operating at a profit without any form of subsidy. COM-BUS serves approximately 2,000 commuters per day on 47 routes which provide service in Ventura, Los Angeles, and Orange counties. A majority of the routes use chartered passenger buses with from 38 to 47 seats. A fleet of eight 13- to 16-passenger minibuses are used on routes where demand is insufficient to warrant the larger buses. Service provides a fairly personalized morning pickup, with major portions of the runs to work destinations being express and using freeways. In the evening, passengers are picked up at their work locations, and runs to their initial origins are accomplished. Because of its method of management operations, COM-BUS maintains subscription levels (weekly seat reservations paid for in advance) at better than 90 percent. COM-BUS was organized and now operates with a minimum of capital outlay, and is managed by essentially volunteer support. Travel times using COM-BUS are only slightly longer than those for private automobiles making the same trips. COM-BUS fares are considerably less than corresponding costs to operate a private automobile for a similar trip. The success of COM-BUS is particularly important in view of current heavy subsidies required for most transportation systems, and in view of the tendency of Southern California commuters to reject mass transit and to use private means instead.

McCall, CHJ; CACI, Incorporated, Transportation Systems Center, Urban Mass Transportation Administration Final Rpt. DOT-TSC-UM-TA-77-13, 1200-24-77, May 1977, 106 pp; Contract DOT-TSC-1082-6; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-272470/6ST

32 167478 INTEGRATION OF SCHOOL BUS AND PUBLIC TRANSIT SERVICE-SUMMARY REPORT. This document describes the investigation conducted within the framework of the Low Capital Alternatives Study as to the integration of school bus transportation and bus service in the Twin Cities Metropolitan Transit Taxing Districts where transit service is currently provided by the Metropolitan Transit Commission. The objective of the school bus study was to identify potentials and opportunities for better coordination of school bus service with other forms of transportation. The School Bus Study Goal relates the integration of school bus and Public Transit service to the goals of the Low Capital Alternatives Study. The study goals include, among others, the following: Increasing the effectiveness of the urban transportation system, maximize the traffic-carrying capacity of the existing street and highway system, minimize the use of limited energy resources in the movement of people and goods in the area and, achieve a level of urban mobility required for the social well-being and economic health of the entire Metropolitan Area. Several recommendations resulted from the study. The integration of the two services should be dropped from consideration under normal economic and fuel availability situations. During times of limited fuel availability, school hours should be staggered or school bus transportation policies changed. For overall transportation planning purposes, school dis-

tricts should submit selected monthly actual ridership totals to the Department of Education. Because some bus fleets are not utilized during off-peak fares, the Metropolitan Transit Commission should act as the catalyst among school districts, public social service agencies, private operators and those persons desiring transportation services to initiate the desired services.

Barton-Aschman Associates, Incorporated Rpt. 75-06, Mar. 1975, 34 pp, 2 Fig., 2 Tab., Photos.; This report was prepared for the Twin Cities Areas Metropolitan Transit Commission.

32 168124 PUBLIC TRANSPORT IN SMALL TOWNS. This paper describes work being carried out at TRRL under the dial-a-bus research programme. The aim is to compare the performance of dial-a-bus with alternative services and to determine which, if any, combinations of demand density and service area size are suitable for its operation. A comparative assessment is being carried out for the case of towns having populations of between ten and twenty thousands. This paper summarizes the model calibration stage of this work and presents the results of the optimisation of public transport for Carterton, Oxfordshire. It is shown that here any internal public transport service would require a subsidy. Only in the case of a fixed route minibus would the social benefits exceed the resource costs. The generalisation of these results to towns having different population densities and areas is currently being studied. /TRRL/

Martin, PH Tunbridge, RJ; Planning and Transport Res and Computation Co Ltd Proceeding 1976, pp 14-23, 3 Tab., 7 Ref.; Proceeding of Seminar M P141 of the PTRC Summer Annual Meeting, University of Warwick, England, July 12-15, 1976; ACKNOWLEDGMENT: TRRL (IRRD 228892)

32 168141 THE OPTIMISATION OF PUBLIC TRANSPORT IN SMALL TOWNS. A study was carried out with the aim of determining the optimum form of public transport for the town of Carterton, Oxfordshire. A demand model was developed and calibrated and was shown to be in close agreement with observations for three different levels of public transport in the town. This model was used to predict the variations of demand with fare and level of service for three different transport systems: fixed route minibus, many-to-many dial-a-bus and taxi. Supply models were developed for each of these types of operation, and the fare and level of service for each system was optimised according to both commercial and social objectives. It was concluded that none of these systems could be operated at a commercial profit and that only a fixed route minibus service could show a net social benefit. /Author/TRRL/

Martin, PH Tunbridge, RJ; Transport and Road Research Laboratory Monograph TRRL Lab. Rpt. 791, 1977, 43 pp, 8 Fig., 16 Tab., 13 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 229181)

32 168442 RIDE SHARING: PSYCHOLOGICAL FACTORS. The conventional automobile transportation system is plagued with increasing congestion, pollution, energy consumption, and costs. These problems diminish the automobile's prime advantage of providing personalized, flexible transportation. Ride sharing--carpooling,

vanpooling-- can deal directly and effectively with these problems at a minimum cost. However, ride sharing has not become widely accepted. A carpooling attitudinal survey indicates that the two most important deterrents to potential carpoolers are the extra time requirements and the loss of independence. Ongoing research involves the analysis of the commuter decision-making process with regard to their mode choice. Models of experimental psychology are being used to study factors underlying individual preferences. These studies relate carpooling as a mode choice preference to interpersonal factors (i. e., composition of the carpool in terms of sex; prior acquaintanceship of potential riders) as important determinants of carpooling desirability.

32 169303 KCMR DIAL-A-RIDE STUDY: REPORT NUMBER 1. DIAL-A-RIDE SERVICE POTENTIAL IN THE KANSAS CITY METROPOLITAN REGION. This study is comprised of 6 reports that encompass all of the major facets of a demand-responsive system. It is designed to assist the Mid-America Regional Council and local government agencies in the detailed service planning of Dial-A-Ride services in the Kansas City Metropolitan Region. A small pilot system was applied in Independence, Missouri, and a larger pilot system was applied in Johnson County, Kansas. Report No. 1 presents background and existing developments of demand-responsive systems in the KCMR. It presents relationships between general public systems vs. specialized systems (which are provided for the elderly and handicapped). It compares the various services, their applicability, potential and funding, and points out the limits and limitations of the Dial-A-Ride program. It was found that Dial-A-Ride service to the general public should be seriously considered for expansion of public transportation in major portions of the KCMR, and especially in medium and lower density suburban areas.

Mid-America Regional Council, Huron River Group, Incorporated, Missouri Transportation Associates, Bishop Engineers, Incorporated, Urban Mass Transportation Administration, (UMTA-IT-09-0047) UMTA-IT-09-0047-77-1, Mar. 1977, 74 pp; Prepared by Huron River Group, Inc., Ann Arbor, Mich., Missouri Transportation Associates, Kansas City, and Bishop Engineers, Inc., Kansas City, Mo.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-275686/4ST

32 169304 KCMR DIAL-A-RIDE STUDY: REPORT NUMBER 2. DISPATCHING AND COMMUNICATIONS. This study is comprised of 6 reports that encompass all of the major facets of a demand-responsive system. It is designed to assist the Mid-America Regional Council and local government agencies in the detailed service planning of Dial-A-Ride services in the Kansas City Metropolitan Region. A small pilot system was applied in Independence, Missouri, and a larger pilot system was applied in Johnson County, Kansas. Report No. 2 describes the dispatching and communication requirements for small Dial-A-Ride systems, such as the small

pilot system in Independence, Missouri, and for a large integrated system, such as the one proposed for Northeastern Johnson County, Kansas. The report presents operating procedures and design and cost considerations for the equipment of the systems, as well as a glossary of radio terminology. It was found that Dial-A-Ride service to the general public should be seriously considered for expansion of public transportation in major portions of the KCMR, and especially in medium and lower density suburban areas.

32 169305 KCMR DIAL-A-RIDE STUDY: REPORT NUMBER 3. PERSONNEL AND TRAINING FOR DIAL-A-RIDE. This study is comprised of 6 reports that encompass all of the major facets of a demand-responsive system. It is designed to assist the Mid-America Regional Council and local government agencies in the detailed service planning of Dial-A-Ride services in the Kansas City Metropolitan Region. A small pilot system was applied in Independence, Missouri, and a larger pilot system was applied in Johnson County, Kansas. Report No. 3 is aimed at providing prospective operators of relatively small Dial-A-Ride systems with tested and workable guidelines for the recruitment, scheduling, and training of personnel. It describes the basic personnel operations of the small and large systems, and lists the necessary duties of management. Sample lesson plans, training sessions, map and routing exercises, dispatcher and driver evaluation checklists, and a self-training worksheet are included. It was found that Dial-A-Ride service to the general public should be seriously considered for expansion of public transportation in major portions of the KCMR, and especially in medium and lower density suburban areas.

Mid-America Regional Council, Huron River Group, Incorporated, Missouri Transportation Administration, Urban Mass Transportation Administration, (UMTA-IT-0-0047) UMTA-IT-09-0047-77-3, June 1976, 50 pp; ACKNOWLEDGMENT: NTIS; UMTA; ORDER FROM: NTIS; PB-275688/0ST

32 169306 KCMR DIAL-A-RIDE STUDY: REPORT NUMBER 4. VEHICLES, MAINTENANCE, FARE COLLECTION. This study is comprised of 6 reports that encompass all of the major facets of a demand-responsive system. It is designed to assist the Mid-America Regional Council and local government agencies in the detailed service planning of Dial-A-Ride services in the Kansas City Metropolitan Region. A small pilot system was applied in Independence, Missouri, and a larger pilot system was applied in Johnson County, Kansas. Report No. 4 is concerned with the maintenance and specifications of Dial-A-Ride vehicles. Considerations in vehicle acquisition is discussed, such as procurement, leasing, specification guidelines, and provisions for wheelchairs. Transit fare collection equipment and related functions are discussed, and alternatives to cash fares are presented, such as tickets or prepayment. It was found that Dial-A-Ride service to the general public should be seriously

considered for expansion of public transportation in major portions of the KCMR, and especially in medium and lower density suburban areas.

Mid-America Regional Council, Huron River Group, Incorporated, Missouri Transportation Associates, Urban Mass Transportation Administration, (UMTA-IT-09-0047) UMTA-IT-09-0047-77-4, Aug. 1976, 28 pp; ACKNOWLEDGMENT: NTIS; UMTA; ORDER FROM: NTIS; PB-275689/8ST

32 169307 KCMR DIAL-A-RIDE STUDY: REPORT NUMBER 5. MANAGEMENT INFORMATION SYSTEMS. This study is comprised of 6 reports that encompass all of the major facets of a demand-responsive system. It is designed to assist the Mid-America Regional Council and local government agencies in the detailed service planning of Dial-A-Ride services in the Kansas City Metropolitan Region. A small pilot system was applied in Independence, Missouri, and a larger pilot system was applied in Johnson County, Kansas. Report No. 5 discusses the role of management in a demand-responsive system. Management's primary role is the continual modification of service, in order that it may remain responsive to the needs of the users. Data generated through the daily operation of the system must be reviewed and analyzed, and the report shows how this data may best be used by management in its decision making process. Sample tables, graphs, and surveys are included. It was found that Dial-A-Ride service to the general public should be seriously considered for expansion of public transportation in major portions of the KCMR, and especially in medium and lower density suburban areas.

Mid-America Regional Council, Bishop Engineers, Incorporated, Urban Mass Transportation Administration, (UMTA-IT-09-0047) UMTA-IT-09-0047-77-5, Apr. 1977, 27 pp; ACKNOWLEDGMENT: NTIS; UMTA; ORDER FROM: NTIS; PB-275690/6ST

32 169416 SCHEDULING DIAL-A-RIDE TRANSPORTATION SYSTEMS: AN ASYMPTOTIC APPROACH [Interim rept]. There has been some recent interest in the Dial-a-Ride proposal for innovative public transportation systems. These schemes ideally provide large numbers of passengers with personalized service. A passenger is taken from his origin to his destination by a small bus; the bus may deviate en-route to collect and deliver additional passengers. In such systems the central mathematical problem is one of scheduling: the assignment of a passenger to a bus and the determination of a time for the trip.

32 170313 THE 'INTELLIGENT BUS SYSTEM' TESTED BY HAMBURG'S TRANSPORT AUTHORITY [Hamburgs Verkehrsverbund Testete "Intelligentes Bussystem"]. One hundred and ten public transport specialists at a conference in Berlin, received an interim report on the development of new and improved bus systems, metropolitan railway systems and urban rapid transport systems, cabin taxi systems, automation and rationalization concepts, moving pavement technology and use

studies. Amongst those mentioned was the so-called 'intelligent bus system', which runs purely on demand and completely independent of fixed time-tables. The studies and model tests have demonstrated beyond doubt, that both the systems "automatically controlled taxi buses" and "dial a ride" are technically feasible without difficult problems and suitable both from the traffic and operational viewpoint. /TRRL/ [German]

32 170351 METHODOLOGY FOR SHORT-RANGE TRAVEL DEMAND PREDICTIONS. ANALYSIS OF CARPOOLING INCENTIVES. This paper presents a methodology for predicting changes in travel patterns for short-range transport options, including carpooling incentive policies. The methodology is based on the application of disaggregate travel demand models. These models are based on the multinomial logit probabilistic choice model. The data used to estimate the coefficients of these models are taken from home interview surveys and represent a cross-section of households in Washington, DC, USA. The dependent variables of the models are the reported travel choices made; the independent variables are socio-economic characteristics measures of travel times and costs, and survey estimate of employment and land use characteristics in the urban area. The models represent the direct and indirect effects on travel behaviour: (1) shifts in mode of work trips from driving alone and transit to carpooling; (2) alternative use of cars left at home for non-work travel; and (3) changes in car ownership level. Results results are presented of predicting from a case study application of this methodology to various carpooling related policies. The paper concludes with a summary of major findings and recommendations for further improvements in carpooling and short-range demand prediction methods. /TRRL/

32 170928 DIAL-A-RIDE-TRANSPORTATION-OPERATIONS MANUAL. A flexible, self-regulating system identified as demand-actuated-responsive-transportation (DART) is described. DART operates by picking up passengers at 5 or 6 locations in one general area and transporting them to different locations throughout the city. Notes are provided regarding the various functions relating to dispatchers, drivers, conduct on the job, and operating techniques and maneuvers. Procedures for bus drivers at railroad grade crossings, planning for emergencies and basic safety rules are covered, as well as radio procedures, 10-codes, accident reporting, waiting for passengers, and hail stops. Other aspects covered here include the drivers log, passenger relations, special transportation bus and equipment, and drivers duties.

32 172093 USING THE DIAL-A-RIDE SYSTEM TO SERVE THE AUTOLESS. An assessment of the nature of transportation problems of the poor, elderly, and handicapped comprises the first section of this paper. It is shown that demand-responsive transportation systems such as Dial-A-Ride are demonstrably superior to conventional transit in providing for the transportation needs of the transportation disadvantaged. The impact of various demonstration projects of demand-responsive transportation are reviewed. The emphasis is on the effect these projects had on serving the poor, elderly and handicapped. /GMRL/

32 172546 PARA TRANSIT OR THE THIRD WAY: ALTERNATIVE TRANSPORT ARRANGEMENTS FOR THE THIRD WORLD. PRELIMINARY PROPOSAL AND PROGRAMME STATEMENT FOR A PROJECT INITIATIVE BEING UNDERTAKEN BY THE OECD DEVELOPMENT CENTRE. This report surveys different forms of paratransit used in developing countries, e.g. vehicle sharing, collective taxis, route-deviation minibuses. Details are given of a 3-phase research project undertaken to provide an improved understanding of these systems and to give guidelines as to ways in which they might be improved. Phase 1: "program design" describes the literature search and review, the draft questionnaire which will be used in case studies, case study technique, design of the matrix for the comparative assessment of alternative systems, selection of sites for detailed case studies. In phase 2: "pilot project and first report" the preparation of case studies is outlined together with that of an international workshop. Phase 3 explains how to set up a collaborative international research and advisory programme. /TRRL/

32 172829 RIDESHARING BEHAVIOR: A REVIEW OF RECENT FINDINGS. This paper reviews recent studies of ridesharing behavior to determine the underlying factors influencing ride-sharing and ways to encourage it. The incidence of ridesharing in the U.S. is estimated at about 10% of work trips, and much lower for other trip purposes; this figure did not increase substantially during the energy crisis of 1973-74. Few demographic factors distinguish carpoolers from non-carpoolers. Most studies have found ride-sharing to be a complex (and little understood) behavior relying heavily on social and psychological processes, particularly group dynamics, role, attitude, perception, and personality. Attempts by agencies to increase its incidence through matching services or appeals to economic or public concerns have thus been generally unsuccessful. It is concluded that, while more basic research is needed to understand the process better, agencies should begin now to address the basic concerns raised against carpooling by solo drivers, if they hope to significantly increase carpooling incidence.

Hartgen, DT ; New York State Department of Transportation Prelim. Res Rpt. 130, Nov. 1977, 36 pp, 12 Tab., 34 Ref.

32 174177 URBAN TRANSPORTATION IN NORTH AMERICA. 4. PARA-TRANSIT. Para-transit is defined as a form of public transportation since the user is transported in a vehicle driven by someone else, the ride is shared with others, and service is provided in an organized and systematic way. It is considered that para-transit can take many forms such as dial-a-bus, jitneys, shared taxis, subscription services, van pools, and public automobile service using small vehicles. In summary, para-transit refers to a class of urban transportation modes that utilizes small vehicles on existing streets and highways. The author describes various forms of para-transit and provides information on the operations of existing demand responsive transit systems in the United States, Canada and Europe. Reference is also made to the jitney, or shared taxi, and examples quoted of their operation in the USA, Caracas, Venezuela and Manila in the Philippines. Other systems are also described, and it is suggested that the objective of all such systems is to improve mobility by making better use of what already exists and at a reasonable cost. The major impediments to realizing these benefits are felt to be in the areas of regulations, insurance, control of vehicles and drivers, and labour. /TRRL/

32 175163 STUDIES OF THE HARROGATE CHAUFFEUR COACH SERVICE. The Harrogate minibus service started operation on 30 October 1972 operating in eight areas as a fixed-route minibus diverting on demand onto a number of other roads on request. In practice the number of demands for diversion have amounted to less than 10 per cent of the total patronage. TRRL studies of the system comprised: timing measurements of radio usage, operational observations of boarding and alighting locations and times and details of articles of luggage carried, and an on-vehicle survey to ascertain the types of people using the service. The patronage of the service built up from 500 passengers per week initially to stabilise at around 700 during 1975. From the on-vehicle survey, it was found that 83 per cent of passengers used the service for shopping. Approximately 84 per cent of users were female. Almost half of the users were aged 65 or over and nearly 60 per cent were non car owners. At the time of travel 90 per cent of users did not have a car available to them. The number of users having telephones was high (72 per cent) and approximately 50 per cent previously travelled by stage-carriage bus. (Copyright (c) Crown Copyright 1977).

32 175566 KCMR DIAL-A-RIDE STUDY: REPORT NUMBER 6. MARKETING AND PUBLIC INFORMATION. The study is comprised of 6 reports that encompass all of the major facets of a demand-responsive system. It is designed to assist the Mid-America Regional Council and local government agencies in the detailed service planning of Dial-A-Ride services in the Kansas City Metropolitan Region. A small pilot system was applied in Independence, Missouri, and a larger pilot system was applied in Johnson County, Kansas. Report No. 6 deals with marketing (news coverage, displays, promotion, advertising, etc.). It discusses the needs of the users and how to arouse and hold the interest of current and potential users. The marketing process for Dial-A-Ride systems are functions which need to be performed by management, but not necessarily by one department or by one individual. It was found that Dial-A-Ride service to the general public should be seriously considered for expansion of public transportation in major portions of the KCMR, and especially in medium and lower density suburban areas.

32 176499 LOCALLY GENERATED TRANSPORTATION MODES OF THE DEVELOPING WORLD. The details are given of 3 public transportation cases in Asia, Africa and South America, and brief descriptions are given of 5 cases from other parts of the developing world. An attempt is also made to summarize these cases particularly highlighting the administrative, financial and regulatory features. The vehicles, ownership, procurement and use are described, as well as the operation and income of the motorized tricycle rickshaws of Karachi. Similar details are given of the public service transport of passengers on St. Lucia, West Indies, as well as the intercity taxis of Egypt. The Carros por puesto of Venezuela, the jeepneys of the Philippines, the kia-kias of Nigeria, the colectivos of Ecuador, and the Sherutim of Israel are also described. The key features of all these highly successful services are flexibility and responsiveness. They are all the projects of private enterprise. However, certain concerns which appear to be common to these systems are also listed.

32 176513 THE IMPACT OF PARATRANSIT INNOVATIONS ON THE JOB SECURITY OF CONVENTIONAL TRANSIT EMPLOYEES WITH DISCUSSION. Some general questions are discussed and the various paratransit service modes are reviewed from the point of view of job security. It is noted that the economic viability of demand responsive transit (DRT) has not yet been established, and that it does not appear to be a significant threat to the job security of transit employees. DRT seems to have the greatest potential in areas that are not currently served by conventional transit. It is also noted that transit workers may gain expanded employment opportunities in combined DRT and conventional transit systems if unions maintain a flexible attitude and management problems can be resolved. The question of whether the cost of dial-a-ride transit could be reduced through effective integration with conventional transit is considered. It is emphasized that dial-a-ride can be more cost-effective if it is designed from the point of new systems efficiency. Such integration will require a great deal of flexibility on the part of both labor and management; if it is adopted, it may mean that the transit industry and transit unions will benefit from the growing interest in paratransit.

32 176540 OVERCOMING IMPEDIMENTS TO TRANSIT INNOVATION. The workshop services established that there is no lack of innovative ideas in the areas of regulation, labor, and marketing, and the panels indicated the many innovative ideas in revenue-raising techniques and on intergovernmental relations. The sessions also pointed out several impediments to innovation. Some solutions are suggested here in the areas of labor, management, politics, regulation, innovation and grants. The suggestions put forward include the following: the establishment of full day's work for a full days pay; the improvement of managerial quality by provision good training, and guidance; the development of proposals that are responsive to constituents needs; the change of regulations based upon legislative change; the need for more research and learning from foreign experience; and grant programs that could be made to spur new solutions.

32 176556 EMPLOYER VANPOOL PROGRAMS: FACTORS IN THEIR SUCCESS OR FAILURE. This research reflects the view that there are certain characteristics of some employers that made the operation of a vanpool service for their employees more successful than others. The focus of this study is only upon the employer operated vanpool programs, and the intent is to identify those conditions under which vanpooling operates best. This study aims to identify factors that have made for the success or failure of some employer vanpool programs. Information was obtained from lengthy questionnaires sent to managers of 58 different employer programs; the results of the 58 returns are documented herein. Results show that vanpooling occurs predominantly in outlying regions of the metropolitan areas, among professional and office workers, and not necessarily in organizations with many employees. Management interest played a key role in their existence, and usually no previous carpool program existed. Successful programs were motivated by factors which had some rewards to management. Failures occurred with user, more so than management, apathy.

Jacobson, JO ; Washington University, Seattle, (WA-11-0005) UMTA-WA-11-0005-78-3, June 1977, 81 pp; Sponsored by DOT, Urban Mass Transportation Administration.; ACKNOWLEDGMENT: UMTA, NTIS; ORDER FROM: NTIS; PB-276955/2ST

32 176557 ESTABLISHING INNOVATIVE TAXICAB SERVICES: A GUIDEBOOK. Similar to the dilemma facing transit operators, taxi operators face rising costs and disappearing profits. This report reflects the view that recent changes within both the taxi and transit industries have made transportation planners aware of the potential of taxis for alleviating urban mobility problems and taxi operations aware of the necessity of being a part of the local transportation planning process. This document is intended to serve as a guidebook for local planners and public officials who wish to integrate taxi services into the mix of local transit services. It attempts to outline how to establish innovative taxi operated paratransit services. The focus is on the problems which face local transportation/public officials rather than taxi operators. Both conventional and innovative taxicab services in the United States are examined. Based upon this examination, guidelines are developed for establishing similar innovative services elsewhere. This report is organized around four topics: Background information of the taxi industry (focus is on economics of taxi operations); Description of taxi service inno-

vations; Practical details of implementing innovative taxi services (focus is on contracts between public agencies and private operators); and Evaluation of innovative paratransit services.

Gilbert, G ; North Carolina University, (NC-11-0005) Final Rpt. UMTA-NC-11-0005-78-1, Aug. 1977, 69 pp; Sponsored by DOT, Urban Mass Transportation Administration.; ACKNOWLEDGMENT: UMTA, NTIS; ORDER FROM: NTIS; PB-278647

32 176559 FEASIBILITY STUDY OF SHARED RIDE AUTO TRANSIT. The objective of this report is to assess the feasibility of the implementation of shared-ride auto transit (SRAT), which is an innovative approach for increasing auto occupancy in rural and urban areas. The report focuses on operational concepts, potential usage, legal and regulatory issues, and insititutional issues. Formulation of the SRAT concept was motivated by several concerns, such as: (1) energy conservation; (2) transit service to areas unable to economically justify conventional transit services, and to travel disadvantaged groups; (3) transit service replacement to achieve greater efficiency and to reduce transit deficits; (4) provision of inexpensive transit service; and (5) and increase of safety and reliability of hitchhiking. Four case study sites (Boulder, Colorado; Boston, Massachusetts; Portland, Oregon; and Tidewater, Virginia), were used to identify the specific institutional issues likely to impact SRAT implementation for that site, and to identify the opportunities for designing, implementing and operating SRAT in a variety of institutional settings. The report includes Appendix A, which lists existing and proposed SRAT systems, and Appednix B, which shows the derivations of equations used in SRAT route and stop analysis. The study recommends that SRAT can provide sufficiently high levels of service. However, a number of potentially serious institutional barriers to SRAT exist, but by designing the system to reflect a site's particular institutional setting, it appears that in many instances, these barriers can be overcome.

Kocur, G Zaelke, D Neumann, L ; Cambridge Systematics, Incorporated, (IT-06-0144) Final Rpt. UMTA-IT-06-0144-77-1, Sept. 1977, 252 pp; Sponsored by DOT, Urban Mass Transportation Administration.; Contract DOT-UT-70007; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS; PB-276539/ASS

32 176576 SHARED-RIDE TAXI COMPUTER CONTROL SYSTEM REQUIREMENTS STUDY. The technical problem of scheduling and routing shared-ride taxi service is so great that only computers can handle it efficiently. This study is concerned with defining the requirements of such a computer system. The major objective of this study is to develop the system requirements and perform a functional design of the computer control system (CCS) for an automated shared-ride taxi (SRT) system. A SRT operation using a CCS offers a potential for increased taxi dispatching efficiency, improved driver productivity and profitability, improved quality of service, integration of taxis into area-wide transit, and improved mobility for the transportation disadvantaged. This interim report describes progress on the study and indicates major findings to date. It is an executive-level summary, and it does not attempt to include all

information or justify all statements. Rather, it is an overview of accomplishments leading to a concluding section which outlines preliminary system design requirements. These requirements are subject to change since the work in many areas is not yet complete. The Appendices consist of a Bibliography and a Report of Inventions. /UMTA/

32 176927 CHOICE-MODEL PREDICTIONS OF CAR-POOL DEMAND: METHODS AND RESULTS. The results of a number of car-pool strategies were predicted by using disaggregate choice models. Car pooling is explicitly considered as an alternative mode only for work trips. However, the effects of carpooling incentives on interdependent travel choices and vice versa are also predicted. Forecasts are made by applying the models to each household individually, using revised values of the appropriate independent variables to simulate the particular transportation alternative being analyzed. These household predictions are then summed to represent predicted areawide changes in travel behavior. Before and after data from the implementation of car-pooling incentives and transit-service improvements were used to test the validity of the model's forecasts. Three such tests are reported. The results indicate that the work-trip modal-choice model successfully captures the effects of changes in level of service on modal choice. The predicted effects of several significant car-pooling strategies are presented. In general, traveler response to many car-pooling incentives is small. The most significant changes in travel behavior are predicted for those parking-related policies that combine disincentives for driving alone with incentives for car pooling. /Author/

32 177125 ANALYSIS OF INTEGRATED URBAN PUBLIC TRANSPORTATION SYSTEMS. Dramatic increases in transit patronage will require a major restructuring of present transit and paratransit operations to achieve integrated regional systems capable of changing as traffic increases and new markets are penetrated. The integration of new public transportation options such as dial-a-ride, jitney, and subscription bus with conventional mass transit promises significantly improved overall levels of service without increased total system costs. Integrated systems and expansion policies require that the individual service and cost attributes of each system component be modeled and the

synergisms that result from various service combinations must be evaluated. Integrated system design is significantly more complex than the conventional bus routing and scheduling problem because of the increased number and complexity of available modes. This paper examines a case in which various service policies are evaluated, for parametrically varied demand levels, by using a combination of manual and automated procedures. Major conclusions are that significant economies of scale develop at relatively low levels of increased transit use and that major redesign of system operating policies is required to sustain desirable service levels and costs.

32 177212 PARATRANSIT PROSPECTS-- FILLING A GAP. Urban travel habits in the United States will change in the next decade in response to energy, environmental, and economic problems and may create a wider gap between what the automobile does well and what conventional public transportation does well. Paratransit can limit the gap and could be serving more passengers than conventional transit in the 1990's. Paratransit is shared riding. It consists of many forms of service between conventional, scheduled, fixed-route public transit, and the private use of the automobile.

32 177327 DIAL-A-RIDE WITH CUSTOMER OPERATED DISPATCHING. Demand responsive bus operation generally requires some type of manual dispatching. If the volume of traffic is low and few vehicles are in service, the cost of dispatching relative to the total operating costs will be substantial. Consequently, many operators hesitate to introduce a dial-a-ride system. In a joint project between Gothenburg Transport Authority (GS) and Volvo, the latter has designed a device to be fitted to the general telephone system whereby a telephone dial can be used to transmit coded information over the public telephone network to a central recorder. In a dial-a-ride service this device can be used as a "robot" dispatcher. During a period of 11 weeks in 1976 this device was tested in practical operation in the northeastern part of Gothenburg, the second largest city of Sweden. During the same period a prototype Volvo vehicle for low volume demand was also tested in this dial-a-ride service. During this experiment it appeared that customers easily adjusted to the new procedure of getting their bus. These promising results have led GS to continue the development of this system for large scale operation. /Author/

Elmberg, CM (Greater Stockholm Transport, Sweden) *Transportation (Netherlands)* Vol. 7 No. 1, Mar. 1978, pp 35-43, 4 Fig., 5 Tab.; ACKNOWLEDGMENT: TRRL (IRRD 233666)

32 178344 PARATRANSIT. The topics that are presented in this issue include among others a

discussion of labor protection coverage under section 13 c of the Urban Mass Transportation Act to taxicab employees. The Lehigh and Northampton Transportation Authority (LANTA) have been awarded a rural transportation demonstration grant whereby LANTA will contract with a taxi company to provide feeder service to fixed-route LANTA buses. The UMTA paratransit demonstration program seeks to test and document the results of innovative transportation services. The University of Tennessee has put out a report on insurance for demand-responsive vehicles that outlines some of the basic problems so that government agencies, the insurance industry, and the legislature and courts can understand each perspective. Pennsylvania has recently enacted a new law, Act 10, that enables PENN DOT to aid rural public transportation systems. San Diego's Commuter Computer ride-sharing program is directed to employers with large concentrations of employees who live in specific areas. The matching program is expected to provide cost savings to commuters and contribute to decreased air pollution and energy conservation. The University of California at San Francisco through its paratransit services, has significantly reduced the level of traffic. The transportation program was developed to address neighborhood concerns about campus traffic growth.

32 178584 CARPOOLING; EXPERIENCES FROM TEST PROJECTS IN OSLO [Organisert kameratkjoering; med erfaringer fra proeveprosjekt i Oslo-området]. This report describes carpooling in general including three basic types of matching methods, and the experience with carpool matching programmes run with two larger firms in Norway. A survey of existing car occupancy gave 1,4 persons per car at firm a and 1,8 persons per car at firm b. The matching process started with questionnaires being sent to all employees containing questions regarding interest in joining a carpool and on what terms they wished to join. At a 7% and at b 9% of the employees wanted to join a carpool on certain conditions. Only 2/3 of these could form an acceptable carpool. The two programmes each resulted in a 1% reduction in the total number of private cars used for work trips. There were no use of incentives to influence decisions. /TRRL/ [Norwegian]

32 178710 DIAL-A-RIDE TRANSPORTATION: A MICRO EXPERIENCE. This paper reports a 22-month examination of Michigan city to determine the costs and benefits of the DART (dial a ride transportation) system. This system carries about 225 passengers per week at an operating subsidy of about \$1.30 per passenger. Experiments have shown that a fixed route system met with overwhelming disapproval and high operating subsidies which exceed \$4 per passenger. DART's basic schedule is essentially a 12-hour schedule, six days a week and a 5-hour morning schedule on Sunday. It was found that many of the persons who were benefiting from this program were not elderly or handicapped and

also that the system was too costly given the level of ridership. A combination of a fixed route system in conjunction with a demand responsive service was recommended to better serve the community at less cost per passenger. This, however, was not successful and led to a return to an all demand-responsive DART service.

32 178800 VANPOOLS FOR URBAN TRANSPORTATION: THEIR LEGISLATIVE BASE, PROMOTION AND POTENTIAL. This research report reflects the view that vanpooling has emerged as a viable and new form of commuter transportation that can help meet public goals of reduced fuel consumption, air pollution, and congestion while affording benefits to individuals and employers; it is worthy of state attention. The report aims to serve as a general assessment of current legislative interest and state promotional development in vanpooling. Information herein should be useful to the following: federal and state regulatory and legislative bodies; federal, state, and local transportation related agencies; university research groups; and employer organizations with or without ridesharing programs for employees. The objectives of this report are as follows: to draw attention to state vanpool development and legislative action; to catalogue how the fifty states approach their regulation of vanpool operations; to present a compendium of state legislative interest, promotion, and development in vanpooling in a scenario format for use by other states; to present a case study documentation of Minnesota's response to promoting and developing vanpooling as a viable commuter mode; and to offer a package list of employer, legislative, and regulatory actions which should be taken to promote the development of shared-ride services like vanpooling. This report contains a comprehensive bibliography on vanpooling to date. Appendix A contains a glossary of terms; Appendix B is a compendium of state legislative interest, promotion, and development of vanpooling activity; and Appendix C contains the letters sent to State Transportation Committees (50 states), DOT personnel, and Regulatory Body Personnel. /UMTA/

32 179056 COMPARATIVE DEMAND ESTIMATION MODELS FOR PERIPHERAL PARK-AND-RIDE SERVICE. In this study, the usage of peripheral park-and-ride transit service is viewed as a modal split problem between the transit mode and the auto mode. Three types of demand estimation tools are investigated, namely the aggregated linear models, the aggregated non-linear models and the disaggregated non-linear models. These models are developed based on information from a license plate survey conducted in the two peripheral park-and-ride lots in Albany, New York. Results of this study indicate that the linear models yield the largest estimation errors and sometimes produce negative estimations of transit usage. On the other hand, the

non-linear models appear to have more reliable predictive ability. A comparison is also made between the aggregated non-linear modelling approach and the disaggregated non-linear modelling approach, and their suitability in predicting park-and-ride demand of potential service lots. /Author/

32 179058 MOBILITY CLUB: A GRASS-ROOTS RURAL AND SMALL TOWN TRANSPORT CONCEPT. The dispersion of relatively small numbers of people in rural environments is a substantial barrier to collective means of travel, such as conventional bus service or demand-responsive transit. Accordingly, this paper proposes and analyzes an approach based on ride-sharing in private autos that might provide significant relief for the problems of rural immobility. This solution, termed Mobility Club, can be implemented within the manpower and financial resources of most small towns and rural communities. Trip desires of autoless individuals are matched to the trip-making intentions of persons with autos, by the Mobility Club telephone dispatcher or ride-broker. A companion feature is the method proposed for increasing the number of travel friends, i.e., the number of persons who are well enough acquainted to be trusting enough to travel together. This paper discusses the operational, administrative, and institutional aspects of the Mobility Club concept. A case example is presented to illustrate the magnitude of the potential driver-member supply and tripmaking desires of autoless residents in a sample rural and small town environment. Operating expenses, fare structures, and subsidy considerations are outlined. Finally the paper lists some simple steps to assist individuals who may wish to start a Mobility Club. /Author/

32 179093 DIAL-A-RIDE AS AN ELEMENT IN TRANSPORTATION SYSTEM MANAGEMENT. The Ann Arbor Transportation Authority has been practicing transportation system management since 1973. The most important program element is the incremental implementation of demand-responsive services that operate in close coordination with the line bus system. Ridership has tripled during the past 3 years. Management of such a system is difficult. Political leaders are not easily satisfied; some want a high-efficiency, high-capacity line bus system; others want a small, stable, unchanging system. Neither side can always accept that constant incremental change is the proper way to achieve the desired end state. The Ann Arbor Transportation Authority must also work with other transportation agencies to ensure coordination and within its own staff to maintain the momentum that has been responsible for its success. This paper describes the Ann Arbor Transportation System and the planning philosophy behind that system as it relates to TSM. /Author/

32 179717 PARA TRANSIT IN THE DEVELOPING WORLD: NEGLECTED OPTIONS FOR MOBILITY AND EMPLOYMENT--VOLUMES I AND 2. This report is presented in two volumes. Volume I is intended to provide the reader with a basic understanding of the topic area and to report on the findings and principal recommendations of the assembled group of experts. It is divided into four main parts as follows: The background; para-transit in the developing world; proceedings; and proposed work program and project structure. Volume II brings together fifteen background documents and reports presenting a general statement and overview of the target area. Part I addresses some of the broader issues concerning the role of the automobile and public transport systems in the developing countries, and discusses some specific investigations and points of view concerning individual systems and technologies. Part II includes two papers giving the reader an understanding of some of the leading trends and issues in the OECD countries. It is noted that these countries have in the past been largely responsible for most of the transportation expertise and council that have in turn effected investment and policy decisions in the lesser developed countries (LDC).

32 179847 THE KNOXVILLE TRANSPORTATION BROKERAGE PROJECT--VOLUME II: OPERATIONS AND MANAGEMENT. This report is a description of the operational development of the commuter transportation brokerage system that was in operation in Knoxville, Tennessee through 30 June 1977. When the Knoxville Commuter Pool (KCP) was established, the concept of a transportation broker came into effect with the intention that if it proved workable, it would become an arm of the proposed City Department of Transportation. The initial purpose of this research was to develop and operationalize a multi-modal public and private transportation service throughout the Knoxville metropolitan area. The instrument through which the project objectives would be obtained was the transportation broker who could coordinate all modes of transportation. The broker would not promote one mode of transportation over another, but would promote all modes in order that the broad objectives of the community would be met. Each individual commuter or group requesting service would be provided with a series of transportation alternatives that permitted the highest level of service at the lowest possible cost. These alternatives included vanpooling, which this study addresses extensively. KCP is now working under the City Department of Transportation, and its future

plans include a continued effort to find better ways to promote all forms of ridesharing. There was not time to realize the full potential of the brokerage concept by 30 June 1977. However, sufficient accomplishments were achieved to show that the brokerage concept has the potential of solving many of the transportation problems with which cities are now faced. /UMTA/

32 180418 A QUEUEING MODEL OF AIRPORT PASSENGER DEPARTURES BY TAXI: COMPETITION WITH A PUBLIC TRANSPORTATION MODE. A Poisson queue with random clearing of all customers is formulated for the purpose of studying the interaction between taxicabs and buses at an airport. The analytical model is validated by comparison with a detailed simulation model calibrated from actual airport data. The operating characteristics of this transportation system are studied. The mean daily and mean peak period expected waiting times and the probabilities of modal switching as a function of the number of taxis in service and bus frequencies are exhibited. Taxis are discovered to be a highly effective transport mode, substituting at the rate of one daily cab to one additional daily bus trip for equal mean peak period passenger wait.

32 180809 AIR QUALITY IMPACTS OF TRANSIT IMPROVEMENT, PREFERENTIAL LANE, AND CARPOOL/VANPOOL PROGRAMS. The report has been prepared in accordance with Section 108(f) of the Clean Air Act, as amended, August 1977. It is intended to assist urban areas in developing State Implementation Plans and integrating their transportation system management and air quality planning programs as required by FHWA, UMTA, and EPA. The report analyzes the air quality, travel, energy consumption, economic, and cost impacts of three types of transportation programs: priority treatment for high occupancy vehicles on freeways and arterials; areawide carpool and vanpool programs; and transit fare reductions and service improvements. Important factors (e.g., meteorological conditions, traffic volumes and speeds and changes in modal choice) likely to influence air quality and emissions for the above programs are also analyzed.

32 180810 AIR QUALITY IMPACTS OF TRANSIT IMPROVEMENT, PREFERENTIAL LANE, AND CARPOOL PROGRAMS: AN ANNOTATED BIBLIOGRAPHY OF DEMONSTRATION AND ANALYTICAL EXPERIENCE. In accordance with the Clean Air Act Amendments of 1977, the Environmental Protection Agency is evaluating the use and cost-effectiveness of alternative short-range transit fare and service improvement strategies, carpool and vanpool strategies, and strategies involving the preferential treatment of high occupancy vehicles to improve air quality in urban areas. The evaluation of individual strategies and combinations of the above strategies includes their emission and air quality impacts and their related energy, noise, and economic impacts. A comprehensive literature review was also conducted, as part of this evaluation, to identify both observed and projected travel, emission, air quality, energy, noise, and economic impacts of the short-range low-cost strategies of interest.

32 180820 RIDE SHARING AND PARK AND RIDE: AN ASSESSMENT OF PAST EXPERIENCE AND PLANNING METHODS FOR THE FUTURE. VOLUME I. CAR POOL PLANNING MANUAL. The document is a planning package (guidelines, estimating procedures, examples and computer software) for the highway oriented para-transit modes of car pooling, van pooling, and park and ride. The package is designed to be a reference to the planner who, for example, must assess the regional or sub-regional potential of one of these modes for TSM planning, or who, at a later stage, must estimate the costs and benefits of implementing that mode or, still later, must target specific companies, stations or areas for actual implementation. The package contains four individual reports, a Service Area Identification Methodology computer program, and an Executive Summary. The reports are the following: The Car Pool Planning Manual; The Van Pool Planning Manual; The Park and Ride Planning Manual; The Service Area Identification Methodology Report (SAIM).

32 181398 EXEMPLARY PROGRAMS INVOLVING THE USE OF SCHOOL BUSES. The operation of safe pupil transportation programs is the subject of the present investigation. The objective of this project was to identify and describe in a report exemplary activities involving the use of school buses. This final report is the result of an in-depth field study of pupil transportation safety programs in twelve (12) jurisdictions. The report includes forty-three (43) detailed descriptions of exemplary activities involving the use of school buses. The exemplary nature of an activity is based on the criteria of safety/efficiency, innovation and replicability. Exemplary activities which enhance the character and quality of pupil transportation safety programs appear in ten categories: driver training, field trips, pupil instruction, special education, public relations, maintenance, record-keeping, community services, safety techniques and administration. This report is a resource for current information on pupil transportation safety programs and the innovative use of school buses, and will be useful to state and local administrators of pupil transportation departments across the country. As a resource, the report will encourage states and communities to improve in all areas attendant to the operation of a safe pupil transportation program.

32 181952 RIDE SHARED VEHICLE PARATRANSIT SYSTEM. The project has been concerned with developing strategies to utilize the existing resources of the taxi industry and other paratransit service organizations. The major emphasis has been to develop the Ride Shared Vehicle Paratransit (RSVP) System, which provides hardware and software support for computer-based fare calculation and display within the existing institutional and regulatory framework of the taxi industry. The project has utilized Peoples Cab Company, an operating taxi company owned by the Center for Entrepreneurial Development, a non-profit corporation affiliated with Carnegie-Mellon University. Taxi service from the RSVP System is requested either

through a telephone call or street hail. The operator enters trip data via the RSVP Operations Console and initiates a routine which calculates the fare and the estimated trip time; the results are displayed on the Operations Console and communicated to the customer prior to the trip. If either exclusive ride or shared ride service is desired, the operator specifies which vehicle will provide the service and initiates transmission of trip data to the appropriate vehicle. The concept of computer-based point-to-point fare calculation and the discount rates based on such fare calculation for various classes of group ride services have been approved by the Pennsylvania Public Utility Commission.

32 181983 COME TOGETHER RIDESHARING PROGRAM OPTION SUMMARIES. The document provides technical summaries of the transportation options under consideration. These include (1) transportation facility improvements (e.g., exclusive lanes for high-occupancy vehicles; park and ride service; park-pool service), (2) non-facility transit service improvements (e.g., revised operation strategies, commuter bus service), (3) paratransit, (4) public sector information, legislative and administrative support, and (5) employer-incentive programs. These option summaries provide background material for identifying and evaluating strategies that encourage ridesharing.

32 182687 PUBLIC TRANSPORT PROBLEMS AND INITIATION OF SOLUTIONS. PLANNING AND REALISATION OF PUBLIC TRANSPORT SYSTEMS AS AN EXERCISE IN INTERDISCIPLINARY RESEARCH AND DEVELOPMENT [Der Nahverkehr--Probleme und Loesungsansatze. Planung und Realisation von Nahverkehrssystemen als Aufgabe Interdisziplinärer Forschung und Entwicklung]. In this handbook, 18 competent practical and academic men from areas of industry, economy, transport and development report on the planning and realisation of public transport systems as an exercise in interdisciplinary research and development, as seen from their own field of experience. The contributions deal with economic and town planning aspects as well as sociological demands of the local traffic systems. In particular new modes of transport such as cabin taxis, elevated railways, compact railways, dual-mode buses and buses directed by computer according to requirements, all of which are currently at the stage of industrial development and testing, are dealt with in respect of their goals and their state of technical development. The handbook gives, in brief, a very good general view of the present development tendencies in public transport, whereby the questions of the reliability of traffic systems and the demand for them must remain open. /TRRL/ [German]

32 183107 HUMAN SERVICE AGENCIES PROVIDING TRANSPORTATION IN THE CAPITAL DISTRICT. Human service agencies in the four New York Counties in the Capital District were surveyed to determine which of these agencies provided transportation for the persons they serve. This directory is a result of that survey. It lists agencies that provide transportation and gives names, address, contact person, present transportation activity, eligibility requirements and transit resources. /GMRL/

32 183116 METHOD FOR ESTIMATING PATRONAGE OF DEMAND RESPONSIVE TRANSPORTATION SYSTEMS. This study has developed a method for estimating patronage of demand responsive transportation (DRT) systems. This procedure requires as inputs a description of the intended service area, current work trip patterns, characteristics of the served population, and the major design choices, such as the vehicle fleet size, changes in fleet size over the day, types of vehicles being used (buses or taxis), and the fare level. Using these data, the model predicts patronage and service levels for each user-specified interval during the day. The modern system has been developed as a software package which includes a set of disaggregate demand models, a set of analytic supply models, and an equilibration procedure. In addition, a simple sketch planning procedure has been developed which can be used for quick, preliminary analysis of DRT sites. /GMRL/

32 183120 PARK-AND-RIDE PLAN FOR TEXAS URBAN MASS TRANSPORTATION SYSTEMS IS BEING STUDIED. Park-and-ride represents a means of providing mass transportation that has demonstrated its applicability to major Texas cities. It is an approach that increases the person movement capability of existing streets and highways. Park-and-ride systems utilize both the private auto and the transit bus; the auto serves as the collection-distribution vehicle while the bus provides the line-haul transit service. /GMRL/

32 183429 POSSIBILITIES FOR DEMAND RESPONSIVE BUS OPERATION IN OUTER SUBURBS. This paper outlines as background the problems of bus operation in outer-eastern suburbs of Melbourne, and includes data on factors which contribute to these problems. It covers the setting-up and operation of an

experimental demand-responsive bus service introduced, with financial assistance from the Victorian Transport Ministry, to meet these problems. Data collected on the operation up to the end of March, 1978 is included. Comment is made on the difference between costs and revenue, and how the operation may be developed to possibly reduce costs and increase patronage. /Author/TRRL/

32 183434 REPORT ON CAR POOLING RESEARCH PROJECT FOR SYDNEY, STAGE 1. Stage 1 of the study involved a comprehensive literature search and attitude surveys of employees and employers in different areas of Sydney. The attitude surveys showed that 11% of commuters currently car pool; between 60% and 70% of commuters might join car pools given certain incentives to do so; the incentive which attracted most people was a direct cost saving. The employers surveyed were generally indifferent to the role that they could play in a car pooling programme, suggesting that the support role should be taken by a lead agency or matching bureau to promote the programme, solicit applications and match applicants into car pools and monitor results of the programme. The anticipated cost of a matching bureau directed programme could be offset by only the savings measured in terms of a reduction in vehicle miles travelled. It was calculated that to break even on this basis it would be necessary to attract only 0.7% of the Sydney Workforce into car pools. The conclusion from the stage 1 benefit-cost analysis was that car-pooling would be an economically justifiable para-transit technique. The appendices, bound separately, contain the bibliography, and tabulations of and commentary on the survey results. /TRRL/

32 183435 REPORT ON CAR POOLING RESEARCH PROJECT STAGE 2. Stage 2 of the study was a car pooling experiment, known as "Share-a-Car", conducted in the Ryde (Suburb of Sydney, N.S.W.) corridor involving both residents (area programme) and workforce (employer programme). Promotional material and application forms were distributed and a matching bureau was formed. Results showed that: 354 applications were received, of which 68% were from the area programme and the remainder from the employer programme; 71% of all applicants lived in the study area, representing less than 0.4% of the estimated workforce; only 50 applicants were matched (30 from the employer programme); only 10 applicants formed 5 car pools, (all of these from the employer programme); the restriction of freedom was seen as the main disadvantage of the car pooling. The appendices, bound separately, contain additional references to those listed in the stage 1 report, details of the promotional efforts, operations

manual, financial analysis and detailed tabulations of data collected during the experiment. /TRRL/

32 183463 MULTIPLE HIRE ALTERNATIVES FOR AUSTRALIAN TAXI CABS. Multiple hire, as opposed to single hire of taxi cabs is a concept often propounded by the community as desirable, yet seldom acknowledged by the taxi industry as practicable. Multiple hire is frequently claimed to have the following potential impacts: 1) an easing of existing under-supply of taxi-cab services, where and when this occurs; 2) a decrease in the cost of travel by taxi-cab thereby both improving the potential to satisfy latent demand and reducing the cost to those currently using taxi-cab transport; 3) an increase in vehicle occupancy, with consequent benefits of reduced congestion, increased efficiency and so on. This paper reports an investigation of the general desirability of introducing multiple hire of taxi-cabs to Australian cities. /Author/TRRL/

32 183502 SMALL SCALE URBAN PUBLIC TRANSPORT: LESSONS FROM THE INDONESIAN EXPERIENCE? Small scale motorised vehicles carrying seven to eleven passengers constitute the backbone of public transport in most larger Indonesian cities. This paper describes the technology of the bemo, the organisation under which it operates, and its role in the public transport systems of East Javanese cities of Malang and Surabaya. The impact of the recent introduction of city buses to Surabaya is discussed. In the light of Indonesian experience, suggestions are made for some simple innovations in Australian public transport systems, in particular for the introduction of unscheduled shared taxis on semi-fixed routes. /Author/TRRL/

32 183699 COMMUNITY BROKERAGE OF TRANSPORTATION SERVICES FOR THE ELDERLY IN MOUNTAIN VIEW, CALIFORNIA. This document reports on a unique way of providing transportation and transportation-related services (e.g., information and scheduling) to elderly and handicapped individuals in a small geographic area. In the Mountain View Community Broker project, a community broker furnished his clients with individualized primary service information and scheduling assistance. He also drove these clients to their destinations in a 12-passenger van. The project was intended to demonstrate the economic and operational feasibility of combining these functions in one role. The report describes the community broker concept and project operations; assesses the economic feasibility of the idea; discusses the project's impact on the target group; and provides some commentary on ways a community-broker type of project could be integrated into the existing network of social services for the handicapped and elderly. /Author/

32 184192 TAXICAB FEEDER SERVICE TO BUS TRANSIT. The use of taxicabs as feeders to fixed-route transit is discussed. Reasons for involving privately operated taxicabs as feeders to publicly subsidized systems are presented and three existing systems are described to illustrate some of the benefits and problems associated with this innovative type of operation. The major questions about feeder service pertaining to economics, quality of service, and demand are reviewed, and the institutional issues that may inhibit using taxicabs as feeders are discussed. A proposal is outlined for an experimental demonstration for a large urban area. /Author/

32 184195 METHODOLOGY FOR THE ANALYSIS OF LOCAL PARATRANSIT OPTIONS. A system of models has been developed that is capable of predicting the performance characteristics of transit service for the purpose of analyzing a wide range of local transit-service alternatives. Patronage and demand forecasting issues are treated parametrically. Local transit is designed to serve access and egress trips bound to and from a regionally oriented line-haul transit system as well as shorter local circulation trips. The model system presented is capable of treating a wide range of modes that can offer such local transit service. In addition to conventional transit and jitney services, which follow fixed routes, point-deviation and checkpoint route-deviation transit can be investigated. More flexible modes, such as checkpoint subscription bus, doorstep subscription bus, and doorstep many-to-many dynamically routed transit (dial-a-ride), can also be examined. Comparisons can be made both between alternatives and between operating policies (such as vehicle size and route spacing) within any single alternative. The model system has been designed to predict four important consequences of implementing local transit service: user level of service, operator cost, pollutant emissions, and energy (fuel) consumption. Results from a sample model application are presented. Use of the system would allow a wide range of alternatives to be tested before significant demonstration and experimentation efforts or implementation funds are committed. Such tests can be integrated with corridor and regional analyses on both policy and planning levels of detail. /Author/

32 184196 SATELLITE-CITY DEVELOPMENT THROUGH IMPROVED PASSENGER TRANSPORTATION SERVICE. The lack of adequate transportation services has been a major impediment to the development and growth of satellite communities outside of major metropolitan areas. This paper presents an approach for selecting and organizing transportation services for commuting trips between satellite communities and metropolitan areas. The services of interest are designed as "commuter clubs" in which most of the administrative functions are performed by volunteers. This approach allows inexpensive services to be offered when travel demand is low and supports gradual development of services for a small start. An analytical technique that makes use of the commuter-club approach is presented for formulating, describing evaluating, and comparing alternative transportation services. Analytical results suggest that van-pooling and subscription bus services are attractive for a wide range of satellite cities. Other services—car pooling, commuter rail, and air—can be attractive in special situations. All require a coordinating function for providing advice, support, and help with problems. This function can best be performed within the satellite-city government. /Author/

32 184197 PLANNING PROCESS FOR THE DESIGN OF INTEGRATED FIXED-AND FLEXIBLE-ROUTE BUS SERVICE IN ROCHESTER. Demand-responsive transportation is an accepted form of transportation in small and medium-size cities. However, as these types of systems are introduced into larger urban areas that already have fixed-route services, the systems and the preceding planning process necessarily become more complex. This paper describes the planning process that was used in the design of an integrated fixed-and flexible-route system in one suburb of Rochester, New York. The system is one component of a federal demonstration project designed to evaluate the feasibility of such systems in major metropolitan areas. A description is given of the planning approach taken and the methodologies and analyses used. The use of a simulation model to determine the extent of the dial-a-bus service area in the suburban and a logit model to predict the expected demand for such service is described. In addition, the methodology developed for the system integration design, i.e., the combination and coordination of existing bus service with flexible-route services, is explained. Provision of opportunities for public involvement during the planning process is also described. /Author/

32 184198 FINDINGS OF A STUDY TO ESTIMATE THE EFFECTIVENESS OF PROPOSED CAR-POOL-INCENTIVE POLICIES. This paper summarizes the findings of a car-pooling impact study conducted for the Federal Energy Administration. The aim of the study was to estimate the impacts of various proposed car-pool-incentive policies on work travel. A market research methodology was adapted to estimate modal-split impacts under various policy conditions and corresponding estimates of vehicle kilometers of travel and fuel consumption. A trade-off model was used to simulate modal behavior under 14 representative car-pool-incentive policies and nine travel-time sensitivity tests. Paired-comparison responses on work-trip preference collected by a specially designed survey were the primary input to the trade-off model. The study produced two major sets of results: (a) tabulations and cross tabulations of the survey data and (b) estimates of the impact on modal split, vehicle kilometers of travel, and fuel consumption from policy simulations of the trade-off model. Gasoline rationing was found to be the most effective policy for reducing vehicle kilometers of travel and fuel consumption. Substantial surcharges on gasoline sales and parking in the central business district or in facilities of major employers were moderately effective. Purely incentive policies such as tax rebates to car-pool members and car-pool matching programs were not very effective. If

practical policies for achieving significant discriminatory travel-time advantages for high-occupancy vehicles could be implemented, they would be moderately effective. /Author/

32 184199 TRANSPORTATION EFFICIENCY AND THE FEASIBILITY OF DYNAMIC RIDE SHARING. This paper defines the theoretical limits imposed on rider sharing by the spatial and temporal structure of urban travel demand. Differences in market potential between prearranged ride sharing as it is used in car pooling and dynamic ride sharing as it is used in, for example, shared taxis are given. The paper presents the results of the simulation of a hypothetical shared-ride transit system that used various operational policies of dynamic ride sharing and identifies the improvements in transportation efficiency and the economic and technological savings that result from ride sharing. Data on the dynamic ride-sharing taxi system operating at Union Station in Washington, D.C. establish the feasibility of implementing dynamic ride sharing. /Author/

32 184200 CAR-POOLING PROGRAMS: SOLUTION TO A PROBLEM? Information from 26 car-pool programs is reported that suggests that appeals to self-interest made through work organizations are more effective than other means of encouraging car pooling because employees of work organizations from a known population with a common destination and, typically, a similar work schedule. It is proposed that such appeals should focus on the benefits of car pooling for the individual rather than on general values such as patriotism. Interviews of selected long-term car-pool participants (2 or more years) indicated that work organizations provide a setting in which personal information about potential participants can be obtained and that this information facilitates the formation of car pools. These interviews further suggested that the intimacy of the private automobile may limit the size of car pools as well as the willingness of some individuals to participate in them. Ride-sharing programs that present alternative transportation modes may be more effective than car-pool matching programs in changing current patterns of work travel. /Author/

32 184203 INTEGRATING TRANSIT AND PARATRANSIT (ABRIDGMENT). The major impacts of expanded paratransit services appear to be: improved mobility for people permanently

or temporarily without access to private automobiles or high quality transit service (e.g., elderly or handicapped); reduced total cost of transportation for commuters, taxi users, and other individuals; and reduced congestion or parking requirements at individual employment or activity centers. However, paratransit can be fairly expensive (over \$3 per ride in some cases), especially in low density areas. Fortunately, there are several possible approaches to controlling costs and subsidies. Among these are limiting the coverage and roadways of local fixed-route service, limiting those eligible to use demand-responsive service, providing service on limited days, requiring reservations and using taxis. Others include use instead of service subsidies and marginal-cost fare policies to limit the subsidy without restricting the system to selected users. Shared-ride services can increase productivity of taxi services by 50 to 1000 percent. However, the much greater complexity of shared-ride operations (particularly scheduling which would require use of computers and digital communication equipment) seems to be rather intimidating to taxi operations and there is a reluctance to change to such a system on their part. The most promising opportunities for the near future appear to be: expanding services to the elderly and handicapped and coordinate social service transportation; the use of subscription commuter service; expanding operations through side sharing, formalizing vanpooling, and the use of feeders to line-haul transit.

Ziegler, E (Urban Mass Transportation Administration) *Transportation Research Record* No. 650, 1977, pp 66-69, 1 Tab.; This paper appeared in *Transportation Research Record* No. 650, Paratransit Services.; ORDER FROM: TRB Publications Off

32 184584 MODELING DEMAND-RESPONSIVE FEEDER SYSTEMS IN THE UTPS FRAMEWORK. For the transit planner considering alternative future transit designs, there has been little in the way of analytical tools available to assess the impact of demand-responsive transportation (DRT) systems. The intent of this report is to provide the Urban Transportation Planning System (UTPS) user with a methodology for incorporating DRT feeder systems in transit network analysis. The focus is on the use of DRT systems to provide feeder services to fixed transit routes in low density areas. A methodology for considering such services within the framework of UTPS modeling is presented herein. A set of previously developed DRT supply models, representing many-to-many service, many-to-one cycled service, and many-to-one subscription service have been refined for the purposes of this report. These services are discussed and general guidelines for designing feeder services offered. The models themselves are described in detail (Appendix A), and program listings provided (Appendix C). In addition, a series of nomographs (Appendix B) based on model results have been developed to enable the analyst to predict the service levels of DRT feeder systems under a range of conditions. Examples of the use of these nomographs, and the overall approach to modeling DRT feeder systems within UTPS, are also included in Appendix B. This report also provides a bibliography and a glossary of terms. /UMTA/

32 184697 COMPUTER-ANIMATED SIMULATION OF TAXI-DISPATCHING STRATEGIES. A conversational, animated modeling environment implemented on a minicomputer is used to build and experiment with models of taxi-dispatching systems and strategies. The implications of each strategy are portrayed by the production and playback of an animated movie that depicts the simulated system as if it were real. The modeler can observe the system, modify the strategy, and immediately see the effects of the change. Use of the technique to assist in verifying the correctness of the simulation program, to enhance human intuition and aid strategy formulation and testing, and to facilitate technical communication about the model is described. /Author/

32 184928 STATE-OF-THE-ART DEMAND-RESPONSIVE SYSTEMS FOR THE TRANSPORTATION HANDICAPPED. This paper describes some relevant data gathered from a recent survey of six state-of-the-art demand-responsive systems for the transportation handicapped. Data described include trip rates, registration rates, productivities, user characteristics, and costs. Based on the data, conclusions are drawn which might be of help to planners designing similar types of systems. Conclusions are reached about balancing supply and demand, about how to increase productivities and about how to reduce costs. /Author/

32 184934 COORDINATIONAL TRANSPORTATION FOR HUMAN SERVICE AGENCY CLIENTS. Because elderly, handicapped and other transportation disadvantaged persons have not had their travel needs met by the conventional transit operator, diverse transportation operations have been initiated by human service agencies throughout the United States. These systems have developed in a policy vacuum and are fragmented, overlapping and uncoordinated. Large public expenditures on these special transit services have caused decision makers to look to coordination as a way of providing more efficient agency client transportation service. This paper traces the development of these systems and the coordination problems they have encountered. One solution to the coordination problem is to contract with a conventional transit operator for special services; another solution is to establish a separate social service transportation agency to provide this service. The arguments for and against each of these organizational options are presented. Finally, the local decision making process is discussed. Factors which influence agencies to provide direct transport services or contract with an outside organization are reviewed. /Author/

32 185861 VANPOOLING: AN OVERVIEW. The report is intended to provide information on vanpooling as it exists in the United States. It is not a comprehensive treatise, rather the report emphasizes key features of vanpooling, with special attention being paid to implementation of vanpool programs and legal and insurance issues pertaining to vanpooling. Organizations in industry and government who are considering implementing or expanding vanpool programs will find the report useful. Topics covered are vanpool program designs, vanpooling experience, insur-

ance and legal issues, vanpooling costs, benefits, and the National Association of Vanpool Operators.

32 185863 AN OVERVIEW OF RIDESHARING AND MASS TRANSIT EMPLOYER INCENTIVES. The report reviews the incentives currently being used by public and private sector employers to encourage employee use of ridesharing and mass transit as an alternative to the single occupant vehicle and identifies a few successful incentive programs. The legal and institutional aspects of employer sponsored incentive programs are discussed in some detail. Existing carpool matching systems and costs are briefly discussed.

32 185996 SHARED RIDE SERVICES: A MAJOR OPPORTUNITY, AND AN ALTERNATIVE WAY FOR PEOPLE TO GET TO WORK. Public policy in the Twin Cities area is moving toward a conclusion that solution to transportation problems will require high-service, low-capital, cost-effective systems. Development of additional ways for people to get to work is, with the energy shortage, a matter of urgency in the area. The shared ride in small vehicles, or 'para-transit', has emerged as an attractive alternative to driving alone. The focus in developing alternatives to the automobile must be to determine which system-car or van pool, taxi, bus or other mass transit-is cost competitive with the automobile and best serves work trips going to specific locations. Small vehicle, door-to-door systems complement the system of large buses in serving the downtown area and could be additionally attractive for up to 40% of the estimated 830,000 daily work trips. The savings and benefits from a major effort at shared ride systems could be substantial for the employee, employer, and for the public. These low cost shared ride systems are available, but steps must be taken to resolve certain issues and make them more widely available.

32 186190 TAXICAB OPERATING CHARACTERISTICS. The report presents the combined results of two mail questionnaire surveys of the taxicab industry conducted in 1974 and 1976. The focus is on taxicab operating characteristics such as types of operations, vehicles, and services provided; industry structure; passenger operations; utilization of employees and vehicles; cost and revenue relationships; and fare structure.

Control Data Corporation, Wells Research Company, Department of Transportation Final Rpt. DOT/TPI/10-77/22, Mar. 1977, 110 p.; Prepared in cooperation with Wells Research Co., Silver Spring, MD.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-287295/0ST

32 188048 CARPOOLING: TWO SURVEYS INVESTIGATING FOUNDATIONS FOR ITS APPLICATION. Questionnaires and results relating to two surveys dealing with the potential application of carpooling are presented. The first survey was concerned with the potential interest in carpooling among employees at a major factory in Leicester. The results indicate that carpooling potential with respect to a major work site would be approximately double that obtained for access to city centre zones (17% for this study as opposed to 7-8% for the analysis of the Sheffield-Rotherham land use transportation study). In practice, rates of carpool usage substantially below the potential figures would be expected, assuming no untoward external factors which prompt a sudden upsurge in interest. The second survey dealing with the attitudes of bus operators to defined policies encouraging carpooling led to the perhaps not surprising conclusion that the operators approached did not apparently favour any policy promoting carpooling. They are clearly more in favour of other approaches towards traffic restraint. The present survey was concerned solely with general policies. If bus operators can see that a scheme for carpooling will have advantages of a positive nature for bus operations (e.g. allowing an extension of bus lanes) they may be prepared to show a little acquiescence. Certainly, bus operators appeared aware of the potential use of data collected for carpool matching as a means of monitoring the suitability of public transport services in relation to the potential market of users. /TRRL/

32 188978 I-95/NW 7TH AVENUE BUS/CAR POOL SYSTEMS DEMONSTRATION PROJECT. UMTA PROJECT EVALUATION SERIES, PHASE II (REPORTS II-1 TO II-4). The UMTA Project Evaluation Series evaluates a three and a half year demonstration project in Miami, Florida, established in 1973 to develop more efficient people-moving capabilities in the I-95/NW 7th Avenue corridor. The basic transit concept of this Project was to provide fast, line haul service with express buses operating between a major residential area (market area) and four specific areas of employment concentration (service areas). Phase I of this project involved the implementation and evaluation of a reserved bus carpool lane in each direction of Interstate 95 (I-95). Express bus operations on the new priority lanes on I-95 in March 1976 constitute Phase II of this project. Phase II is presented in four separate reports: Report II-1 "Evaluation of the I-95 Express Bus and High Occupancy Vehicle Priority Systems," Report II-2 "Evaluation of the Effects of the I-95 Exclusive Bus/Car Pool Lane Priority System on Vehicular and Passenger Movements," Report II-3 "Evaluation of the Effects of the I-95 Bus/Car Pool System." This report, Report II-1, presents a summary of the evaluation of Phase II of the project, and it consists of the evaluation of the effect of the exclusive bus/car pool lanes on the I-95, Golden Glades Park'nRide facility, and a direct flyover connector between the facility and the reserved lanes on I-95. /UMTA/

32 189228 EVALUATION OF TAXI SYSTEMS BY THE USE OF SIMULATION [Utvärdering av olika taxisystemens prestanda genom simulering]. The purpose of this project was to establish, through computer simulation, the savings that can be made by introducing sharing of taxis. The simulated taxi systems act in a city during peak hours. Two systems with the same type of computer allocated trips were simulated, one system with shared taxi and another without. To examine the accuracy needed in the vehicle locator, some different degrees of accuracy have been simulated. An attempt to simulate the present taxi system was also made. The simulations have shown that a system with organized shared riding manages to serve a given amount of customers with a considerably lower number of vehicles than the corresponding system without shared riding. To serve the simulated amount of customers (about 1400 trips per hour) the systems used the following number of vehicles: shared taxi-320, un-shared taxi-410, present system-500. In addition, the vehicles in the system with shared taxi will drive a shorter total distance. This will mean a decreased fuel consumption. The following driving times for the vehicles were obtained (in hours per 1000 trips): shared taxi-223, un-shared taxi-253 and present system-300. Vehicle localization accuracy ranged from 0 to plus or minus 500 M. The effect of different inaccuracies was hardly noticeable compared with precise localization. /TRRL/ [Swedish]

32 189348 THE MINNEAPOLIS RIDESHARING COMMUTER SERVICE DEMONSTRATION--EVALUATION PLAN. In April 1977, the Metropolitan Transit Commission initiated a two-year ridesharing brokerage demonstration project designed to increase work trip-vehicle occupancy at three employment sites located outside the Minneapolis/St. Paul Central Business District: South Central Minneapolis, Pentagon Park/Normandale, and Central Bloomington. The key elements which differentiate this ridesharing demonstration from previous efforts are the use of a regional transit agency to serve as a broker in marketing, coordinating, and monitoring the program; the promotion of a wide range of ridesharing services; and the choice of multi-employer sites. The program is marketed under the name "Commuter Services" and provides carpooling, vanpooling, subscriptions and regular bus services to commuters to and from the employment sites. The marketing strategy is to make personal calls to the largest employers and to use an audiovisual presentation for smaller

employers and business groups. The major objectives of this project is to provide a detailed, chronological process description of brokerage service and a statistically sound assessment of the results of the demonstration project. Issue areas to be analyzed include level-of-service changes; demand shifts; and the costs, productivities, and economics of the ridesharing modes promoted. While all of the demonstration elements cited in the study should serve to stimulate ridesharing activity, they should be viewed against several off-setting factors that are discussed in the report, and which may discourage significant increases in work trip-vehicle occupancy. However, overall, the study should serve as a reference guide to interested agencies, indicating the type and range of issues they may confront. This report contains a "Listing of References" and a "Report of New Technology". /UMTA/

32 189414 TAXIS: A PUBLIC TRANSPORT MODE OF INCREASING IMPORTANCE [Les taxis: un mode de transport public de plus en plus important]. In the course of recent years, the bus has suffered a certain decline compared to the taxi. The author studies the new services supplied by taxis, such as those in London, New York, Hong Kong. Certain taxi operating companies have succeeded in outwitting the regulations governing taxis, to offer new types of services. Thus, taxi pirates have made their appearance. Transport on demand or 'dial-a-ride' system, such as the 'busphone', although little used in Europe, has spread in the United States, but the system appears to be a costly one. The shared taxi, a controversial system, which is well established in the cities of Central America and the middle east, is generally forbidden in Europe and the USA. Taxis play an increasingly large role in urban transport but one important problem remains: that of the regulation of the number of taxis. /TRRL/ [French]

32 189533 CAR POOLING: ITS POSSIBLE ROLE AND LIMITATIONS. Car pooling is one mechanism by which many of the problems of modern traffic might be reduced, but its application poses many problems. This report discusses these difficulties under the following headings:- (1) the psychology of car use and attitudes towards it, (2) incentives that might be incorporated to make carpooling attractive, and (3) the legal restraints that restrict the adoption of car pooling and the changes necessary. In addition, car pooling is compared to other methods of traffic restraint. A comparative study of the effects of traffic restraint on fuel consumption is made in an appendix. /TRRL/

32 189821 DEMAND RESPONSIVE TRANSPORTATION AND THE TRANSPORTATION DISADVANTAGED: A MARKETING CASE STUDY FOR FREEPORT, NEW YORK. This report examines both the needs and the existing transportation opportunities of the transportation disadvantaged in a suburban community where these individuals constitute a significant part of the population. The travel patterns of individual segments including school transportation (including parochial and private) handicapped students, housing authority residents, co-op social service activities center, the elderly, medicaid, and welfare transportation) are examined. The capabilities of the Dial-a-Ride in meeting the needs of the above groups are assessed. The report also presents an analysis which is used to indicate geographically, which sections of the Freeport area should have the greatest propensity to use Dial-a-Ride. The economic aspects of demand-responsive-transportation in Freeport are also analyzed.

32 190213 STATEWIDE STUDY OF THE FEASIBILITY OF COORDINATING OR CONSOLIDATING SPECIALIZED TRANSPORTATION SERVICES. The objectives of this study are to identify: current and latent demands for specialized transportation in New York State; current State and Federal programs applicable to specialized transportation; a methodology to measure the effectiveness of coordination/consolidation in demographic areas; as well as to develop modifications to existing State and Federal legislation and regulations to assist coordination/consolidation efforts. This report outlines a procedure to plan, develop, and implement coordination/consolidation options. The study developed consolidation scenarios for typical locations within an urban, suburban, and small urban/rural setting. Poughkeepsie (Dutchess County) was selected for the urban scenario, Hempstead for the suburban, and Tompkins County for the small urban by the NY State Department of Transportation and the Project Advisory Committee based on the following five criteria: availability of data; evidence of concern, presence of public transit provider; community conditions amenable to proposed consolidation options; and no comparable effort underway. It has been estimated that \$80-100 million in public funds is spent per year on specialized transportation services in NY State in addition to \$25 million per year for reduced fares for the elderly and handicapped on public transit systems. The author estimated the client group for this study as 2,694,000 individuals and that specialized transit systems in NY State supply 175,000 trips/day; latent demand is estimated as 1,945,000 trips/day. This report summarizes the study's findings, conclusions, and recommendations; it states that the conclusions herein should be broadly applicable to all governmental levels in a variety of locations. /UMTA/

32 190935 I-95/NW 7TH AVENUE BUS/CAR POOL SYSTEMS DEMONSTRATION PROJECT REPORT I-4. MODAL SHIFT ACHIEVED ON THE NW 7TH AVENUE EXPRESS BUS SYSTEM. The purpose of this report was to evaluate the modal split achieved by the Orange Streaker express bus system. Screen-line studies and a home interview were conducted to obtain the data necessary to establish a proportional relationship producing modal split of project trips. The project modal split increased with early ridership increases but leveled off with a leveling trend in ridership. The significant increases in modal split achieved in the early months of the study period could not be directly attributed to the attractiveness of the Orange

Streaker service due to the impact of other factors, such as the energy crisis. The fact that modal split did not decline at the end of the energy crisis indicates patron satisfaction and suggests that the service provided represented a viable alternative to the automobile to make project trips.

32 191177 VANPOOLING INSTITUTIONAL BARRIERS. The current interest in van pooling has raised numerous institutional problems. This report addresses several of the more apparent state and Federal institutional issues, describes current progress in resolving the problems, and suggests alternatives for removing the inhibiting factors. The report will conclude by listing specific recommendations. The discussion of institutional issues will focus on three types of pooling. These include employer-sponsored pools, in which the company owns or leases the vehicle which transports their employees, i.e., TVA, 3M Company, and the Continental Oil Company programs; employee-owned and operated pools, in which an individual operates a van just as he would a shared-expense carpool; and third-party programs, in which a government, lease firm, or company supplies the vehicle and coordinates groups of commuters as a business activity or as a public service, such as, Commuter Computer or Pinetree Transportation of Los Angeles, Vango in Maryland, or the Knoxville Commuter Pool.

32 191231 BALTIMORE CITY'S HUMAN SERVICES TRANSPORTATION: ANALYSIS AND RECOMMENDATIONS. The eleven agencies with 30 divisions were providing services to handicapped and non-handicapped children and adults, elderly persons, and infirmed residents. Trips were both individual and group. The types of trips provided include medical, personal business, shopping, recreation, social, nutrition, education, child day care, elderly day care, and volunteer service trips. Trips were provided with 155 City-owned, donated, and shared vehicles and through various purchase of service arrangements. The following problems were found with the transportation system as it existed at the time of the study: under-utilization of city-controlled vehicles (hours of use per vehicle per week, miles traveled per day per vehicle, and percent passenger capacity utilized per vehicle per one-way trip); use of professional and para-professional staff as drivers; path duplication; minimal service provided to the physically handicapped; interruption of service when a vehicle was undergoing maintenance or repair; high administrative costs; duplication of administrative support staff across divisions; and overall high costs per passenger trip and per mile. The study recommended consolidation of many of the divisions' transportation services to eliminate the aforementioned

problems. An incremental consolidation effort is currently underway.

Katz, DC ; Baltimore City Department of Planning, Maryland Department of Transportation, Baltimore Mayor's Office of Human Resources, Baltimore Region Unified Transp Planning Program Final Rpt. 32 191296 ANALYSIS OF COMMUNITY RESOURCES. Changing patterns of resource allocation in five human service agencies in Jefferson County, Kentucky, were studied over a three-year period from July 1, 1974, to June 30, 1977. Four major questions were addressed: how many agencies at which locations provide what kinds of services. Have the kinds of services provided changed over time. How much service is provided and how quickly and at what cost to clients. Has there been a change in the number of unique or distinct services available to clients. Information from about 500 agencies and on 357 unique services was analyzed. The county has experienced a trend toward more decentralized services. The number of agencies and sites providing financial resources, food and clothing, housing services, and family planning and problem pregnancy service sites have increased. Transportation agencies and sites, and community education and information services related to alcohol, drugs, and developmental disabilities have decreased. The proportion of emergency services has increased in the areas of protection from abuse, neglect, and exploitation; substitute living arrangements; community safety and justice; and social / emotional development and adjustment. Two-thirds of the agencies are open only during daytime hours, and nine out of ten sites are accessible to public transportation. More than half of the agencies do not charge fees for the services provided. Overall, the number of different services has increased. Implications related to accessibility and availability of service are examined.

32 191402 I-95/NW 7TH AVENUE BUS/CAR POOL SYSTEMS DEMONSTRATION PROJECT REPORT II-4. EVALUATION OF CHARACTERISTICS OF USERS AND NON-USERS OF THE I-95 BUS/CAR POOL SYSTEM. Express bus operations on the new priority lanes on I-95 in March 1976 constitute Phase II of a project. This report, Report II-4, presents the findings of three surveys administered to obtain data on the socio-economic, travel, and attitudinal characteristics of two types of users, express bus passengers and non-users from the target market population. The survey instruments are in Appendixes B, C, and D of this

report. Both users and non-users wanted the exclusive lanes to be retained on I-95. Many respondents favored exclusive lanes on all urban freeways.

Long, G Scherbarth, JA Reaves, DP Wattleworth, JA Wallace, CE ; Florida University, Gainesville, Urban Mass Transportation Administration, Florida Department of Transportation, (UMTA-FL-06-0006) Final Rpt. 32 192352 CARPOOLS, VANPOOLS, AND HIGH OCCUPANCY PREFERENCE LANES: COST EFFECTIVENESS AND FEASIBILITY. The report looks at the reductions in vehicle miles traveled (VMT) and air pollution that can be accomplished with voluntary transportation control measures. The measures studied are carpool/vanpool programs and preferential highway lanes for buses and other high occupancy vehicles (HOVL). The report examined transportation control programs in four major metropolitan areas to analyze what factors affect the programs' effectiveness. Based on empirical data and use of a computer model, the report predicts that carpools, vanpools, and HOVL's may reduce car use 2-3% and save travelers millions of dollars. The costs of these programs are generally small compared to their benefits, except where new highway lanes are built for use as potential lanes. However, the study concludes that major reductions in air pollution may not be accomplished unless mandatory traffic controls are also used. The study also describes how people travel to work in 124 major metropolitan areas and includes case studies of carpool, vanpool and HOVL programs in use in both urban and less-densely populated areas.

32 193611 PARATRANSIT INVENTORY ST. LOUIS REGION. An inventory of paratransit services was performed as part of a larger transportation research effort to address concerns regarding congestion, air quality and energy consumption. A mail survey was used to gather information concerning service area, operations characteristics and cost, ridership and vehicle type for all paratransit modes. Follow-up interviews were conducted with operators in some categories to insure that an adequate sample was obtained. The services covered included taxicabs, commercial auto rental and leasing, limousines, shuttle services, school bus, church service, subscription service and special transportation services for the elderly and handicapped. The inventory revealed that while many transit dependent individuals and groups are served through paratransit that are not sufficiently served by fixed-line services and areas that are yet lacking in

any services. For the future the paratransit services must be coordinated followed by fitting to-together paratransit and fixed line transit together to give one intergrated system to meet the needs of St. Louis.

East-West Gateway Coordinating Council Final Rpt. 32 193616 THE KNOXVILLE TRANSPORTATION BROKERAGE PROJECT. VOLUME III: AN EIGHTEEN MONTH EVALUATION. The transportation brokerage approach has as its basic objective to identify and match transportation demand/supply on an individual basis. The broker acts to publicize the benefits of ridesharing through the media by experimenting with vans or negotiating special services with local transit operators. The objective of this report is to document the results of the Knoxville Transportation Brokerage Service (KTBS) project while operated by the University of Tennessee Transportation Center (January 1976-June 1977). This evaluation is restricted to an analysis of KTBS's commuter arm--the Knoxville Commuter Pool (KCP), and the major focus of the KCP effort revolves about vans rather than carpool formations. Highlighted herein is the fact that this demonstration introduced a new mode of commuter transportation--vanpooling. Currently, 47 KCP vans are operating daily serving over 450 commuters working at 12 different firms. With 36 percent of the vanpoolers having formerly driven alone, the broker has served to eliminate 10,056 daily miles of travel. The demonstration's contribution extended beyond the successful deployment of seed vans and the removal of institutional barriers restricting the legal operation of commuter vans in Tennessee. The project demonstrated the ability to survey commuter needs and to match them to the available supply of transportation on a community-wide basis. Over the 18-month project, 234 firms were surveyed and over 18,000 match lists distributed. The project achieved an increased level of rideshare awareness in the community with 67 percent of the general population recognizing the name of the project and 41 percent knowing how to contact KCP. /UMTA/

Wegmann, FJ ; Tennessee University, Knoxville, (TN-06-0006) UMTA-TN-06-0006-78-1, Nov. 1978, 144 p.; Sponsored by the Urban Mass Transportation Administration. 32 193617 THE KNOXVILLE TRANSPORTATION BROKERAGE PROJECTS. VOLUME I: PHILOSOPHY AND INSTITUTIONAL ISSUES. This report is designed to describe the theoretical concepts behind the Brokerage Project and to describe the institutional problems involved in implementing the concepts. The Knoxville Brokerage Project,

which evolved over a five-year period, was not the promotion of a single transportation mode, but the promotion of a philosophy and approach to coordinate various forms of transportation to meet the many diverse needs of urban and rural areas. The purpose of the broker is to locate areas of surplus (willing suppliers/sellers) and areas of needs (willing buyers/consumers), to resolve institutional barriers (contracts, financing, transportation, etc.) and to consummate sale. This report, one of a series of reports, discusses the evolution of the brokerage concept; it describes pre-project experiences, project activities, and some planned activities. Topics discussed herein are: the availability of alternative suppliers; the transportation markets; institutional barriers; and an overview of the accomplishments and conclusions reached during the first 19 months of the project. The authors state three reasons why the brokerage approach works, namely: it is easy to find a solution to individual transportation needs given the full resources of the community; the brokerage approach would not be possible if people were not creatures of habit; and the brokerage approach is possible because of the development of new technology. This report provides a list of references and the following appendixes: Origins of the Brokerage Concepts; Knoxville Taxicab Ordinance; Test Market Legislation; and Citizen Transportation Areas Legislation. /UMTA/

32 193691 URBAN TRANSPORT SERVICE INNOVATIONS. This volume amounts to a progress report on paratransit. The papers published here include some that were presented at the Transportation Research Board's Conference on Urban Transport Service Innovations in San Diego, December 5 to 8, 1977, and some that were presented at the Fifty-seventh Annual Meeting of the Transportation Research Board in January 1978. They review both American and Canadian experiences with shared-ride services such as car pools, van pools, shared-ride taxi services, subscription bus services, and dial-a-ride and demand-responsive services for special-need groups. One common characteristic of these services is their ability to respond flexibly to the spatial patterns and temporal rhythms of travel demand. Another common characteristic is a recent record of increased interest and relatively rapid program expansion. The pace of recent developments argues that this is an appropriate time to review the performance of shared-ride programs and the direction of paratransit innovations. /Author/

32 193692 RELATIONSHIP OF INNOVATIVE SERVICES TO A FAMILY OF URBAN TRANSPORTATION SERVICES. A mixture of different transportation services and providers

are required to serve the varied markets and needs in an urban area. Innovative services such as ride sharing and demand-responsive transportation provide new opportunities to serve markets that are currently not served by more traditional services. Communities such as Westport, Connecticut, have demonstrated that these services can be combined in a complementary fashion, so that the different services reinforce, rather than complete with, one another. By offering a range of services provided by different suppliers, a unique system has been created that has had a significant impact on the community. Westport shows what can be achieved by a single community, and the lessons of this and other communities with the family-of-services concept must be diffused on a much broader basis. To achieve this, changes are required on a local and federal level. These changes require an increased awareness of available options and approaches, incentives to adapt these options and approaches where appropriate, and new institutional arrangements to accommodate the changes. An increased emphasis on service implementation and coordination is required, and different relations between planning and operations are appropriate.

32 193693 SOCIAL SERVICE TRANSPORTATION. The nature and scope of social service transportation systems are summarized, and the benefits and limitations of coordination among such services are explored. The potential for improvements in coordination and a series of considerations for future improvements are identified. The increased interest in coordinating social service transportation is explained by the increasing funding constraints of the late 1960s and the 1970s as projects became more concerned about using their resources as effectively as possible. The nature of coordination is examined and the findings of a national survey of state agencies on aging are presented. The barriers to coordination are identified and classified into two broad categories: statutory and legal and administrative, institutional, and perceptual. The statutory and legal barriers include eligibility and user restrictions and franchise and labor problems; the administrative, institutional, and perceptual barriers include regulatory and administrative constraints, accountability requirements, insufficient information on Transportation costs, turf protection, preferential treatment of clients, discontinuity of funding, and public transit. The benefits of coordination include (a) reduced overlap and duplication, (b) increased service capacity, (c) improved vehicles productivity, and (d) cost reductions in purchases. Directions for improved coordination--in the areas of policy, planning operations, and research--in the future among transportation services provided by social service agencies are identified. /Author/

32 193694 COORDINATION OF HUMAN SERVICE AGENCY TRANSPORTATION: EVALUATION METHOD.

The topic of the coordination of transportation services among human service agencies has become very popular in the past years. The involvement of these agencies, whose initial mandates probably did not include transportation, creates the potential for such problems as duplication of services, higher than necessary costs, and equipment maintenance difficulties. While transportation service coordination is desirable, it is a difficult task. One of the major problems is the lack of experience in analyzing agency transportation programs. This paper presents and analytical methodology that should assist in service evaluation and, therefore, the development of coordination plans. Two fundamental questions that must be considered before any coordination plan is developed are addressed. First, how much coordination is good for any particular agency? Criteria were developed to assist in the determination of which agencies would benefit from service coordination and which would not. Agencies were found to vary greatly in the degree of coordination that is useful to them. Second, just what is meant by service coordination? Is it a motor pool of vehicles? Is it a centralized maintenance facility? Or is it a coordinated transportation service with especially designed vehicles and professional drivers? A method is presented for matching the needs of the agencies with the services provided through the concept of a transportation support center that can be developed in phases and offer a range of services to be purchased by agencies according to their need. /Author/

32 193695 PARATRANSIT AND THE JOURNEY TO WORK: STATUS REPORT.

Work-trip paratransit will flourish if the time and money costs of competing modes increase, whether due to price increases or taxation policies. It will also prosper if its time, money, and flexibility costs decrease as a result of operational economies or subsidies. In the short run, it appears that the competing modes will suffer only modest price inflation and largely escape the effects of energy taxation. It also appears that paratransit will receive little subsidization; it has only a weak institutional base and public officials are currently reluctant to embark on new spending programs. It follows that the growth of work-trip paratransit in the near term depends on the development of suitable, low-cost provider arrangements and on price reductions deriving from decreased insurance costs and improved vehicle operating efficiency for van pools. If successful adoption of these techniques produces significant market penetration at present price levels, public officials may find additional ride-sharing initiatives, in the form of price incentives or subsidies, both cost-effective and politically feasible as means of conserving energy, reducing emissions, and alleviating congestion. /Author/

32 193696 REDUCTIONS IN VEHICLE TRAVEL BY USE OF CAR AND VAN POOLS IN MAJOR METROPOLITAN AREAS. Techniques are developed for determining the car-and van-pool potential of major employment centers as functions of employee residential distribution and income level. The techniques are based on an automobile-occupancy model previously developed for the national capital area and an empirical van-pool model derived from the highly successful van-pool program by the 3M Company in St. Paul. Application of the techniques to private and government employment centers in the national capital area indicates a potential 10 percent reduction in peak-hour traffic and a potential saving of 3.5 percent of total gasoline consumption. /Author/

32 193698 EVALUATION OF AN EMPLOYER-BASED COMMUTER RIDE-SHARING PROGRAM.

The commuter ride-sharing program developed by the Tennessee Valley Authority for its employees in Knoxville, Tennessee, uses a variety of transportation modes—express buses van pools and car pools. The program has been very successful with 2686 employees (79 percent of the total work force of 3400 employees) participating. The program has different implications for the employer, the employees, and the community; these implications for each interest group are quantified in terms of benefits and costs. The analysis shows that by supporting the ride-sharing demonstration program, the employer was able to avoid the cost of constructing a new parking structure for the employees and that the resulting annual savings are larger than the annual cost of the subsidies to the program that are paid as an incentive to participating employees. From the standpoint of the employees, the program resulted in a substantial reduction in commuting costs. The reduction in fuel consumption that can be attributed to ride sharing was quantified, and the consequences in terms of improved traffic operating conditions along a major travel corridor and the favorable impact on the local transit system were examined. /Author/

32 193699 COMPARISONS OF PRODUCTIVITY OF FOUR MODES OF SERVICE IN ORANGE, CALIFORNIA.

The Orange County Transit District has operated a community-service transit program in the city of Orange, California, since May 1975. Because of an adverse court ruling and a subsequent successful appeal, this service underwent four modal changes. These four modes provide a unique opportunity for

comparison. In order of implementation, they were a demand-responsive dial-a-bus, a three-loop fixed-route bus system, a two-loop fixed-route bus system, and a demand-responsive dial-a-taxi system. The four systems were compared by using five performance indicators. The two demand-responsive systems were found more efficient and effective than the fixed-route systems. The dial-a-taxi system, during its first 3 months of operation, compared very favorably to the dial-a-bus system, and continues to show monthly improvements on each indicator. The information gained in this study may be of limited transferability, but the data suggest that dial-a-taxi can be very efficient and effective in serving cities or suburban areas with population densities of 1900/sq km (5000/sq mi) or less. /Author/

32 193700 COST-REVENUE SQUEEZE IN CONVENTIONAL TRANSIT.

Transit ridership is increasing after more than 2 decades of decline. But the share of the travel market held by transit continues to decrease relative to that of the automobile, and the reverse of patronage decline has been achieved at enormous cost. Operating losses have escalated at a rate (more than 30 percent/year) that cannot be sustained. In part, this is due to inflation, the increasing cost of fuel, the aggressive bargaining posture of transit unions, and a policy of fare stabilization. But the more fundamental reasons are (a) the evolution of urbanization and social interaction patterns that are incompatible with the operating regime of conventional transit and (b) the introduction of costly and underused services stimulated by formula subsidy programs based on fair-share politics. The cost of transit deficits is evident in taxes. But there are other, less evident, costs of expecting too much from transit. These include the failure to develop a coherent national policy toward the future of the automobile and the highway system. Paratransit can be a part of the solution if it offers a way of lowering expectations and focusing attention on the cost-effectiveness and market potential of competing alternatives. It can be part of the problem if it creates new expectations that serve to establish the right to service regardless of need. The best possibility for restraining costs and matching services to needs seems to lie in the reform of the subsidy allocation process. If regional planning agencies or general purpose governments could be given greater discretion to allocate federal funds, competitive bidding arrangements could be used to secure quality service from the most efficient vendor. This would entail severing the direct connection from the federal treasury to the transit properties and designating nonoperating agencies as the recipients of federal operating funds. /Author/

32 193701 COSTS AND PRODUCTIVITIES OF INNOVATIVE URBAN TRANSPORTATION SERVICES. The aspects of supply and demand that determine the costs and productivities of paratransit services are described, the variations in performance of the services are explained, and ways of improving them are suggested. Publicly owned dial-a-ride services are observed to be very expensive operations and, although the potential for cost reduction exists, these trip costs will probably remain high. The current practices of ubiquitous dial-a-ride services and extremely low fares are questioned. It is also suggested that increased participation in paratransit operations by the private sector--the taxi industry--promises significant improvements in the cost performance. /Author/

32 193702 LEGAL AND INSTITUTIONAL CONSIDERATIONS IN PARATRANSIT INNOVATIONS. Transportation has a rigid background of laws, regulations, and business practices developed during the late 1800s that strongly influences the transportation options available today. This paper examines some of the assumptions on which these policies and practices are based. Several alternative approaches and ways in which they could be implemented are suggested. In addition, specific laws and practices that may need to be reevaluated are identified. /Author/

32 193703 INSURANCE AS IT RELATES TO DEMAND-RESPONSIVE TRANSIT (ABRIDGMENT). At the present time, it is difficult to set insurance premiums for ride-sharing systems. The concept is relatively new. Therefore, carriers have been unable so far to identify adequately the exposure to losses for rating purposes. Compared with conventional taxicabs, ride-sharing systems do have higher passenger loads which would tend to raise insurance costs due to the increased liability limits required. However, they also have a lower accident frequency which tends to lower insurance costs. Premiums can also be kept in line through proper hiring procedures, safety programs, thorough claims-handling procedures, and curtailing medical fees.

32 193705 LABOR, PARATRANSIT, AND SECTION 13C. There are many legal and institutional strategies that transit labor can use to protect itself from unwanted innovation; this paper examines the specific protection given by section 13c of the Urban Mass Transportation Act of 1964. The paper begins with a description

of the mass transportation system to which section 13c applies and then describes the use of competitive brokerage for the selection of new mass transportation services. It next discusses the historical context of section 13c and the application of this section to the acquisition of private mass transit companies by using Urban Mass Transportation Administration funds. Finally, the paper describes various applications of section 13c that affect paratransit innovation, including competitive brokerage, and recommends measures for ameliorating any adverse effects such applications may cause. /Author/

32 193707 INFORMATION AND CONTROL SYSTEMS FOR PARATRANSIT SERVICES. The current uses of information and control systems in paratransit services are reviewed, and new applications that are currently being developed are discussed. Thus far, the greatest use has been by the conventional transit and taxi industries for accounting, payroll, and limited management information. In both of these industries, the larger operators have recognized that the costs of automating these clerical functions are readily justified by the benefits. However, for many other functions, the questions of whether automation will produce benefits and whether the costs can be justified are still open. In several functional areas, most strikingly brokerage and pooling services, advances in computer technology and reductions in computer costs are already making a stronger economic argument for automation. At present, however, the ability of many of the more innovative applications of computer technology to paratransit to provide real economic advantages is unproven. /Author/

32 193708 MANAGEMENT AND ORGANIZATION FOR PROMOTING THE USE OF PARATRANSIT. Before paratransit organizations can develop, it is necessary to demonstrate their capabilities to the community. This paper presents a strategy for implementing various paratransit services and integrating these services into the community. It also presents some of the philosophical issues on which paratransit programs may be structured. Finally, it suggests an organizational structure that can be used to promote these concepts and appropriate funding levels. /Author/

32 193709 INVOLVING THE PRIVATE OPERATOR. Issues related to the use of the excess capacity in paratransit resources provided by taxicab operators are discussed, and recommendations are made. The local nature of the daily surface transportation of people is stressed. The decisions regarding options available under federal and state public transportation programs that most directly affect efforts to more effectively use existing public transportation resources, including private operators, are local. The states should provide technical assistance to those local governmental entities that lack the staff and economic resources to support permanent public transportation research and planning. The states should also exercise leadership in harmonizing public transportation planning and optimizing state and local programs and funding mechanisms to supplement federal efforts. Before additional paratransit funding sources are approved, the states should identify and understand the use of the paratransit funds already available in their jurisdictions through federally funded categorical programs. They should seek to reallocate these existing monies to purchase paratransit services more effectively than in possible under present circumstances of fragmentation, duplication, and waste. Reforms at the federal level are ultimately necessary to achieve this. More must be done at the regional level to identify existing public and private paratransit services and resources. Advisory committees to metropolitan planning organizations are recommended composed of public transportation decision makers, users, and public and private providers. The need for local reregulation to implement innovations in meeting paratransit demand is addressed. The roles of independent owner drivers and lease drivers, shared-ride taxi services, and fuel-tax relief equal to that granted transit are discussed as reforms required to enable the private operator to gain control over operating costs and provide for easier entry into the taxi market for entrepreneurial drivers. Labor considerations under section 13c of the Urban Mass Transportation Act of 1964 need not have only negative connotations in the use of private operators for paratransit service. As taxicab operators move into shared-ride services and function as mass transportation companies, with or without Urban Mass Transportation Administration monies, their employees may qualify for section 13c protection whether or not they are unionized. /Author/

32 193712 REVIEW OF PARATRANSIT ACTIVITIES IN CANADA. Canadian experiences with paratransit services--dial-a-bus services in 12 communities and five car-and van-pooling operations--are reviewed. In general, the Canadian operations have differed from those in the United States in the following ways. The Canadian operations are typically more productive and operate at lower costs per rider, and the demonstration projects have been more modest in scale and the use of new technologies. The introduction of computerized routing and scheduling techniques has usually been postponed until the operation has achieved stability. Dial-a-bus operations are usually treated as interim services to be replaced by fixed-route transit as soon as possible, and organized ride-sharing programs have been subordinate to dial-a-bus and mass transit services. /Author/

32 193713 IMPLEMENTATION AND PRELIMINARY IMPACTS OF SHARED-RIDE TAXI SERVICE AT BOSTON LOGAN INTERNATIONAL AIRPORT. On April 26, 1977, the Massachusetts Port Authority introduced a pilot shared-ride taxicab dispatching service called share-a-cab from Boston Logan International Airport to 21 cities and suburban towns to the west and northwest of the city of Boston. The service provides for the grouping of up to four passengers in one taxi for a flat fare known in advance to the passenger that is approximately half the average metered fare to the city or town to which he or she is destined. Share-a-cab passengers are grouped from five airport terminal locations by means of a central assignment and taxi dispatching system that is linked by telecommunications to personnel in the terminals. On July 19, 1977, the service was expanded to 117 additional eastern Massachusetts cities and towns and on September 19, 1977, service at reduced fares was guaranteed after a maximum 15-min wait even if only one passenger had requested service. Preliminary impacts for the service area of 138 communities indicate that the share-a-cab service has attracted approximately 3 percent of the total daily trips from Logan Airport to these cities and towns. Among the users of share-a-cab trips, approximately 42 percent had shifted from exclusive-ride taxi, 30 percent had shifted from private or rental automobiles, and about 28 percent had shifted from bus, limousine, or rapid transit services. Share-a-cab has significantly increased taxi rider-

ship and revenue. The service was implemented without any major operational problems, although its labor-intensity has resulted in subsidies per passenger that are relatively high. The expected demand levels and diversions from private automobile trips have not yet been reached. The early results have been evaluated to reach conclusions and provide recommendations for improvements to the initial service. /Author/

32 194046 TELECOMMUNICATIONS AND TRAFFIC [Telekommunikation und Verkehr]. The relation between telecommunications and traffic is illustrated. After the electronic media brought an increasing separation of freight transport and information transport, a situation exists where there is an increasing entanglement of telecommunications and traffic. On the one hand, telecommunications act as support systems (e.g. car phones, dial-a-ride systems) and on the other hand, they are substitutes (e.g. business journeys-conference arrangements). The substitution potential of newer and enlarged telecommunication services for traffic is considerable: an extensive movement in favour of telecommunications is economically necessary and is in the public interest. /TRRL/ [German]

32 195311 MODAL SPLIT MODEL CONSIDERING CARPOOL MODE. Modal split remains a primary concern of transportation planners as the state-of-the-art has developed from diversion curves to behavioral models. The approach taken here is to formulate the mode-choice decision for the work trip as a linear combination of real and perceived characteristics of the modes considered. The logit formulation is used with three modes being considered, i.e., two automobile modes (drive-alone and carpool) and a public transit mode (bus). The final model provides insight to what factors are important in travel decisions among these three modes and the importance of examining traveler's perceptions of the differences among modes relative to actual measureable differences.

32 195331 SCHEDULING DIAL-A-RIDE TRANSPORTATION SYSTEMS. An analytic investigation into the fundamental aspects of scheduling "Dial-a-Ride" transportation systems is conducted. Based upon simple mathematical models that focus on the combinatorial nature of the problem, a class of algorithms is derived for which performance can be measured in a precise asymptotic probabilistic sense. It is concluded that the approach yields many qualitative insights and the resulting transportation schemes have modest computational requirements, are decentralized, and are easy to visualize and implement.

32 195393 APPROXIMATE ANALYTIC MODEL OF MANY-TO-MANY DEMAND RESPONSIVE TRANSPORTATION SYSTEMS. This paper presents an analytic model to predict average waiting and riding times in urban transportation systems (such as dial-a-bus and taxicabs), which provide non-transfer door-to-door transportation with a dynamically dispatched fleet of vehicles. Three different dispatching algorithms are analyzed with a simple deterministic model, which is then generalized to capture the most relevant stochastic phenomena. The formulae obtained have been successfully compared with simulated data and are simple enough for hand calculation.

32 195577 INTERIM EVALUATION OF THE MINNEAPOLIS RIDESHARING COMMUTER SERVICES DEMONSTRATION. This report presents an interim evaluation of the impacts of ridesharing brokerage project at three multi-employer work sites in the Minneapolis metropolitan area. The demonstration project is funded by the Urban Mass Transportation Administration as part of the Service and Methods Demonstration Program. In this demonstration, the Metropolitan Transit Commission is coordinating a variety of brokerage functions which are designed to encourage increased ridership in high occupancy vehicles to non-CBD work sites. The modes being promoted are carpooling, vanpooling, subscription and regular bus. This interim evaluation focuses on an analysis of pre-demonstration survey data. Site characteristics and work conditions are described in detail, including parking availability, observed variance in start-end times, worker overtime requirements and business need for a car. It is shown that these work conditions and the relatively short commute distances to the demonstration site impose major barriers to successful demonstration results. A series of market penetration measures are presented to evaluate the effectiveness of the broker's marketing efforts. The results suggest that formal employee presentations are much more effective than passive marketing tools in attracting commuter interest in ridesharing. This evaluation report is based on the project events up to September 1, 1978. As such, conclusions drawn in this report are strictly preliminary and subject to modification to reflect changes in the project during the remainder of the evaluation period. /UMTA/

32 195639 A DEMAND ESTIMATING MODEL FOR DIAL-A-BUS PLANNING PROCEDURES. Dial-a-bus demand estimating techniques often have overestimated patronage, and have contributed to deficits as unacceptable as the deficits incurred on the fixed-route system replaced by dial-a-bus. A simple demand model for estimating dial-a-bus ridership has been developed. The model takes into consideration the population, type of service operated, hours of service and distance to the major trip generator. A test application of the model estimated actual ridership within 10%. It has been concluded that the model is accurate enough for planning purposes and can, therefore, be used as a guide by transportation planners as input into the analysis of required funding for dial-a-bus installations. /TRRL/

32 196709 DEMAND RESPONSIVE TRANSPORT: THE FIRST SIX MONTHS. Two experimental demand responsive bus services were established in the Melbourne suburbs of Lilydale and St. Albans on the 24th October 1977. The services were initiated with the following objectives: (I) to measure level of demand, (II) to establish a relationship between the characteristics of an area and the likely success of a demand-responsive service, (III) to examine the operational aspects of a simple dial-a-bus service in a suburban environment. Both services were in operation for six months. The six months trial period ended on the 22nd April, 1978 and it was decided at that stage to continue both services for a further three months with significant alteration to fares, timetables and areas served. The conclusions reached was that the services as established required a subsidy beyond that which the Ministry could support throughout the state. The experimental period demonstrated the potential of demand responsive bus services and further development was encouraged by the existence of opportunities to reduce costs and increase revenue. /TRRL/

32 196819 AN OVERVIEW OF PARATRANSIT ACTIVITIES IN CANADA. This paper reviews the development of paratransit services in Canada since 1970 in dial-a-bus, privately operated systems, transportation pooling options and specialized services for the handicapped. It also outlines the role of the federal, provincial and municipal governments as well as

the private operators in fostering paratransit systems implementation. The paper deals with the difficulties of evaluating paratransit projects since evaluation relies mostly on subjective judgement due to a lack of quantifiable performance criteria. It outlines a list of criteria against which all the Canadian paratransit projects are evaluated. These criteria can be summed up in five main categories: systems performance, operational efficiency, economics, social impact and environmental impact. Finally, the paper attempts to predict the future paths of paratransit development in Canada. /TRRL/

32 196832 ROLE OF ELECTRIC VEHICLES IN MULTI-MODAL URBAN TRANSPORT SYSTEM. Electric vehicles are able to satisfy some of the urban transport needs. The ability of battery and guide-way-sourced vehicles are discussed and compared with internal combustion engines for a variety of vehicle types and journey characteristics. The factors which are significant are performance, energy source and efficiency of conversion and pollution. Existing urban transport policies will change the characteristics of city travel and the demand for vehicles. These factors are outlined, together with new government incentives which may be introduced if electric vehicles are shown to offer advantages. /TRRL/

32 197117 USE OF TAXICABS FOR TRANSPORTING THE HANDICAPPED: DADE COUNTY EXPERIENCE. This paper describes the special transportation service program designed to provide transportation services to handicapped residents of Dade County, Florida. Private for-hire operators of taxis and lift-equipped vans transport approved handicapped users, who are too disabled to use regular public transit, anywhere in the county for \$1.00 for a one-way trip. This report reviews the program's initial concepts, stated goals, and objectives and describes how the program has worked. User application forms, user trip vouchers, vehicle travel records, and a telephone survey of a random sample of program users provided data to assess user characteristics and trip-making patterns during the first 10 months of operation. After 10 months, the program had over 3400 approved users, 45 percent of whom were 65 years old or over. Out of 56 552 trips, 17 percent of the trips were made by wheelchair-bound users, 74 percent by transfer able users, and 9 percent by companions. Disabled persons used a cab in 80 percent of the cases, and lift-equipped vans accounted for the remaining 20 percent of the vehicle trips. The average cost per person per trip was comparable with those reported in Atlanta and Denver for special handicapped services (\$9.56/person in Dade County). The special

transportation service program has proven to be successful in Miami and has the potential of being successfully implemented in other areas. The trip-making characteristics and operating data found for the 10-month monitoring period could prove useful to other communities planning transportation for handicapped residents. /Author/

32 197118 FACTORS AFFECTING THE USE OF TAXICABS BY LOWER INCOME GROUPS. This study investigates the propensity of poor persons to use taxicabs. An evaluation of existing data on the use of taxicabs by different income groups shows that in larger urban areas lower income groups display a relatively high rate of taxi use. A critical analysis of previous work suggests, however, that the data analysis contained therein actually underestimated the reliance of the poor on the taxi. An analysis of the limited work on taxi use in small- and medium-sized urban areas reveals an even greater dependence of the poor on the taxicab. This work is supported by a survey of taxi drivers and an analysis of the origins of taxi trips. The factors that create this pattern of use are also examined. Previous studies and our data suggest that the poor often choose taxis because they are the principal option when an automobile is not available. Taxis appear to be chosen over conventional transit (when it exists) because they offer greater service flexibility, convenience, and duration of service, as well as better meeting the security demands of the poor. Increased availability of taxi service by reduced market entry restrictions and reduced cost of taxi service by permitting group riding and providing subsidies would increase the mobility of the poor. /Author/

32 197119 SOCIAL SERVICE AGENCIES TRANSPORTATION SERVICES IN TEXAS: POTENTIAL FOR OTHER PARATRANSIT MODES. This study analyzes the current transportation operations of social service agencies in three prototype communities in Texas: urban, rural, and rural with urban interface. The study was designed to identify and analyze the costs of direct provision of client transportation by social service agencies and to develop comparative cost indexes for the same or similar classes of trips if delivered by alternative providers, including taxi operators, transit systems, and nonprofit providers. Common classes of trips are identified and categorized by major operational characteristics, and actual and perceived cost data are developed for trips provided directly by social service agencies to their own clients. Actual cost figures, including expenses borne externally or through

grants, are developed to allow policymakers to evaluate effectively the costs of direct transportation provision by social service agencies. Since federal and state subsidies exist and will be used, perceived cost figures are developed to allow social service agencies to compare the advantages of alternative service provision to their out-of-pocket costs. Although no other provider was found to be cost-effective for all client trips, some social service agencies are found to be operating inefficient or ineffective transportation systems and should, therefore, consider an alternative provider. Guidelines are developed to facilitate these decisions. /Author/

32 197171 SYSTEM ANALYSIS OF AIRPORT DEMAND RESPONSIVE TRANSPORT (DRT). This report details the study that was conducted of the operation of a service offering door-to-door transportation between Mirabel airport and customer-specified addresses in selected suburban zones in Montreal. The simulated demand responsive transport (DRT) service was requested on demand at the airport and through a booking service at suburban locations. The study investigated the potential demand for such a transportation service, the optimum fleet and vehicle size combination, the economic costs of the system, and the levels of service offered to customers.

32 197366 EVALUATION OF INCENTIVES FOR CARPOOLING AND BUS USE, BANFIELD FREEWAY. The report summarizes what has occurred on the Banfield Freeway Preferential Lanes for High Occupancy Vehicles Demonstration Project from November 1, 1977 through July 1978. Phase II of the project commenced November 1, 1977 and has a different emphasis than did Phase I. Phase I deals with evaluating the effects of adding preferential lanes for high occupancy vehicles on an existing facility, the Banfield Freeway, serving eastern Portland. Phase II, on the other hand, is concerned with the effects of adding new incentives for carpooling and riding the bus to the performance of an ongoing HOV lane on the Banfield Freeway.

32 197367 ASSESSMENT OF THE INCLINED ELEVATOR AND ITS USE IN STOCKHOLM. This is a study of the inclined elevators installed in the Stockholm mass transit system. The Stockholm experience, reported herein, with operation of inclined elevators in subway stations is intended to serve as a basis for

judgment of the feasibility of inclined elevator applications in U.S. mass transit systems. During a two-week inspection of the Stockholm subway system, five specialists studied the inclined elevator and its setting, including planning and architectural aspects, design, construction, maintenance, costs, and actual use. An onsite investigation was conducted by a multidisciplinary team through direct observation of equipment; interviews of personnel concerned with the development, operation, and use of the elevators; and review of source material. The inclined elevators are technically similar to vertical, counterweighted, mechanical traction-type automatic elevators, except for the inclined travel. Their installation within escalatorways integrates the travel path of elderly and handicapped elevator users with the escalator route of able-bodied passengers. Station arrangement is simplified where separate vertical elevator shafts and lateral connections to platforms can be eliminated. Inclined elevators are a possible alternative to vertical elevators in U.S. subway systems for new stations where escalator rise is greater than 40 feet, or greater than 25 feet and accompanied by a lateral displacement that prevents vertical connection.

32 197450 KNOXVILLE COMMUTER POOL. ANNUAL REPORT. The Brokerage Bureau, commonly known as the Knoxville Commuter Pool (KCP), came into being on October 23, 1975, through a formal agreement between the Urban Mass Transportation Administration and the City of Knoxville. Currently the KCP is a part of the City government; however, its services actually extend over a region comparable to the East Tennessee Development District. KCP has acted to integrate vanpools into the general ridesharing system which includes carpools, transit buses, and privately operated express buses. One of the most significant accomplishments of the KCP was the establishment of credibility and awareness among the local business community and the general public, concerning ridesharing. This annual report presents a concise description of the background, objectives, organization, and accomplishments of the Knoxville Transportation Brokerage Project. Special attention is given to details of employer/employee participation, concentrated program efforts in the Central Business District, and a telephone information and brokerage service. The vanpool program is described in detail, including maintenance, the transition of the vans to private ownership, and the formation of an association of private vanpool owner/operators. Other aspects of the project are also covered, including the development of computer matching capacity, social service brokerage, a downtown fare free bus zone, and promotion and advertising.

32 197500 INTEGRATED PARA-TRANSIT TRANSPORTATION PLANNING FOR OFF-PEAK LOW DENSITY TRAVEL. The product of this research project is a three-report reference to aid in planning for off-peak transportation services. They constitute a comparison volume to a report entitled: Para-Transit: An Assessment of Past Experience and Planning Methods for the Future, Volumes 1 and 2 (available from NTIS), which describes the use of paratransit modes in the provision of journey-to-work transportation in low density areas. This present three-report volume provides guidelines for planning paratransit for off-peak and/or non-work travel. As a summary of off-peak trip characteristics, Report 1, provides the background for two subsequent reports: Report 2: Elderly and Handicapped Transportation and Report 3: Planning Methodology (available from NTIS). It is not intended to be comprehensive, but rather to furnish the basic nature of off-peak travel. With some exceptions, this report may be viewed as an examination of non-work trips, since most of the travel discussed here relates to other trip purposes. Most of the data in this report are based on the Chicago area, since this area is felt to be representative of many of the transportation problems facing urban areas today. (UMTA)

32 198203 THE ROCHESTER NEW YORK INTEGRATED TRANSIT DEMONSTRATION. VOLUME I: EXECUTIVE SUMMARY. The Rochester Integrated Transit Demonstration (RITD) was designed to assess the roles of demand-responsive transit services in a regionwide transit system that includes an extensive fixed-route bus network. The demonstration extended transit service into suburban areas by using integrated mixes of fixed-route and paratransit services. Four types of innovations were demonstrated: service; system integration; equipment; and fares, marketing, and promotion. This report describes the conduct of and the impacts resulting from the implementation of a family of demand-responsive transit services and several related innovations in Greece and Irondequoit, New York (two suburbs of Rochester). The report covers the time period beginning with the implementation of PERT (Personal Transit) services in August 1973 through July 1977. The report contains a description of the implementation process and the impacts of individual services and innovations on the level of service provided, transit demand, and transit productivity. The implications of the Rochester experience are summarized for the benefit of other localities considering the implementation of similar services.

32 198747 PARATRANSIT REPORTING SYSTEM: A SYSTEM FOR COLLECTING AND REPORTING UNIFORM PARATRANSIT FINANCIAL AND OPERATING STATISTICS. In July, 1976, the Urban Mass Transportation Administration contracted to develop and test the implementation of a computerized system for collecting and reporting paratransit financial and operating statistics. The project objectives are: to expand/modify the computerized uniform system of accounts and records developed in project TAXISTATS so that it can be applied to all paratransit operations; to ensure that this reporting system is compatible with the reporting system developed for scheduled mass transit operations (FARE System) and to test and implement the computerized uniform reporting system in several paratransit operations to provide necessary information for large-scale implementation of the system. The report provides the documentation of the system and is divided into four chapters: Chapter I 'General description' presents an overview of the system,

how it relates to the required FARE System for transit operators, and discusses implementation issues; Chapter II 'Analytical reports' describes the reports that are generated for use by paratransit operators, UMTA, and the general public; Chapter III 'Instruction manual' contains definitions of the accounts and records and provides instruction to the paratransit operators as to how to fill out the data transmission reports; and Chapter IV 'Data processing procedures and program descriptions' provides the general documentation of the automatic data processing aspects of the system.

International Taxicab Association, Urban Mass Transportation Administration Final Rpt. 32 199018 IMPLEMENTING THE ROCHESTER COMMUNITY TRANSIT SERVICE DEMONSTRATION. The report describes the implementation process and the early impacts of the Rochester Community Transit Service demonstration in four suburbs of Rochester, New York. The demonstration project is an outgrowth of an earlier one which ended in October 1977. The new demonstration will continue until July 1979. In the first demonstration, a variety of demand-responsive services were operated in two Rochester suburbs--Greece and Irondequoit. In the new demonstration, the door-to-door dial-a-ride service was expanded in July 1978 to two additional suburbs--Brighton and Henrietta, and the handicapped service became a region-wide operation over a four-month period starting in July 1978. In addition, all four dial-a-ride service areas will eventually have computerized scheduling and dispatching using a dedicated minicomputer. The new demonstration is largely concerned with two institutional innovations developed by the Rochester-Genesee Regional Transportation Authority to deal with the problems of high operating costs and insufficient local funding availability. These innovations are the use of a competitively selected private operator and the shifting of the funding responsibility to the suburban towns served by dial-a-ride. The report describes the events leading to these innovations, their implementation, and their results and implications thus far.

32 260220 POLICY-SENSITIVE MODEL FOR MODE SPLIT PLANNING. Urban transportation mode choice is critically dependent upon residential walk times, transit frequency, and out-of-pocket costs. A policy-sensitive model of these attributes account for a significant portion of mode choice variation among a set of commuters. A discrimination-classification model was generalized and used to simulate the probability that an individual would choose an abstract mode, k, of policy-sensitive variables.

The variables were used to define linear discriminant functions and mode choice probability was tested based on individual discriminant functions by a model. Data for calibration were provided by a hand out/mail back travel survey of commuters to the central business district of Vancouver, B.C. Presimulation tests showed that transportation system attributes were more important than socioeconomic characteristics in the mode choice decision.

Brown, GR (British Columbia University, Canada) *ASCE Journal of Transportation Engineering* Vol. 99 No. TE4, Proc. Paper 10123, Nov. 1973, pp 711-724, 7 Tab., 9 Ref., Apps.

32 260246 VAN, BUS POOLS OPERATE SUCCESSFULLY. The 3M Company's ride-sharing project in St. Paul, Minnesota which operates 41 vehicles on a profit-to-the driver plan is described. Drivers were selected to form and manage pools of at least 8 passengers. The company leased a van on a mileage-based fee which was calculated to recover all costs of vehicle insurance, maintenance and operation. The cost was estimated to be \$6.10 per day and 5.5 cents per mile. The fee charged to riders varies from \$19.50 per month for the shortest trip (seven miles) to \$29.50 monthly for the longest (40 miles). The driver, in addition to his own free transportation, keeps all income collected from passengers above 8 persons and may also use the van for private purposes for a charge of 7 cents per mile. The company absorbs administrative costs. Van drivers who must have a special Minnesota licence, have the responsibility of arranging for standby drivers, and must see that the company-paid maintenance is performed. Other firms are investigating van and bus pools as a means of reducing urban traffic congestion and lowering commuting costs. A bus may be used when a sizeable number of people live in the same general area or can collect at a common intermediate point and travel to the same destination. The most common arrangement is the chartering of a bus to serve one or more collector localities. Among the most successful programs are those of the Government Employees Insurance Company in Bethesda, Maryland which operates 8 buses, and the Atlantic Ritchfield Company program in Los Angeles which operates 14 buses.

Automotive Information Vol. 2 No. 11, 1974, p 2

32 260259 STATUS OF CARPOOLING IN THE HIGHWAY PROGRAM. Carpooling is one way of immediately reducing gasoline consumption without having to severely restrict personal mobility or expend large amounts of public funds, or do harm to other important and desirable national goals. One of the provisions of the "Emergency Highway Energy Conservation Act" was to permit Federal-aid highway funds, normally available for urban highway construction projects at a 70 percent Federal share, to be used for carpool demonstration projects at a 90 percent Federal share. The types of demonstration projects that are eligible for this bonus Federal share include those for (a) manual or computerized systems for locating and informing potential participants in carpools or buspools, (b) work necessary to designate existing highway lanes (whether or not the highway is on a Federal-aid system) as preferential carpool lanes or bus and carpool lanes, (c) traffic control

devices that are necessary to advise motorists and control the movement of carpools, (d) work necessary to designate existing publicly owned facilities as preferential parking for carpools, and (e) the risk or "abort" cost of making commuter driven vanpool service available. The directive implementing this provision gives the FHWA division engineers complete authority to approve projects and to use maximum discretion in working with the State highway agencies to develop meaningful projects. As of May 1974, 34 carpool demonstration projects involving \$5 million have been approved for funding under the 90 percent Federal funding provisions of the Emergency Highway Energy Conservation Act. The projects are located in 29 cities in 10 different States. In addition to these, there are many more that are being developed and are in the process of being approved. The author notes, however, that reports from field offices indicate that with the recently improved situation involving the availability of gasoline at the service stations, there is a general falling off of interest on the part of many groups for continued promotion of carpooling and other energy conservation programs. Citing the examples of the successes of Shirley Highway (northern Virginia), Reston Charter Bus Co. (northern Virginia, Long Beach, California, and the San Francisco-Oakland Bay Bridge, he concludes these projects are valueable and should be continued.

Morin, DA (Indian Institute of Technology) ; Western Association of State Highway & Transp Off June 1974, 5 pp; Proceedings of the 53rd Annual Meeting of the Western Association of State Highway Officials held at Portland, Oregon on June 6, 1974.; ACKNOWLEDGMENT: Federal Highway Administration

32 260268 SECRETS OF A CAR POOL. Carpooling reduces traffic, cuts down on vehicular pollution and saves gasoline. For individuals, carpooling can cut the cost of commuting dramatically. Three key factors must be taken into consideration when forming carpools: time, origin and destination of commute. Computer matching services are an efficient way of gleening this information and forming carpools. Once a carpool has been formed, other factors come into play; adequate insurance and the possibility of leasing a car for the pool. Human nature is a major consideration of any car pool and matters such as promptness, smoking and temperament should be discussed. A carpool with happy members does not happen automatically but the effort is worth it economically and ecologically. Smith, B ; Shell Oil Company 1974, 19 pp

32 260305 MINIBUS AND DIAL-A-RIDE: INITIAL EXPERIENCES WITH THE ABINGDON EXPERIMENT. A review of the first five months of this experiment is presented, together with the findings of user and household surveys. Some specific conclusions are drawn for the Abingdon situation, together with guidelines for further experiments elsewhere. The major problems are those of educating the public on how to use the new system, and of maintaining adequate access to the system for people who do not own a telephone. /Author/

32 260618 DEMAND-RESPONSIVE TAXI SYSTEMS: NEW YORK CITY EXPERIENCE. The medallion taxi industry in New York City, particularly with respect to two-way radio communications, has potential as a demand-responsive transportation system. A passenger is motivated to call a cab by a number of reasons, from simple convenience to extremes of need for dependable transportation. The business person going to or from work, daytime shoppers, elderly and handicapped people needing door-to-door arrangements, and travelers requiring rides to depots or airports during late evening and early morning hours when demand exceeds the general taxi supply often utilize radio-cabs. Requirements for ownership, operations and equipment for radio cabs are detailed here as well as the city's regulation of location of operations. Informal cab and fare sharing have long existed. A recent demonstration of Dial-a-Ride was conducted in an area of the city containing a high density of the aged population. A new ten-passenger "maxitaxi" vehicle is being considered with which to capitalize on a variety of group riding applications.

Mautner, AJ *Traffic Quarterly* Vol. 28 No. 3, July 1974, pp 453-465

32 260621 COMPARISON OF TAXI AND DIAL-A-BUS SERVICES. A probabilistic model of a conventional taxi service is formulated and analyzed. This model also applies to other queueing systems in which the servers must travel to the customers. The main assumptions are that demand is homogeneous and that the street network is uniform in a certain sense. Computer simulations incorporating these assumptions were made of both the taxi service and a many-to-many dial-a-bus system. It was found that small dial-a-bus vehicles (capacity 6-8) can serve 50 percent more people than taxis with only a slight increase in travel-time. An attempt to carry more passengers leads to steadily greater travel-times. However, dial-a-bus is generally less affected by changes in demand than taxis. The size of the region served has a pronounced effect on the efficiency of both dial-a-bus and taxi services.

Gerrard, MJ *Transportation Science* Vol. 8 No. 2, May 1974, pp 85-101

32 260637 COMMUNITY/SCHOOL BUS PROJECT. A PILOT PROJECT USING SCHOOL BUSES FOR PUBLIC TRANSPORTATION. The Community/School Bus Project, funded by a demonstration grant from UMTA, was designed to test the feasibility of using school buses for public transportation when not in school service, thus obviating formidable

capital investment in equipment. Klamath Falls, Oregon, is a small urban community (approximately 36,000) lying in the heart of a sparsely populated region. Prior to the commencement of this project the area has been without the public bus service since 1958. According to the 1970 Census, nearly 15% of the population was 62 years of age or older. The combination of a number of conditions, namely, a community without public transportation and a growing demand for such service, the resistance of taxpayers to local budget increases, and the existence of idle school buses led to the conception of this demonstration project. Three objectives were: (1) to test and report on feasibility of using school buses for public transportation during their idle hours; (2) to evaluate the need for public transportation in the area; and (3) to lay a foundation for continuing a public bus service after conclusion of the project. The two phases of the project were during the 1972-3 school year when service was part-time and during the summer of 1973 when buses were continually available. Organization, operations, community response, local versus state operation, legislation, conclusions and recommendations are discussed. Photographs complement the text and appendices include advertising techniques. /UMTA/

Klamath Area Transit, (OR-06-0001) Final Rpt. UMTA-OR-06-0001-73-1, Dec. 1973, 108 pp; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-233509/AS

32 261588 DIAL-A-BUS MANUAL, VOLUME 1. This report is the first of a two volume study of the Dial-a-Bus concept. It forms an introduction to the subject and its purpose is to provide members of city councils, transit managers, city managers, other municipal officials and interested citizens with a non-technical explanation of D.A.B. operation. It also highlights the attractiveness of D.A.B. in terms of the social and transportation objectives of a community.

Transportation Development Agency, Canada Vol. 1 Jan. 1974, 7 Fig.

32 261611 ELECTRICS TRY TO EASE AMSTERDAM CONGESTION. A new concept in the design and organization of rent-a-car fleets has been introduced in Amsterdam. Designed to serve as an alternative to private cars and the existing means of public transportation, the Witkar ("white car") differs from conventional car-rental systems in that all of the cars are two-passenger electric cabs intended for use only in the downtown area. Five stations and 35 cars are scheduled to go into service later this year, and 15 stations and 125 cars are planned for the near future. They are all electric vehicles, occupying only one-third the road surface of the average car. The cars are 86 inches high, and plastic construction limits total weight, including battery, to 858 pounds. They have a 55-inch-wide steel chassis and a 55-inch wheelbase. Because a number of important modifications remain to be made, it is still too early to predict the ultimate feasibility of the Witkar system. But its possibilities as an alternative to other means of urban transportation are already being studied by the city government of Rotterdam (The Netherlands), Luxembourg (Luxembourg) and Boston.

Senger, WM *Automotive News* Vol. 49 No. 4498, July 1974, pp 29-30

32 261655 MANUAL CARPOOL MATCHING METHODS. There are three basic types of manual matching for carpools; centralized, locator and roster. The roster technique is best applied to small groups of about one hundred. The Locator board method is most effective in an office building type of situation where it is a self service type of arrangement. More administrative work is required for the centralized technique but is the best method to use as a transition between manual and computer methods. Essential requirements for an effective matching technique are: good maps, standardized grid and questionnaires, commitment of the people involved, incentives, feedback and public information. Matching seems to work best in a work situation.

Department of Transportation Jan. 1974, 33 pp, 14 Fig., Photos., 1 App.; This report is part of a series. The full report is entered in HRIS as 263921. Prepared by Alan M. Voorhees and Associates, Inc.

32 261659 TRANSIT/TAXI COORDINATION. Potentially carpools, buspools and vanpools could threaten taxis and public transit by reducing ridership. As carpools are given priority treatment in terms of express lanes and special tolls it adds to their attractiveness over more traditional taxis and public transit. A coordinated program of both means of transit could be mutually beneficial. Taxi and Transit operators are already good resources on public transportation and could even be used to form and run carpools of act in an advisory capacity. As part of questionnaires in matching carpools, information could be gathered on using taxis as a feeder system, subscription services or willingness to join a bus or taxipool. Matching data could indicate where and when there is a need for more taxi and transit services or a group large enough for an transit pool rather than a carpool. The public information phase in coordination with transit could provide route maps and information on taxi areas. This also would enable the commuter to choose a convenient back up service for carpooling. Priority lanes could be opened to all multioccupancy vehicles above a certain minimum. Transit services could provided feeder services, demand responsive transit, shuttle services taxipools, group shared riding in taxis and jitney services.

This report is part of a series. The full report is entered in HRIS as 263921. Prepared by Alan M. Voorhees and Associates, Inc.

32 261660 BUSPOOLS. Buspools are a transit service where the riders determine the routes, headway, origin destination and sometimes the fare. It can apply to any kind of trip (work, shopping, social) that is established on a weekly or monthly basis. Buspools can be instituted where there is a large group of people with the same origin and destination, a high volume collection point, buses for charter, a group to initiate the pool, a high level of service and a distance long enough to make buspooling more practical over carpooling. Use of the bus during nonpooling hours makes buspooling more economical and energy efficient. Successful buspools are operating in Reston, Virginia, Mantua, Virginia, Columbia, Maryland, Pittsburgh, Pennsylvania, Omaha, Nebraska, Tuxedo, Maryland, Rochester, New York, San Francisco and Long Beach, California.

Department of Transportation Jan. 1974, 18 pp

This report is part of a series. The full report is entered in HRIS as #261652. Prepared by Alan M. Voorhees and Associates, Incorporated.

32 261663 VANPOOLS. Vanpools are defined as vehicles used to carry from seven to fifteen passengers. This form of pooling on a wide scale can reduce traffic during peak hours, help alleviate air pollution and aid energy conservation. The vanpool participant profits by having door to door transportation and reduced travel costs. The employer profits by having a multipurpose vehicle. Large employers can implement their own vanpool systems. While smaller ones may find it convenient to use an outside agency. Vanpools sometimes grow out of two carpools serving the same area. Employees should be used for support and promotion of vanpools. The 3M Corporation's "Commute-a-Van" has been very successful.

32 261982 AUTO RAPID TRANSIT: BENEFITS COMMUTING DRIVERS, PASSENGERS, OTHER TRANSIT MODES AND THE ENVIRONMENT. A new modified jitney mode of transportation is proposed called Auto Rapid Transit (ART) that could become popular for peak period work travel in an energy conservation economy. Conceptually, it uses the services of citizens making work trips as transit drivers and their private cars as transit vehicles. The appeal is that drivers would supplement their regular incomes with transit fares from passengers and passengers could get a cheap, line-haul high frequency level transit service. The ART vehicles would not be allowed to operate in off-peak period between regional transportation centers. This new mode of travel should be considered as another low cost means of easing the available seating capacity in peak travel period transportation systems.

Mann, WW *Traffic Engineering* Vol. 44 No. 8, Apr. 1974, pp 6-11

32 262933 POTENTIAL DEMANDS OF A DIAL-A-BUS SYSTEM. THIS ARTICLE DESCRIBES THE ROLE DIAL-A-BUS MIGHT PLAY IN AN URBAN AREA WITH A POPULATION UNDER 1 MILLION. DIAL-A-BUS WAS FOUND TO BE MOST SUCCESSFUL WHEN COMBINED WITH MAIN-LINE SERVICES INTO AND OUT OF THE CENTRAL BUSINESS DISTRICT (CBD). RESIDENTIAL AREAS WOULD BE DIVIDED INTO SECTORS EACH SERVED BY ONE OR MORE 20-SEATER "JITNEYS", WHICH WOULD OFFER A SERVICE CONNECTING WITH MAIN-LINE BUSES. HIGH SPEEDS ON THE MAIN LINE WOULD BE ACHIEVED BY INFREQUENT ACCESS POINTS AND BUS ONLY LANES, WHICH WOULD ALSO FACILITATE SYNCHRONIZATION INTO THE JITNEYS AND NOT REQUIRE ADDITIONAL INVESTMENT IN BUSES. TO BE ATTRACTIVE TO POTENTIAL RIDERS, DIAL-A-BUS WOULD ALSO REQUIRE SUBSIDIES IN OFF PEAK PERIODS THE JITNEYS COULD BE USED FOR

CROSS MOVEMENTS BETWEEN AREAS OUTSIDE THE CBD AND NOT PASSING THROUGH IT. IT IS CONCLUDED THAT DIAL-A-BUS COULD BE SUFFICIENTLY CHEAP AND QUICK TO ENCOURAGE SUBSTANTIAL TRANSFERS FROM PRIVATE CAR TO PUBLIC TRANSPORT. /TRRL/

Soliman, AH Manastersky, R *Traffic Engineering and Control* Vol. 15 No. 8, Dec. 1973, pp 402-403, 1 Fig., 11 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 208435)

32 263361 HADDONFIELD DIAL-A-RIDE THIRD PROGRESS REPORT. The Haddonfield Dial-A-Ride Demonstration Project is one of more than 40 demand-responsive transportation systems currently being used throughout the world. The prime objective of this particular project is to obtain accurate and reliable data for evaluation of the Dial-A-Ride concept. This third progress report delineates project direction during Phase II, beginning February 1, 1973 and ending January 31, 1974. It details ridership trends, vehicle productivity, service quality, revenues, and costs of operation. The report includes a quantity of graphs, charts, and tables that show the effects of service-area expansion, fare reduction, fleet expansion and service innovation. The main objectives of the Project for the period covered by this report were to: (1) determine achievable performance maxima for the Haddonfield manually scheduled Dial-A-Ride system; (2) determine when the manually scheduled system should be abandoned in favor of computer scheduling; (3) develop the system constants required to implement a computer-based scheduling function; and (4) simultaneously expand the service areas and introduce new system concepts while maintaining or improving service quality. To meet these objects, the following changes were made: two service area expansions, addition of six 10-passenger buses, inauguration of a shuttle service and a basic and senior citizen fare reduction. /UMTA/

32 263374 THE HADDONFIELD DIAL-A-RIDE DEMONSTRATION: DEMOGRAPHIC, SYSTEM AND USER CHARACTERISTICS. Data concerning the Dial-A-Ride demonstration in the Haddonfield, New Jersey area are presented in tabular and graphical form. This is a demonstration conducted by the Urban Mass Transportation Administration of the U.S. Department of Transportation, and the New Jersey Department of Transportation. The tables and graphs found in this report summarize the major characteristics of the area served, the attributes of the services provided and the characteristics of Dial-A-Ride users. Where it is possible to do so, comparisons are provided between the characteristics of the Dial-A-Ride users and those of the entire area served. The information used in this report was obtained from household surveys conducted during October 1971 and January 1973, from trip ticket data through October 1973, and from three on-board surveys conducted in January, July and September of 1973. /MITRE/ Medville, DM Arrillaga, B ; Mitre Corporation, (M73-228, Rev. 1) UMTA-VA-06-0012-74-4, Mar. 1974, 37 pp; Contract DOT-UT-10028;

32 263570 PAST, PRESENT, AND FUTURE OF DEMAND-RESPONSIVE TRANSPORTATION. In a discussion on the development of and prospects for demand-responsive transportation, the panelists called for a cost-benefit justification of dial-a-ride and a state-of-the-art analysis of integrated system in order to determine cross subsidization and trade-offs in productivity of fixed-route and dial-a-ride systems. Consideration is also given to management and marketing techniques, labor problems, attitude of consultants, and funding. The necessity for complete integration of systems, expertise in dial-a-ride implementation and information dissemination methods is discussed.

Roos, D (Massachusetts Institute of Technology) *Transportation Research Board Special Reports* No. 147, 1974, pp 81-85; Proceedings of the Fourth Annual International Conference on Demand-Responsive Transportation Systems conducted by the Highway Research Board on October 3-5, 1973, Rochester, New York.; ORDER FROM: TRB, Repr. PC

32 263572 DIAL-A-RIDE: OPPORTUNITY FOR MANAGERIAL CONTROL. Competent management requires the ability to perceive problems, the ability to conceptualize solutions, and the skill to communicate both the problem and the solution to those responsible for carrying out management directives. It also requires that managers infuse the issue with a sense of urgency so that the solution is implemented. For the most part, public transit has not been managed by these objectives. Rather transit management has been totally absorbed with service, maintenance, and escalating costs. Policy decisions in public transit are often based on inadequate, outdated, or incomplete information or have come too late to reverse system inefficiency. Costs rise, the level of service falls, and patronage drops to levels so low that many operations are in desperate financial situations. And yet transit systems continue to be managed by hierarchical control. Effective management through the control of information flow will reverse this trend. Dial-a-ride transit, with its capability of providing real-time information about system status, is an ideal medium in which innovative management techniques can be tested. This paper explores the opportunities dial-a-ride offers for developing innovative systems for the management, control, and interpretation of information and outlines information flow techniques that can be useful in the optimization of system efficiency.

Fielding, GJ Shilling, DR (Orange County Transit District, California) *Transportation Research Board Special Reports* No. 147, 1974, pp 69-77, 8 Ref.; Proceedings of the Fourth Annual International Conference on Demand-Responsive Transportation System conducted by the Highway Research Board on October 3-5, 1973, Rochester, New York.; ORDER FROM: TRB Publications Off

32 263573 TECHNIQUE FOR SELECTING OPERATING CHARACTERISTICS OF DEMAND-ACTUATED BUS SYSTEM. As the number of applications of demand-actuated public transit systems increases, careful consideration

must be given to the selection of operating policies. It is not sufficient to merely determine that a demand-actuated system is better than a fixed-time operation. We should also attempt to select those operating characteristics that result in the optimal benefit to the user, operator, and community. In this paper, we explore the effect of several variables on the economic and service characteristics of demand-actuated systems. Comparative tables and charts describe a process for selecting the "best" system for prescribed service area and potential demand. The variables include scheduling dynamics and routing dynamics. The selection criteria include user statistics such as ride time and waiting time and operator statistics such as total capital cost, operating-hours, and vehicle productivity. The selection of a system will necessitate a trade-off between service and operating costs, and techniques for formalizing these decisions and results of applying these techniques are presented.

32 263574 ANALYTIC MODEL FOR PREDICTING DIAL-A-RIDE SYSTEM PERFORMANCE. Though much work has been done on the supply side of dial-a-ride systems, little has been done which allows for prediction of the demand aspects of such a system. In this paper a model is presented which includes both supply and demand, and allows transit planners to explore a variety of design and policy options. The model predicts the equilibrium operation of a dial-a-ride system and the outputs including revenues, costs, ridership and quality of service. The supply model considers trips to consist of two parts: wait time and travel time. The demand model considers the elasticity of modal split with respect to wait time, travel time, and fare.

Lerman, S Wilson, NHM (Massachusetts Institute of Technology) *Transportation Research Board Special Reports* No. 147, 1974, pp 48-53, 8 Fig., 1 Tab., 8 Ref.; Proceedings of the Fourth Annual International Conference on Demand-Responsive Transportation Systems conducted by the Highway Research Board on October 3-5, 1973, Rochester, New York.; ORDER FROM: TRB, Repr. PC

32 263575 DEMAND, SUPPLY, AND COST MODELLING FRAMEWORK FOR DEMAND-RESPONSIVE TRANSPORTATION SYSTEMS. A comprehensive evaluation framework to aid in the implementation of demand-responsive transportation systems is proposed. The framework consists of demand, supply, and cost models that could be applied at general and detailed levels of decision. General-level models use information from existing demand-responsive operations in the United States and Canada. The models provide estimates of expected ridership, vehicle supply, ridership, and cost of operations as a function of system parameters such as population density, fleet size, fare, travel time, and control center requirements. The use of the models to obtain these estimates is

exemplified, and their sensitivity to parametric changes is discussed.

Arrillaga, B Medville, DM (Mitre Corporation) *Transportation Research Board Special Reports* No. 147, 1974, pp 32-47, 15 Fig., 3 Tab., 6 Ref. PC

32 263577 AUTOMATION IN DISPATCHING DEMAND-RESPONSIVE VEHICLES. The role of automation in dispatching demand-responsive transportation vehicles is discussed. Panelists discussed the justification for, and performance of the system. A computerized dispatch system alleviated two problem areas of the taxicab industry: piracy; and favoritism. Costs are considered in terms of time and money saved. The panelists are questioned on user and staff attitudes, and on the extent of automation and backup system. Future plans such as dial-a-ride application for cabs, computer digital systems and data communications between cab and dispatch center are discussed.

32 263670 PROCEEDINGS OF THE WORKSHOP ON MOVING WAY TRANSPORTATION SYSTEMS. Moving way transportation systems are described as constituting means for massive movement of people in cities and in such places as airports, sprawling university campuses, shopping centers, rapid transit stations and the like, where traffic congestion or considerable walking distances occur. Principal issues affecting the development and implementation of moving way systems in the U.S. and abroad are discussed at this workshop, with a view to exchanging related socio-economic and technical concepts among the participants, while within bounds set by proprietary considerations. Engineering and economic data are presented not only to report prior state-of-the-art which goes back to the 1880's, but also to stimulate aggressive research and development activities in the private and public sectors. Questions of need, safety, financing, public acceptance and implementation of

moving way transportation systems are discussed with the development of a regard for the difficult problems that remain to be solved. Optimistic attitudes are discernable, however, in the sense that vigorous action is already underway, contemplated and projected.

Northeastern University, Transportation Systems Center, (MA-11-0006) UMTA-MA-11-0006-74-1, July 1974, 313 pp; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC., Microfiche; PB-236348

32 263921 TRANSPORTATION POOLING.

With the advent of impending energy shortages in the winter of 1973-74, the U.S. Department of Transportation embarked on an accelerated program to promote increased use of high-occupancy vehicles--transit and carpools. As part of this program a series of reports was prepared that summarized the major aspects of carpool programs designed to assist local areas in initiating successful pooling action programs. This report is a collection of the ten individual reports. The goal of the Carpool/Buspool program is to satisfy travel requirements more efficiently by increasing passenger occupancy in autos and buses, thereby reducing the number of vehicles using the streets and highways. Achievement of that goal calls for coordination among many institutions within a metropolitan region. The information and techniques presented in this report should be considered as a guide to the development of a sound program in a metropolitan area. The individual reports contained in this volume are: Review of Carpool Activities, Organization for Carpooling, Approaches to Matching, Legal and Institutional Issues, Incentives to Carpooling, Transit/Taxi Coordination, Vanpools, Buspools, Pooling for the Disadvantaged, and Carpool Backup Systems. /UMTA/

Voorhees (Alan M) and Associates, Incorporated, (IT-06-0092) UMTA-IT-06-0092-74-1, Jan. 1974, 283 PP, 24 FIG., 7 TAB.; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-236157

32 264035 DEMAND ACTIVATED TRANSIT.

This report focuses on the problem of estimating the ridership increase experienced when regular fixed-route and fixed-schedule bus systems adopt a Dial-A-Bus policy. The mathematical model used to accomplish such estimation is a modal split model. At the time this study was initiated (Jan. 1971) there were three distinct Dial-A-Bus operations: Columbia, Maryland; Bay Ridges, a suburb of Toronto Ontario, Canada; and Mansfield, Ohio. All three communities had conventional fixed-route and fixed-schedule bus systems prior to the introduction of Dial-A-Bus. A combination of published data, data specific to Dial-A-Bus (DAB) operations, and data collected for 3 surveys were used to develop a modal choice model which explained the transit ridership increases. The model development depended on an understanding of transit operations and the interaction of patrons with the system. The technique used to develop the model was a process of fitting empirical data, from diverse sources, into a relationship which was reasonable from transit operation experience and easy for a transit planner to use. The model was then tested using a stochastic demand process and the Bay Ridges study area. The test showed the applicability of the model for small area transit analysis. The

study also established relationships between attitudes held by people toward potential service of DAB. Many attributes of DAB were ranked relative to each other, thus providing insight into DAB operation. /UMTA/

Navin, FPD; Minnesota University, Minneapolis Univ. Res. UMTA-MN-11-0003-74-1, June 1974, 305 pp; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-236753

32 264621 THE VALLEY TRANSIT DISTRICT DEMONSTRATION.

The Valley Transit Demonstration project represents a comprehensive and far reaching effort to develop new flexible forms of integrated transit operations to serve the transportation needs of many small to medium-sized cities. This interim report summarizes the significant results and accomplishments of this innovative bus system which has been in public operation for approximately 6 months in the Southern part of Connecticut. The three year program began July 1971 and is currently beginning its third year. The first phase (18 months in duration) was devoted to the design and development of equipment and operations. The second phase is concerned with testing and demonstrating the system in public operation. Operations at present involve the use of 6 medium-sized buses owned and operated by the Valley Transit District (VTD) of Derby, CT. Transit services provided include door-to-door, rent-a-bus, and shuttle service. Major accomplishments to date include: ridership response has been overwhelming with the VTD now taking action to double fleet size; a new concept of fare collection based on the use of credit cards is now an operating part of the system; and vehicle modifications have been demonstrated in actual transit operations to be highly acceptable and effective means of solving bus entry/exit problems encountered by elderly/handicapped passengers.

RRC International, Incorporated, (CT-06-0003) Intrm Rpt. UMTA-CT-06-0003-73-1, July 1973, 28 pp; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-236816

32 264711 GUIDELINES ON THE OPERATION OF SUBSCRIPTION BUS SERVICES.

The purpose of this report is to provide guidelines on the planning, organization, and operation of subscription bus services. The report deals with identifying potential riders; obtaining vehicles and drivers; meeting regulatory requirements; setting routes, schedules and fares; revising routes and schedules as demand changes; and obtaining special privileges such as the use of express lanes, priority movement at intersections, and close-in parking. The term "subscription" has been applied to a variety of specialized bus services tailored to serve urban travelers who patronize them on a regular basis, usually for their daily trips to and from work. This report concentrates on services provided by large buses. Guidelines are presented which are critical to the successful operation of subscription bus services. These guidelines are based on detailed case studies of subscription services in Wentzville, MO; Fredericksburg, VA; Huntington Beach, CA; Reston, VA; the San Francisco Mid-Peninsula; Gaithersburg, MD; Los Angeles, CA; Golden Gate Bridge, Highway and Transportation District "Commuter Clubs"; Flint, MI; and Peoria, IL.

The report concludes with a discussion of the potential impacts of subscription services on the congestion, pollution and fuel consumption associated with urban travel. A glossary and a bibliography are furnished.

Kirby, RF Bhatt, KU; Urban Institute, (UI-5021-4) UMTA-DC-06-0093-74-1, Aug. 1974, 75 pp; Sponsored by Urban Mass Transportation Administration.; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-237076

32 264753 HIGHWAY'S POTENTIAL THROUGH CARPOOLING.

A cross-section of successful programs are reviewed ranging from public and private carpool programs to commuter bus operations, and the basic ingredient required by all carpool and buspool programs is identified as the matching of commuters sharing common Time-Origin Destination (TOD) needs into potential carpools or buspools. Other facets of a comprehensive carpool service are public information on the benefits of carpools and buspools, incentives for parking priorities, priority lanes, and continuing programs to provide carpool locator assistance. The data processing phase closes the information gap now existing between the potential ride sharers by making TOD information readily available. A computer program based on a grid system and developed by the FHWA is outlined. The public information phase which is a critical portion of a carpool program must stress the factors of time, cost, convenience and environment. The review of carpool matching programs for employee concentrations in specific residential areas, could provide valuable information to bus companies or citizen groups for establishing buspool routes. Implementation of these programs requires relatively short lead time and are low in cost as they essentially utilize existing facilities more effectively.

32 264839 THE CAB-TAXI-LOCAL TRANSPORTATION SYSTEM OF THE FUTURE

[Das Cabinen-Taxi-Nahverkehrs-System der Zukunft]. The article is a report of a project by demag foerdertechnik called the cab taxi (CAT); this hovers on supports above the road and does not affect other traffic. By means of a computer ticket the passenger determines his destination himself. The functioning of the CAT system, plans for its introduction and the construction of a test installation are described.

Hebe-und Ferdertechnik 114 pp, 2 Phot.AC. KNOWLEDGMENT: TRRL (IRRD 301246)

32 265202 CARPOOLS: THE UNDERUTILIZED RESOURCE.

The widespread adoption of carpools which can have a benefit/cost ratio of 47 to one, and the advantage of speedy implementation with little or no capital outlay, could help ease the current environment and energy-related problems. Rush hour congestion will be reduced, overall travel speed will be increased, and emissions and fuel consumption will be reduced. Urbanwide carpool programs implementable by 1975 can produce reductions in emissions far exceeding the absolute reduction in vehicle miles of travel. The smog generation problem between

6 a.m. and 9 a.m. is discussed in relation to speed and vehicle emissions. Whereas park-ride and kiss-ride facilities will not solve the problem of high emissions generated during the cold-start/hot-soak cycle of pollution controlled automobiles, vehicle pooling will offer a solution. Adding 2 or 3 more people with similar time-origin-destination to a vehicle, dramatically reduces the energy consumed per mile. An increase of rush hour auto occupancy by 30 percent can save 5 percent of the total highway fuel and 3 percent of the nations transportation fuel needs. Studies have shown that acceptable service is the most important factor in ride sharing. To optimize carpool formation, a comprehensive program consisting of 3 phases: carpool patching, public information, and incentives are recommended. The most successful incentive is identified as parking privileges for carpools. Other incentives (priority freeway lanes, higher tolls for single occupancy) are briefly reviewed. Comments are made on the increase in taxi use.

Pratsch, L (Federal Highway Administration) *ASCE Civil Engineering* Vol. 44 No. 1, Jan. 1974, pp 49-52, 4 Fig.

32 265302 DIAL-A-BUS MANUAL, VOLUME II. Dial-A-Bus is a demand-responsive transportation system in which the customer requests and receives personal transportation service. It is of benefit in areas where public transport does not offer regular service. This volume of the Dial-A-Bus Manual gives general guidelines for the principles of the system, since each system is unique and should be adapted to local conditions. Part I consists of the historical background of Dial-A-Bus, and presents comparisons of eight such systems in operation. Part II deals with design considerations, financial expenditures, fares, demand, site selection, and community factors. Aspects of implementation such as licenses, personnel, communication systems, and vehicle selection, are dealt with in Part 3. A bibliography of pertinent publications in 1972 comprises Part 4.

Transportation Development Agency Vol. 2 Mar. 1974, 168 pp, 41 Fig., 13 Tab., 1 App.

32 265322 URBAN LAND USE PLANNING: IMPLICATIONS OF A TELEBUS SYSTEM. The implications of urban transportation for land use planning are considered and illustrated in this article by examining the Telebus public transit concept recently introduced in Regina, Canada. The fact that so many riders use Telebus to travel within their communities, suggests a broad base of public utility and appeal. It further confirms the significant role which Telebus may play in contributing to the social interactions and physical design in neighborhoods, larger communities, and entire cities in terms of neighborhood design, community development, and physical structure of the city. A practical alternative to the private automobile, such as Telebus, can offer wide possibilities for people to move within and between neighborhoods to meet, discuss, barter and exchange goods and ideas.

Sherman, LC *Management Controls* Vol. 21 No. 12, Dec. 1974, pp 253-263

32 267009 DEMAND-RESPONSIVE TRANSPORTATION SYSTEM PLANNING GUIDELINES. Based on the limited empirical information of 12 demand-responsive transporta-

tion systems, preliminary planning guidelines have been developed to aid in the design of new demand-responsive systems. These guidelines facilitate the estimation of ridership, fleet size, staff requirement and costs. A summary is also presented of the major characteristics of these 12 demand-responsive systems that are operating in the United States and Canada. This summary illustrates the types of systems that have been recently implemented. They include many-to-many, many-to-few, many-to-one and route deviation systems.

Arrillaga, B Mouchahoir, GE ; Mitre Corporation, (MTR-6659) UMTA-VA-06-0012-74-6, Apr. 1974, 41 pp; Contract DOT-UT-10028; ACKNOWLEDGMENT: UMTA (VA-06-0012); ORDER FROM: NTIS, Repr. PC, Microfiche; PB-232970/AS

32 267010 SUMMARY OF AN AUTOMATED SCHEDULING SYSTEM FOR DEMAND RESPONSIVE PUBLIC TRANSPORTATION. The Dial-A-Ride Automated Scheduling System is a package of computer programs developed on a Westinghouse 2500 minicomputer by the MITRE Corporation under sponsorship of the Urban Mass Transportation Administration. The system contains an automated scheduler that dynamically assigns customer requests for trips to vehicle tours and dispatches the vehicles through their stops; data analysis programs that produce statistical reports on system performance; and programs to generate and maintain the data files required by the scheduler, such as the file of related street names. The automated scheduler accepts messages from control room personnel through computer terminals. The messages are processed by an interactive message editor that verifies the message and initiates the appropriate function. Functions performed by the real-time scheduler include the assignment of trip requests, deferment of trip requests to be assigned later, cancellation of trip requests, vehicle dispatching, vehicle positioning, reassignment of stops of a disabled vehicle, and complete monitoring capabilities. In addition, the system supports a file containing trip requests that are automatically scheduled on a periodic basis. During scheduling, vehicle tours are printed in the event of failure of the automated system and a tape file is created for use by the data analysis programs.

Rebibo, KK Scott, RL Ferrantino, JR Hartzler, RE Klopfenstein, RC ; Mitre Corporation, (M74-26) 2 UMTA-VA-06-0012-74-2, Mar. 1974, 28 pp; ACKNOWLEDGMENT: UMTA (VA-06-0012); ORDER FROM: NTIS, Repr. PC, Microfiche; PB-232419/AS

32 267014 DOOR-TO-DOOR BUSPOOLS: RECOMMENDATIONS FOR PUBLIC POLICY. Buspools, based on a partnership between a group of riders and a privately-owned bus company, provide potentially higher efficiency for commuter travel than traditional bus service. Pickup and discharge close to home and office eliminate necessary of transfer. Routes and schedules may be tailored to a specific group of commuters. Overcrowding is reduced. Multiple-trip tickets diminish demand for exact change and offer discount fares. Personnel is on-board, in addition to the driver, to generally make the trip more comfortable. For these reasons, this report suggests that buspools be given serious consider-

ation in formulating public transportation policy relating to commuter travel. The purpose of the report is to aid that consideration by first, describing the planning, implementation, expansion, refinement and problem areas of 2 previously undocumented community initiated and operated buspools based in Columbia, Maryland, servicing Washington, D.C. and Baltimore, Maryland, and then, by identifying ways that public policy can encourage creation of buspools. Buspools in Columbia; Reston, Virginia; Flint, Michigan; and Peoria and Decatur, Illinois, are compared. Indicated are overall advantages of having riders participate in operations and of having privately-owned companies rather than public transit authorities, provide buses and drivers. Public policy could encourage consumers' attempts to develop buspools by facilitating matching of time-origin-destination data, providing seed money to cover deficits in the initial period of operation and devising pricing policies for the charter of public transit equipment and drivers. Data on rider surveys, routes and scheduling, population characteristics and location maps are provided.

32 267016 DOWNTOWN CIRCULAR SERVICE IN KANSAS CITY AN EVALUATION OF DIME-A-TIME. Since a number of cities have or are considering adopting some kind of downtown circulator service, it is useful to describe and analyze a specific bus circulator service such as Dime-A-Time in Kansas City, Missouri. This study describes Dime-A-Time and its history and then goes on to analyze Dime-A-Time by comparing its operations and characteristics with similar service in Cleveland and Denver. It is shown that by eliminating rush hour service (as in Denver), Dime-A-Time could cut its operating deficit although at the price of providing less service. A multiple regression model is used to test several hypotheses and estimate the value of the relationships among ridership, fare policy and external conditions. The estimates obtained from this regression model make it possible to evaluate the impact of fare changes. It is shown that a somewhat higher fare would increase total revenue but not substantially. The conclusions are that Dime-A-Time has been set up and operated in a reasonable manner, given its situation. Other cities may wish to adopt alternative systems such as the shorter hours used in Denver or the provision of circulator service with regular route buses. Benefits and costs of various alternatives are discussed.

32 269939 WHITECAR SOON FOR HIRE [Witkar gaat Rijden]. In Amsterdam a three-month experiment will shortly take place to test a first station at the Amsterveld with seven

so-called whitecars. These cars are to be considered as small self-drive electric hire cabs for use in the city. Their users, driving from one station to another, are always sure to find a parking-place at the station of destination, which is reserved through a processor. In the first stage of the project, starting after the experiment, five stations and 35 cars are planned. Ultimately the network might comprise 150 stations in Amsterdam. This article contains a description of the whitecar-system. /Author/

32 272070 PUBLIC TRANSPORTATION PROBLEMS IN URBAN AREAS. The immediate problems facing the taxicab industry are: the inability to increase the productivity of the taxicab driver and service personnel; the inability to control the increased cost of doing business; and the inability to increase revenue sufficiently to offset higher costs. The high rate of turnover of taxicab drivers in a major problem in increasing productivity. The driver population includes employees, independent contractors and independent drivers in local associations. A 1972 report by the U.S. DOT states that a typical trip length for a sample survey was 5.8 miles of which 2.95 were paid miles. The number of passengers per trip was 1.3 persons and the receipts were 1.95 per trip. Cost analysis studies reveal that under the present rate structure, a company must achieve 60 percent paid-mile/operating ratio to remain profitable. A factor of great importance is the cost of doing business imposed on the industry by the government. An inconsistent pattern of tax levies has been imposed on the industry, and new administrative law has altered government-taxicab industry relations. Overregulation and underregulation by government damage the ability of companies to perform efficiently. At the present time, there are an estimated 7,200 fleet taxicab operations in the U.S. A fourth of these operate 10 taxicab or fewer, mainly in rural and suburban area. A study revealed that the rate increases are granted approximately every 3.5 years. The industry estimates that there is a 3 percent decrease in passenger trips each time a new rate is put into effect. Another study indicates that computerized dispatching offers the most immediate opportunity to increase productivity in the industry. Improved urban traffic conditions (restriction of private vehicle and the use of special lanes for buses, and hopefully, taxis) will further contribute to increased productivity.

Gallagher, RV (International Taxicab Association) *Transportation Research Board Special Reports* Proceeding No. 144, 1974, pp 20-23, 1 Ref.; Appeared in Issues in Public Transportation, proceedings of a conference held by the Highway Research Board at Henniker, New Hampshire, July 9-14, 1972; ORDER FROM: TRB

32 291122 FUTURE DEVELOPMENT IN PERSONAL TRANSIT. Personal rapid transit systems are now under development in the U.S.A. These systems, comprising small capsules to transport family-sized groups of passengers, would operate on special guideways under full automatic control. Although it is foreseen that the initial installations of these types of systems in the next three to five years will be small in scale,

typically a few miles of guideway, the potential exists for area-wide urban systems that will gradually take over many of the transport functions of the automobile and conventional urban transport. In this paper the existing forms of land transport are reviewed to provide perspective for a discussion of advanced forms. The opportunities for advanced systems are seen in applications where existing modes are particularly deficient; for example, in high-density activity centres. It is shown that improvements in urban transport may be made by using more advanced technologies, or by a fundamental revision in the system concept, or both. The personal rapid transit concept is seen as a basic system innovation that offers a major departure from the mass transit concepts of the past. It is shown that it can be implemented either with conventional technology or may use advanced technology to reduce costs and improve performance. Three representative types of systems are described to illustrate hardware approaches by different industrial groups. The discussion emphasizes the possibilities of advanced technologies, an approach that appears to provide a better implementation of these systems and extend their potential. Possible long-range future developments in this new mode of land transport are reviewed. /TRRL/

32 300031 OPTIONS FOR SUBURBAN PARATRANSIT SYSTEMS. Once a public authority has decided on a paratransit service for suburban public transport, it has valuable lessons to learn from overseas experience. This is particularly true of the "second generation" demand responsive systems that followed early dial-a-rides. These are less flexible in scheduling, but maintain route flexibility which raises dependability, eases co-ordination with other services, and lowers dispatching costs. /Author/TRRL/

32 300040 PRIVATE BUS OPERATIONS IN URBAN AREAS-THEIR ECONOMICS AND ROLE. This paper is concerned with the role that privately-operated bus services might play in urban areas of Australia, vis-a-vis services pro-

vided by public operators. It shows that a given level of bus service can be provided substantially more cheaply by private than public operators, and that the majority of the cost savings arise from better utilisation of staff and lower wage rates and associated on-costs. Expansion of the role of private services is therefore a possible means of reducing the levels of urban public transport subsidies. The principles which should underlie subsidy schemes for private operators are discussed. /Author/TRRL/

32 300070 TECHNICAL AND OPERATIONAL AIDS FOR TAXICAB ORGANIZATIONS [Tekniska och operativa hjalpmedel foer taxi]. This report is divided into the following chapters: technical equipment for taxi, taxi systems and cost and benefits. The first chapter describes present and future technical aids for improvement of taxi effectiveness such as: radio, taximeter, vehicle time recorder, vehicle monitoring, call-diverter, new public telephone exchanges, telephone exchange for taxi, answering and recording devices for telephone, mobile telephone, the new national public paging system, taxicab stations with direct telephone and computers with peripherals. The second chapter describes various kinds of smaller taxi systems with or without dispatching offices. The technical conditions for a regional dispatching office are discussed. A manual system featuring various kinds of computer aided dispatching systems is described in detail. Such questions as different system functions, data communication system, function of the operators, reliability and ergonomics are discussed. In the third chapter, costs are presented in figures when possible. Benefits are presented in general terms. However, the intention of this chapter is to give a basis for decisions regarding investments in new systems. Finally benefits are discussed that can be reached with the aid of measures other than purely technical. These are new and different tasks and ways of transit (e.g. shared-ride) for taxi. /TRRL/ [Swedish]

32 300147 CAR POOLING-TRAVEL TO WORK AT AN ISOLATED SITE. As part of a study of the use of cars in peak periods, staff at an isolated rural workplace were surveyed to determine how they travelled to work. The survey concentrated on the choice between driving alone and car-pooling in which two or more people travel together, taking it in turns to drive their own car and give a lift to the other(s). Information was obtained in two ways: a questionnaire (90 percent response), and a follow-up telephone survey of car-poolers. Car-poolers came predominantly from urban areas and travelled medium distances (5-25 km) to work-for short journeys the inconve-

nience of car-pooling is greater than the saving, and at long distances people are unlikely to live close enough together to form a convenient car-pool. The survey results were modelled using a logit model to try to quantify the factors involved. This showed that diverting 1 km was perceived to be about as undesirable as driving an extra 5 km. However, all the model results should be treated with caution as they are subject to large errors and based on data from only one site. /Author/TRRL/

32 300711 SMALL BUS MARKET. ABRIDGMENT. The apparent instability of the small bus market is attributed to 2 major factors. The major automobile manufacturers do not see this area as an economically sound market, and small bus manufacturing is carried out by school and recreational vehicle companies which cannot afford to do the research and engineering design to produce a better bus. Social issues combined with government standards also contribute to the instability. The situation could be improved by improvement of the purchasing process as well as short-term improvements in the life expectancy of the vehicle. With regard to the purchasing process efforts are underway to use lifecycle costing to evaluate bids. Also road testing of the first vehicles off the line combined with detailed final inspection could be used to set a standard for the rest of the purchase. With regard to improvements in vehicle life expectancy, vehicles should be purchased with proper engine-drive-train combination. Attention should be paid to maintenance, storage and cleaning aspects. Productive service runs should be maintained and buses that make empty runs should be eliminated. Good driving habits should be reinforced by periodic retraining.

32 300712 TAXIS AND SUBSIDIZED PROGRAMS IN RURAL AREAS. The taxi industry in rural communities is undergoing scrutiny, especially as it relates to the transportation of special groups within a community--the elderly, handicapped, and others who do not have access to automobiles or to public transit. A major concern of the taxi operators is the survival of small taxi operations of 10 vehicles or fewer in communities with populations of 25,000 or less. This paper describes ongoing small-taxi programs in Lancaster County, Pennsylvania; Houston, Texas; and Indianapolis, Indiana. Possible solutions to the problems of the taxi operator in rural areas, such as direct subsidies, mergers with a centrally located operation, and support through social service agency transportation contracts are examined. /Author/

32 300713 USING TAXIS TO SERVE THE ELDERLY AND HANDICAPPED. Three user-side subsidy demonstration projects funded by the Urban Mass Transportation Administration are described, along with an evaluation of six locally sponsored subsidized taxi programs in the San Francisco Bay area. Although these programs are not located in decidedly rural areas, the techniques and methods employed are applicable to the provision of services to the elderly and handicapped living in rural and small-town communities. The study concluded, for example, that subsidized taxi service is especially well suited to low-volume, scattered demand as in smaller communities; that taxi operators are willing to participate in subsidized programs to transport the elderly and handicapped; and that user-subsidized taxi service is a workable, economically viable transportation mode for the elderly and handicapped. /Author/

32 300762 THINKING SMALL: TRANSPORTATION'S ROLE IN NEIGHBORHOOD REVITALIZATION. "Thinking Small" is a relatively new concept for transportation planning, for citizens and professionals alike. Transportation planners have tended to think big, devising comprehensive plans to meet regional needs. The new trends in cities, and the increased understanding of the importance of livability, call for neighborhood impacts to inform transportation planning at every level. This document is based on a national conference on transportation's role in neighborhood revitalization sponsored by the Urban Mass Transportation Administration in order to seek advice from citizen leaders and state and local officials. This report presents the proceedings of a conference held in Baltimore, Maryland, in February 1978 to discuss small-scale transportation solutions as a means of revitalizing urban neighborhoods. The report is divided into two sections. Section one discusses the major issues involved in planning for these improvements, including citizen involvement, the role of local governments, and the many forms of pedestrian, paratransit, parking, and street-improvement strategies available to the transportation planner. The second section consists of three case studies discussed at the Baltimore Conference. Successful projects involving a number of very different techniques, in Boston, St. Louis, and Seattle are described in some detail. The appendixes herein contain a list of participants and a bibliography related to citizen participation and transportation planning.

32 300966 COMMUNICATION AND COMPUTER SYSTEMS FOR SHARED TAXI [Maet-och datasystem foer samaakning med taxi]. The purpose of this study is to determine whether shared taxi rides can produce profits

sufficient to pay for the additional equipment (computer and communication systems for traffic control) necessary for better utilization of the vehicles. At present there is a great gap between public transport systems and taxi systems in regard to price and service level. This study is based on the hypothesis that there is a market for a middle-of-the-road system, ie a system that will provide a transport from door to door, but not always the shortest way. The main chapters of the report: a survey of existing public transport systems; computerized route planning; techniques and methods for vehicle location; aspects on computer and communication systems. /TRRL/ [Swedish]

Sundberg, H ; Chalmers University of Technology, Sweden Monograph Rapport E 76-05, 1976, 53 p., 13 Fig., Tabs., Refs.; ACKNOWLEDGMENT: TRRL (IRRD 241309), National Swedish Road & Traffic Research Institute

32 300968 COMPUTER SIMULATION OF SHARED TAXI SYSTEMS [Datorsimulering av Samaakningssystem foer Taxi]. The purpose of this project has been to develop the model used in a previous project for shared taxi rides, (report r77-01) and to establish through computer simulation the savings that can be made by shared taxi rides. In order to make a shared taxi system efficient a central traffic control is needed. The traffic control receives all requests for taxi services, allocates trips and dispatches the cars. To determine what savings are made by the shared taxi system and what by the central traffic control, a corresponding taxi system without shared riding was simulated. To serve the present number of customers in a large city (400000 inhabitants), it was found that the system would manage with about half as many cars as today. For a smaller town, the savings were not as large. The total driving time was reduced by 30 percent in the shared taxi system, compared with the present system. /TRRL/ [Swedish]

Andersson, H Almen, KG Otteblad, A ; Chalmers University of Technology, Sweden Monograph Rapport R78-03, June 1978, 55 p., 15 Fig., 15 Tab., Refs.; ACKNOWLEDGMENT: TRRL (IRRD 241308), National Swedish Road & Traffic Research Institute

32 301011 PROCESS COMPUTER SIMULATION OF TAXI SYSTEMS [Simulering paa processdator av taxisystem]. The purpose of the project described in this paper is to find ways to improve existing taxi systems, and to create models for computer simulation in order to evaluate the improvements. The systems are compared in regard to customer waiting time, taxi vacant driving time and load. The simulated system uses computerized central traffic control for location and dispatching of the cars. It was found, that in a system with taxi stations using zone location, customer waiting time was shorter than for systems using no taxi stations. And for a system able to locate the cars exactly, it was found that by letting the car wait where the last trip ended, vacant driving time would be significantly reduced. /TRRL/ [Swedish]

32 301029 STOP-GAP OR GAP FILLER? FRIEDRICHSHAFEN TESTS DIAL-A-RIDE SYSTEM [Lueckenfueller oder Lueckenueesser? Friedrichshafen Erprobt Rufbusse]. Since December 1977 the first computer controlled dial-a-ride system in Europe has been in trial operation. Where it is not profitable to run bus schedules with few passengers through an area, the dial-a-ride bus system comes into its own. It acts as a feeder to the scheduled buses and releases these from unremunerative journeys. It is particularly advantageous in rural areas with their low numbers of passengers where it fills a gap in the available transport left between scheduled buses and taxis. How does one deal with the passenger requests? The incoming passenger requests are processed in the central telephone operated control centre and transmitted through data processing equipment to the computer. This computer arranges the requests in accordance with the most suitable vehicles available at the time, oversees the arrival and departure times and reports faults. The manager in the control centre is at all times informed of the current state of the transport availability. The stopping points and the routes of the individual vehicles appear continuously on a screen. The driver is also continuously in contact with the control centre. When the driver arrives at a stopping point, he activates the "arrival" signal. The destination of the boarding passengers and the number of passengers appears on a screen installed in the vehicle. When all the passengers have boarded, the driver presses the 'depart' button. The control centre then informs them of the next pick-up point. Only the faultless interaction of passenger, call point (or telephone instruction), control centre, driver and vehicle will guarantee the smooth running of a computer controlled dial-a-ride bus system. /TRRL/ [German]

32 301249 CARPOOLS DOUBLE EXPRESS LANE PRODUCTIVITY. Carpools in combination with buses on the express lane of two freeway projects have doubled the person-moving productivity of the express facilities. The results have been obtained on the Shirley Highway in the Washington, D.C., area and the San Bernardino Freeway in Los Angeles where physically separated express lanes for high-occupancy vehicles (HV's) have been built within the existing rights-of-way. On Shirley Highway, the express lane currently carries almost 40,000 passengers (21,600 bus riders and 17,785 carpool riders) during the morning rush hour, as opposed to the 14,000 bus riders carried prior to the late 1973 opening of the express lane to carpools. On the San Bernardino Freeway, peak period passenger service volumes on the 11-mile San Bernardino have doubled since October 1976 when the priority lanes were opened to carpools even though bus ridership has not been affected. (Bus ridership had had its spectacular rise after 1973 when the express lane was first opened from 1,000 to 18,000 passengers per day). The two projects demonstrate that properly designed express lanes for HV's can serve passenger volumes as high as those carried by many rail rapid transit lines, and at a far lower cost.

32 301256 PARA TRANSIT REPORTING SYSTEM: A SYSTEM FOR COLLECTING AND REPORTING UNIFORM PARATRANSIT FINANCIAL AND OPERATING STATISTICS. In July, 1976, the Urban Mass Transportation Administration contracted to develop and test the implementation of a computerized system for collecting and reporting paratransit financial and operating statistics. The project objectives are: to expand/modify the computerized uniform system of accounts and records developed in project TAXISTATS so that it can be applied to all paratransit operations; to ensure that this reporting system is compatible with the reporting system developed for scheduled mass transit operations (FARE System); to satisfy the requirements of Section 15 (a) of the UMTA Act of 1964, as amended; and to test and implement the computerized uniform reporting system in several paratransit operations to provide necessary information for large-scale implementation of the system. This report provides the documentation of the system and is divided into four chapters: Chapter I: General Description presents an overview of the system, how it relates to the required FARE System for transit operators, and discusses implementation issues; Chapter II: Analytical Reports describes the reports that are generated for use by paratransit operators, UMTA, and the general public; Chapter III: Instruction Manual contains definitions of the accounts and records and provides instructions to the paratransit operators as to how to fill out the data transmission reports; and Chapter IV: Data Processing Procedures and Program Descriptions provides the general documentation of the automatic data processing aspects of the system. /UMTA/

32 301450 EV BUS OPERATION LOOKS GOOD IN NEW YORK. This paper discusses the use of electric minibuses on Roosevelt Island New York. The buses have enabled this model city to achieve its primary objective of creating a pollution-free, low traffic density environment. The route of the minibuses is approximately 1 1/2 miles long with a current passenger loading of approximately 35,000 per week. The minibuses complete more than 150 trips each day and cover an average of 1500 miles each week. They have adequately served the transit needs of the city's 6,000 residents. The operation of electric buses poses many operating constraints and unique maintenance problems. Since the model 20 Electrobuses used on Roosevelt Island is no longer manufactured, spare parts are difficult to obtain. During the two years of operation, it has been necessary to develop sources of substitute and/or replacement components and to otherwise improve maintenance and repair procedures. Maintenance costs over the past year were approximately \$22,000. Operation of an electric bus requires certain driver skills and knowledge to cope with the unique characteristics of the electric traction system. During the two year operation of electric buses on Roosevelt Island, passenger acceptance has been very favorable. The paper concludes with a synopsis of future prospects for electric buses.

32 301794 TAXI COMMUNICATION SYSTEM. This paper covers an integrated computer controlled booking and dispatching system for taxicabs in which the cabs receive printed orders by means of mobile radio data communication. The system is being developed for the three major cities in Sweden and will be introduced in 1981.

Billstrom, O (SRA Communications, Sweden); Institute of Electrical and Electronics Engineers Conf Paper 79CH1378-9VT, 1979, pp 307-308; Presented at the 29th IEEE Vehicular Technology Conference, held in Arlington Heights, Ill., March 27-30, 1979.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL

32 301866 COMPETITION AND SUPPLY IN LONDON TAXIS. The article examines reasons for the expansion of the London taxi trade and assesses the influence of tourist demand and competition from the hire car trade. The trend of real prices for taxis is compared with that of buses and underground rail services. The author considers the influence of changes in productivity, shifts to input prices, and innovation. This study involves an exploration of supply, especially of drivers, and of the cost structure underlying fares. A principal feature is found to be the radical changes in labour contracts for London taxis associated with free entry subject to quality constraints. /TRRL/

32 302111 COMPARISON OF ORGANIZATIONAL AND OPERATIONAL ASPECTS OF FOUR VANPOOL DEMONSTRATION PROJECTS. The purpose of this report is to describe in detail the organizational and operational aspects of four Service and Methods Demonstration projects involving vanpooling. The projects are located in San Francisco, California; Minneapolis, Minnesota; Knoxville, Tennessee; and Norfolk, Virginia. All of the projects involve third party providers and multiple employment locations. This report compares the projects with respect to: management and administration; target group focus; marketing procedures; driver and rider application and selection procedures; van acquisition and provision arrangements; and financial aspects such as cost structures, driver lease fees, passenger fares, and project funding. By highlighting the similarities and differences among project designs, the authors state that the information herein is relevant not only to the ongoing evaluations of these projects, but also to organizers of similar vanpooling projects in other locales. Appendix A of this comparative report contains a table summarizing the project characteristics; and Appendices B and C contain driver, passenger, and other types of agreements used in the four demonstration projects. /UMTA/

32 302378 REPORT OF THE THIRTY-FIFTH ROUND TABLE ON TRANSPORT ECONOMICS HELD IN PARIS ON 28TH AND 29TH OCTOBER 1976 ON THE FOLLOWING TOPIC: ORGANISATION OF REGIONAL PASSENGER TRANSPORT. This paper was presented as a basis for discussion among transport economists taking part in a round table on transport economics organised by the European Conference of Ministers of Transport. The author advanced a number of theses, related to regional transport needs, the organisation of undertakings, the role of the authorities, regular special-purpose services, the function of national railways, intermediate modes of transport and fares. A summary of the discussion is presented, which concluded that in many cases, the methods of providing transport needed to be revised, and that the money spent on running scheduled services would often suffice to finance a system which was more individualised and better suited to meet demand. A list of participants to the round table is appended. (TRRL)

32 303475 TSM MEASURES FOR MAJOR ACTIVITY CENTERS. Transportation Systems Management (TSM) measures, originally conceived as a tool applicable on a region-wide scale, can be successfully applied at major activity centers to avoid, minimize or postpone the need for more capital-intensive transportation improvements. The results from two case studies (an urban university campus and a suburban industrial park/regional shopping center) are presented and analyzed to illustrate how traffic reduction and improved vehicular flow can be achieved by low-cost measures such as ride-sharing programs, parking management policies, transit service improvements, marketing and others. The effectiveness of the university's on-going program, which has reduced traffic generated by the campus by almost 8%, is assessed and a recommended expansion of the program which potentially can double this reduction by 1985 is described. While conditions at the suburban industrial park/shopping center are such that a traffic reduction of 4% to 10% is considered the upper limit of what can be achieved, a comprehensive TSM program for maximizing the efficiency of existing facilities was also developed and is described.

32 303911 PARATRANSIT: 1979. PROCEEDINGS OF A WORKSHOP. The proceedings are presented of a Conference that synthesized and evaluated the significant paratransit services across the U.S. and Canada, and assessed their relevance for other communities. The Conference was organized to provide results that would help the Urban Mass Transportation Administration (UMTA) to understand the problems and potentials of paratransit. Comprehensive resource papers were presented on six major issues: labor protections and labor standards; appropriate

institutional framework for paratransit development; evaluation and measurement of service effectiveness; competitive opportunities in paratransit; coordination of social-service-agency transportation; and technology requirements. Workshop reports and plenary session transcripts on these major issues are also presented. Introductory articles briefly discuss current conditions, briefly review the resource papers, and present some considerations on the changing environment of paratransit.

Transportation Research Board Special Report No. 186, 1979, 89 p., Figs., Tabs., Refs. ORDER FROM: TRB Publications Off

32 303913 CHANGING AND COMPLICATED ENVIRONMENT OF PARATRANSIT: SOME CONSIDERATIONS. The differences between the first and second Williamsburg Paratransit Conferences are noted. The lack of overt controversy at this second conference may represent a greater understanding of opposing positions rather than agreement on those positions. The Conference, showed far less expectation that the federal government would solve many of the conflicts and problems of paratransit. Also, participants at this conference are concerned with many more government agencies, statutes and regulations. The reports of each of six workshops at this second conference are reviewed, and attention is focused on four significant issues: efforts at the local level; technology transfer; realistic measures and evaluation of costs; and clarification of federal policies. Unresolved issues discussed here include labor and organizational responsibility.

Rosenbloom, S (Texas University, Austin) *Transportation Research Board Special Report* No. 186, 1979, pp 3-6; This paper appeared in TRB publication Special Report No. 186: Paratransit, 1979.; ORDER FROM: TRB Publications Off

32 303914 LABOR PROTECTION, LABOR STANDARDS, AND THE FUTURE OF PARATRANSIT. The changing roles played by various transportation providers and the changing balance among different components of the urban public transportation sector, coupled with changing federal policy toward the public subsidization of both different modes and competitive modes have created two significant conflicts: (a) the competition between different conventional and paratransit modes for a limited market and (b) the competition among different labor forces. This paper focuses on the implications for the development of paratransit services of statutory labor protections and prevailing labor standards. The paper examines the recent evolution of federal policy in the labor-protection area and then seeks to identify the broad implications of current arrangements and philosophies. The present policy and practices serve as serious constraints to the natural development of paratransit. The paper concludes that several legislative options are open that would clarify and define key labor protection issues. (Author)

Alschuler, DM (Multisystems, Incorporated) *Transportation Research Board Special Report* No. 186, 1979, pp 8-20, 5 Ref.; This paper appeared in TRB publication Special Report No. 186: Paratransit, 1979.; ORDER FROM: TRB Publications Off

32 303915 INSTITUTIONAL DYNAMICS OF PARATRANSIT IMPLEMENTATION. This paper argues that recent federal policy incorporates a normative theory of administration and planning that highly values coordinated efforts, comprehensive plans, and regional decision-making structures. It also argues, however, that the key planning question for paratransit should not be how to achieve service coordination and organized planning but rather what institutional factors and frameworks lead to successful paratransit implementation. Three major types of paratransit projects are examined--demand-responsive services, vanpooling, and special-client services--and it is concluded that, in each case, successful implementation has been linked to local community and business factors, individual labor-management agreements, and the involvement of existing service providers and local institutional frameworks. The paper further concludes that increasing federal involvement can significantly increase the cost of paratransit services and reduce the chance for implementation. Thus the federal government is challenged to develop rules and funding criteria that will, by making clear that paratransit is a legitimate competitor for federal funds, effectively accommodate the diversity of existing local governmental structures, political bargaining, and service providers. Jones, DW, Jr (California University, Berkeley) *Transportation Research Board Special Report* No. 186, 1979, pp 21-26, 5 Ref.; This paper appeared in TRB publication Special Report No. 186: Paratransit, 1979.; ORDER FROM: TRB Publications Off

32 303916 ASSESSING THE EFFECTIVENESS OF PARATRANSIT SERVICES. The information and procedures required for the assessment of the effectiveness of paratransit options as part of a comprehensive evaluation of public transportation alternatives are reviewed. Recent paratransit projects directed toward three major travel markets--high-density home-to-work travel, special-user-group travel, and general-purpose travel--are used to illustrate the discussion. Although these examples provide useful insight into the effectiveness of paratransit modes and their relationship to conventional transit, they also draw attention to some important information gaps and some major shortcomings in current evaluation procedures. Suggestions are made for filling these data gaps and improving overall evaluation procedures for paratransit and other public transportation modes. (Author)

Kirby, R Miller, GK (Urban Institute) *Transportation Research Board Special Report* No. 186, 1979, pp 27-43, 3 Fig., 8 Tab., 21 Ref.; This paper appeared in TRB publication Special Report No. 186: Paratransit, 1979.; ORDER FROM: TRB Publications Off

32 303917 OPPORTUNITIES FOR INCREASING COMPETITION IN THE PROVISION OF PARATRANSIT SERVICES. The goals and objectives are examined that could be served by encouraging competition among various paratransit providers in a community. It is argued that subsidy mechanisms could be used to enhance such competition but that two major factors--statutory labor-protection provisions and local regulatory environments--act as barriers

to this approach. Several instances in which paratransit implementation attempts have been affected by state or local restrictions are described, and the experiences, benefits, and problems of three methods for increasing competition among service providers—expanding services under existing regulation, requiring bidding for price and service contracts, and user-side subsidies—are discussed. Finally, it is concluded that equity between private providers and publicly subsidized systems should be studied. (Author)

Rechel, RE (Institute of Public Administration) *Transportation Research Board Special Report No. 186, 1979, pp 44-51*; This paper appeared in TRB publication Special Report No. 186: Paratransit, 1979.; ORDER FROM: TRB Publications Off

32 303919 EVALUATION OF AUTOMATED DISPATCHING FOR FLEXIBLY ROUTED PARATRANSIT SERVICES. Computerized dispatching systems may be appropriate for flexibly routed paratransit systems if they can reduce the cost of vehicle dispatching, improve vehicle productivity, or increase the quality of service provided to riders. This paper compares the performances of computerized, computer-assisted, and manual dispatching based on recent experiences in several systems and analyzes the cost parameters of each under various vehicle, rider, and service-area constraints. Although relative data are too limited to allow major conclusions about the cost or effectiveness of different dispatching processes in varying environments, it is concluded that automated dispatching appears to be more expensive than manual dispatching for the present scale of shared-ride, flexibly routed services. However, it is also noted that improvements in the cost, capability, and flexibility of new computers, as well as the growing need for extensive rider and trip-information processing, will be important factors in the future. 32 303951 FEASIBILITY OF COMBINING PUBLIC TRANSIT AND SCHOOL BUS SYSTEM SERVICES IN DADE COUNTY, FLORIDA (ABRIDGMENT). The objective of this study was to examine the appropriateness of joint use of public transit and school bus services in Dade County, Florida, which includes the city of Miami as well as other urban, suburban, and rural areas. Four alternatives for joint use of transit services were examined: home-to-school and return transportation of public school students by the public transit system, known as the Metropolitan Transit Agency (MTA); field-trip transportation of public school students by the MTA; after-school transportation of public school students by the MTA, and maintenance of school-board buses by the MTA. It was concluded that there are very limited opportunities for joint utilization of transit services in Dade County. The home-to-school transportation of students should continue to be provided by the school board's transportation unit—primarily because of the inability of MTA to guarantee seats on its vehicles, the significantly lower operating

costs of the school board's vehicles, and the more flexible labor contract of the school board in terms of guaranteed hours for drivers. The school board should also continue to provide field-trip transportation for students, primarily because its cost is significantly lower than the charter rates of MTA. MTA maintenance of school board vehicles is not feasible under federal regulations, nor is it desirable. However, MTA provision of after-school service for students should be explored.

32 304452 TAXICAB TRANSPORTATION (A BIBLIOGRAPHY WITH ABSTRACTS). The role of taxicab services as another means of public transportation is cited including services of large taxicab vehicles, multi-origin destination taxi systems responding on demand, and shared ride taxi systems. Vehicle monitoring systems for centralized management to provide location for fleet vehicles are described as are user characteristics and taxi traffic in urban areas. Regulations and ordinances, policies, operating and economic characteristics of the urban taxicab industry including fare structure, computer applications and market studies are covered. (This updated bibliography contains 65 abstracts, 14 of which are new entries to the previous edition.)

32 304535 OPTIMIZATION IN DIAL-A-RIDE SYSTEM ANALYSIS: A COMPARISON OF RECENT MODELLING AND AN EXPECTED VALUE MODEL. A literature review of optimization models for small bus system designs is presented. Maximization algorithms are briefly discussed for project CARS at Massachusetts Institute of Technology, project BUSTOP at Northwestern, a model developed by Tapan Datta at Wayne State University, and a mean value model developed at Ford Motor Company and programmed at The University of Michigan. The design features of the models are presented and suggestions are offered as to the applicability of the models to the transit authority planning environment.

32 304618 VEHICLE LONGITUDINAL CONTROL AND RELIABILITY PROJECT. VOLUME 5. VLCR ENTRAINMENT AND PLATOONING ANALYSIS AND DESIGN. PARTS A AND B. The U.S. Department of Transportation's Automated Guideway Transit Technology Program (AGTTP) is directed towards the development of critical technologies

which provide the foundation for the successful deployment of Automated Guideway Transit (AGT) systems. The program is not directed towards development of complete deployable systems, but towards system elements which may be used in a variety of advanced urban transportation systems. As part of the AGTTP, a project was established to address two critical areas where technological improvements at the subsystem level can substantially improve the deployability of AGT systems: vehicle longitudinal control and reliability. One of the efforts discussed in this report deals with the longitudinal control aspects of automatic entrainment and platooning concepts. The project objectives were to: (1) develop functional and performance specifications for longitudinal control systems for AGT systems using automatic entrainment or platooning; (2) perform an analytical and experimental evaluation of an automatic coupling and decoupling system suitable for trained vehicle operation and failed vehicle pulling and pushing; (3) establish design concepts and specifications for automatic coupling systems which meet the requirements in a cost-effective manner; and (4) perform an analytical assessment of the platooning concept and establish platooned vehicle operation. Work in this report includes review of status of existing technology, specification of design goals and requirements, detailed mathematical modeling, analysis and simulation, development and specification of design concepts and their mechanization, and some experimental validation of the design. The latter will be reported in Volume 6 of the final report.

32 304655 GOLDEN GATE VANPOOL DEMONSTRATION PROJECT. The report evaluates the Golden Gate Vanpool Demonstration Project activities begun in October 1977. The objective of the demonstration is to successfully promote commuter ridesharing through vanpools. The project grantee, the Golden Gate Bridge, Highway and Transportation District, is a multi-modal transportation agency which operates buses and ferries and sponsors club buses, with control of a toll bridge and joint control of a High Occupancy vehicle (HOV) highway lane that feeds into it and leads to the San Francisco employment area. The Golden Gate Corridor presents a set of conditions ideal for vanpool formation: a single congested traffic corridor with an exclusive HOV lane leading into a major employment center via a toll bridge. The vanpool facilitator controls the toll booth and actively promotes ridesharing by allowing free bridge passage for 3-person or larger carpools and for vanpools. The report describes operating characteristics and documents planning implementation stages. Analyses of service levels, demand, productivity, marketing strategies, and vanpool demographics are presented. The report points out that the Golden Gate Project clearly demonstrates that a public transit authority can facili-

tate vanpool formation and that issues once viewed as constraints, such as 13(c) agreements and reasonable insurance coverage, can be negotiated.

Dorosin, E FitzGerald, P Richard, B ; Crain and Associates, Transportation Systems Center, Urban Mass Transportation Administration, (UMTA-CA-06-0095) Intrm Rpt. UMTA-CA-06-0095-79-1, July 1979, 310 p.; Contract DOT-TSC-1081; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-300685/5ST

32 304670 HUMAN SERVICE AGENCY TRANSPORTATION COORDINATION. The objectives of this study were to compare the costs of independent special purpose transportation services with the costs of combined transportation services and to study the reability of coordinating existing transit to satisfy the transportation needs of human service agencies in various sized communities. This report contains the California Department of Transportation's (Caltrans) study of the feasibility of coordinating human service agency transportation in three areas of California, namely: Pittsburg; Fairfield-Suisun City-Vacaville areas; and the National City-Chula Vista areas. Cost and ridership data were collected from these agencies by means of inventories, interviews, and questionnaires. The resulting data were analyzed to determine cost and ridership factors. The cost data indicated that combined transportation costs are approximately equal to the average of the costs of independent special purpose transportation.

32 304756 PARATRANSIT RESOURCE GUIDE. The report is one element of a set of curriculum materials to support university classroom and professional short course training in local paratransit planning. This Paratransit Resource Guide is structured to provide the reader with sources of information, including personal contacts, on paratransit development at the Federal, state, and local levels, with emphasis on Federal sources and national information sources. The Guide includes definitions of paratransit, pertinent Federal policies, annotated introductory overview literature, other information sources such as TRISNET and NTIS, Federal legislation, Federal agencies with contact persons, UMTA and FHWA regional offices, professional organizations and other associations, consulting firms and research organizations, foreign sources of information, and a paratransit educator resource list.

32 305753 VANPOOL RESEARCH: STATE-OF-THE-ART REVIEW. A wide dichotomy of viewpoints currently exist regarding the growth of employer-based, third-party, and owner-operator vanpool programs. The purpose of the report is to identify existing vanpool research activities of Federal, state, and local

governments, private organizations, and universities; to assess the current state of knowledge, based on this research, of vanpool operating characteristics, institutional issues, and ridership; to determine areas where additional vanpool research may be needed; and to provide guidance in future vanpool-related demonstration projects. The authors state that although the assessment of vanpooling that emerges from both a review of available material and discussions with those active in the field is mixed, an examination of available vanpool information indicates a lack of reliable and objective evaluation data on the relative costs and effectiveness of different vanpooling arrangements. The study implies that the success of vanpool programs should be evaluated over a three-to five-year period. The proposed research needs herein are oriented to those individuals attempting to operate vanpool programs by increasing the current state of knowledge of vanpooling as a travel mode, by developing improved operational techniques in support of program management, and by relating vanpooling to other urban area transportation activities. 32 305779 COMPUTER DIAL-A-RIDE SOFTWARE INSTALLATION GUIDE, VOLUME 1. Computer Dial-A-Ride is a software system designed to automate scheduling and dispatching of vehicles. The system consists of a real-time program that controls all aspects of operating the transportation service and various support programs used for file maintenance and statistical analyses. An understanding of the operation of the software is the key to its successful installation. Section IV details the process of unpacking and installing the software system. The software is not self-installing, and it is not a 'turn-key' system; it will require technical support in its installation and operation. The purpose of the document is to assist systems programmers in the installation of the Computer Dial-A-Ride Package. The functions, composition, and form of the package are described and the activities and operations related to the installation of the software at a user site are defined. The software is most suitable for installation on a 36-bit or greater (e.g., a 48-bit) computer. Installation on 16-bit, 24-bit, and 32-bit computers requires modifications to the software system.

32 305781 COMPUTER DIAL-A-RIDE STREET NAME FILE BUILDING SYSTEM, VOLUME 3. This document addresses the street name file system that the real-time program uses for translating addresses to a set of coordinates and zone. The major portion of the data necessary to build the street name files originates with the Census Dime Files. Addresses may be in the form of house number and street name, store names, mall names, intersections, etc. This document supplies user documentation and a functional description of the software provided for building the various files that comprise the street name file system. Detailed information for executing each of the steps of the building process is given in addition to message descriptions, input data file descriptions and sample values, and a description of the structure of each of the files created. A detailed functional description is given of the major data bases and the procedures included in the software.

Harper, SH ; ADP Network Services, Inc., Washington, DC., Federal Systems Div.*Urban Mass Transportation, Administration, Washington, DC. 32 305782 COMPUTER DIAL-A-RIDE SOFTWARE DESIGN AND FUNCTIONAL DESCRIPTION, VOLUME 4. This document consists of the following three reports: A Software Design and Functional Description of Dial-A-Ride; Dial-A-Ride Input Parameter Files; and Building, Maintaining, and Listing the Advance Customer File. The first report introduces and briefly discusses the hardware and software comprising the Dial-A-Ride system and the general capabilities of the real-time program. An in-depth functional description is given for each subsystem of the real-time program. The Dial-A-Ride Input Parameter Files report gives a detailed description of the real-time program's parameter files' contents and structure and gives suggested input values suitable for initial program testing purposes. The remaining report included in this document discusses the file structure and the programs that create and maintain the Advance Customer file.

32 305783 COMPUTER DIAL-A-RIDE TERMINAL HANDLING SYSTEM. VOLUME 5. This document describes the Terminal Handling System used by the Dial-A-Ride system on the Interdata 8/32. Each module and common block is described in detail. The Terminal Handler for the Interdata 8/32 Dial-A-Ride System is in two parts--the Terminal Interface Subsystem in Dial-A-Ride and a Terminal Handling System operating separately from Dial-A-Ride. The Terminal Interface Subsystem communicates with the Terminal Handling System in order to perform terminal functions--input, output, checking for I/O complete, etc.

32 305827 BENEFIT-COST ANALYSIS OF INTEGRATED PARATRANSIT SYSTEMS. No abstract available.

Multisystems, Inc., Cambridge, MA.*Transportation, Systems Center, Cambridge, MA. Sept. 1979, 845p-in 6v; nSet includes PB80-125479, PB80-125487, PB80-125495, PB80-125503, PB80-125511, and PB80-125529. n; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-125461

32 305828 BENEFIT-COST ANALYSIS OF INTEGRATED PARATRANSIT SYSTEMS. VOLUME 1: EXECUTIVE SUMMARY. Integrated Paratransit (IP) is a concept which involves the integration of conventional fixed-route transit with flexibly routed paratransit services to provide the most effective area-wide transit coverage. The report estimates the benefits and costs associated with different IP options in different settings and compares these results with those of other transportation alternatives. Based on the results of the various components of analysis in this study, a variety of conclusions about IP service can be reached. The conclusions suggest that in some circumstances integrated paratransit may be an effective strategy for improving overall mobility.

Flusberg, M Menhard, HR Walker, J Sobel, K ; Multisystems, Incorporated, Transportation Systems Center Final Rpt. DOT-TSC-UMTA-79-39-1, Sept. 1979, 73 p.; See also Volume 2, PB80-125487. Also available in set of 6 reports PC E19, PB80-125461.; Contract DOT-TSC-1334; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-125479

32 305829 BENEFIT-COST ANALYSIS OF INTEGRATED PARATRANSIT SYSTEMS. VOLUME 2: INTRODUCTION AND FRAMEWORK FOR ANALYSIS. The study represents the first systematic attempt to estimate the potential impacts of a wide range of IP options in different settings. The output of this

study should provide local decision-makers with a better understanding of the varied impacts an IP system might have. In addition, the study has attempted to identify potentially promising IP options and policies (as well as those options which show little promise), which may lead to the next round of paratransit demonstrations. Finally, the study has identified those instances where IP is, and those where it is not, the most appropriate way to improve public transportation services in a given area.

32 305830 BENEFIT-COST ANALYSIS OF INTEGRATED PARATRANSIT SYSTEMS. VOLUME 3: SCENARIO ANALYSES. This is the third volume of a six-volume report documenting the results of a study entitled "Benefit-Cost Analysis of Integrated Paratransit Systems." This volume provides detailed results of a series of scenario analyses designed to determine the impacts of various integrated paratransit (IP) configurations and other, more conventional, alternatives in a variety of settings. These transportation options are analyzed for the year 1980; the IP scenarios are also analyzed for the year 2000.

32 305831 BENEFIT-COST ANALYSIS OF INTEGRATED PARATRANSIT SYSTEMS. VOLUME 4: ISSUES IN COMMUNITY ACCEPTANCE AND IP IMPLEMENTATION. The report describes various factors which influence community acceptance of integrated paratransit (IP) systems. In order to fully explore past events in those communities which have already accepted IP, a case study approach has been used. Seven well known IP systems were selected for analysis, based on system size, extent of community acceptance, and availability of data. Given the experiences in each case study, certain generalizations have been made about factors which seem common to each site, and comparisons have been made to show the resultant influences of different policies or other factors at the local level.

32 305900 THE WESTPORT CONNECTICUT INTEGRATED TRANSIT SYSTEM. The purpose of the project was to demonstrate the feasibility of combining shared-ride taxi and other paratransit service with conventional fixed-route bus service in Westport, Connecticut. The project focused on the Westport Transit District (WTD) playing a major brokerage role which involved contracting with private operators for the provision of shared-ride service. The report is an evaluation of the Westport Demonstration implementation, operations, and impacts; it covers a six month planning period and two full years of service operations. The planned and actual project implementation is described including important Federal litigation initiated against the project by one of the two local taxi operators. The report also describes the integrated fleet management and vehicle deployment strategies utilized by the WTD to provide regular fixed-route, supplemental fixed-route, shared-ride taxi, and special markets services. Arrangements for system integration in the areas of maintenance, marketing, public information, and fare structure are also discussed. The evaluation examines ridership markets, system productivity, service economics, and community impacts.

Furniss, RE ; CACI, Incorporated, Urban Mass Transportation Administration UM927/R9742, UMTA-CT-06-007-79-1, July 1979, 211p; Contract DOT-TSC-1082; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-129877

32 307592 MICHIGAN STATEWIDE TRANSPORTATION MODELING SYSTEM. VOLUME XVI. MULT-MODAL ANALYSIS: DIAL-A-RIDE. Because of increased public demand for such service as Dial-a-Ride coupled with the necessity of using every tax dollar to the fullest measure, multi-modal planners have a responsibility to the public to use all available information in choosing communities in which they plan to spend money. The process documented in this report is offered as a possible first step in providing an additional dimension in Dial-a-Ride site selection. A process of this nature could also be useful in formulating a statewide Dial-a-Ride plan. This report should be regarded more as a working paper than as a finished product. Feedback from potential users, it is hoped, will strengthen it until it can be used as a day-to-day planning tool. /Author/

32 307701 BIG OPPORTUNITIES FOR INTELLIGENT BUS-SYSTEMS [Grosse Chancen fuer Intelligentes Bussystem]. In July 1976 the results of the "Feasibility Study for Demand-Controlled Bus Systems" were published. According to this, the two system concepts of 'retax' (computer-controlled taxi-bus) and 'rufbus' (call-bus) were found to be technically possible and workable. Demand-control means that the passenger can call a public service vehicle either from his own telephone or from a street-corner call box. Further development work and the testing of components are to follow. /TRRL/ [German]

32 307717 FEASIBILITY STUDY FOR A PRT (CAB TAXI) SYSTEM IN MARL [Durchfuhrbarkeitsstudie fuer ein Cabintaxi-System in Marl]. The feasibility study for the application of DEMAG/MBB taxis is being undertaken in the town of Marl. Since public passenger transport in Marl is not attractive, the results have more than usual significance. The social acceptability of such a network was investigated, its costs were estimated and a comparison was made with another system (a comfortable version of a v-bus). The results showed the prt/taxi system to be more attractive, therefore possibly leading to a recovery in public transport, but more expensive. Which system is "better" is a political decision. /TRRL/ [German]

32 307750 WHEN THE BUS COMES AS IT IS CALLED [Wenn der Bus Wie Gerufen Kommt]. The experimental service for the dial-a-bus system in Friedrichshafen on Lake Constance is beginning to operate. It should contribute towards improving the attraction of local public passenger transport. The minibus operates according to requirement and represents to some extent the middle place between taxis and service buses. Operational control is electronic. In the dial-a-bus control centre the computer has already taken over 85% of the operational control. Two problem areas have crystallized: the difficulties in calling a bus by means of a keyboard at the call-point and the numerous misunderstandings caused when the bus does not travel immediately to the requested destination, but often starts off in the opposite direction because of other instructions issued to it and then sometimes waits at these stops for several minutes using up its buffer time. The control terminal in the bus and the unorthodox entry conditions place a heavy strain upon the driving personnel. Here it is necessary to make improvements. Improved legibility of the particulars on the display screen would help towards this. One effect which strongly influences the economy of the dial-a-bus is the proportion of

"non appearances" among the callers. At over 10% at present it is still too high. /TRRL/ [German]

32 307921 PUBLIC TRANSPORT PLAN 1980-1981 DRAFT.. This report gives a history of public transport planning with particular reference to the traffic act 1930 and the transport act 1968. A description follows of current trends in public transport and its operation, including the responsibilities of the local authority. Clwyd CC's public transport policy is discussed and key objectives are listed. Explanations are given of policies to meet these objectives. An overall description is included of the public transport system in Clwyd, including reference to supplementary services such as minibuses and post-buses. The transport problems and needs within the county are considered both for urban and interurban services, and the resulting proposed programme is presented. Changes from the previous public transport plan are indicated. (TRRL)

32 307964 COLONIAL TAXI COMPANY OF BETHEL PARK, PENNSYLVANIA--PRIVATE ENTERPRISE IN PARATRANSIT. The purpose of this paratransit agency case study was to develop basic instructional materials to support university classroom and professional short course training in local paratransit planning. This curriculum material consists of 6 separate documents--a guide and 5 paratransit case studies--titled: Paratransit Resource Guide; The Seattle/King County Commuter Pool Program--Paratransit and Rush Hour Congestion; Colonial Taxi Company of Bethel Park, Pennsylvania--Private Enterprise in Paratransit; The Paratransit Services of the Choanoke Area (North Carolina) Development Association--Rural Transit in Coordinated Human Services Transportation; The Dial-A-Bat Paratransit Service of Brockton, Massachusetts, Area Transit--Public Transit in Coordinated Human Services Transportation; and Knoxville, Tennessee, Commuter Pool--Matching Markets to Modes with Paratransit Brokering.

Oklahoma University, Urban Mass Transportation Administration, (OK-11-0001) UMTA-OK-11-0001-79-3, June 1978, 60 p.; Report 3 of 6, Paratransit Case Studies.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-103252

32 307965 KNOXVILLE, TENNESSEE COMMUTER POOL-MATCHING MARKETS TO MODES WITH PARATRANSIT BROKERING. The purpose of this paratransit agency case study was to develop basic instructional materials to support university classroom and professional short course training in local paratransit planning. Knoxville Commuter Pool was a significant national experiment in community-wide transportation brokerage, particularly in its broad scale implementation of an owner/operator van pool program (47 van pools at the end of 1978), its aggressive promotion of all forms of ridesharing among employers and employees in the area,

and in the resolution of barriers (notably state regulations and insurance) to ridesharing brokerage. Knoxville Computer Pool engaged in limited amounts of human service agency transportation brokerage through 1977. Comparisons are made with the local Tennessee Valley Authority ridesharing programs, which is a successful model of an employer-based commuter work trip brokerage.

Cook, AR Barb, CE, Jr ; Oklahoma University, Urban Mass Transportation Administration, (OK-11-0001) UMTA-OK-11-0001-79-6, Dec. 1978, 55 p.; Report 6 of 6, Paratransit Case Studies.; ORDER FROM: NTIS; PB 80-103286

32 307966 THE PARATRANSIT SERVICES OF THE CHOANOKE AREA (NORTH CAROLINA) DEVELOPMENT ASSOCIATION--RURAL TRANSIT IN COORDINATED HUMAN SERVICES TRANSPORTATION. The purpose of this paratransit agency case study was to develop basic instructional materials to support university classroom and professional short course training in local paratransit planning. This study gives background information on the Choanoke Area Development Association (CADA) and area, and reviews CADA's paratransit operations in 1978. Over 7,000 patrons use the service each month at a total cost to CADA of \$0.60 per vehicle mile, including capital and administrative overhead. The study documents the planning and implementation of news services, reviews current management and operating practices, and concludes with commentary on the local and national significance of the service. CADA has significantly increased the mobility of low income and elderly and handicapped residents of the Choanoke area and local human service agencies appear to have benefited from the availability of the CADA transportation service. The rural fixed-route bus services with feeder vans have been and should continue to be a model for rural public transportation programs.

32 307968 THE SEATTLE/KING COUNTY COMMUTER POOL PROGRAM--PARATRANSIT AND RUSH HOUR CONGESTION. The purpose of this paratransit agency case study was to develop basic instructional materials to support university classroom and professional short course training in local paratransit planning. The Seattle/King County Commuter Pool program evolved from a 1973 energy crisis carpool program into a multi-faceted paratransit, paratransit incentives development and planning program focused upon reducing peak hour traffic congestion. The program has been involved in twenty-two recognizable activities, including operating a computer rider-match system and buspool program; development of paratransit incentives, including preferential parking, lane access and tolls; planning and employer consulting, including vanpooling and parking programs, transit strike contingency planning, state legislative lobbying for ridesharing legislation, special commuter and transporta-

tion studies, and Federal research into vehicle occupancy monitoring; flexible work hour promotion; and media promotion and educational program development.

32 308036 FACTORS AFFECTING RIDE-SHARING BEHAVIOR. Recent research has shown that ridesharing is not basically an economic phenomenon but a complex social and psychological one influenced by numerous factors, as well as demographic and situational variables. The purposes of this study are (1) to determine which factors influence ridesharing, and (2) to develop appropriate strategies to encourage non-ridesharers to switch to ridesharing. Using a survey of 901 employees of New York State government, AID analysis and two-stage least squares regression were used to test for causal relationships between demographics, attitudes and ride-sharing behavior. Four market segments based on distance and travel time to work were identified. The segments were analyzed to determine which attitudes about carpooling influenced behavior. Results and strategies vary among the segments. For commuters traveling over 3 miles one-way, an overall carpool rating, dependent on an individual's perception of salient attitudes, was found to influence, and be influenced by, behaviour. In addition, attitude toward crowding in carpools was found to influence the behavior of long-distance (greater than 10 miles) commuters using expressways. No relationships were found in the segment of commuters traveling less than 3 miles. The research concluded that in order to account for such differences, it is necessary to have a carpool coordinator probe the prospective ridesharer and assess which set of attitudes are more important to each prospective carpooler's overall view of carpooling.

Brunso, JM Kocis, MA Ugolik, WR ; New York State Department of Transportation Report No 165, Aug. 1979, 31 p., 7 Fig., 3 Tab., 24 Ref.

32 308045 THE CAR LEFT HOME. Much of the recent emphasis of transportation planning has been on short-term, TSM-type actions intended to induce mode shifts from auto driver to carpooling and transit, particularly for the work trip. However, these actions subsequently free up a vehicle for use by other family members during the day. They also disrupt the worker's normal routine and may force that person to change the time at which he takes a trip. The result may be an increase in the household's nonwork VMT offsetting a portion of the work trip VMT saving. Using data collected during three home interview surveys conducted in New York State, it was concluded that the mode shifts away from vehicle driver for the work trip will result in a net VMT reduction less than work trip length. The net saving will be in the range 55-60% of the work trip VMT. It was also found that though the availability of a vehicle during the day for non-work trips does alter the distribution by purpose of the household's vehicle driver trips, it has little impact on the distribution by purpose of the household's total trips. The additional non-work

travel must be included in the analysis of any of these transportation actions or else the picture will be incomplete and overly optimistic. In addition transportation actions must be advanced which impact non-work travel if total VMT is to be reduced and subsequently congestion, energy consumption and air pollution lessened. /Author/

Gross, JM ; New York State Department of Transportation Aug. 1979, 19 p., 4 Tab., 5 Ref.

32 308206 THE ONTARIO SHARE-A-RIDE PROGRAM. The Ontario Share-A-Ride program is designed to achieve widespread use of car and vanpooling across the Province of Ontario. The paper describes the three phases of the program, study, demonstration and broadscale implementation. A number of preliminary results are presented. These results show a 10% to 20% increase in pooling activity and substantial cost savings for the participants in the vanpool program. A cost comparison is made between the total costs of operating carpools and vanpools and of providing bus service in which buses are shown to be four times and the average car five times as expensive as a vanpool. The data is used to perform a benefit analysis for creating new car and vanpools and to calculate benefit/cost ratios for the ongoing pilot projects. Potential community and social benefits from the creation of each new car and vanpool are shown to total \$800 and \$4000 a year, respectively. Including personal benefits and subtracting time costs brings the total benefits per pool to approximately \$2500 and \$7700, respectively with individual cost savings of \$1000 to \$1300 per year per person. The future program will consist of a broadscale outreach effort across the Province in which technical advice and guidance will be provided from the experience gained in the demonstrations. In addition, implementation handbooks and publicity material have been developed for large scale distribution and other incentive measures to promote high occupancy vehicle use are being studied. The program goal is to create 400 vanpools and 5000 new carpools in the Province by 1983.

32 308207 CAR AND VANPOOLING IN CANADA-ITS IMMEDIATE PAST AND PROSPECTS FOR THE FUTURE. This paper examines the past experience of the Transportation Development Agency program in carpooling and current developments in the promotion of vanpooling under the sponsorship of Transport Canada, Energy Mines and Resources and the provinces. The main thrust of the TDA carpool program was the sponsorship of a two year, large scale, areawide carpool demonstration program carried out in Vancouver. While this project was very professionally conducted it failed to draw the hoped for public support for carpooling and consequently was discontinued. An evaluation of the project carried out at its conclusion revealed that the excellent transit system in Vancouver, the absence of adequate incentives for carpooling and

the lack of credibility of the energy crisis made it impossible to get commuters to switch to carpooling. A detailed analysis of the carpool market based on the Vancouver experience showed that only through fairly draconian disincentives to driving alone could a significant shift to carpooling be achieved. Furthermore it was found that due to the alternative use by other family members of carpool vehicles left at home, the energy saving of carpooling was only 10% per carpooling household. The carpool program proved unsuccessful for central areas well served by transit and it was concluded that future promotion of pooling should aim to service remote industrial sites and areas with poor transit service. Building on this knowledge, the Strategic Studies Branch of Transport Canada, Energy Mines and Resources and the provinces have initiated a program to encourage vanpooling in such circumstances. The paper concludes with a description of this program and the lessons Canadians can learn from the entire carpool/vanpool experience to date including its utility as one component of a contingency plan to meet any future energy crisis.

32 308523 COORDINATING PARATRANSIT AND HEAVY RAIL SERVICE. Paratransit, when fully integrated and complimentary to existing public transit services, provides a flexible and necessary dimension to intermodal coordination. This is illustrated by the successful public transit system in Westport, Connecticut, an affluent community of 28,000 people. The Westport Minnybus carries approximately 600,000 persons/year in its daytime and commuter bus services, while the Maxytaxy, a shared ride, demand-responsive Urban Mass Transportation Administration service and methods demonstration project, carries 160,000 persons/year. The Maxytaxy has successfully integrated goods movements and elderly and handicapped services into generally available, demand-responsive public transportation while achieving a vehicle productivity of five to six passengers per operating hour. Westport residents utilize public transportation services to the extent of 25 trips per capita per year. The Minnybus and Maxytaxy provide general supportive services to the rail system during the entire day by routing schemes and operational practices to make all parts of the Westport community accessible by public transportation modes to and from the railroad station.

32 308550 JITNEY PARATRANSIT SERVICES: AN APPRAISAL OF PRESENT AND FUTURE OPERATIONS. Jitney, one of the oldest paratransit modes and one of the few that are privately owned, is examined to ascertain its present and future viability. Land use, population, travel patterns, and transportation system characteristics are drawn from field observations and census sources for jitney corridors in Atlantic City, Chicago, and San Francisco. These corridors are prototypes of two different types of jitney operations: (a) taxicabs operating as jitneys and

(b) specially licensed jitney vans. Jitney and bus operations are compared to differentiate the relative start-up and operating cost advantages of each mode. An advantage of the jitney is its low start-up cost. Corridors appraised to be suitable for jitneys are those that have a mix of intense land uses that generates a consistent demand for intracorridor travel, low rates of automobile ownership, and travel demand that is evenly dispersed spatially and temporally to reduce deadheading. However, the future viability of jitney could be endangered if fare increases instituted to provide adequate wages for drivers threaten jitney's competitiveness with publicly subsidized transit services. 32 308551 DIAL-A-RIDE IN ROCHESTER: SEARCH FOR A VIABLE SUBURBAN TRANSIT ALTERNATIVE. The evolution of the federally assisted demand-responsive transportation demonstration in Rochester, New York, is examined. The history of dial-a-ride in Rochester is divided into four phases: (a) the growth period, from 1973 to late 1975; (b) 1976, the transition period, during which growth of dial-a-ride service ended and reassessment began; (c) 1977, the period of drastic cutbacks; and (d) the new demonstration, which began in November 1977. The problems and achievements of the program in each of these phases are evaluated, and the implications of the Rochester experience for suburban transit services in other cities are cited. (Author)

Holoszye, M (Systan, Incorporated) *Transportation Research Record* Vol. 724 1979, pp 8-15, 1 Fig., 4 Ref.; This paper appeared in TRB Record No. 724, Current Paratransit and Ride-Sharing Activities.; ORDER FROM: TRB Publications Off

32 308552 HYBRID PARATRANSIT SERVICE. Hybrid paratransit, which combines features of conventional bus service and demand-responsive transportation, is examined. Hybrid paratransit sacrifices some of the flexibility of demand-responsive transportation to attain improved productivity and cost savings but retains some of that flexibility to achieve the levels of service necessary for adequate market penetration. One example of hybrid paratransit is checkpoint subscription service, a prearranged operation in which groups of passengers gather at common locations for collection and passengers are distributed only to those locations. Checkpoint and doorstep subscription service were analyzed and compared by applying models that predict cost and performance. The results show not only that the expected productivity increases accrue to the hybrid operation but also that, under many circumstances, the level of service of hybrid paratransit is superior. In addition, for any level of ridership, there may be a vehicle size that minimizes the operating costs of both subscription services. It is concluded that hybrid paratransit may offer service and cost characteristics that dominate demand-responsive transportation under a variety of conditions and may be the most

appropriate option for service areas of moderate population density. (Author)

Sobel, KL (Cambridge Systematics Europe) *Transportation Research Record* No. 724, 1979, pp 15-22, 9 Fig., 19 Ref.; This paper appeared in TRB Record No. 724, Current Paratransit and Ride-Sharing Activities.; ORDER FROM: TRB Publications Off

32 308553 INTEGRATED PARATRANSIT: MYTHS AND REALITIES. A study that involved a systematic attempt to estimate all of the potential impacts of a range of integrated transit-paratransit options in a variety of settings is reported. The study concluded that, in some but not all instances, the benefits of integrated paratransit—in terms of improved service levels and mobility, reduced automobile expenditures, and other impacts—may justify system deficits. Necessary conditions for this include (a) high paratransit productivity, which could possibly be achieved by implementing hybrid fixed-route and demand-responsive service (such as checkpoint many-to-many), and (b) low operating costs, which might be achieved by contracting with private operators. Integrated paratransit was found to have a positive but insignificant impact on automobile use and ownership and no measurable impact on vehicle kilometers of travel, fuel consumption, or emissions. Areas that have population density of 1160-2300 persons/sq km (3000-6000 persons/sq mile) and limited existing transit service are promising locations for implementation of integrated paratransit service. 32 308554 REVIEW AND ASSESSMENT OF PARATRANSIT MODELS. The development of integrated paratransit systems has been accompanied by the development of a wide range of modeling and analytic activities designed to shed light on the delicate balance between supply, demand, and cost in a paratransit network. Modeling and analytic approaches have ranged from complex situations to simple rules of thumb. Of the wide range of theoretical models developed so far by academics, researchers, and consultants, relatively few have been applied in a practical planning context, and the results of these limited applications have been mixed. A comprehensive survey of the analytic procedures and tools developed to address paratransit planning and evaluation problems is presented. Modeling procedures are described and classified, the historical development of the models is traced in the context of the parallel development of paratransit systems, the performance of existing models is compared, and the attributes and publication potential of several general classes of models are summarized. (Author)

Billheimer, JW Lucas, GR Wilmuth, RW (Systan, Incorporated) *Transportation Research Record* No. 724, 1979, pp 29-35, 6 Fig., 1 Tab., 37 Ref.; This paper appeared in TRB Record No. 724, Current Paratransit and Ride-Sharing Activities.; ORDER FROM: TRB Publications Off

32 308556 TECHNOLOGY TRANSFER IN PARATRANSIT: FIVE CASE STUDIES. The evolution and adaptation of paratransit from the perspective of technology transfer are examined. Three key factors in successful technology transfer and local adoption are the presence of necessary prerequisites (local paratransit-program mandates, a service patron, and entrepreneurial staff skills), the resolution of barriers (recognized as including local transportation planners, government agency staff, and federal programs and policies), and the transferability of the situation (unique local program or community characteristics that militate against the successful duplication of case study experiences). Five case studies are used to represent the major paratransit modes and mandates and substantial operating experience: the Seattle-King County Commuter Pool; the Knoxville Commuter Pool; Colonial Paratransit and Taxi Company of Bethel Park, Pennsylvania; Dial-a-Bat of Brockton, Massachusetts; and the Choanoke Area Development Association, Inc., of Murfreesboro, North Carolina. All five programs have evolved toward successful examples of technology adaptation and are characterized by broadly conceived mandates and multiple service activities. The case studies underscore the significance of the noted local prerequisites, particularly the role of the patron. (Author)

32 308557 ESTIMATING THE COSTS OF A SUBSCRIPTION VAN SERVICE. The development and results of a model that examines in detail the costs associated with supplying subscription van service in a small urban community are discussed. The service is assumed to consist of a number of vehicles that travel fixed routes for an extended period of time. Start-up costs, equipment replacement, system growth, and other variables are incorporated in the analysis. The effects of depreciation, taxes, purchasing and leasing of equipment, and other parameters are monitored. Possible savings to participating commuters under service cost-recovery criteria are also investigated. The procedure developed was implemented by a series of interactive computer routines coded in APL and simulated in hypothetical demand situation for the Fredericton, New Brunswick, area, and a sensitivity analysis of the major variables and assumptions was performed. The analysis indicated that the model produced reasonable estimates of the results of introducing subscription van service in the Fredericton area. The development of the model is described, and a representative module is provided to show the level of detail undertaken in the analysis. Results of the simulation runs are presented, and variables in the sensitivity analysis that were found to have major impacts on the economic viability of subscription van service are discussed. Fleming, DS Wilson, FR Stevens, AM (New Brunswick University, Canada) *Transportation Research Record* No. 724, 1979, pp 45-52, 7 Fig., 1 Tab., 4 Ref.; This paper appeared in TRB Record No. 724, Current Paratransit and Ride-Sharing Activities.; ORDER FROM: TRB Publications Off

32 308558 ECONOMICS OF VANPOOLING.

The concept of commuter vanpooling and the incentives that make it financially advantageous to the rider, the driver, and the company are examined. The primary incentive for riders is the money they can save on the commute to and from work. The farther the commute is, the greater are the savings. Convenience and camaraderie are also found to be important inducements for riders. For the driver, the incentives are a free commute to work, the possibility of getting rid of a second automobile, and personal use of the van on weekends. The incentives for 20 Texas firms that are currently operating approximately 310 vanpools are found to vary. Some companies initiated vanpooling to expand their labor market, some as a means of providing an increase in disposable income to employees, and some to save on parking costs. A detailed comparison of commuting and parking costs for automobile and vanpool is presented. Conditions in the state of Texas that have encouraged the use of vanpooling and future prospects for vanpooling in Texas are summarized. (Author)

32 308635 TAXI. REQUIREMENTS AND DEVELOPMENT POSSIBILITIES [Taxi. Krav och utvecklingsmoejligheter].

The traditional use of taxi is mainly the transportation of people to and from railway stations and airports, and transportation of people to and from different public places e.g. places of entertainment, hospitals, etc. The use of taxi as a means of transportation in areas such as school children transport, and substitution for time scheduled collective traffic, especially in rural areas, has lately increased considerably. The dominating business form of taxi transport is one license one owner. The owner then has drivers in his employment. Presently there are ca. 9000 licenses for taxi traffic in Sweden and only 400 to 500 taxi companies have more than one licence. The taxi companies often run a co-operative local calling station. This organization can effectively cope to a small extent with the fluctuating demands especially in densely populated areas. In the report the author describes alternative company organization such as: (1) the big company, which would own and control all its taxi cabs and licenses, (2) the association of license holders, and (3) competing taxi companies. The author describes the development of the utilization of taxi cabs in the collective transportation, along with the distribution of taxi licenses. The possibilities of a collective taxi transport, e.g. jitney services is discussed, along with the simplification of the construction of the taxi fare. The increasing illegal taxi traffic is becoming serious and should be dealt with by more severe punishment. (TRRL) [Swedish]

32 308789 PARATRANSIT-THE ANSWER.

Transport planners have shown increasing interest in the application of 'unconventional' or

paratransit forms of public transport services in situations where conventional rail or stage carriage bus services are not practical. Various experimental bus services have been introduced as exemplified by the UK Rutex programme. Many developing countries have such transport systems which have developed over a long period rather than as a result of sophisticated transport planning. Mostly privately owned, these systems perform satisfactorily with respect to local conditions and needs. The article describes a number of these minibus and shared-taxi systems and examines their operating characteristics. (TRRL)

32 309147 INCREASING THE ROLE OF TAXIS IN URBAN PUBLIC TRANSPORT.

The plea that taxis should be playing a greater role in urban public transport has been heard for many years. In Australian cities the only note-worthy attempt to facilitate this aim has been the introduction of some limited multiple-hire schemes. Innovative taxi operating schemes have been introduced in overseas cities aimed at reducing expenditure by the publicly operated transport organisations and at the same time increasing the revenue of the taxi industry. One of these schemes involves replacing buses with taxis on routes experiencing low passenger demand. This concept, known as "route-taxis", can be implemented in a number of different schemes. A theoretical study was undertaken for a specific bus route in Perth and a methodology was developed to ascertain the order-of-magnitude costs and benefits of replacing the bus service, at certain times, with a route-taxi. The study also identified a number of administrative and operational constraints that could hamper the introduction of route-taxi schemes. These constraints and a number of other issues relating to route-taxis are discussed in this paper. (TRRL)

32 309186 TAXIS AS AN ALTERNATIVE FORM OF COMMUNITY BASED TRANSPORT.

This paper presents a critical examination of community based transport for elderly people in urban areas. Many elderly people are transport disadvantaged. A common response of local area planners is to provide some form of subsidised mini bus service for use by elderly people. A study was made which examined a number of such mini bus services and concluded that, in terms of satisfying the transport needs of elderly people, mini bus services are generally inferior to commercially operated taxi car services on both efficiency and equity criteria. 32 309821 DIAL-A-RIDE FACES A FINANCIAL CRISIS.

The article reviews the present position of the sale dial-a-ride service in greater

Manchester. Of the many similar services introduced in the UK only this service survives in its original form. Although the service carries 120000 passengers annually this must be increased to 180000 to eliminate an annual deficit of 20000. The six Bedford cf340-based minibuses in the fleet have suffered reliability problems and may be replaced with Dodge 50-series vehicles. The service includes many regular bookings such as home-to-school for children and home-to-clinic for old people. This type of operation has allowed the drivers to build up social contacts within the community. It is essential that the operating economies planned be successful if the system is to survive. 32 310025 THE ORGANISATION AND ROLE OF PRIVATE BUS AND COACH COMPANIES.

A study of the organisation and operating methods of privately owned bus and coach companies is reported. It shows that the industry is a growing one dominated by relatively small companies which play a significant role in providing local road passenger transport. Notable features of private bus and coach companies are their apparently low overheads, the flexibility of their full-time staff and the extent of use of part-time drivers. Peak school contracts form the main basis of their work and many have all their vehicles committed to at least one such contract during peak periods. This peak work is supplemented by a smaller number of works contracts. Off-peak work is more limited and varied, consisting of a mix of other school services, transport of shift workers, social services work, licensed road service operation, various one-off contracts and, in the case of minibus operators, parcel and school meals deliveries. At the weekends and during the summer holidays many operators run day outings or licensed services to the coast or other places of entertainment and interest. Their costing methods lead many private operators to charge comparable prices for both peak and off-peak work. Such methods contrast with that used by many publicly-owned companies which lead to a much higher level of pricing in the peak. (a) (TRRL)

32 310137 A STUDY TO ASSESS THE FEASIBILITY OF USING TAXI CABS FOR SERVICE TO THE AMBULATORY HANDICAPPED.

This report is an assessment of the feasibility of providing door-to-door transportation for the ambulatory handicapped, by taxi. The rationale for the study is primarily financial, with the prospect of providing such service using a standard taxicab at less cost than the special van-type services now operating in a number of Canadian cities. Comparative programs in five American cities are outlined. (TRRL)

32 310245 CAR POOLING IN THE USA: A BRITISH PERSPECTIVE. The present US ride-sharing programme was initiated as an emergency measure during the 1973 crisis and, in the heat of the moment, perhaps rather over-zealous claims were made for its likely effectiveness within transport policy as a whole. The emergency conditions then prevailing precluded the establishment of an adequate monitoring framework. Attempts are now being made to establish the true impact of ride-sharing and to make realistic forecasts of its future effects. Perhaps the most important lesson to be learned from the US experience of organised ride-sharing is that unless petrol prices are raised dramatically, and in the absence of clear incentives, the reduced personal flexibility associated with organised ride-sharing schemes makes them an unattractive option to all but a minority of commuters. Differences between the US and Britain, particularly in terms of car ownership and work journey characteristics, suggest that ride-sharing might fulfil a quite different role in Britain from that which it has in the US. Its major justification could well lie in an improvement in the operating environment of public transport (through skimming the peak load and providing basic mobility in small communities) rather than in its more widely publicised effects on energy consumption and road congestion. (a) (TRRL)

32 310702 CHOICE OF ACCESS MODE TO INTERCITY TERMINALS. Disaggregate demand models are developed for Canada's national capital region (Ottawa-Hull and vicinity) for the choice of access mode to intercity transportation terminals. Models that consider a choice of five alternative access modes are reported for the airport, railroad station, and intercity bus terminals. The results show that considerations of convenience (walking time, schedule frequency, and baggage handling) and dominant factors in the choice of access mode. The models are applied to test passenger preference for several proposed strategies for improving access to intercity transportation terminals in the region. The evaluation indicates that, although more direct and faster public limousine and transit services will produce a modest increase in mode share, shared-ride taxi services offer a better compromise between the low cost of public transportation and the convenience of the private automobile and conventional taxi service. 32 311312 BENEFIT-COST ANALYSIS OF INTEGRATED PARATRANSIT SYSTEMS, VOLUME 1: EXECUTIVE SUMMARY. Integrated paratransit (IP) service is a concept which involves the integration of conventional fixed-route transit services with flexible, demand-responsive services in order to best serve emerging urban development patterns. To learn more about the capability of IP to meet the transit needs in the urban/suburban environment, the Urban Mass Transportation Administration sponsored a study to identify and define the benefits due to and the costs associated with the deployment of various hypothetical IP systems. This study systematically estimates potential impacts of a range of integrated transit/paratransit options and policies in a variety of settings and compares them with impacts of transportation alternatives. This study concludes that, in general, IP with fares closer to fixed-route transit than exclusive-ride taxi will result in net paratransit operating deficits. However, in some instances, the benefits of IP options in terms of improved service levels and mobility, reduced auto expenditures and other impacts appear to offset these operating deficits. Necessary factors for this include high paratransit productivities, possibly achieved by implementing hybrid, fixed-route/demand responsive service; and low operating costs, possibly achieved by contracting with private operators. IP was found to have a positive but insignificant impact in reducing automobile usage and ownership, but no measurable impact on vehicle miles traveled, fuel consumption, or emissions. Promising locations for paratransit implementation are those areas with population densities between 3,000 and 6,000 persons per square mile and limited transit service. The most promising paratransit concepts appear to be checkpoint many-to-many service, route deviation service, automated doorstep service with high vehicle densities, and vanpool service. The results of the study further suggest that paratransit service is sensitive to fare. Fare increases above \$.25 were determined to be counterproductive, while free transfers from feeder services to line haul became an inducement to use paratransit. The study also concluded that digital communications and automated dispatching systems are potentially cost-effective technological innovations. (UMTA) above \$.25 were determined to be counterproductive, while

Flusberg, M; Multisystems, Incorporated, Urban Mass Transportation Administration, (DTS-721) Final Rpt. 32 311875 INTERACTIVE FIXED-ROUTE BUS AND DIAL-A-BUS SYSTEMS [Samverkan mellan linjebuss och taxibuss]. This report describes a simulation study of combining fixed-route bus systems with dial-a-bus systems. The report also describes and discusses the methods used and the factors influencing costs and travel time of a dial-a-bus system. Two alternatives were studied: (1) max travel time; the dial-a-bus system takes care of all journeys, which in the fixed-route system have travel times longer than 45 minutes and 55 minutes respectively. (2) higher charge; the dial-a-bus system can be used for all trips within the city but the charge for this system is considerably higher than for the fixed-route system. Two levels of investment have been studied, 10 and 20 buses respectively. These levels correspond to the charges 30 skr/trip and 20 skr/trip. The high standard of the dial-a-bus system creates problems by greatly raising the travel demand compared to that of the fixed-route bus system. The dial-a-bus system attracts travellers that previously used cars, bicycles or walked. The alternative max travel time gives reduction of travel times up to 30 min, and the costs increase by 0-40% (45 min) and 35-80% (55 min). The alternative higher charge gives hardly any reduction in travel time and would in practice work as a more efficient taxicab system. The charges would easily finance the increased costs. 32 312485 NEW WAYS FORWARD, PUBLIC TRANSPORT ALTERNATIVES IN CLWYD (2ND EDITION). This edition outlines schemes introduced by the Clwyd County Council over the last four years, showing how they were put into practice; it also contains a report on the development and progress of the new Air Wales service and outlines the operation of a post-bus scheme in an area of very difficult terrain. Details are given of an experiment to determine the effect of a fare reduction on bus usage and revenue. The operation of a voluntary social car service in three districts of Glyndwr is discussed. This service is designed to provide supplementary transport for rural areas ill-served by traditional forms of transport. This scheme has been expanded to form a voluntary essential car service, aimed at

areas where no public transport is available, or where passengers are unable to use public transport through age or infirmity. The development of an experimental community bus scheme in the Cerrigydrudion area is described. Results show that a 50 per cent reduction in off-peak fares produced a passenger gain of 22 per cent and a revenue loss of 28 per cent. The highest increase in passengers occurred where the actual amount of the discount was largest. (TRRL)

32 313175 VANGO ANNUAL REPORT, 1978-79. VANGO is a non-profit, government-funded corporation committed to the organization of commuter vanpools in Maryland. Its services eliminate the financial risk to companies and vanpoolers, simplify getting started and are provided at no cost to the users. The 1978-79 annual report describes the successful attainment of VANGO's goals of proving the feasibility and marketability of the third party leasing approach as well as of promoting the basic concept of vanpooling in general. VANGO's incredible growth rate of 636% has made the corporation the recognized leader in vanpool promotion in the United States.

32 313971 THE KNOXVILLE TENNESSEE TRANSPORTATION BROKERAGE DEMONSTRATION: AN EVALUATION. The Knoxville Tennessee Transportation Brokerage Demonstration was conducted from October 1975 through December 1978. In this first metropolitan, multi-modal implementation of the brokerage concept, an organization known as the Knoxville Commuter Pool (KCP) attempted to identify and match transportation demand and supply across a variety of users and providers, and to effect legal and regulatory reforms conducive to the improvement of transportation services. Primary emphasis during the demonstration was on serving the commuters and social service agencies. A major aspect of KCP's commuter-oriented activities was the large scale surveying of employees at their worksites and their subsequent computer matching with buses and with other commuters having similar travel patterns. KCP purchased 51 vans and leased them to individual commuters as part of an operational vanpool program designed to encourage the growth of a large private vanpool fleet. Implementation of the vanpool program and its resulting impact on state regulatory law and vanpool insurance is discussed, as well as the resulting changes in Tennessee laws affecting other public transportation modes as well.

32 314096 THE INNOVATION PROCESS FOR DIAL-A-RIDE [Rept. on Phase 1]. The purpose of the investigation is to examine policy-relevant issues regarding the Federal role in the diffusion of urban mass transportation innovations, and to arrive at an understanding of the innovation process in organizations. This report is Phase I of a three-phase research project, and it documents the nature of the innovation process in organizations that adopted Dial-A-Ride. Dial-A-Ride is a form of demand-responsive transportation characterized by the traveler's telephoning for a bus, van, or cab, as he or she needs a ride. During Phase I, a series of ten in-depth case studies were conducted for the purpose of identifying the general stages of the innovation process in organizations dealing with mass transportation, and specifying those factors in that process pertinent to the adoption of Dial-A-Ride by those organizations.

32 314710 CAR-SHARING-WHERE ARE WE NOW? This article results from an informal seminar held at Leeds University in November 1979. The seminar, open to all those organisations and individuals contributing to British car-sharing research, reviewed knowledge on current levels of car-sharing and the likely consequences of increasing those levels. It was revealed that the impacts of car-sharing on the complete transport system are unlikely to be very large but examples were given of successful schemes at particular sites, usually those poorly served by public transport. Results from several experimental car-sharing schemes in Britain are being used to examine current car-sharing behaviour and forecast possible reductions in trip mileage. Provision of special incentives for car-sharers (such as free-reserved parking space) does not greatly increase the percentage of car-sharers. The author suggests that, before useful advice can be given to potential organisers of car-sharing schemes, the complex secondary effect that car-sharing can have on public transport patronage should be investigated to supplement the available data on model prediction, attitude surveys and patronage of existing schemes. 32 316482 PARATRANSIT STUDY. The Urban Mass Transportation Administration (UMTA) and the Federal Highway Administration (FHWA) recognized the importance of paratransit modes in serving urban travel needs and decided to initiate a Paratransit Program Design Study. This study defined the role of paratransit modes in an integrated transportation system, considered the potential of these modes for providing feeder service to regular transit systems as well as their potential as substitutes for the private automobiles and mass transit systems. This report will review operational experience of paratransit modes accrued to date in the Shreveport-Bossier City area, assess their potential for serving urban transportation needs, and propose a design program for identifying innovations in

providing paratransit services which will be beneficial to the citizens of Shreveport and Bossie City. Service is considered adequate, the only disadvantage being the cost of fare. Perhaps in the future, regulations permitting taxicab service could be coordinated with the transit system and serve as a feeder mode of travel. If all dial-a-ride services were coordinated as one, the possibility of these services being able to provide both feeder service and local door-to-door service at a lower cost than could the taxicab, would be a desirable alternative. Currently there is very little pooling in the study area. Carpooling and vanpooling participation should be encouraged by the local jurisdiction as a viable transportation alternative relieve traffic congestion, lower parking requirements, and provide savings in commuter cost to members participating in shared riding. The existing services provided by SporTran is considered excellent, with the exception of West Shreveport and the Cooper Road areas. With implementation of paratransit services to those areas, SA-COG concludes public transit services would then be accessible to all local residents in need of public transportation. The Shreve Area Council of Governments is recommending a combined express bus route/paratransit system for the West Shreveport area. The express buses are an alternative to alleviate potential transportation problems incurred by increased traffic to AMI, GM, GE, and the remainder of the West Shreveport Industrial Park. The Shreve Area Council of Governments recommends that the two jitneys presently in operation be phased out and replaced with a fixed-route paratransit van system. The proposed paratransit van system for this area would lessen walking distance to SporTran's bus stop for Cooper Road residents. Broadmoor and South Bossier are two areas SA-COG feels should be further studied for possible extension of transit service and/or inclusion of some form of paratransit service at a later date. At this time SporTran is not providing Sunday service at all on the two Bossier City routes and the Cooper Road route. A survey would need to be conducted to establish a "need" for Sunday service in these areas. (Author)

32 316491 PARATRANSIT HANDBOOK, A GUIDE TO PARATRANSIT IMPLEMENTATION VOLUME 11--PARTS 4&5. This Paratransit Handbook has been developed to aid public officials, planners and system operators in planning, designing, implementing, operating and evaluating integrated paratransit systems. The Handbook represents a compendium of techniques and experience drawn from existing dial-a-bus and shared-ride taxi paratransit systems. Five interrelated sections in two volumes comprise the Handbook: Volume I; Part 1, the Introduction, summarizes the current state-of-the-art of integrated paratransit systems; Part 2, Creating the System, contains prescriptive guidance for the individual tasks required in planning, designing, implementing operating and evaluating integrated systems. Each element of this key section contains overview flow diagrams showing the major relationship of individual tasks, cross-references to more detailed examples contained in other sections of the Handbook, and a summary

of pitfalls to be avoided. Part 3, System Characteristics, summarizes the operating characteristics of over 100 dial-a-ride and shared-ride taxi systems, and presents specific guidance regarding target market systems for the elderly and handicapped. Volume II; Part 4, SCRAPS, contains detailed information on Service Components, Regulations, Analytical Procedures, and Sources to complement the planning and design process. Part 5 contains Appendices, including references, a glossary, summaries of individual system characteristics and other technical material. (UMTA)

32 319395 CHANGING PERSPECTIVES ON TRANSPORTATION ENGINEERING EDUCATION. The role of the university, and especially of civil engineering programs, in the education of transportation professionals is assessed in a discussion that focuses on paratransit training needs. A survey of 110 university representatives of the Transportation Research Board indicated that paratransit education is lagging behind in addressing the broader issues of paratransit. It was also found in the survey that most transportation faculties are small (50 percent have

one or two people) but that most offer graduate programs. Paratransit may be a harbinger of trends toward a short-term, service-oriented approach to transportation development by people who lack or do not need the traditional transportation engineering and planning skills. Case-study analysis of five leading, experienced paratransit organizations disclosed that individuals with entrepreneurial skills and a motivation to innovate were key factors in the success of local paratransit systems. A set of paratransit curriculum materials that consists of five case-study documents and supporting documents (a case-study overview, a set of selected readings, a paratransit resource guide, and a curriculum guide) is described. These materials are intended for use by faculty, students, and professionals interested in paratransit, can be used in a variety of course formats or by students alone, and are intended to address some of the educational needs in the paratransit field while presenting the broader dimensions of it. Finally, a brief commentary on educational issues is presented. (Author)

32 319589 PERFORMANCE MODELS OF FLEXIBLY ROUTED TRANSPORTATION SERVICES. This paper critically reviews models to predict the performance of flexibly routed transportation services such as taxi and dial-a-ride. Models of these services have been developed to assist in system design, in evaluation of alternatives, and in regulation. The approaches to modelling such services have been simulation, empirical, deterministic queuing and stochastic processes. Application of several models is illustrated by forecasting the level-of-service on six existing systems. While a good deal of effort has gone into model development and while some of the models appear to be quite accurate, an open question remains as to the acceptance and use of these models by planning and operating agencies. (Author/TRRL) (TRRL) ratio was found. An acceptance criterion for flowing concrete is proposed.(a)

32 322059 MICROSIMULATION OF ORGANISED CAR SHARING-MODEL PREDICTIONS AND POLICY IMPLICATIONS. This paper presents the results of a range of tests

funded by TRRL of organised car sharing schemes. The performance of the schemes is predicted using a sophisticated microsimulation model. A brief resume of the model is followed by a description of the tests and an analysis of their results. Conclusions are drawn on the place of organised car sharing within broader transport policies, the performance of the model when compared to the available empirical data and directions for public research. The tests here presented include: a series of sensitivity analyses; tests of organisational strategies for car sharing schemes; tests of schemes in a variety of locations and at a variety of scales and finally a batch of tests which investigate the effect of major changes in the operating environment of car sharing schemes-changes in the price of fuel and public transport fares and the provision of parking space incentives for car sharers for example. 32 326223 LIMITS ON CIL CONSERVATION IN THE US TRANSPORTATION SECTOR. Conservation measures in the transportation sector are expected to significantly reduce oil consumption to help meet the national goal to reduce oil imports by about 4 million bbl/day (MBD) by 1990. These measures include increased carpooling, increased use of mass transit, enforced 55-mph speed limit, and the introduction of more fuel-efficient autos. This paper attempts to quantify the effectiveness of each. Increased carpooling and mass transit, by themselves, are inadequate conservation measures. The key to transportation energy conservation is the introduction of the efficient auto. However, because of the difference between EPA-tested new car mileage and that obtained under actual driving conditions, it is unlikely that oil consumption will reduce as expected. It is estimated that, at best, we can expect only a 1.8 to 2.7-MBD oil savings in 1990—a considerable shortfall. (ERA citation 05:008782)

32 326269 SHARED RIDE TAXI SERVICES AS COMMUNITY PUBLIC TRANSIT. This report examines the use of taxi firms as the providers of publicly supported demand responsive transit (DRT). The use of taxi firms as DRT providers raises a number of important institutional and performance issues. Accordingly, the primary purposes of this study are: (1) to analyze the issues associated with taxi firm provision of publicly sponsored community transit services, including the institutional reasons for contracting, competition for contracts, and contractual arrangements and their effects; and (2) to evaluate the performance of taxi-based community transit systems and the consequences for taxi firms becoming public transit providers, including legal implications, operational changes, labor-management relations, impact of subsidization, and effects of contracting on the firm's financial situation and future plans. Shared ride taxi (SRT) performance is evaluated in terms of cost-efficiency and effectiveness, and is also compared to that achieved by other forms of community level transit.

32 326272 PARATRANSIT CASE STUDIES: OVERVIEW. The report is one element of a set of curriculum materials to support university

class and professional short course training in local paratransit planning. In an attempt to capture some of the diverse elements of paratransit and move toward a synthesis of paratransit development, the authors have developed five case studies of local paratransit organizations which have successfully implemented paratransit services. They encompass a broad range of modes, market applications, and institutional structures. Each case study was developed around a common analysis framework, and all facets to service development were investigated. The purpose of this overview is principally to introduce the analysis framework for these case studies and provide pertinent historical background information. It also summarizes the case study experiences, and comments on technology transfer in paratransit service development. In addition, the case study experiences are compared with national statistics and experiences.

32 327205 EVALUATION OF THE STATE ENERGY CONSERVATION PROGRAM FROM PROGRAM INITIATION TO SEPTEMBER 1978. FINAL REPORT. The State Energy Conservation Program was established in 1975 to promote energy conservation and to help states develop and implement their own conservation programs. Base (5) and supplemental (3) programs required states to implement programs including: mandatory thermal-efficiency standards and insulation requirements for new and renovated buildings; mandatory lighting efficiency standards for public buildings; mandatory standards and policies affecting the procurement practices of the state and its political subdivisions; program measures to promote the availability and use of carpools, vanpools, and public transportation; a traffic law or regulation which permits a right turn-on-red; and procedures to carry out a continuing public education effort to increase awareness of energy conservation; procedures which promote effective coordination among local, state, and Federal energy conservation programs; and procedures for carrying out energy audits on buildings and industrial plants. All 50 states and Puerto Rico, Guam, the Virgin Islands, American Samoa, and the District of Columbia participated in the program. The total 1980 energy savings projected by the states is about 5.9 quadrillion Btu's or about 7% of the DOE projected 1980 baseline consumption of just under 83 quads. The detailed summary is presented on the following: information the SECP evaluation; DOE response to the SECP; DOE's role in the program management process; the effectiveness of the states in managing the SECP; the status of program measure implementation; innovative state energy conservation programs; and the evaluation methodology. (ERA citation 05:024191)

32 327357 TAXICAB TRANSPORTATION. 1964-JULY, 1980 (CITATIONS FROM THE NTIS DATA BASE) [Rept. for 1964-Jul 80]. The role of taxicab services as another means of public transportation is cited including services of large taxicab vehicles, multi-origin destination taxi systems responding on demand, and shared ride taxi systems. Vehicle monitoring systems for centralized management to provide location for fleet vehicles are described as are user characteristics and taxi traffic in urban areas. Regulations and ordinances, policies, operating and economic characteristics of the urban taxicab industry including fare structure, computer applications and market studies are covered. (This updated bibliography contains 85 citations, 20 of which are new entries to the previous edition.)

32 328280 PASSENGER TRANSPORT INNOVATION IN ADELAIDE: TAXI-CABS [Final rept.]. The report describes further study of passenger transport innovation in Adelaide. A broad understanding was given of the objectives of passenger transport, and potentially valuable transport innovations were isolated in another volume. Among the many possibilities discussed were those relating to innovative use of taxi-cabs. In the present study, the way in which taxi-cabs are and could be operated is further examined, with particular emphasis given to innovative operation and usage.

MacLean, S Segal, L ; South Australia Director-General of Transport., Adelaide. July 1976, 214p; Prepared in cooperation with Nicholas Clark and Associates, South Melbourne (Australia); ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB81-125460

32 343603 USER-SIDE SUBSIDIES FOR SHARED-RIDE TAXIS IN KINSTON, NORTH CAROLINA. The Kinston User-Side Subsidy Demonstration Project began operation in September 1977 and involved the provision of reduced-fare conventional taxi service to the elderly and handicapped (E&H). This report summarizes the findings of the independent evaluation of the Kinston project. In Kinston, user-side subsidies were found to be administratively feasible and were utilized almost exclusively by the most mobility-disadvantaged segments of the eligible population. These individuals, of low incomes or few travel alternatives, used the project to increase their frequency of total trip making by 3-4 percent, and to make some trips by taxi that otherwise would have been made by a less preferred mode (e.g. walking). The resulting changes in taxi-use frequency caused some changes in the supply of taxi service, though these were mainly with firms that had a large portion of E&H riders prior to the demonstration. Overall, the Kinston project provides evidence that user-side subsidies can be a viable and practical technique for facilitating the mobility of the E&H.

32 345239 THE TAXI INDUSTRY-PRIVATE ENTERPRISE IN PUBLIC TRANSPORT.

This paper was presented at session 5: Regulation Versus Competition in the eighties. The secondary private enterprise operator faces problems, which force him to compete with the primary public transport oriented system, instead of working as a complement to that system. Outmoded regulations stand in the way of progress, but is deregulation the answer? World transport systems are changing to accommodate the different needs of the individual. The fuel conscious society is beginning to place more importance on transport alternatives, as private motorists are finding it increasingly difficult to compete with transport systems which are being progressively updated and hence becoming more efficient, as witnessed in the modernisation of the Japanese rail system. Australia must not and cannot be left behind. It is crucial that Australia keep pace with the changing world emphasis. To do this, it is

necessary to critically analyse existing transport systems. Future recommendations will result as a consequence of this analysis (a). The number of the (TRRL)

32 345466 A DIAL-A-RIDE BUS-AN INDISPENSABLE CONCEPT [DER RUFBUS IST NICHT MEHR WEGZUDENKEN]. The dial-a-ride bus service in the eastern lake constance region is the largest operator of dial-a-ride sys-

tems in the world. Up to now some 700000 passengers have been carried (1600 per week day), the growth rate amounts to 30% to 150% (sundays). The first extension of the area served has covered the suburb of Friedrichshafen. The second from 1.11.1979 linked the neighbouring town of Markdorf. The attractiveness of the system made possible tariff increases; numerous suggestions for improvements to eliminate weaknesses in the system are under consideration. The bus system which has been installed now for over two years can now be regarded as indispensable. Political decisions are required. (TRRL) [German]

33 083716 WAYS TO MEET NATION'S RURAL TRANSPORTATION NEEDS ANALYZED IN RECENT SENATE STUDY. In an effort to solve the severe rural transportation needs and problems, a two-part study has been published which reflects a number of policy changes which might be needed to insure a sound transportation system for the nations outlying areas. Several means for preventing future crises, such as improvements in the use of rail equipment and increases in rail equipment capacity are examined. Wide year-to-year variations in agricultural demand for transportation services might be prevented by locating storage facilities for surplus food grains near ports, and the flexible pricing of rail services could prove a more satisfactory solution than equipment allocation mechanisms currently in use. The study also discusses the diverse and changing rural interests, and summarizes the more significant concerns of rural interest groups. A system is described for representing rural interests in the formulation and administration of federal rural transportation policy. The report also assesses rural highways and trucking, general freight service, transportation of people, the effect of federal rural development policies, and rural mass transit.

Area Development Interchange Vol. 5 No. 4, Feb. 1975, pp 1-2

33 084317 INTERCITY BUS TRANSPORT: THE TENNESSEE EXPERIENCE. Interstate carriers, using the familiar over-the-road vehicles, provide regular route passenger service and charters and constitute the primary supply line to small communities providing fast delivery of such items as automobile parts, drugs, newspapers and films, and cut flowers. Intrastate carrier provide small rural communities with access to interstate terminals in larger urban areas (feeder lines) or to major employment centers (commuter lines). The future of interstate bus service will be determined largely by public transportation policy in the following areas: allocation of charter activity, abandonment of non-profitable routes, assessment of taxes and fees, restriction on use of the 102-inch-wide bus, and highway system plans which would facilitate the interchange of passenger and vehicle in the design of limited access highways. Rural communities are now beginning to request funds to develop rural transportation systems to replace the intrastate services that current regulatory taxing and insurance policies are eliminating.

33 084777 THE MIDWESTERN ONTARIO-BRUCE PUBLIC TRANSPORT STUDY-PARTS I, II, III. This three-part study which examines the problem of public passenger transport in a low-density, semi-rural region, describes (in Part I) the economic and demographic characteristics of the region and its relations to nearby major cities. The evolution and current status of the region's public transport system are also outlined. Part II presents and analyzes the performance and cost of four alternatives for providing public transport in the region. The possibility of creating a public transport marketing organization is also discussed. Part III

presents the results and implications of an extensive transport consumer survey.

Canadian Transport Commission Dec. 1973; Part I-Review of the Public Transport System (Report #75), December 1973. Part II-Comparative Analysis of Some February 1974. Part III-Transport Consumer Preferences (Report #77),

33 090180 RURAL TRANSPORTATION IN THE SOUTHEAST. The report was prepared by the Expanded Metro Mobility Task Force, an interagency group of the Southeastern Federal Regional Council in Atlanta. Part I of the report examines rural transportation systems in Boone, North Carolina, and Sumter, South Carolina, and makes specific and general recommendations which are applicable to the establishment and operation of any rural system. Appendices provide helpful information in the form of sample operating rules and regulations, routing and scheduling techniques, typical costs, state roles and statutes, and a bibliography.

Southeastern Federal Regional Council, Department of Transportation Final Rpt. Nov. 1974, 113 pp, Refs., App.; See also PB-238 881.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-238880/9ST

33 090181 RURAL TRANSPORTATION IN THE SOUTHEAST. PART II, APPENDIX D, TRANSPORTATION SERVICES INVENTORY FORMS. Part II of 'Rural Transportation in the Southeast' is a companion document to the basic report and comprises Appendix D, Transportation Services Inventory Forms, of that report. Part II documents the statutory and regulatory authorities in the programs of the U.S. Departments of Health, Education and Welfare, Labor and Transportation, and the Office of Economic Opportunity which may be used to provide support (dollars and/or services) for rural transportation. The inventory is specifically geared toward Southeastern region states and omits information on those programs of supporting staffing, training, pure research activities, student financial aid, planning and administration, and specific cash benefits programs such as Social Security.

33 090458 NEEDS AND POTENTIALS FOR TRANSIT IN RURAL AREAS, RICHMOND, VA. REGION. Many rural areas, even those fairly close to large cities, suffer from lack of employment centers, health facilities, and the like. This dearth of local opportunities can be made up, in part, through better public transportation services. The study summarizes the 'needs' and potentials for transit in several rural counties in the Richmond (Va.) region. The 'needs' are specified in terms of lack of employment centers, banks, hospitals, health services (including doctors and hospitals), libraries, recreation programs, and, of course, existing transit services. Car ownership is also considered. It is concluded that several counties have a high potential for transit based on the above factors.

Virginia Interuniv Transportation Study Group, Department of Transportation Intrm Rpt. VITSG-74/3, July 1974, 68 pp; Contract DOT-OS-30097; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-239851/9SL

33 090459 ANALYSIS OF THE NEED FOR A RURAL TRANSPORTATION SYSTEM. Travel in rural localities has received little attention to date. Recent legislation has pointed to the possibility of financial aid to public transit systems set up in such areas. The study defines and develops tools for analyzing the 'need' for rural public transportation. Using Madison County, Virginia as an example case, the study first defines travel demand, latent demand, travel 'wants,' and diverted travel. Five techniques then are analyzed for making demand and need forecasts (accessibility, gap analysis, attitude surveying, committee estimates, demonstration projects). It is concluded that full-scale O-D surveys and analyses are too expensive and that a combination of committee estimates and demonstration projects may be the best forecasting method.

33 090573 A THEORETICAL COMPARISON OF FIXED ROUTE BUS AND FLEXIBLE ROUTE SUBSCRIPTION BUS FEEDER SERVICE IN LOW DENSITY AREAS. A parametric variation of demand density was used to compare service level and cost of two alternative systems for providing low density feeder service. Supply models for fixed route and flexible route service were developed and applied to determine ranges of relative efficiency. It was found that flexible route bus exhibited a lower sensitivity of cost to level of service provided than did fixed route bus. Flexible route bus can provide better service at the same or higher level of productivity at all demand levels below about 100 passengers per square mile per hour, except when minimal service only is to be provided.

33 093345 FORT BERTHOLD INDIAN RESERVATION BUS DEMONSTRATION PROJECT. A demonstration project was designed to develop and evaluate a transit system in

a growing urban-rural Indian Region in Central North Dakota. Fort Berthold is a reservation of about 650 square miles, with an Indian population of approximately 2,774. The people reside mainly in five small towns. The distance from the main town to the most distant community is 110 miles. The primary concern of the project was to support the economic and social development of the entire region by interconnecting the various, and sometimes isolated communities with employment, commercial, medical, educational, and other centers of activity. An element of the project was to search for ways of incorporating all the transit services in the region into a package that would sustain the system at a point where it would become economically self-sufficient.

33 095586 ESTIMATING LATENT DEMAND AND COST FOR STATEWIDE TRANSIT SERVICE. In 1968, the U. S. Department of Housing and Urban Development commissioned a series of studies to define the potential demand for new systems of urban transportation. Among these was a study of latent demand for urban transportation to focus specifically on urban groups who have transport needs that are not met by existing systems. Emphasis was placed on the needs of the elderly, the poor, the young, and the handicapped. Need was identified through a series of questionnaires of select groups in Pittsburgh & Baltimore. In a Minnesota study, transit needs were established through a latent demand survey conducted to determine the extent of travel that would occur under various levels of transit system improvement. The survey also developed information on the perceived needs of individual travelers. The analysis of latent demand at various levels of transit service for rural communities is the subject of this paper.

Anderson, RB (General Analytic, Incorporated) Hoel, LA (Carnegie-Mellon University) *Transportation Research Record* No. 519, 1974, pp 26-35, 2 Fig., 4 Tab., 61 Ref.; ORDER FROM: TRB Publications Off, Orig. PC

33 095589 RURAL PUBLIC TRANSPORTATION IN VIRGINIA. Travel in most rural areas is now confined to one mode: the private automobile. Those who cannot own or operate cars either do not travel or must arrange, sometimes paying high prices, for others to take them where they need to go. Public transportation should be made available to those in rural areas. This paper analyzes the rural transportation problem in Virginia and suggests how public transit systems can be developed and operated in rural areas of the state. A number of projects are reviewed that are in operation or are proposed for rural areas in other states. The study concludes that, although scattered, sufficient resources are available in Virginia for the planning and development of rural public transportation systems.

33 095745 TO AND FROM CAMPUS: CHANGING STUDENT TRANSPORTATION PATTERNS. This study analyzes past student transportation patterns at the University of California—conditions which helped to create the patterns, and policies that have been initiated to change them. The publication reports on factors which are most influential in shaping university student transportation patterns, summarizes changes in student travel modes and student vehicle ownership rates from the period 1965-66 through 1971-72, and describes student transportation on pedestrian, bicycle, automobile, and public transportation oriented campuses. The report also examines student vehicle use in relationship to student vehicle ownership.

33 096146 PEOPLE AND THE PARK: REACTIONS TO A SYSTEM OF PUBLIC TRANSPORTATION IN MT. MCKINLEY NATIONAL PARK, ALASKA. In 1972 the National Park Service greatly restricted the use of private automobiles in Mt. McKinley National Park, Alaska. As a substitute for private transportation, the Park Service offered free bus service for visitors. Also for the first time in 1972, the Park Service required that visitors have advance reservations for campsites in the five campgrounds located well inside the park. This study revealed that the vast majority of people who visited the park approved of the new transportation policy. Eighty-four percent of the 1,094 people who responded to the key question regarding the policy indicated their approval. The same percentage thought that the shuttle bus service was good. Seventy percent of the sample of people with campground reservations approved of the new reservation requirement. However, a mailed survey suggests that the resident population of Alaskans in Anchorage and Fairbanks may divide nearly 50/50 on their opinion of the new policy.

33 098977 RURAL PUBLIC TRANSPORTATION. Rural public transportation demonstration funds are authorized by the Federal-Aid Highway Act of 1973. To determine rural public transportation needs and evaluate parameters of service the Pennsylvania Department of Agriculture operates such a demonstration project. Essentially a dial-a-ride minibus service, the system has recently been expanded to serve 21 counties and has the following objectives: to collect relevant cost data; to determine efficiency measures, including optimum procedures for scheduling and dispatching; and to enhance the effectiveness of interagency coordination of transportation alternatives. The ultimate goal is to develop a statewide rural transportation network. In a discussion of rural transportation system needs, alternative systems, administrative and legislative developments and future models are considered.

33 125119 RURAL TRANSPORT: IS THE LONG WAIT OVER?. This article is concerned with the problems of rural transport, particularly in Cambridgeshire and Hertfordshire. The problems of rural transport under present conditions are discussed and details are given of the proposed dial-a-ride service to be based at Sawtry, which will provide a service running at fixed times through the larger villages, but which will also call in at remote villages and individual homes via a pre-booking facility. It is also planned to provide a service to meet commuter trains and may be extended to pick up shopping and prescriptions. Reference is also made to other car and bus social services in Cambridgeshire particularly in relation to the new system of transport supplementary grants, and to the possibility of opening a number of possible railway lines. The author next discusses the total approach being adopted by Hertfordshire, which is based on a comprehensive survey of rural bus needs. Details of the survey are given and of the options being considered. These include minibus operation, postbus services, "rural special" buses, new rural services and the combining of works (or school) buses with a stage service on the return trips. Drastic overhaul of present services in some areas is also being considered. The remainder of the article briefly deals with alternative systems with particular reference to the postbus and proposals for a tramway network for the lake district. /TRRL/

33 128811 RECREATIONAL TRAVEL AND THE RECREATION ACCESS STUDY. This study which provided a perspective comprising both objective case studies and subjective views of users and nonusers alike, included study of specific recreation resources and their access system together with surveys of the recreation interests and attitudes of people in Boston and Atlanta. The methodology involved a study of trips people make to specific places and the information is oriented toward major outdoor recreation sites, to urban parks, and to major sports and cultural facilities. The findings of the study are categorized in the following classes: data relating to recreation areas, data relating to users and nonusers of such areas, and findings concerning institutions and legislation. Automobile/highway access, internal circulation systems, public mass transportation, commercial and common-carrier transportation to recreation areas are covered. Findings concerning the general public and low mobility groups are discussed, and issues related to regulations, and planning processes are briefly reviewed.

33 134684 MOBILITY CLUB: A GRASS-ROOTS SMALL-TOWN TRANSPORT CONCEPT. The dispersion of relatively small numbers of people in rural environments is a substantial barrier to collective means of travel such as conventional bus service or demand-responsive transit. Accordingly, this paper proposes and analyzes an approach based on ride sharing in private automobiles that might provide significant relief for the problems of rural immobility. This solution, termed a mobility club, can be implemented within the work-force and financial resources of most small towns and rural communities. Trip desires of individuals without automobiles are matched to the trip-making intentions of persons with automobiles by the mobility club telephone dispatcher or ride broker. A companion feature is the method proposed for increasing the number of "travel friends," that is, the number of persons who are well enough acquainted to trust traveling together. This paper discusses the operational, administrative, and institutional aspects of the mobility club concept. An example is presented to illustrate the magnitude of the potential driver-member supply and trip-making desires of residents without automobiles in a sample rural and small-town environment. Operating expenses, fare structures, and subsidy considerations are outlined. Some simple steps to assist individuals who may wish to start a mobility club are given.

33 137363 INTEGRATED ANALYSIS OF SMALL CITIES' INTERCITY TRANSPORTATION TO FACILITATE THE ACHIEVEMENT OF REGIONAL URBAN GOALS. INTERCITY TRANSPORTATION IN RURAL REGIONS: VOLUME I. INVENTORY AND ANALYSES. Published in two volumes the research is a continuation of that presented in a report, June 1974 with the same title. The research focuses upon intercity transportation and its relationship to socioeconomic characteristics in rural regions. The study area consists of nine administrative planning regions in Iowa that do not include a community of 50,000 or more population. The objective was to relate the intercity transportation system of small urban communities to their ability to attract and absorb growth. This volume reports on an inventory of the transportation system in the study regions, including an update of data presented previously on bus and rail passenger movements and air

transportation. The inventory includes water transportation and additional forms of public passenger transportation, motor truck and rail freight transport, and an investigation into expansion in the transportation role of agricultural cooperatives.

33 137970 PROBLEMS OF TRAFFIC MANAGEMENT ARISING FROM THE RECREATIONAL USE OF THE MOTOR-CAR IN THE COUNTRYSIDE, WITH PARTICULAR REFERENCE TO THE 'PARK AND RIDE' TECHNIQUE. The earlier chapters of this thesis attempt to bring together from disparate sources data on the nature and extent of recreational motoring in the British countryside. Problems of accommodating this activity are described and in an appendix to the main study the concept of recreational capacity is examined for its value as an aid to determining traffic management policy. One of the more radical and controversial of the proposed traffic management techniques is the 'park and ride' method associated with a motorless zone. The use of private cars is banned and visitors are required to walk or use public transport if they wish to gain access to the area. The middle chapters of this study are an account of a traffic management experiment in the upper Goyt Valley, Derbyshire, which was designed to test the suitability of 'park and ride' as a method of recreational traffic management in rural areas. This experiment was sponsored jointly by the countryside commission and the peak park planning board during the summers of 1970 and 1971. The work described was undertaken by the author while research officer for the experiment, with further analysis done by him subsequent to leaving that post. Results of the experiment have been used to examine the wider role of the 'park and ride' technique with special reference to the lake district national park. The study concludes by advancing principles which should govern the design of traffic management for popular rural areas. /TRRL/

33 138455 NONURBANIZED PUBLIC TRANSPORTATION: A FEDERAL PERSPECTIVE. A selected number of demonstration projects are described which were identified for funding by the Federal Highway Administration and the Urban Mass Transportation Administration. This study of 45 projects which were designed to demonstrate how the mobility of nonurbanized residents may be improved, provides information that will be useful to both federal and state governments in framing future policies and programs to meet the public transportation needs of rural areas. The projects represent a wide variety of schemes ranging from fixed-route, scheduled general services to an assortment of demand-responsive van operations and an institutionalized volunteer transportation

concept. The New York, Pennsylvania, Tennessee, Oklahoma, North Dakota, California, and Oregon projects reviewed here, indicate that the question of the provider of the service depends on many local conditions and experiences. The importance of the state's role as coordinator is emphasized. Localities must explore all existing transportation resources particularly because federal assistance programs will be service oriented and will emphasize improvement of services to meet the needs. Comments are made related to the planning required to develop service-oriented approaches. Comments are also made on the nature of the financing. The studies show that paratransit because of its ability to adapt to various needs, will contribute significantly to the effort to provide public transportation in rural and nonurbanized areas.

33 139843 TRANSIT NEEDS IN SMALL CALIFORNIA COMMUNITIES. A study is reported which was designed to identify several rural sites as candidates for rural highway public transportation demonstration projects. This report describes the status of the continuing study of transportation needs of rural and small urban areas and draws general conclusions which will be helpful to a study of needs in other areas of California. The study which covered all Caltrans transportation districts and, therefore, most of the rural and small urban areas, was designed to determine the location and magnitude of public transport needs and to recommend public transportation legislation and implementation programs. The study is developing methodology that may be used to determine needs in other areas, and is providing training for transportation personnel in public transportation planning activities. Details are given of the organization of the study, the model that was developed, data collection and data analysis. Major findings to data of this ongoing study are discussed. These findings relate to the strategy of site paving and the use of a data envelope.

33 141142 REVITALIZATION OF SMALL COMMUNITIES: TRANSPORTATION OPTIONS. VOLUME 2: APPENDICES. This is a final report of a two-year policy-oriented, interdisciplinary study of the long-range trends affecting small towns in non-metropolitan areas, the effects of transportation availability and systems on their viability and vitality, and their needs and problems related to transportation. The study concludes that the role and functions of rural small communities are changing as America becomes a "post-industrial" society. The majority of small towns were found to be viable as a human habitat offering a quality of life desirable to many Americans, but vulnerable over the long term to structural changes in society and the economy

which may result from rising energy costs or energy shortages. Lack of mobility (local transportation alternatives) for those who lack access to an automobile was identified as the most severe Transportation problem for small towns at present. The study also concluded that rural areas need special consideration in formulating national energy policy, transportation policy, and welfare policy. The research project is categorized as Technology Assessment. /Author/

33 141932 ECONOMICS OF RURAL PUBLIC TRANSPORTATION PROGRAMS. Rural transit systems cannot be expected to be self-supporting. Revenue rarely comes close to the 7 cents/mile (4.4 cents/km) that is typical of the costs of the system. Costs are high because low population density and the great number of destinations in most rural areas cause high per-passenger cost for driver salaries and management. Ridership on subsidized systems that have been set up under the Office of Economic Opportunity and similar auspices tends to be a small fraction of the general population and even the disadvantaged population. Competition from automobile alternatives (car pooling and ride sharing) diminishes the effective demand for transit solutions. Getting programmatic consensus on destinations is difficult because of conflicting alternatives; therefore, ridership is low. A subsidy large enough to provide minimum service levels to all the disadvantaged in a region is beyond what appears to be the fiscal capacity of local governments in rural areas. Few of the original Office of Economic Opportunity experiments have been picked up for sustained local funding. In light of these findings, restricting new expenditures of money for rural transportation demonstration programs to low-cost innovations such as (a) systematized car pooling, (b) transportation vouchers for specific target populations, or (c) consolidating social-service transportation and service delivery programs may be useful.

33 141933 ESTIMATING COST OF PROVIDING RURAL TRANSPORTATION SERVICE. The issue of rural transportation has attracted the attention of public policymakers. Now that the general need has been recognized, decision makers want to move to the important questions of demand and cost. Despite the existence of hundreds of small-scale transportation systems, many of which are rural, very little research on demand is available to guide the would-be designer of a rural transportation system. This paper reports work done by the Governor's Rural Transportation Task Force in Pennsylvania. Among the task force objectives was estimating demand for and cost of transportation in all rural areas of Pennsylvania. Based on what little documentation of demand for public transportation systems in rural areas is available, a range of demand estimates is produced. Alternative service options are introduced to show their influence on final costs. These 2 factors-level

of demand and level of service appear to be the most significant determinants of the cost of rural transportation systems.

33 142165 PLANNING OF URBAN TRAFFIC. COORDINATION WITH RURAL TRAFFIC [Planering av Taetortstrafik. Sambordning med Landsbygdstrafik]. The object of this study was to devise a planning method for public transport in towns of 20-50000 population, and to coordinate urban traffic with traffic in surrounding areas. Nykoping (30000) was chosen as the subject of study. Statistics were collected concerning the population and workplaces in the town and surrounding areas. The existing routes were studied with regard to interchanges between urban and rural services, as well as travelling standards, travel requirements and service frequencies. Economic aspects were taken into consideration. Comparisons were made with other towns of similar size. An analysis of problems showed that existing routes are not altogether appropriate, and that peak loads on urban and rural routes occur at the same time, which precludes sharing of vehicles. In the short term, some improvements in standards are possible by using existing resources; special workmen's buses can be provided. A doubling in frequency would raise costs by about 30%. In the long term, new services to expansion areas must be provided. An improvement with the same resources is possible by staggering working hours and school times. /TRRL/ [Swedish]

33 144137 A PUBLIC TRANSPORTATION IMPROVEMENT PLAN FOR THE AMHERST-FIVE COLLEGE AREA. This study presents a short-range public transportation improvement plan for the Amherst-Five College Areas--12 suburban-rural communities (population approximately 105,000) in Hampshire and Franklin Counties, Massachusetts. By use of a generalized methodology, residential and commercial areas (termed potential service areas) and distinct demographic segments of the Study Area (termed potential service groups) are identified for (1) conventional fixed-route, scheduled bus transit and/or (2) para-transit public transportation services. Patronage levels are estimated with ridership, "reach," and "penetration" data gathered during an UMTA fare-free bus service Research and Demonstration Project at the Amherst campus of the University of Massachusetts (UMass). A total of 15 potential service areas are identified in the Study Area as deserving of fixed-route, scheduled bus transit service, where the frequency of bus service proposed for the potential service areas ranges from a high of six bus-trips per hour to a low of seven bus-trips per day. Para-transit public transportation services find justifiable application for many of the potential service groups identified in the Study Area, including the worker-commuter, the midday shopper, and the limited mobility potential ser-

vice groups. Para-transit is also justifiably applicable in those rurally-located potential service areas with relatively low predicted patronage levels. Moreover, it is concluded that the market applications of the many public transportation modes considered in this study are not mutually exclusive but rather intersecting (or overlapping) sets. A list of policy-oriented recommendations is included in the report. The Appendix contains a detailed analysis of the costs of operation. /FHWA/

33 145399 RURAL TRANSPORT. INFORMATION FROM R.C.C'S-WHAT IS THE ALTERNATIVE? The purpose of this document is to disseminate information about new ideas, experiments, schemes, etc., concerning public transport in rural areas. Examples of schemes being tried are post buses, school buses, minibus, car schemes, works buses carrying fare paying passengers, railway re-openings, etc. The report is arranged alphabetically by rural community council, and for each such council, brief details are given of type of transport scheme, where it is operating, by whom, and with what success. Also briefly mentioned are any surveys conducted in the rural communities which have helped to establish a new transport scheme or project. /TRRL/

33 147650 THE PROBLEM OF RURAL TRANSPORT. A survey of 1200 households in Merioneth undertaken to identify the demand for transport showed that over 64 percent of households had the use of a car. Data on trip behaviour showed that fewer than 10 percent of all trips were made by public transport, while over 65 percent were made by car. Forecasts of future transport usage predicted a further decline in public transport trips. However, although few people used public transport, the study showed that there was still a social need to maintain the service if hardship was to be avoided. An appraisal of public transport operations showed that for small passenger flows the railways of rural Wales were inefficient and not the least cost solution. For the bus industry large variations in costs and efficiency were found between the national bus company and independent operators. A number of policy options to improve the efficiency of public transport were examined. These indicated that for external trips a specially designed bus service was preferable to the present rail system. For internal trips improvements to the bus service might be made at little social cost, but large savings in resource costs. This paper was one of four given at a symposium--"Transportation--Problems and Solutions"--held in September 1975. /Author/TRRL/

33 149838 METHODS OF PREDICTING RURAL TRANSIT DEMAND. The Pennsylvania Department of Transportation, under Executive Order from the Governor, is responsible for developing a plan for a comprehensive rural transportation system for Pennsylvania. The research and methodology included in this report is a crucial part of the development of a comprehensive rural transportation program. There is a pressing need for public transit systems in rural areas. In order to operate such systems efficiently and effectively, local planners must have accurate projections of the number of riders that will demand service. Using data from 100 existing rural transportation systems, simulation models of factors influencing the number of riders were developed. The Report provides demand estimation models for both total system-wide and route specific transit systems. Separate models are developed for fixed route and demand responsive systems. The report also includes guidelines necessary to properly utilize these models. The text is presented in a way that local and regional planning staffs can easily determine the demand for rural public transportation by knowing the population characteristics of the area being studied and the characteristics of the proposed transit system.

33 150469 TOURIST TRAFFIC IN SMALL HISTORIC CITIES: ANALYSIS, STRATEGIES, AND RECOMMENDATIONS. EXECUTIVE SUMMARY. The report summarizes the state of the art in reference to transportation to and within small cities with historic/scenic sites. It postulates a field of tourist travel having five components: travel behavior; impacts on communities and areas arising from that behavior; alternative strategies for dealing with those impacts; projects and policies chosen from these alternatives; and an institutional system within which these activities occur.

33 152728 SERVICE LEVELS FOR REGIONAL AND COUNTRY BUS SERVICES [Het voorzieningsniveau van streekbuslijnen]. The study has two aspects: 1. Judgment of frequencies offered, planned or potentially viable for regular public bus services other than local town routes; 2. Prediction of effects any alterations on frequency of service, scheduled trip time, and routing, will have on passenger volumes and prognosis of passenger volumes for new routes. Frequencies will be judged against either actually measured or potentially expected passenger volumes. Aim is a normative system in which the passenger volume is the decisive factor for the frequency to be offered on the route under consideration. For prognosis of passenger volumes on projected routes, a methodology is being developed which leads to a formula which is in between a polar formula and the gravity model. Consequently information required can be produced quickly and at low cost. Moreover the procedure remains a clear one. Obviously such a prognosis methodology is essential for a proper judgment concerning the effect that any reduction or improvement of frequency will have on passenger volume. /TRRL/ [Dutch]

33 157181 SMALL CITY AND RURAL TRANSPORTATION PLANNING: A REVIEW. The mobility needs of the carless (the poor, handicapped, elderly and the youth) are examined in this review. The characteristics of the special mobility groups are studied. The emphasis of the review is on the planning process and operation of public transportation services in the small cities and rural areas. A summary of the characteristics of existing nonmetropolitan transportation services is also presented. The state of the art in nonmetropolitan transportation planning is one of considerable disjointed effort. Although there has been careful planning related

to the implementation of public transportation operations in the rural areas and small cities, little systematic development of goals, objectives, policies, and criteria could be found. The high capita costs of providing transportation services to a small disadvantaged group require careful analyses with respect to the equity and efficiency of costs and benefits. In view of increasing competition of various public and social services for very limited funds, there will be greater demand for careful accounting and justification of public transportation services in small cities and rural areas. /Author/

33 157380 FUTURE LANDSCAPES. The book examines the changing countryside under the influence of regional development and changing land use patterns. Chapters discuss such topics as changes in farming, the landscape and the rural community. One chapter 'transport in the countryside' examines the effect of a gradually changing transport system on a rural community. The increasing use of private transport, offering increased mobility to rural communities, has reduced the remoteness of rural areas. This in turn has led to the withdrawal of bus and train services so depriving the non-car owning section of the population of transport facilities. The effect of policies designed to encourage the concentration of shopping and employment facilities is discussed as well as the direction of financial support to encourage public transport in rural areas. The effect of increasing tourist traffic accessibility and highway construction on the countryside is also examined. /TRRL/

33 158573 EFFECT OF THE VALLEY TRANSIT SYSTEM ON THE UTILIZATION OF SELECTED HEALTH SERVICES IN THE NAUGATUCK VALLEY. A study of the impact of the Valley Transit District (VTD) on the use of selected health resources in the Naugatuck Valley of Connecticut is detailed. It is pointed out that, in general, public transportation within the Naugatuck Valley is inadequate. Prior to the initiation of VTD service in 1972, there was no internal transportation system in the region except for limited bus service provided by the Connecticut Company. Funding for the VTD project came from the Urban Mass Transportation Administration, the State of Connecticut, the four towns served by the system, and DHEW. DHEW's purpose in funding was to extend outreach activities of health and social service agencies through the subsidization of riders and to evaluate the impact of the VTD on the utilization of services provided by these agencies. Information was collected to provide demographic and transport data on users of each facility studied. Data were collected on a retrospective basis for the months of January, April, July, and October 1973. Data were obtained from the emergency department, outpatient department, and department of physical medicine at the Griffin Hospital in the valley. Data were also collected from visits to the Pleasant View Hospital's outpatient department. A sample was made of all medically

related trips by valley police cars and ambulance companies for the study months, along with a sample of valley residents who used public health nursing and homemaker services. It was apparent from data analysis that transportation patterns in the valley identified in 1972 remained essentially constant during the subsequent year. Supporting tabular data are appended.

33 163923 RURAL PUBLIC TRANSPORTATION: ALTERNATIVE SYSTEMS (ABRIDGMENT). Alternative transportation systems for rural areas which use either existing vehicles or the purchase of new vehicles with a wide range of operating and capital costs are examined. Systems requiring new equipment include: A demand responsive system; fixed route system; feeder system; subscription service system; rural family transportation system; and institutional commuter vans. Systems using existing vehicles include: Neighbor compensation system (the owner of a vehicle shares rides with a neighbor who does not have access to a vehicle); volunteer driver and vehicle system; leased personal vehicles; social service provider system; group trips (charger service); intercity bus system (would provide transportation on a fixed-route and fixed-schedule basis within a rural regional setting); and a combined school bus system. The authors conclude that having some form of public transportation available, people who were previously restricted in their travel opportunities would be able to make trips to obtain education and employment to increase their income, and would have more freedom to travel because they would no longer be dependent on other individuals for transportation.

33 164029 ARKANSAS SMALL-URBAN AND RURAL AREA TRANSIT EVALUATION WORK PLAN. Work is described that was undertaken to provide a basis for defining principal transportation planning tasks that need to be undertaken at the State level, to ensure that such planning is as effective and responsive as possible to the needs of small urban and rural areas throughout the state. Attempts were made to quantitatively define the specific problems associated with the delivery of transit services, to explore possible avenues of solution and to examine organizational working relationships. A survey of organizations showed that there is a high level of agreement that financial problems are the overriding consideration, and service design and operational considerations are the least important problems. Working relationships within the state is the next most important issue. The desirability of state action to support local effort is also indicated. The development of a

planning methodology is discussed and recommendations are made regarding the installation of the fare chart. A work plan is recommended for transportation in small urban and rural areas.

Chase, Rosen, and Wallace, Incorporated, Community Sciences, Incorporated UMTA-AR-09-8001, May 1977, 26 pp, 3 Fig., 3 App.; Prepared for the State of Arkansas Department of Local Services and financed in part through a grant from DOT, Urban Mass Transportation Administration

33 166430 EVALUATING RURAL PUBLIC TRANSPORTATION. The report includes case studies, baseline data, and summaries of the Section 147 demonstration planning process for four rural public transportation systems: the Appalachian Ohio Regional Transportation Association (AORTA), Athens, Ohio; the Qualla Public Transportation System, Cherokee, North Carolina; the Progress for People Human Resource Agency (HRA), Dunlap, Tennessee; and the Pee Dee Regional Transportation Authority (PDRTA), Florence, South Carolina.

McKelvey, DJ ; North Carolina Agricultural and Technical State U, Department of Transportation, of Transportation, Washington, D.C. Office of Final Rpt. DOT/TST-77-42, Feb. 1977, 177 pp; Contract DOT-OS-50115; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-269287/9ST

33 167586 FEASIBILITY OF DEVELOPING LOW-COST MEASURES OF DEMAND FOR PUBLIC TRANSPORTATION IN RURAL AREAS. The Appalachian region has many rural areas of limited accessibility. To improve the accessibility of the rural carless (poor, elderly, young, inform) public transportation has often been suggested. The objective of the research is to develop a low-cost methodology for determining latent demand for public transportation in rural areas, i.e., to develop a data base of key socioeconomic, highway network, and geographic variables which can be used to estimate latent demand along possible rural transit routes. Data have been collected on existing rural transit operations in Planning Region VI of West Virginia (Monongalia, Taylor, Marion, Harrison, Doddridge, and Preston counties) by means of an on-off survey and an on-board questionnaire survey. Using these as indicators of demand, this information will be related to census data for the affected region to determine if a simplified modeling approach to estimate rural public transportation demand is feasible. /Author/

33 168122 RURAL MIDIBUS PROJECT. PHASE 1 MAY-DECEMBER 1976. This report deals with the introduction and initial operating results of a joint project by Eastern Counties Omnibus Company, Cambridgeshire and Northamptonshire county councils to test more flexible ways of providing rural public transport using a 25-seater 'midibus'. Various types of service were provided for several villages lying between Peterborough, Oundle, Huntingdon and St. Ives. The report mentions the publicity given to the scheme and the results of surveys to ascertain the level of use. Changes made to the original services, due to public demand, are recorded. The use or non-use of the services, the value of the project for testing different methods of operation and types of demand and the advantages of using a "midibus" are considered in the conclusions of the report. /TRRL/

33 177136 RURAL PUBLIC TRANSPORTATION: NORTH DAKOTA CASE STUDY (ABRIDGMENT). A rural public transportation program has been developed for west-central North Dakota which consists of two levels of service. One level is the formation of local transportation associates which would coordinate the travel demands of those in need of transportation and the automobile drivers in the community who are willing to provide transportation and which would actively pursue the expansion of a pool of volunteer drivers who would be willing to provide rides for those in need. The other level is specialized transportation vehicles, (designed for the handicapped) being leased by the community to institutions such as nursing and retirement homes in order to serve groups such as the elderly and handicapped whose needs cannot be met by the private automobile service.

Weaver, VC Lundberg, BD (Barton-Aschman Associates, Incorporated) *Transportation Research Record* No. 638, 1977, pp 44-46, 1 Fig., 1 Ref.; This article appeared in *Transportation Research Record* No. 638, Transportation Planning Techniques for Small Communities.; ORDER FROM: TRB Publications Off

33 178711 IMPROVING TRANSIT USAGE IN SMALL URBAN AREAS. A demonstration program is reported which offered free rides to anyone working in the Downtown Salem (Oregon) area. The response to the program is enthusiastic, but it remains to be seen what impact a resumption of full or partial fares would have on the new riders. A significant number of new riders came from single-occupant autos. Only 37% of the new bus riders reported they previously paid for parking. However, a new program to reduce the amount of close-in free parking in the downtown area is expected to further increase bus ridership. The key factor in creating this program was the availability of excess peak-hour bus capacity. The relative cost, travel time and convenience of auto vs. transit travel has kept transit at a competitive disadvantage in the Salem area. However, at very little expense, it has been demonstrated that the cost impact can have a disadvantage on ridership. The public relations value of the program is also

noted. The Transit service has gained increased exposure and acceptance among the business community as a positive force in downtown redevelopment. The no-cost fringe benefit to both employers and employees has turned transit services from a social service for the captive rider to a community service for everyone.

Walker, KR (Mid Willamette Valley Council of Governments) *Transit Journal* Vol. 4 No. 2, Apr. 1978, pp 41-50, 5 Tab.

33 178739 RURAL HIGHWAY PUBLIC TRANSPORTATION DEMONSTRATION PROGRAM EVALUATION-PROGRESS REPORT. Section 147 of the 1973 Federal-Aid Highway Act established the Rural Highway Public Transportation Demonstration Program which authorized funds to encourage the development, improvement, and use of public transportation for residents of non-urban areas, so as to improve access to employment, health care, retail centers, education, and public services. Total funding of \$24.65 million for FY 1975 and 1976 permitted the selection of 102 projects from more than 500 applications. Ninety-eight of the projects have been authorized to proceed with about three-fourths in actual operation. A variety of organizational arrangements, service types, and sizes are being demonstrated. There is a significant evaluation component to the program which will provide needed information for future decisions regarding possible national programs for rural transportation. The results of the first two quarters' evaluation, although preliminary, show performance measures comparable to or better than previous rural public transportation projects. It is significant to note that over half of the initial projects studied were performing according to pre-project estimates of ridership and service. /Author/

33 179371 THE ROLE OF MASS TRANSIT IN SMALL URBAN COMMUNITIES: A CASE STUDY OF WATERTOWN. The objective of this study is to investigate the social and economic viability of mass transit in small sized urban areas. Examinations of information collection techniques, transit problems, historical trends, and improvement proposals of transit systems in smaller urban areas all around the country are included. Numerous information gathering techniques are incorporated in an effort to uncover the exact dimensions of the need for mass transportation services in Watertown and to determine the shortcomings of the present Community people moving systems. The inventories, surveys, interviews, and other observations conducted in this study provide information about the existing conditions of the Watertown City Bus Lines, the Watertown Cab Company, and the local School Bus Systems which are utilized in the multi-stage transit alternative generation and selection process. This study by step compilation of lists of management-ownership, financial, operations, equipment, fare structure, and marketing alternatives effectively dispals most of the realistic transit improvement options. Public takeover

of the existing privately owned City Bus Lines with the eventual formation of a City Transit System is recommended in this study. A combined demand-responsive, fixed-route transit operation with modern mini-bus type vehicles appears to be the most promising system for Watertown in the future. The peak hour fixed-route, non-peak hour demand-responsive service should be ambitiously promoted locally. The system could be financed by state and federal assistance programs as well as from local sources.

33 179821 PROCEEDINGS OF THE SECOND NATIONAL CONFERENCE ON RURAL PUBLIC TRANSPORTATION. These proceedings are divided into two major parts. The first part consists of the formal presentations made at the plenary sessions of the conference, under the general headings of overview of rural transportation activities; the state's role in rural transportation; maximizing the use of existing resources; the role of taxes in rural transportation; marketing and behavioral aspects of rural public transportation; and, experiences gained in implementing and operating rural public transportation systems. The second part includes the resource papers presented at each of the eight workshops and brief summaries of the workshop discussions. Topics include, among others, integration of services; using intercity bus transportation; demand estimations and system design; efficiency and coordination in rural public transportation; and, policy considerations in rural transit.

Miller, JH Mullen, SS; Pennsylvania Transportation Institute, (PTI 7805) Proceeding June 1977, 188 pp, 5 Fig., 1 Tab., 2 App.; Sponsored by DOT, Office of the Secretary.; Contract PS-70369; ORDER FROM: NTIS

33 184387 TRANSPORT STANDARD IN TOWNS AND RURAL AREAS [Transportstandard i stæder och paa landsbygd]. Roads are a community resource. They are essential for our living conditions. Public debate pays surprisingly little attention to the importance of road traffic for national production and economy, and concentrates instead on its negative consequences. In most cases, road transport offers the best transport standard. In Norway, over 80% of goods tonnage is transported by road. 90% of passenger transport is by road. In towns, however, 20% of journeys to work are on foot, and foot traffic is therefore as important as cycle traffic and public transport put together. About 80% of national roads have a paved surface at present; this will be raised to 90% in the next 8 years. Only 10% of roads have permitted axle loads of 10 tonnes; this will be raised to 40% by 1986. A large proportion of the road network is shared by vehicular, cycle and pedestrian traffic, and by local and fast long-distance traffic. To raise transport standards and at the same time reduce the negative consequences of road transport, separation and differentiation are the main tasks. The standard of public transport must be improved. The cost of motorways can be reduced by designing them for a lower speed. /TRRL/ [Norwegian]

33 184443 THE DEVELOPING ROLE OF RURAL PUBLIC TRANSPORT. Of the many inherited public transport problems currently facing county councils, one of the foremost concerns the future of public transport in rural areas. The paper outlines the background of the current problems of rural public transport which have been gradually eroded over a long period and the factors which led to this decline, together with the effects it is having on the rural counties and the policy of the county councils. Against this background, the paper describes the way in which the counties are setting about solving the problem of rural public transport by examining the policies adopted within the present legal and financial restraints and looks at possible solutions for the future, including the role of unconventional forms of transport and the need for modification in the legal framework. /Author/TRRL/

33 184846 ESTIMATING THE EFFECTS OF ALTERNATE SERVICE LEVELS ON RURAL TRANSIT RIDERSHIP. Estimating demand is an essential step in rural transit planning. Several techniques have been developed in other studies for estimating demand. This paper deals with the need to assess public response to alternate service levels and travel flexibility on proposed rural transportation systems. A public opinion survey was conducted in rural Otsego County, New York (56,000 pop.) among 339 households, thirty of which had no telephones. The survey presented three public transportation options, fixed route, dial-a-bus, and mobility club, and asked various questions regarding possible use of such services at different fare and service levels, (reservation time, travel flexibility, etc). The survey questionnaire was designed to minimize non-commitment bias and responses were separated on the basis of car availability to minimize the need for non-commitment adjustment. Some non-commitment adjustment was necessary, particularly for the car available group. This adjustment was based on the trip rate of the existing dial-a-bus system operating in Oneonta (pop. 16,000) the county's largest city. Matrices relating potential ridership to fare, service levels, and travel flexibility were developed for each transit option. While no suggestion is made that the demand estimates developed for Otsego County are transferable to other areas, the relative changes in demand resulting from changing fare, service levels, and travel flexibility should be generally useful. /Author/

33 185391 A REALISTIC ASSESSMENT OF MASS TRANSIT SYSTEMS IN A LOW DENSITY REGION: THE CASE OF SAN DIEGO.

This article outlines several major reasons why a fixed-route system of mass transit in a low density region is not a viable mode of transportation for the vast majority of residents. After establishing the problems associated with such a system, attention is focused upon a proposal to implement a fixed-guideway system in the San Diego region. It is demonstrated by reference to a Mass Transit Survey that San Diego residents by and large do not intend to use the newly proposed system although they would finance its construction. It is concluded that the attitudes of these residents are typical of commuters who live in an exceedingly auto-oriented and decentralized urban setting. The land use configuration is used to illustrate basic problems which confront fixed-route mass transit systems in cities like San Diego. The dynamics of speed and frequency of service in rapid mass transit systems, and the relationship between price and service capability are discussed, and criticism is offered of the transit element of the Comprehensive Plan for San Diego Region. The observation is made that unless a transit system is capable of providing the average traveller with the same flexibility and demand-responsive potential as the automobile, it is not hopeful that the transit system will draw a substantial number of riders from the automobile to make the construction and operation of the new system economically feasible.

33 189345 TRANSIT PROBLEMS IN SMALL CITIES AND NON-URBANIZED AREAS: INVENTORY OF TRANSPORTATION SERVICES IN PLACES LESS THAN TEN THOUSAND POPULATION OUTSIDE OF URBANIZED AREAS. This report summarizes the type and level of transportation services (taxi,

specialized transportation services, intracity and intercity buses) available in places between 2,500 and 10,000 population outside of urbanized areas in 48 contiguous states and the number of such services serving these communities. It also includes a section summarizing information on places under 2,500 population. In places (2,500-10,000), the inventory highlights the following unexpected results: Taxi-75% of total companies serve 3 or 4 places, 18% had contracts with agencies, and State is second most common regulator and City government is the least common; Specialized Transportation Services--13% of all vehicles were equipped for non-ambulatory, 9% of the places had more than one specialized service, 50% provided demand-responsive service, and local governments operated 23% of the systems; Intercity Buses Service-service provided to only 42% of places sampled, and 7% had contracts received a subsidy; Intracity Bus Service--5% of the systems were large metropolitan systems, 52% were privately owned, and only 21% were countywide. Of the 291 sample places with population between 100 and 2,500, 27 sample places were served by 40 taxi systems; 47 were served by 54 specialized transportation systems, and 32 had intercity bus service. Four of the systems (13%) stated that they had passenger service contracts or subsidies from state or local governments. Of the 32 systems reporting capital funding assistance, two received 16 (b) 2 funding. This inventory report contains many charts/fact sheets regarding the transportation services examined. /UMTA/

33 198697 RURAL DEVELOPMENT INITIATIVES: IMPROVING TRANSPORTATION IN RURAL AMERICA.

The report outlines ways in which transportation in rural America can be improved. Items discussed include social service and public transportation, commuter air service, railroad branchline rehabilitation, and ridesharing. These improvements in rural transportation are designed to help rural and small town residents overcome the problems of isolation, gain full access to essential human services, and meet the transportation requirements of healthy, growing economies.

33 300687 OVERVIEW OF PROBLEMS AND PROSPECTS IN RURAL PASSENGER TRANSPORTATION.

This overview of the state of the art in rural passenger transportation focuses on lessons that have and have not been learned during the past decade. Significant progress has been made on certain technical issues such as planning techniques, resource requirements, and performance standards. At the same time, very little progress is evident in some nontechnical areas--particularly in the areas of political leadership and financial stability. Future developments in rural passenger transportation will vary significantly. /Author/

33 300688 STATE ROLE IN RURAL PUBLIC TRANSPORTATION.

This paper reports on the efforts of various states to be more deeply involved in providing transit services in rural and small-town areas. Current state involvement, innovative programs initiated in a few states, existing problems, and future programs are discussed. Most of the information presented in this paper was obtained from a survey of all states by the North Carolina Department of Transportation. The survey results suggest that one of the most significant problems to be solved is the fragmentation of services due to the multiplicity of federal programs funding rural transportation--until now an issue usually dealt with at the local level. /Authors/

33 300689 RURAL DEVELOPMENT POLICY AND RURAL PUBLIC TRANSPORTATION.

The transportation systems that serve rural people and their communities continue to dwindle. Local communities affected by the diminution of these transportation resources are under pressure to raise local money to subsidize, almost simultaneously, air service, rail service, and intercity bus lines, to maintain their off-system roads and bridges in usable condition, and to provide whatever forms of public transit may be achievable. The competition for local funds is among the problems to be faced if a small-town and rural-area public transit program is, as seems likely, at last obtained from Congress. Because the lack of accessibility to jobs, training, and other essential services will continue to be an obstacle to a rational rural development policy, comprehensive plan and the maximum feasible coordination of transportation resource must be given high priority. /Author/

33 300691 TRANSPORTATION PLANNING AND IMPLEMENTATION IN SMALL CITIES AND RURAL AREAS.

The Indiana Mass Transportation Improvement Project is responsible for public transportation planning in the small urban and rural areas of Indiana. The goals of the Indiana Public Transportation Advisory Committee emphasize the public transportation system. In Indiana a unique working arrangement is established in which the mass transportation improvement project serves as the staff for local public transportation operators. The project attempts to combine planning and operations into a total management assistance program. Work currently is being done in nine cities of less than 50,000 population and 26 counties in the state. In rural areas, the transportation advisory committee plays a dominant role in local transportation planning and evaluation. It addresses the community's total transportation needs rather than having local social service agencies think only of their own transportation needs. The Indiana Mass Transportation Improvement Project is establishing transportation advisory committees in all of the state's 18 planning regions. Transportation problems must be addressed by the service or market area, not by political boundaries such as counties. The success of the transportation improvement project is defined by how well it designs and helps implement a public transportation system that serves public transportation needs in the state. /Author/

33 300697 PRIVATE ENTERPRISE TECHNIQUES IMPROVE PRODUCTIVITY OF RURAL TRANSIT SYSTEMS IN IOWA. The primary objective of the Iowa Department of

Transportation rural transit program is increased productivity--to be able to produce more output (passengers carried) while using less input (money). When the department assumed control of rural transit in 1976, it became obvious that traditional methods of developing rural transit would hinder, if not actually negate, progress toward the objective of improved productivity. Consequently, the private enterprise philosophy of management was implemented. This philosophy dictated the consolidation of the 275 rural transit systems into 16 systems and the elimination of nonproductive systems, provided authority equal to responsibility, holding specific people and agencies responsible for results, and implemented management and business decisions into an area of social work. The results, after 3 years of effort on a statewide basis, show that the output has increased by 33 percent and the input has decreased by 10 percent. The implications of these results are that transit in general (urban, rural, or intercity) can benefit from consolidating authority and responsibility, managing by objectives, and making decisions that are based on economic and productivity analyses. /Author/

33 300706 PROCEDURES AND EXPERIENCES IN EVALUATION OF RURAL HIGHWAY PUBLIC TRANSPORTATION DEMONSTRATION PROGRAM. The Rural Highway Public Transportation Demonstration Program projects funded under section 147 of the Federal-Aid Highway Act of 1973 are being evaluated on the basis of an extensive reporting procedure. Three categories of information--statistical, narrative, and detailed passenger survey data--are being collected. Statistical data on project operating characteristics are collected monthly, and narrative reports are submitted each quarter, at the end of the first year, and as a final report. After Federal Highway Administration analysis, the monthly statistical data are summarized quarterly in computer-tabulation form and distributed back through the field offices and the states to the project personnel. One year (January-December 1977) of statistical data have been reported back to the projects by this mechanism. Peer groups have been established that contain projects that, based on population density and size of vehicle fleets, are similar. Although all projects are required to be able to meet the service needs of elderly and handicapped riders, some projects have been more successful than others. The predominant one-way trip purposes were work, shopping, and school and education. Data for the fourth quarter of 1977 showed that drivers' wages account for more than half of the operating costs. Eighty percent of the funding comes from federal sources, the states contribute 13 percent, and local and private agencies contribute 7 percent. The statistical-evaluation results were remarkably steady throughout 1977; no significant fluctuations were identified. /Author/

33 300707 RURAL HIGHWAY PUBLIC TRANSPORTATION DEMONSTRATION PROGRAM: INTERGOVERNMENTAL RELATIONS, ABRIDGMENT.

The use of the resources and expertise of the state transportation agencies in the administration of projects at the local level and the provision of needed technical assistance are described. Activities in Michigan included technical assistance to applicants in the development of a service plan, advertising and conducting of public hearing, preparation of a contract between the state and applicant agency, as well as assistance in other areas. The Florida DOT'S technical and financial assistance to the Suwannee Valley Transit Project is outlined. The efforts of these and many other state and local groups have led to viable rural transportation operations. These projects have been successful in providing for the needs of the transportation handicapped. Statistics are beginning to show improved economic efficiencies over time, and several operations, especially those supported by state and local governments, may be able to continue operations without federal financial support.

33 300710 ROLE OF THE INTERCITY BUS IN RURAL PUBLIC TRANSPORTATION.

ABRIDGMENT. The intercity bus industry services over 14,000 cities and communities which have no alternative form of common carrier transportation. This comprehensive service is provided by 1000 independent bus companies which cater to the personal travel market, providing greater mobility to the less affluent, the handicapped, the elderly, and the young. However, the intercity bus industry's position in the market is insecure and unstable. The results are discussed of a comprehensive study by the Interstate Commerce Commission (ICC) which shows that the general growth and prosperity of the industry has been dimmed by shrinkage of passenger demand and reduced profitability, particularly on regular route passenger service. The conclusions and recommendations of the ICC report are also discussed. It is noted that the need for operating and capital assistance for transportation in rural areas can no longer be ignored. Legislation is being considered in Congress, and a Highway Mass Transit Bill has been approved which contains a provision for specific designation of \$20 million annually over 1 years to subsidize operations of intercity bus service in small urban and rural areas. A bill (S2441) has been adopted in the Senate which provides that the private intercity bus industry would be eligible for participation in the \$100 million annual assistance program for rural and small urban areas. Meanwhile planners should investigate the feasibility of using the potential of 1000 or so already operating private bus companies in solving some intracommunity transportation problems on a subcontracting basis.

33 301857 A BORDER TRIAL. The article describes a development in rural area transport introduced in the border region of Scotland by the Scottish bus group in conjunction with the Border Health Board. Operated by eastern Scottish, the border courier minibuses run throughout the region carrying health board and council goods and supplies. They are also routed to cover 11000 miles per year on passenger services such as schoolchildren and old people attending day centres. The vehicles used for these services are 13-seat Bedford CF340's fitted with Reebur 17 bodies having 110 cu ft capacity goods compartments. The services will be evaluated over the next two years for possible application in other rural areas with similar transport problems. /TRRL/

33 301964 PUBLIC TRANSPORT FOR COUNTRYSIDE RECREATION-A REPORT TO THE COUNTRYSIDE COMMISSION. Following the monitoring of experimental bus services in three national parks, a study was undertaken of public transport in countryside recreation. Recreation facilities in the countryside are placed in four categories: specific sites such as parks; linear features such as coasts, waterways and footpaths; accessible land such as commons and royal parks; and, the general countryside. The distinct implications for flows of recreational transport movement for these categories are discussed. Chapters examine the development and recreational use of public transport. Case studies are discussed in which relevant public transport facilities were examined in eight areas of recreational interest in the United Kingdom. /TRRL/

33 302240 RESORT TRANSPORTATION IMPROVEMENTS: CASE OF LITTLE COTTONWOOD CANYON, UTAH. The objective of this study was to adopt a practical methodology for short-range transportation improvements that are fully responsive to the typical problem of recreational resources near an urban area. The methodology was applied to alleviate the transportation and related problems of ski resorts of Little Cottonwood Canyon of Utah. Specific evaluation data related to the canyon; however, the breadth of the system considered, the parameters developed, and the decision-making process suggested were structured so that the concept could be adopted as a consistent planning tool to resolve problems in similar recreation resorts. Emphasis was placed on simplicity and practicality of the developed methodology as well as on maximum accessibility and minimum negative environmental impacts. A specific park-and-ride bus transit system has been recommended for the study resort on the basis of economic factors and community responses. Application of the suggested methodology stressed intangible factors as well as strictly monetary factors. /Author/

33 302252 TRANSIT SERVICE AND ORGANIZATIONAL ALTERNATIVES FOR A LOW DENSITY SUBURBAN-RURAL AREA: A STUDY OF PUBLIC TRANSIT OPTIONS FOR ALBERMARLE COUNTY, VIRGINIA. The intent of this study is to provide planning options for public transportation in Albemarle County and the City of Charlottesville, Virginia. The results are intended to provide a range of planning options for community service, but not a comprehensive plan for implementation. The options are intended for review in a future study by citizens and officials of the Charlottesville-Albemarle area to be refined according to local opinion as an aid to developing a plan for implementation. The options cover future transit demand scenarios depending on energy availability and price, alternative transit systems, and alternative organizational formats for coordinating low density rural and suburban transit and paratransit services. Special attention is given to the institutional issues affecting coordinated transit. This study approaches the basic problem of transportation in low density areas from the institutional perspective of an operating organization. This approach is reflected in the study objectives which are: 1) to define the public transportation needs and demand in the Charlottesville-Albemarle area; 2) to design alternative transit and paratransit services for the Charlottesville-Albemarle area; and 3) to define and evaluate alternatives to coordinate transit services. The findings of the study are based on local transit and demographic data, state-of-the-art transit and paratransit information, and Commonwealth of Virginia laws and regulations. In addition, two local surveys were conducted. One survey measured transit behavior and attitudes in Albemarle County, and the other assessed community preferences for transit coordination. The conclusions of the study are presented corresponding to the three major areas of investigation. Suggestions for community action are presented. (UMTA)

33 302926 THE TOURIST AND HIS TRAFFIC. The paper argues that the pattern of holiday development and of countryside recreation in East Anglia is almost entirely attributable to changing modes of transport. With the improved accessibility of the region, a continued increase in car-based pressures on the coast and the countryside is inevitable. Traditional traffic and land-use planning provide inadequate frameworks for coping with the resulting problems. There is a strong case for a process of co-ordinated management which has conservation as its prime objective. /Author/TRRL/

33 303940 ANALYSIS OF VOLUNTEER DRIVER SYSTEMS IN RURAL PUBLIC TRANSPORTATION (ABRIDGMENT). The purpose of this study is to evaluate the potential for continuing, and even expanding, volunteer driver systems in rural areas. Case studies of volunteer driver systems in two Wisconsin counties are used to test the hypothesis that volunteer driver systems can be cost-effective, feasible means of providing high-quality, specialized transportation service in rural areas. In addition, the role of volunteer drivers systems in relation to paid driver systems that use vans or buses is examined in terms of an optimum mix of service types. Finally, the implementations of the rural public transportation operating assistance program (Section 18 of the Surface Transportation Assistance Act of 1978) are examined. The two case studies show that volunteer driver systems can provide high-quality, cost-effective transportation for the elderly in rural areas. Volunteer driver systems can provide lower costs per trip than all but the most productive van systems. Only a high-cost, taxi-like van system can approach the high-quality, door-through-door service of the volunteer driver system. Even then the volunteer system provides superior service because of the potential for personal assistance to passengers at their destination.

33 307703 BUS TRAFFIC IN RURAL AREAS-THE SAME AS IN DENSELY POPULATED CITIES [Busverkehr auf Dem Land: Wie in Dicht Besiedelten Staedten]. The present paper describes a public passenger transport model for the improvement of transport facilities in rural areas which is to be tried out this year in the Hohenlohe District. The basic aim is the creation of a transport network which is equal to that found in densely populated city regions: no

stopping point further than 1000 M from the place of residence, regular time intervals, e.g. service at hourly or two-hourly intervals to the nearest town or city, fixed fares and uniform fare structure, hourly services during peak hours, at least eight connections each day in each direction for any locality. It is intended to achieve this object in the Hohenlohe model without extra vehicles or drivers and without any addition costs—purely by improved utilisation of existing capacity. /TRRL/ [German]

33 307951 RURAL PUBLIC TRANSPORT. This paper describes a methodology for planning public transport on a county-wide basis where the principal concern is the needs of villages, small communities and small towns. The paper describes the relationship between the needs of small communities and the provision of transport. It highlights the complex social relationships that exist between the long-term character of a rural area and the supply of transport services. Having provided the context for public transport, the methodology developed by the authors in various studies over five years is described in terms of the data, the technical procedures developed and typical results obtained. 33 307952 RURAL TRANSPORT EXPERIMENTS: THE WELSH SCHEMES. Three public transport experiments were conducted in Wales as part of the Rutex Programme, all based on Llandovery in Dyfed. This report describes the planning, operational and financial aspects of the experiments. The three schemes complemented each other and existing services, and had the objective of improving transport provision by means of low-cost options making efficient use of existing resources. The three services were as follows: (I) a postbus served two routes, and operated in typical fashion, providing a service most suitable for shopping and personal business trips. The experimental provision of a two-way Saturday service attracted very little patronage. (II) spare capacity on four schoolbus routes was made available to the public. These routes were only available during term-time, and attracted only a small group of users, but they were able to cater for certain work journeys, and were provided at very low cost. (III) a voluntary car service was provided over the whole designated area, organised and operated by the women's royal voluntary service. The service was free to passengers, but available only for 'essential' purposes. Despite some uncertainty about permissible purposes, the scheme provided a valuable service, and coped economically with dispersed and unpredictable demands. (a) (TRRL)

33 308618 ACCESSIBILITY: THE RURAL CHALLENGE. The author sets out the problem, faced by planners, County Councils, education

and health authorities, transport officials, and by those who live in rural Britain, of the inaccessibility of many areas of the country. For those two-car families who choose to live in the remoter villages, it matters little that the main town is only accessible by bus once a day. But for the poor, children, housewives, the elderly it can be a matter of some urgency when local shops, schools and medical services are being whittled away in favour of larger units in distant towns. This book, based on the author's report for the Department of the Environment on rural transport and accessibility, reviews the process of decline which has led to this situation, and considers the concept of accessibility and shows how it can be developed into an analytical tool for measuring the success or failure of alternative policies. The author details each policy option in turn: the support of conventional bus or other transport services; the provision of mobile services; "mini-outlet" policies; and the long-term restructuring of the rural settlement pattern. He devotes a chapter to the crucial fragmentation of decision-making bodies, which inhibits the necessary coordinated attack on the problem, and concludes with a chapter on "the way ahead" which sets out his policy for meeting the 'rural inaccessibility problem'. 33 308625 EVALUATION OF RURAL VOLUNTEER DRIVER TRANSPORTATION SYSTEMS IN WISCONSIN. The purpose of this study is to evaluate the potential for volunteer driver systems in rural areas. Volunteer driver systems in which volunteers are reimbursed for mileage are hypothesized to be a cost-effective means of providing high quality, specialized transportation in rural areas. The reasons for the growth of volunteer driver systems are outlined in terms of their advantages and disadvantages. Volunteer driver systems are used extensively in Wisconsin to provide specialized transportation service for the elderly and handicapped. The potential for expanding the systems exists as the result of a new state operating assistance program. Two well-developed volunteer driver systems which serve rural areas in Wisconsin are analyzed and compared with paid driver systems using vans. Models are developed to compare the costs of volunteer driver and van systems. The analysis shows that volunteer driver systems provide high quality door-through-door service with lower costs per trip than all but the most productive van systems. With professional direction problems of volunteer recruitment and retention, volunteer reliability, and driver safety can be minimized. Insurance is a problem but has not severely restricted the growth of volunteer systems in Wisconsin. Volunteer systems can best serve high priority trips. Van systems are better when extensive grouping of rides is possible. Finally, implications of the results for federal operating assistance are discussed. (Author/TRRL)

33 309528 PUBLIC TRANSPORT IN RURAL AREAS [Le transport collectif en milieu rural]. Sparsely populated rural areas are the object of large-scale operations carried out with the hope of giving a boost to their economy. As regards public transport, it is necessary to find formulae facilitating internal travel as well as linking them with other regions. The role of public transport services should be to instil life in these regions and to integrate them in the environment. The author describes the state of the art of public transport: road or rail infrastructures may be satisfactory but closing of lines has cut off some areas. Local initiatives to ease travel are noted for their increase and diversity. In conclusion three main objectives are outlined: to guarantee great technical flexibility, to adapt services to local needs, and to give local communities every means of decision making and control. 33 309529 PUBLIC TRANSPORT OPERATIONS IN RURAL AREAS [Les opérations de transport collectif en milieu rural]. In order to awaken or reawaken rural parts of France, it is necessary to increase the possibility of transporting people and transporting local goods. Sufficiently dense road and rail networks exist, but are insufficiently exploited. In order to fulfil known public transport needs, the authorities responsible for developing rural areas have drafted a guide for public transport operations in rural areas, which deals particularly with the financial evaluation of public transport projects. 33 309920 PERMANENT WAY FOR RURAL TRAINS. The article discusses the positive contribution that rail services can play in rural areas. In areas in the U.K. rail closures have left an uneven distribution of rural rail services depending on political, social and physical influences. Rural communities near to conurbations benefit from commuter demand while in areas where stopping services are a hindrance to operations, bus services can provide greater coverage. It is argued that there is a need for criteria against which the social value of rural rail and bus services can be evaluated as part of a co-ordinated public transport system. Operating economies in rural rail services could result from introducing lightweight rolling stock now being developed by Leyland. The declining significance of public transport is likely to lead to a more selective and specific function for British Rail according to particular social needs.

33 310069 RURAL TRANSPORT EXPERIMENTS: THE MID-DEVON LIFT-GIVING SCHEME. A REPORT BY THE DEVON RUTEX WORKING GROUP.

The mod-Devon lift-giving scheme permitted motorists to accept payments from passengers in private cars in a designated area, in advance of the general car sharing provisions contained in the transport act 1978. It was the only such 'general authorisation' in the government's programme of rural transport experiments (rutex). An assessment of the scheme is presented. The designated area contained only limited conventional public transport facilities, and lift giving was already prevalent. Few residents felt themselves to be experiencing important transport difficulties, either before or after implementation of the scheme. The authorisation had little effect on car-sharing habits in the area; few lift givers wanted payments, and few residents had been inhibited by the previous legislation. Some difficulties were identified concerning the matching of potential lift receivers with possible lift givers; those needing lifts were reluctant to ask for help, but car drivers had difficulty knowing when lifts were required. The relevant provisions of the transport act 1978 are likely to have been similarly ineffective in comparable areas elsewhere; organised car schemes may offer a better way of improving rural mobility. 33 310070 RURAL TRANSPORT EXPERIMENTS: THE RIPON FLEXIBUS. A REPORT BY THE NORTH YORKSHIRE RUTEX WORKING GROUP.

The ripon flexibus was part of the government's programme of rural transport experiments (rutex). It served an area to the west of Ripon in North Yorkshire where it replaced three bus routes. It was operated by a national bus company subsidiary using a standard bus which made specified diversions from a circular route on demand. A high level of service was offered initially. During phase I of the experiment the level of service in the area as a whole was nearly doubled. However, the improved service carried virtually no more passengers. After seven months the level of service was reduced to a similar level to that offered before the service began, but with the diversions retained. The reorganisation had little effect on patronage (on average 160 trips per week). The diversions were little used and did cause some problems with timekeeping. The booking of detours caused few problems. If phase I of the experiment had been operated for a full year, the revenue would have covered 28 percent of the costs, and the corresponding proportion for phase II would have been 53 per cent, compared with 45 percent for the original bus service. 33 310071 RURAL TRANSPORT PROBLEMS IN BRITAIN. PAPERS AND DISCUSSION. REPORT OF A SYMPOSIUM ORGANISED BY THE TRANSPORT GEOGRAPHY STUDY GROUP OF THE INSTITUTE OF BRITISH GEOGRAPHERS, UNIVERSITY COLLEGE OF NORTH WALES, BANGOR, SEPTEMBER 1978.

The symposium discussed the problems of planning and operating rural public transport systems. Papers also evaluated the part to be played by transport in rural communities at a time of decreasing rural facilities. The following papers were included in the proceedings: The Development of Public Transport Policy in Rural Wales (Dredge, AS); Rural Public Transport: The Economic Stranglehold (Dobbs, B); Transport Problems in Gwynedd: The Bus Operator's Experience (Humphreys, JG); The Snowdon Sherpa: Public Transport and National Park Management Experience (Mulligan, CA); Levels of Rural Bus Provision and Fares Policy (Holding, DM); Railway Network Contraction in Rural North Wales, 1948-1972 (Halsall, DA); An Analysis of The Trunk Road Network in Rural Wales (Willis, EL); Road Equivalent Tariffs: The Scandinavian Experience and the Scottish Prospects (Kowles, RD); Evaluating Public Transport Provision in Skye and Lochalsh (Stanley, PA and Farrington, JH); Access to Health Care Facilities in Cumbria (Whitelegg, J and Gibson, CT); Rural Public Transport needs in South-West Shropshire (Bartle, MH); Transport Co-ordination in Rural Areas (Greenwood, RH). 33 310309 RURAL DEPRIVATION. This report contains the results and conclusions of the examination of rural deprivation carried out by the Association of County Councils. The terms of reference were to consider and report on: (I) the nature and extent of rural deprivation in England and Wales; (II) the difficulties and costs of providing rural services; (III) the extent to which the allocation of resources reflects the scale of rural problems and the costs of overcoming them; (IV) the policies at present adopted by public authorities in rural areas; and (V) ways in which public authorities could alleviate rural problems, especially if a fairer allocation of national resources were achieved. Part a of the report examines the nature and extent of rural deprivation in England and Wales. Parts B and C discuss items (II), (III) and (IV). In Part D, the present national allocation of resources is discussed. Some ways by which public authorities could alleviate rural problems, given a more realistic allocation of resources, are also examined. (TRRL)

33 311443 RURAL RAILWAYS. A REPORT ON BRITISH RAIL'S OTHER PROVINCIAL SERVICES. The major categories of British Rail's other provincial services (OPS) are listed, and BR's policy covers development of a secondary inter-city system, use of the cascade principle for replacing rolling stock, and the replacement of diesel multiple units. Use of Leyland railbus is seen as possible for low volume services. Details

are presented, and discussed, of the CTC's dissatisfaction with this policy. A brief critique is given of successive governments' railway investment policies, making long term planning difficult. Suggestions are presented for an improved policy and emphasize the value of a complete rail network for passenger and freight traffic. There is need for stability in investment, and consideration of residential and industrial needs in transport planning. Safeguarding the OPS is recommended by measures to reduce operating and maintenance costs and preserve the assets of the existing rail network. (TRRL)

33 311749 INNOVATIONS IN RURAL BUS SERVICES. THE GOVERNMENT'S RESPONSE TO THE EIGHTH REPORT FROM THE SELECT COMMITTEE ON NATIONALISED INDUSTRIES: SESSION 1977-78. HC635.

Finance was considered to be the major problem. The government's intention of stabilising public expenditure requires the maximum value for money. Higher productivity could be achieved by using the National Bus Company's (NBC) market analysis project (map). It was agreed that the present system of licensing can hinder the efficient development of new services and needs reform. New services, such as minibuses, shared cars and post buses, should be developed to supplement the existing network of conventional buses. Observations on specific recommendations include the need for regular discussions with the association for county councils on topics such as finance and the training of community bus drivers. The government would not agree to the recommendations that some of the NBC's debt should be written off, or to maintain the new bus grant at 50 per cent beyond 1981. (TRRL)

33 311805 RURAL DEPRIVATION. PART B6. RURAL TRANSPORT.

The essential needs for transport in rural areas are considered, which include good communications by rural industries. The scale, distribution and quality of transport opportunities in rural areas are discussed. Details are tabulated of the high road mileage in sparsely populated areas, and the decrease in passenger journeys made by public transport during 1965-75, with vehicle fleet remaining almost constant, is shown graphically. The relation between population decline and transport network is shown for Devon Country, and the effects on a rural population of changes in motoring costs are discussed. Transport provision by local authority consists mainly of providing and adequately maintaining the highway network. This is reviewed in the light of increased vehicle loadings and financial resources available. Reference is made to the need for subsidizing uneconomic passenger services for various groups in rural communities. A description is given of unconventional passenger services and reference is made to the experience gained by TRRL Rutex experi-

ments. The need for extra financial resources is stated, and policies and actions which might be pursued are listed. (TRRL)

33 312665 THE RURAL TRANSPORT EXPERIMENTS: A MID-TERM REVIEW. This report describes the background to the Government's program of Rural Transport Experiments (RUTEX) and its organization. There were fifteen experiments, in Devon, North Yorkshire, Dyfed and Strathclyde, each of which incorporated at least one of five unconventional features: community transport; small vehicles; demand-responsive operation; dual-purpose services, and feeder services. The experiments are described in detail, together with results obtained by the end of 1978. A number of tentative conclusions are presented, and the future research program is outlined. (Copyright (c) Crown Copyright 1979.) presented at the University of Newcastle upon Tyne symposium "Efficient Public transport for the 1980's", April 1979 and at the Cranfield Institute of Technology conference "Mobility in Rural Areas", 24-26 April 1979.

33 313817 RURAL TRANSPORT EXPERIMENTS: BLACKMOUNT SERVICES. A REPORT BY THE SCOTTISH RUTEX WORKING GROUP. Detailed information about the design implementation and operation of the Government's first rural transport experiment in Scotland is reported. The experiment comprises an integrated service operated by a 17 seater minibus (the Medwyn Gypsy) and two postbuses. Parts of the minibus route are served on a demand responsive basis. Results of surveys carried out prior to the introduction of the experiment and since its commencement are recorded. Costs of the experimental service are compared with the costs of the conventional bus services which were previously operating in the area. Patronage on the experimental services consists mainly of women and pensioners who do not have a private vehicle belonging to their households. Most trips are for shopping and social purposes. 33 314079 A SECTION 147 RURAL TRANSPORTATION DEMONSTRATION MANUAL. NUMBER 1. RURAL PUBLIC TRANSPORTATION SERVICES AND PERFORMANCE [Final rept.]. The manual summarizes the lessons that have been learned from the Section 147 Rural Transit Demonstrations about service and fare policies, and performance and costs. The report concludes that rural transit services have to be innovative, combining conventional transit operations with fixed routes and regular schedules with various forms of paratransit, to meet the specific needs of individual areas. The report also emphasizes the need for careful monitoring of costs and system performance as transit services develop. The report provides capsule summaries of system characteristics and performance for selected projects, identified by State.

33 314080 A SECTION 147 RURAL PUBLIC TRANSPORTATION DEMONSTRATION MANUAL. NUMBER 2. PLANNING RURAL PUBLIC TRANSPORTATION SYSTEMS [Final rept.]. The report describes planning processes used to establish rural transportation, and was prepared by examining planning documents and operating reports of projects funded under the Section 147 Demonstrations. It examines the premise that good planning and management measurably contributes to the potential success of rural transportation projects. The study examines system planning, startup, management, funding and alteration in separate chapters, and concludes with an overall assessment of key factors for success. These include common sense, a good project director, a willingness to change, vehicle utilization, high trips per person, and vehicle miles of service.

33 314081 A SECTION 147 RURAL PUBLIC TRANSPORTATION DEMONSTRATION MANUAL. NUMBER 3. RURAL PUBLIC TRANSPORTATION COORDINATION EFFORTS [Final rept.]. The technical manual discusses coordination and the role it plays in developing successful rural public transportation programs. The report stresses that coordination must begin early, involve as many participants as possible, and be carried forward through the planning, operation, and implementation of a project. Four sections elaborate on coordination with respect to community support, regulatory considerations, the role of public and private operators, and the role of human service agencies.

Ketola, HN ; Applied Resource Integration Limited, Department of Transportation Final Rpt. DOT-I-79-6, Aug. 1979, 45p; See also Number 2, PB80-181407, and Number 4, PB80-181423. ñ Also available in set of 5 reports PC E13, PB80-181381.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB80-181415

33 314082 A SECTION 147 RURAL PUBLIC TRANSPORTATION DEMONSTRATION MANUAL. NUMBER 4. RURAL PUBLIC TRANSPORTATION VEHICLES [Final rept.]. The report examines the various types of vehicles used in the Section 147 Rural Public Transportations, and provides guidelines on vehicle considerations. The report covers specifications, vehicle maintenance, communications equipment, and driver training, and includes example material and suggested methods for each topic. The report finds that a mix of vehicle sizes is normally the best method for purchasing vehicles initially, and sufficient attention has to be provided for back-up vehicles.

33 314533 TRANSPORT SERVICES IN LOW DENSITY AREAS. An international road research group was set up by OECD to examine public transport systems, both conventional and innovative, implemented in low density areas as well as possible future improvements to these types of service. Due to the increasing number of dispersed and low density zones which have evolved within the last thirty years in OECD countries, the problem of public transport services in these areas is of increasing economic and social importance as the levels of urban accessibility provided depend to a large extent on whether or not the residents possess a private means of transport. Firstly, the report examines urban development patterns, activity distributions and trip patterns and highlights the share of trips made by public transport. It considers the set of transport problems related to these zones supported by a classification of different forms of transport services together with their characteristics, such as system availability and intrinsic accessibility, flexibility in time and space depending on the nature of the system, private or public. The report indicates the main factors to take into account in physical planning in order to promote improved operation of conventional or de-

mand-responsive systems currently in use or under study. It deals in turn with the general conditions applying to public involvement in these areas, the social objectives assigned to public transport, the framework for adequate co-ordination and lastly, the overall problem of evaluating transport schemes for low-density areas. Finally, the report presents a number of conclusions and recommendations regarding methods for improving transport services in low density areas and priority research subjects in this field.

33 314651 RURAL PUBLIC TRANSPORTATION COORDINATION EFFORTS: A SECTION 147 DEMONSTRATION PROGRAM, TECHNICAL MANUAL. The rural transportation projects of the 147 demonstration program were developed in a complex environment of individual transportation needs; competing human service service agency, public, and private transportation providers; and multiple levels of government. Those projects which were the most successful dealt directly with these elements by coordinating project efforts to conform to the needs and desires of the local community. By doing so, they developed a strong community identification which was translated into sponsorship and other forms of community support. In this technical manual coordination and the role it played in developing successful programs is discussed. Throughout the technical manual, there is one overriding conclusion: Coordination must begin early, involve as many participants as possible, and be carried forward through the planning, implementation and operations of a project. The four sections develop this point as it applies to: community support, regulatory considerations, coordination with public and private operators, and coordination with human service agencies. Community support begins early and continues throughout the successful project's life. By developing strong working relationships and a firm understanding of the local transportation environment many projects turned written proposals into successful and greatly appreciated local transportation operations. 33 319151 PROCEEDINGS OF THE FOURTH NATIONAL CONFERENCE ON RURAL PUBLIC TRANSPORTATION. The Fourth National Conference on Rural Public Transportation was held in June 1979 in Vail, Colorado. This represented a fairly substantial period of transition for rural transit services. The Section 147 Demonstrations were in many cases winding to a close, and a landmark series of reports on their results was under preparation. The Congress had passed the new Section 18 program, which for the first time provided both capital and operating support for rural public transportation services. Although only \$75 million in FY-1979, the Section 18 money represented a "coming of age" for rural transit. To top things off, the White House was putting the

finishing touches on a Rural Transportation initiative, which was formally announced shortly after the conference. The papers presented at the conference reflect the transition taking place. Many attempted to assess the results of the Section 147 demonstrations, and speculated about their long-term implications. A major theme of the conference was coordination, and how it could be accomplished. This reflect the limited amount of Section 18 funds and provided an option for stretching available resources. A number of papers also dealt with the role of the states in managing rural transportation programs reflecting the emphasis which Section 18 places on this function. This volume contains most of the papers presented at the Fourth National Conference. Rather than following the sequence of paper at the sessions, they have been regrouped in several major areas which the conference highlighted. Some of the papers have been revised or abridged by their authors since their original presentation, and a few have been edited to make them consistent in format with the other papers in the report. 33 326681 RURAL TRANSPORT EXPERIMENTS: THE NORTHALLERTON HOSPITAL TRANSPORT SERVICE. The Northallerton Hospital Transport Service was part of the Government's program of Rural Transport Experiments (RUTEX). It was a demand responsive shared hire-car service to the hospital from two areas containing some 10,000 households. The provisions of the Passenger Vehicles (Experimental Areas) Act 1977 were used to authorize drivers to collect separate fares from passengers. The service operated in the morning and afternoon from Monday to Friday and in the evening from Monday to Thursday. On average 10 return vehicle journeys were made each week and 15 passengers made return journeys, but more than one half of vehicle journeys were made with a single passenger. Without the service 16 per cent of the passengers would have foregone the journey, a further 8 per cent did not know how they would have traveled; the remaining passengers could have made other arrangements. The average passenger spent 80 minutes at the hospital and travelled 31 miles; the average vehicle journey length was 48 miles. Twenty-two per cent of costs were met from revenue, the remainder, \$4.50 per passenger journey, by the Department of Transport. (Copyright (c) Crown Copyright 1980.)

Transport and Road Research Lab., Crowthorne, (England). 52 TRRL-SUPPLEMENTARY-5, c1980., 28p; Prepared in cooperation with North Yorkshire Rutex Working Group, England.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB81-100455

33 327456 RURAL RIDES. A PRACTICAL HANDBOOK FOR STARTING AND OPERATING A RURAL PUBLIC TRANSPORTATION SYSTEM. Guidelines for planning, implementing, and operating a rural public transportation system are presented. Selection of personnel and vehicles, routing and scheduling, maintenance, accountability, economics, insurance, sources of funding, and potential problems are discussed. It is noted that public transportation is lacking in rural areas, and that the elderly, handicapped, poor, isolated, unemployed, and otherwise disadvantaged rural residents are in more critical need of public transportation than their urban counterparts. Rural transportation systems tend to be initiated to transport people to needed social services, such as senior citizen centers, educational programs, job training programs, and health facilities. While individual agencies tend to acquire a few vehicles for transporting clients to and from services, a coordinated system would be more efficient in terms of manpower, fuel, and vehicles. Responsibility for routing and scheduling should be retained by the manager. Local senior citizen groups, businesses, and social service agencies should be consulted regarding needs. Possible problems with communication, resistance to coordination, and excessive bureaucratization are noted.

Farmers Home Administration, Washington, DC. USDA/PA-1215, Oct. 1978, 22p; Prepared in cooperation with National Council for the Transportation Disadvantaged, Rio Grande, NJ.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; HRP-0031228/0

33 327752 A STUDY ON FACTORS AFFECTING SUCCESS OF SUBURBAN MASS TRANSIT LINES. The purpose of the study was to identify and analyze the factors that influence the success or failure of public transportation lines that operate mainly within the low density suburban areas, and whose purpose is to serve the local travel needs between and within suburban communities, rather than to provide corridor connections with the central business district (CBD) of the metropolitan region. This report presents the efforts of a research project on factors that effect the success levels of suburban bus transit lines, operating in low density areas and serving non-CBD-oriented, localized travel needs, on fixed-routes and schedules of service. The analysis is based on data from suburban transit routes from two distinctly different metropolitan areas, namely: Philadelphia SMSA and San Diego SMSA. The factors investigated in-

clude those expressive of the connectivity of transit lines, land use mix in the service areas, areal/spatial characteristics of the transit routes, and the characteristics of the transit users.

Tomazinis, AR Replogle, M Del Casino, J Young, D Gleichman, G ; Pennsylvania University, Philadelphia, Urban Mass Transportation Administration, (UMTA-PA-11-0018) Final Rpt. UMTA-PA-11-0018-80-1, Dec. 1979, 170p; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB81-116428

33 328226 INTERCITY, BUS, RAIL, AND AIR SERVICE FOR RESIDENTS OF RURAL AREAS. This is a four part study which focuses on intercity passenger service for residents of rural areas, i.e., persons who live outside officially designated urbanized areas. Part I develops the analytical structure for the study and introduces a definitional structure designed to reduce the

considerable semantic confusion surrounding the subject matter area. Parts II, III and IV examine the characteristics of bus, rail and air service, respectively, currently provided to rural residents. The bus findings were based partly upon case studies of rural areas in 10 states. The study concludes that the combination of bus and air service usually provides adequate intercity service for most rural residents, and that access to this service is not a major problem.

34 050737 THE ADDITIONAL COST OF PROVIDING MOBILITY FOR THE ELDERLY AND HANDICAPPED ON THE WASHINGTON METROPOLITAN RAIL RAPID TRANSIT SYSTEM. The report presents an estimate of the cost of adding elevators and associated equipment to the Washington Metropolitan Rail Rapid Transit System as part of a planning and designing procedure which would meet the special needs of the elderly and the handicapped. The report covers the following specific areas of study: potential elderly and handicapped users, needs of the elderly and handicapped in rail rapid transit, the metro system and its accessibility to the elderly and the handicapped, cost of providing additional facilities, security and safety. A list of references is included.

34 056993 ACCESSIBILITY OF THE METROPOLITAN WASHINGTON, D.C. PUBLIC TRANSPORTATION SYSTEM TO THE HANDICAPPED AND ELDERLY. Two hundred and fifty handicapped and/or elderly citizens from throughout the Metropolitan Washington, D.C., area were interviewed to determine their travel experiences. The survey findings, together with findings from an extensive search of research literature and demonstration programs concerning the travel problems of the elderly and handicapped, provided information about their travel needs and experiences and served as a basis for developing performance standards and guidelines applicable to the design of transit systems that are accessible to the handicapped and elderly. Two computer programs were developed that could be used as design decision tools in transit planning. Portions of this document are not fully legible.

34 057841 TRANSPORTATION OF THE ELDERLY (TOTE)-A PILOT PROJECT TO DEVELOP MOBILITY FOR THE ELDERLY AND THE HANDICAPPED. The Transportation of the Elderly (TOTE) demonstration project in St. Petersburg, FL, was initiated for the purpose of improving and increasing the mobility of the elderly and handicapped. This demonstration is being conducted in a ten square-mile area which houses a target group of 30,000 persons. Reservation, subscription, demand response and rent-a-bus are four door-to-door services being utilized to provide the elderly (60 and over) and the handicapped (no age limitation) with increased mobility. At the conclusion of the project it is anticipated that TOTE will be integrated with the municipal transit system.

34 072242 TRANSPORTATION RESEARCH DELEGATION NEWS NUMBER ONE. The bulk of the pamphlet is a summary of three completed research projects. The first was an attempt to develop and test a theory of drivers' route choice in urban areas. From 1500 interviews, drivers' preferences and estimated travel times were ascertained. From these results, and certain other requirements, the model was constructed. It was found that, while travel time is the most important consideration, the number of stops and turns, road width, etc., are also important. The second was an attempt to develop and test methods for traffic actuated control of isolated signal intersections. The project was carried out in five stages- criteria for signal control, literature inventory of control strategies, development of strategies, simulation, and field tests. It was found that vehicle actuated signal timing can be studied within the same theoretical framework as fixed-time signal timing. Together with equipment for selective bus detection, vehicle-actuated controllers can reduce average bus delay by 20 percent. Traffic-actuated control with optimization logic for minimization of operating costs can reduce average bus delay by 40 percent and average vehicle delay by 25 percent. The third was a study of safety in public transportation for persons in wheel-chairs or who have difficulty walking. Most Swedish municipalities have special vehicles for such persons. The study shows that the present system of seat belts is unsafe, and makes suggestions for new systems. Desirable dimensions are given for ramps and hoists to help the passengers enter and leave the vehicle. The rest of the pamphlet consists of a short article on the applications to the transportation research delegation for research money in addition to announcements of a paper on traffic control in 14 Swedish population centers, the appointment of a committee for a project on movable platforms. A project to study taxis, and a trip by the transportation research delegation to Oslo. [Swedish]

34 081303 THE HANDICAPPED AND ELDERLY MARKET FOR URBAN MASS TRANSIT-EXECUTIVE SUMMARY. The purpose of this study is to determine the urban mass transit needs of the elderly and handicapped in order that the Department might better meet their needs. The entire study is divided into three reports: The Executive Summary (this report), a Technical Report which details the study findings, methodology, references, data, etc., and a Census Data section which consists of supportive statistics. This report describes the status, existing services and transit needs and demands of the elderly and handicapped. Alternative solutions discussed include the upgrading of existing or planned systems, Dial-A-Ride, transit stamps, coupon taxi and ubiquitous fixed route service. Various impacts are analyzed and recommendations are made concerning further studies and reports and approaches for local planners are outlined.

Transportation Systems Center, (MA-06-0034) Sumry Rpt. UMTA-MA-06-0034-73-1, July 1973, 32 pp; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche

34 083971 PUBLIC TRANSPORTATION AND TRANSPORTATION NEEDS OF THE ELDERLY AND HANDICAPPED. Section 16(a) of the Urban Mass Transportation Act of 1964, as amended, declares as national policy that urban public transportation shall be available to the elderly and handicapped and that this shall be transportation that they can effectively use. This paper reports on a series of interviews concerning the most efficient and economical means of ensuring the availability of transportation that meets that requirement. The paper discusses the characteristics of these citizens, defines the dimensions of the problem, and focuses on the major measures already in existence or proposed for facilitating their use of urban transit. Measures include modification of the types of vehicles currently in service, use of taxis, development of new vehicles in the TRANSBUS and Small Bus Programs, and demand-responsive service. In the opinions of those interviewed, the most efficient and economical means of providing transportation that the elderly and handicapped can effectively use is to centralize, and support by public subsidy, transportation in the principal urban transit systems: TRANSBUS and small bus for the ambulatory and semiambulatory and demand-responsive vehicles with attendants who would assist invalids and nonambulatory through the doors of their homes and through the doors of their destinations. Interviewers agreed that, regardless of the solution, a sustained program of education is essential to convince and remind the public and the typical rider that the needs of the elderly and handicapped deserve special attention.

Schnell, JB (American Public Transit Association) *Transportation Research Record* No. 516, 1974, pp 1-10, 1 Ref.; ORDER FROM: TRB Publications Off, Orig. PC

34 083974 TRANSPORTATION NEEDS AND DESIRES OF THE ELDERLY RESIDING IN A MEDIUM-SIZED CITY. Large numbers of elderly live in medium-and small-sized cities where the sole form of public transportation is the bus, which is infrequently used and has limited route coverage. This paper reports a study of the transportation needs of those citizens and their reasons for using the modes that they do. Basic data were collected by sampling the elderly in a city of 125,000 population. In a special phase of the study to determine why they used transit, 2 conclusions were reached: Cost plays a minor role in the decision to use or not use the bus, and physical problems significantly limit ridership. Based on the findings, several recommendations are made for improving the mobility of the elderly.

Weaver, VC (Barton-Aschman Associates, Incorporated) Herrin, M (Illinois University, Urbana) *Transportation Research Record* No. 516, 1974, pp 28-34, 6 Tab., 11 Ref.; ORDER FROM: TRB Publications Off, Orig. PC

34 090178 TRANSPORTATION NEEDS OF THE AGED AND HANDICAPPED: A BACKGROUND/RESOURCE PAPER FOR THE UPPER GREAT LAKES UNIVERSITY CONSORTIUM FOR TRANSPORTATION RESEARCH. Two approaches are noted in classifying persons as aged or handicapped, a legal definition, easy for the aged, or a consideration of proficiency in performance of certain

actions. The size of the handicapped population is described, and physical, emotional, and economic travel barriers are discussed. Legislation and programs at local, state and national levels are described. The 1970, 1971 White House Conference on Aging is discussed, with special emphasis on mobility problems. Several current projects in the Upper Great Lakes Region and other regions of the U.S. are described. Several suggestions are made for research to better define and alleviate the transportation problems of the aged and handicapped population.

VanAble, DP Nordley, PM Nelms, JDJ Vicory, AC ; Department of Transportation Final Rpt. Sept. 1973, 142 pp; Prepared in cooperation with Upper Great Lakes Univ. 34 090341 BART AND THE HANDICAPPED.

A ten-year review of BART with regard to special facilities for the handicapped shows a gradual awareness of needs as citizen pressure has mounted. Special facilities for the visually and audibly disabled are not yet provided, and many elevators are awkwardly located for the physically handicapped. A study team in 1974 found many minor elevator operational problems, with an additional barrier for wheelchair users as the lack of level access to and egress from buses that transfer with BART. It is observed that new responsibility is now being taken to provide transportation for the handicapped and that BART has set a planning precedent.

Levine, R ; Metropolitan Transportation Commission, Department of Transportation, Department of Housing and Urban Development, California University, Berkeley MTC-WP-17-1-75, Nov. 1974, 67 pp; Contract DOT-OS-38176; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-239211/6ST

34 091650 STUDENT WHEELCHAIR TRANSPORTATION, LOADING AND SECUREMENT.

California has no standard specifications or regulations which specifically address the construction and outfitting of special school buses required to transport wheelchair confined students. The standard requirements for regular school buses are not suited for buses carrying wheelchairs. Therefore, whenever a new wheelchair bus is proposed, an exemption from the regular school bus requirements is issued by the Department of Education (DOE) for its adaptation. This practice has led to inconsistency in approved systems. A state-of-the-art study was made to assist DOE in developing specifications for their 'wheelchair' school buses. Twenty-one entities, including school districts, transportation contractors and suppliers, were visited, and a documentation was made of the systems found. An engineering judgment type evaluation was made of the equipment. This report also discusses several questions raised during the study relative to the behavior of the student's wheelchair and its associated hardware during a vehicular accident.

Stewart, CF Reinl, HG ; California Department of Transportation Final Rpt. DMT-001, Aug. 1974, 85 pp; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-241350/8ST

34 092212 LIFESTYLES AND TRANSPORTATION NEEDS AMONG THE ELDERLY OF LOS ANGELES COUNTY. The report examined the trip-making behavior of persons over 65 years of age residing in Los Angeles County, California. The two types of elderly lifestyles that were studied were those living in the inner-city and those located around the urban fringe. Four areas within the county were selected that reflect these two living patterns. A comparative analysis of trip patterns and socio-economic data was completed. In addition to investigating travel patterns, a survey of taxicab use on weekends and weekdays was undertaken. The elderly represent a substantial proportion of taxicab patrons. Their use of taxis is further indicative of the changes which occur in mobility patterns upon reaching retirement. This mode of transportation is presently the only type of demand-responsive service available to the senior population in some parts of the county. Tables present data collected in the study.

Gillan, J Wachs, M ; California University, Los Angeles, Urban Mass Transportation Administration, California Department of Transportation, Yellow Cab Company, (UMTA-CAL-URT-7(7)T-3) UMTA-CA-11-0009-75-1, Feb. 1975, 28p; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-243631/9ST

34 092213 DESIGN FOR THE HANDICAPPED IN ELEVATED TRANSPORTATION SYSTEMS.

The report is concerned with the mobility of the physically disabled within urban areas. It identifies architectural barriers faced by the handicapped in relation to rapid transit, establishes design standards, and shows ways these standards may be incorporated in prototypical and existing stations. An evaluation of the Howard Street line of the Chicago Transit Authority (CTA) is presented. Design standards are established to aid designers in making elevated transportation systems accessible to the handicapped. Various architectural elements, including doors, entry and exit controls, stairs and elevators are diagrammed and discussed. The design standards established are for minimal tolerances and may be exceeded wherever it is felt necessary. The two basic types of platforms presently being used in rapid transit systems, the mid platform and the split platform, are analyzed with particular interest to providing access to the handicapped. Representative station types presently used are explained by diagrams and text.

Gelick, MS Silver, ML ; Illinois University, Chicago, Urban Mass Transportation Administration Res. Rpt. RR-11, UMTA-IL-11-0024-75-1, Jan. 1975, 68 pp; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-243650/9ST

34 092329 TRANSPORTATION FOR SENIORS AND HANDICAPPED PERSONS IN ROCKLAND COUNTY.

The objective of the report is to develop a precise description of the transportation problems of the handicapped and elderly in Rockland County, N.Y., and to formulate an operational solution to these problems. The essence of the statement of work scope is that a joint Federal-local, multi-agency approach should be used to develop the transportation facilities deemed necessary as a result of this

planning study. Key elements to the work statement are data gathering and analysis, system design sketch, support plan and implementation plan. Some of the major problems facing the elderly and handicapped are delineated. A system design plan incorporating some of the following elements has been developed: establishment of a County office responsible for all transportation activities; development of a 'Council of Agencies' to coordinate agency needs, including transportation; appointment of a Policy Advisory Committee drawn from the agencies, government, target group and employers; 'Purchase of Service' agreements between agencies and the centralized transit operation to provide target group activities; and recommendation of Federal funding for three major purposes.

34 092398 A DIRECTORY OF VEHICLES AND RELATED SYSTEM COMPONENTS FOR THE ELDERLY AND HANDICAPPED.

The purpose of this report is to determine which manufacturers offer products for over-the-road transportation of elderly and handicapped persons. The report is basically a catalog of small, medium and large transit bus, school bus, and other vehicle manufacturers offering special features to accommodate the elderly and handicapped. It also includes companies which modify vehicles by adding lifts, ramps, wheelchair securement devices and retractable steps for vehicles. Information contained in this report is intended to be a guide for the selection of equipment for purchase. Data were generated by compiling a list of potential manufacturers from registers and mass transit operators. Then, all companies identified were requested, in writing, to send pertinent catalog information. It is recommended that this catalog be updated every three months.

34 092722 TRANSPORTATION FOR OLDER AMERICANS. A STATE OF THE ART REPORT.

The study examines the transportation demands of the elderly, present delivery systems, taxi and bus modes, the elderly as drivers and pedestrians, and the scope of the market for elderly transportation needs. The study also examines sources of project funding for transportation (present and future potentials), special problems and constraints in developing transport projects for older Americans (public, special and private transport systems), and future needs for research and programs. The study also contains a set of detailed systems serving the elderly, a bibliography, and other special annexes on driver licensing, reduced fares, school bus laws, and others.

Revis, JS ; Institute of Public Administration, Administration on Aging Final Rpt. IPA/AoA-1, Apr. 1975, 727p; Grant HEW-93-P-57405/1-01; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-243441/3ST

34 094016 A STUDY ON MAKING TRANSPORTATION FACILITIES ACCESSIBLE TO THE HANDICAPPED AND ELDERLY. The study presents a classification scheme for vertical circulation devices, a classification scheme for fixed facilities, a station questionnaire for recording barriers and a transit user scenario which considers psychological as well as physical barriers. Vertical circulation devices currently used in transportation facilities, their assets and shortcomings are detailed. New concepts of vertical circulation are grouped into ramp, stair, escalator and elevator devices. The concepts are designed to stimulate creative design approaches to the problem. Conclusions center around the applicability of existing circulation devices, the aspect of human engineering, problems related to various devices, and improvements concerning escalators and elevators.

34 094034 THE USE OF EXISTING FACILITIES FOR TRANSPORTING DISADVANTAGED RESIDENTS OF RURAL AREAS. VOLUME ONE. GUIDE FOR TRANSPORTATION PROVIDERS. This Guide constitutes the first volume of a two-part study. It emphasizes solutions to the transportation problems of the elderly, the handicapped, and the poor people in rural areas. More general treatment has been given to the problems of other transportation disadvantaged groups such as the young and persons in autoless and one-car families. Programs were investigated that were determined to be sufficiently flexible to promote increased use of privately owned automobiles, taxis, vans, or buses by the rural disadvantaged groups.

Hauser, EW Rooks, EH Johnston, SA MacGillivray, L ; Research Triangle Institute, Federal Highway Administration RTI-26U-956-Vol-1, FHWA/SES-75/06-1, Jan. 1975, 151 pp; See also Volume 2, PB-248 747.; Contract DOT-FH-11-8261; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-248746/0ST

34 094035 THE USE OF EXISTING FACILITIES FOR TRANSPORTING DISADVANTAGED RESIDENTS OF RURAL AREAS. VOLUME TWO. Volume 2 continues the survey of a variety of programs for improving the mobility of the transportation disadvantaged using only locally available resources--public or private vehicles. The vehicles range from small buses to 7-14 passenger vans to private cars. The programs include volunteer drivers in their own cars, leased personal vehicles, subscription service, transportation service by social service agencies, regular fixed-route/fixed-schedule service, and others. The report is a manual for laymen, based on the authors' suggested planning methodology as demonstrated in a Southeastern rural area. Ten alternative transportation programs were examined for their potential utility. The Delphi technique translated non-quantifiable goals into quantified data.

34 094123 LINCOLN EXPERIMENTAL TRANSPORTATION DEMONSTRATION PROJECT. The project involves the provision of a specialized transportation service, known as the HANDIBUS, for handicapped and elderly citizens who encounter barriers to existing mass transportation services. The service includes door-to-door transportation at the same fare as the regular city bus service. Special tickets are purchased by qualified applicants. The specialized service is operated by Lincoln Transportation Service, a city-owned mass transportation system which operates the regular city bus lines. This evaluation specifically addresses five primary objectives of the HANDIBUS service: (1) To achieve a high level of penetration of the target population; (2) to eliminate, to the degree possible, existing barriers to mass transportation among the target population; (3) to substantially increase mobility among the target group; (4) to increase community social and economic integration with the target population; and (5) to provide efficient equipment and operating methods for providing the intended service.

Lincoln-Lancaster Commission on Aging, Urban Mass Transportation Administration, Applied Planning and Management and Associates, (UMTA-NE-06-0002) Final Rpt. 34 094128 CITY OF CLEVELAND NEIGHBORHOOD ELDERLY TRANSPORTATION (N.E.T.) PROJECT. DIAL-A-BUS. The project establishes for people 60 years of age and older what is variously called 'demand responsive,' 'dial-a-bus,' and 'dial-a-ride' door-to-door local transportation service with vehicles specifically adapted to the needs of older persons. The demonstration project, sponsored by the city of Cleveland, Ohio, services three neighborhoods (Buckeye, Model Cities, and Tremont) selected, among other reasons, on the basis of large concentrations of elderly citizens. Seventeen thousand (17,000) persons 60 years and older reside within these three areas which encompass approximately ten square miles. Revenue service began in mid-March, 1975, and by the end of May, 1975, over 21,000 Dial-A-Bus passengers were carried. The report documents the implementation efforts and actual operational experience.

34 094132 TRANSPORTATION FOR THE ELDERLY AND HANDICAPPED. A PROTOTYPE CASE STUDY OF NEW YORK STATE EXPERIENCE IN ACTIVATING AN ELEMENT OF A FEDERAL GRANT PROGRAM. The Urban Mass Transportation Act of 1964, provided grants and loans to states and local public bodies and agencies to assist them in providing mass transportation systems to meet the special needs of the elderly and handicapped. This act was further amended in 1973, and the assistance was extended to private nonprofit corporations and associations. The report looks at this program and its administration in New York State. The development of this program was traced from the rules and regulations provided by the Urban Mass Transportation Administration, to examine the proposals of the private nonprofit organizations, and to determine both the problems involved in the administration of the program and the ways in which these proposals would meet the transportation needs of the elderly and handicapped.

34 094179 PLANNING HANDBOOK: TRANSPORTATION. A Handbook on planning and implementing transportation projects for serving the elderly is presented. The Handbook contains sections on getting organized, developing a data base, designing the service, selecting the right equipment, running the project, putting a budget together, monitoring and evaluation, paying for the project and problems related to franchise conflicts, insurance costs and labor problems. The Handbook also contains a separate flow chart showing all the steps described in the Handbook and permits easy planning of all stages. The Handbook also contains four Annexes which include sample survey forms, a route information and development chart, a list of vehicle and other equipment suppliers, and sample layouts for developing an operating expense analysis.

34 094420 LIFE STYLES AND TRANSPORTATION NEEDS OF THE ELDERLY IN THE FUTURE. Several common views of the transportation requirements of elderly Americans are reviewed, and conclusions are reached regarding the elderly population of the next two decades.

Wachs, M Blanchard, RD ; California University, Los Angeles, Urban Mass Transportation Administration, (UMTA-CA-11-0009) UMTA-CA-11-0009-75-3, July 1975, 20 pp; See also report dated February 75, PB-243631.; ACKNOWLEDGMENT: NTIS, TRRL (IRRD 219293); ORDER FROM: NTIS; PB-249523/2ST

34 094641 TRANSPORTATION FOR SENIORS AND HANDICAPPED PERSONS IN ST. LOUIS, VOLUME II. APPENDICES. The primary purpose of the St. Louis Transportation Study was to identify the unmet public transit needs of the elderly and handicapped and plan a demonstration project to respond to these needs. Several specific innovations were being considered at the time, including a reduced fare plan for senior citizens and the handicapped during off-peak hours and a subsidiary, demand-actuated transit service for the physically disabled.

Crain and Associates, Urban Mass Transportation Administration, (UMTA-IT-09-002A) UMTA-IT-09-0028-74-2, Jan. 1974, 145 pp; Paper copy also available in set of 2 reports as PB-250 789-SET, PC\$10.00.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-250790/3ST

34 094642 TRANSPORTATION FOR SENIORS AND HANDICAPPED PERSONS IN ST. LOUIS, VOLUME I. MAIN REPORT. The report describes in 2 volumes the transportation problems of the handicapped and older persons of St. Louis, Missouri. The features of the proposed plan are: (1) contracts between the Bi-State Development Agency and health-welfare agencies for purchased transit services; (2) reductions in fares for all persons over 65, and further reductions, through a specific agency contract, for seniors and handicapped who are poor; (3) a special demand actuated subsidiary of the Bi-State system providing door-to-door service for handicapped persons and for the elderly who do not live near the present bus routes; and (4) an accountability system that assures payment for all trips under the various agency contracts. The major breakthrough of the proposed demonstration would be the entry of the transit operator into a new social service role, providing transportation on a purchased services basis in support of health-welfare programs. Simultaneously, the operator would be initiating a new form of public transportation—small bus, demand actuated, door-to-door service.

Crain and Associates, Urban Mass Transportation Administration, (UMTA-IT-09-002A) UMTA-IT-09-0028-74-1, Jan. 1974, 80 pp; Paper copy also available in set of 2 reports as PB-250 789-SET, PC\$10.00.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-250791/1ST

34 095291 TRANSPORTATION FOR THE POOR, THE ELDERLY, AND THE DISADVANTAGED. This publication contains five papers that examine various aspects of transportation needs of the poor, disadvantaged and elderly, and the use of public transportation in meeting these needs. Schnell reports on interviews about the most efficient and economical means of insuring the availability of public transportation. Paaswell and Recker identify who and where those without cars are and what transportation alternatives exist for them. Kidder examines the ways social service agencies in a small city cope with the transportation of immobile clients. Weaver and Herrin studied the needs of elderly citizens in medium-sized cities. Dajani and Egan report on income-distribution effects of the proposed Atlanta transit system.

Transportation Research Record #516, 1974, 47 pp, Figs., Tabs., Refs. Included are Five reports prepared for the 53rd Annual Meeting of the Highway Research Board.;

ORDER FROM: TRB Publications Off, Orig. PC

34 097125 MOBILITY FOR THE ELDERLY AND HANDICAPPED: A CASE FOR CHOICES. Human resources agencies which serve the elderly, the urban and rural poor, and the handicapped at the federal, state and local level, know very little about planning, designing, managing, equipping and maintaining transit systems. On the other hand, until recently, it has never been necessary for transit providers to know a great deal about the specialized needs of the elderly and handicapped. A November 1974 study of transportation authorities in the programs administered by HEW, DOL, OEO and the Department of Transportation revealed that no less than 30 programs are authorized by law or regulation to provide transportation funds or services to eligible program clients. What is desperately needed now is a policy that mandates coordination. Unless the human resources agencies and the transportation industry can eliminate fragmentation and duplication of efforts, learn from one another the best way to serve everyone, and make every dollar a dollar well spent, both will be bankrupt and disillusioned.

Brooks, S *Transit Journal* Vol. 1 No. 2, May 1975, pp 45-50

34 098047 DESIGNING FOR THE DISADVANTAGED: OPTIMUM DESIGN CONSIDERS ALL USERS. Designers are becoming more aware of the growing numbers of people prevented from making full use of buildings and transportation systems because of barriers imposed by inadequate design. This disadvantaged category is larger than generally realized, including not only those with obvious physical disability—the wheelchair-restricted or the blind—but the elderly and those temporarily encumbered with packages, suitcases or heavy clothing. Attention to some simple design elements described here can increase the ultimate use of a structure or system.

Fruin, JJ (Port Authority of New York and New Jersey) *ASCE Civil Engineering* Vol. 45 No. 3, Mar. 1975, pp 65-69; ACKNOWLEDGMENT: ASCE Civil Engineering; ORDER FROM: ESL, Repr. PC, Microfilm

34 098656 TRANSPORTATION FOR THE HANDICAPPED. This annotated bibliography is an update of the one published in November 1969 by the Department of Transportation Library. It contains references to papers, journal articles, and reports on the subject of transportation for the handicapped. Topics include: General, Government Activities, Accessibility, Air Travel, Mass Transit, Automobiles, Special Equipment, Transportation and the Blind, and Transportation and the Elderly.

34 099135 TRANSPORTATION PROBLEMS OF THE MENTALLY RETARDED. Inadequate travel training and institutional isolation affects retarded individuals' awareness of job, shopping and recreational opportunities. This study identifies the mobility problems experienced by the educable retarded; develops a basic curriculum guide for the teaching of their travel

and transportation awareness; and suggests changes in public and private transit usage that would alleviate some of the difficulties. Specifically, residents of the Austin State School Annex Campus, Austin, Texas were surveyed as to their everyday utilization of predominantly intra-city public and private transportation.

Davies, S Carley, JW ; Texas University, Austin Res. Rept. No. 17, Dec. 1974, 60 pp

34 126167 TRANSPORTATION FOR THE ELDERLY AND THE HANDICAPPED. SPEAKER 1. As a result of deputations and requests for transportation from several handicapped groups, surveys were conducted in 6 Ontario cities. Interviews and mail surveys were carried out (to determine the economic and travel characteristics of the handicapped) and basic transportation options were identified. Work at the provincial level and the independent work of 2 large operators point to the conclusion that initially, the most effective way of providing transportation for the severely physically handicapped in urban areas is to provide a specially equipped demand-responsive transportation service. As the demand for this type of service grows, partial integration of services may be required. The three basic transportation improvement options identified in the studies were: improve existing services, pay direct subsidy to handicapped individuals; and provide new special services for the handicapped. The Toronto Transit Commission has initiated a pilot project for the physically handicapped in which door-to-door transportation is provided for 50 people on their work trips. The project is estimated to require an operating subsidy of \$14,000 per year at a regular 25-cent fare. In Ottawa a handicapped persons' transportation service will be contracted out to a private operator and will provide service for work and medical trips. The daily demand is estimated at between 300 and 400 trips and the anticipated cost is expected to be \$400,000 a year.

Garner, DP (Ontario Ministry of Transportation & Communc, Can) *Transportation Research Board Special Reports Conf Paper* No. 154, 1975, pp 61-65, 4 tab., 3 Ref.; Presented at the Fifth Annual International Conference on Demand-Responsive Transportation Systems conducted by the TRB, Nov. 11-13, 1974, Oakland, Calif.; and co-sponsored by American Public Transit Association, California DOT, Alameda-Contra Costa Transit, MIT, UMTA and Technology Sharing Program of U.S. DOT.; ORDER FROM: TRB Publications Off, Orig. PC

34 126847 AN EVALUATION OF COUNCILS ON AGING DIAL-A-RIDE SYSTEMS IN MASSACHUSETTS. Councils On Aging in some Massachusetts communities have set up dial-a-ride systems for the elderly and the handicapped. The purpose of this research was to evaluate how well these demand responsive systems work. Several different communities were compared. The evaluation included a study of each system's productivity, measured by passenger trips per vehicle hour, its cost per vehicle hour and the quality of service. It was found that the dial-a-ride's productivity is not as high as that for public transit but the costs involved are much lower. The latter was due largely to the reliance on volunteer workers.

Teixeira, DB Karash, KH *Transportation (Netherlands)* Vol. 4 No. 2, June 1975, pp 150-121, 1 Fig., 4 Tab.

34 127942 TRANSPORTATION OF ELDERLY TO RURAL SOCIAL SERVICES. In an effort to organize a systematic approach to the development of guidelines for public agencies estimating the need for, and use of, special transit systems, and to enable them to design cost-effective systems in terms of vehicle size and number, routing, scheduling and general operating procedures, this report summarizes the current status of the rural transportation problem for the elderly and discusses a methodology for designing and implementing a rural transportation system. Detailed information from surveys in Southwestern Virginia and other sources were used and a variety of travel variables were interrelated to develop an approximate image of travel activity of the rural elderly, showing effects of residential density, income and living situation on frequency and mode of travel. The nature of social services and currently available travel services are detailed. Although less than 3 percent of all elderly use special services, at least 10 percent would prefer such services. Questions concerning the findings substantiate the need for a broad systems perspective. A broad formulation for studying the effects of attractiveness of transportation services is proposed. Analysis of alternative operating configurations for typical rural transportation systems revealed that significant operational cost savings could be realized by coordinating the provision of rides to a variety of social services. It was concluded that a systematic and comprehensive definition of rural transportation problems is essential to the development of a successful rural transportation program; it cannot be assumed that simple rules and approximations to transportation system design are applicable to all possible rural service delivery scenarios; and demand estimates may be generated through existing, but approximate methods. Data from existing systems must be monitored, collected and utilized in planning future systems.

Notess, C Eakes, E Popper, RJ Zapata, R Pillelkau, E Rajala, D Vemur, SR Chavis, L Davis, P ; Virginia Polytechnic Institute & State University Aug. 1975, 213 pp, Figs., Tabs., Refs., 4 App.; Prepared for the Office of Human Development, Administration of Aging, Dept. of Health, Education and Welfare.

34 128946 TRANSPORTATION FOR THE ELDERLY: THE STATE OF THE ART. This extensive literature review and project identification effort undertaken to provide material for a policy-relevant analysis of existing and past efforts to improve the level and scope of transportation service for the elderly, includes an overview of public transit reduced fare programs, taxi use, special transportation systems, the use of school buses and the potential use of Defense Vehicles. The transportation problems confronting the elderly are considered from two perspectives: those factors that limit mobility of the consumer, and those limitations associated with the supplier. This report which suggests possible solutions to some issues, will be sued as a basis for recommendations relative to: action at Federal, State and Community level; research and demonstration projects; and legislation.

34 129626 PLANNING HANDBOOK: TRANSPORTATION SERVICES FOR THE ELDERLY. This Handbook provides guidance and assistance in the designing and running of a special transportation service for the elderly. Transportation planning methods and techniques (plus background information of value) to be applied in developing special transportation service are presented in the following nine sections: Getting started; Building a Sound Data Base; Designing the Service; Selecting the Right Equipment; Running the Project; Putting the Budget Together; Monitoring and Evaluation; Paying for the Project; and Problems to Watch For. Several key points are identified which should be kept clearly in mind throughout the project planning phase. These are: (1) Some service is better than non; (2) Resources (human, funding and equipment) should not be overextended; (3) More small vehicles are generally better than fewer large vehicles; (4) It is better to have a standardized vehicle from the point of view of maintenance and service requirements; and (5) The service is far more important than the vehicle, since reliable service to appropriate destinations for their needs is what the elderly repeatedly express as the overriding factor in their transportation demands.

Institute of Public Administration Nov. 1975, 269 pp, 4 App.; Sponsored by the Administration on Aging and Department of Health, Education and Welfare.; Grant 93-P-57405;1-01

34 132997 DIRECTORY OF SPECIAL TRANSPORTATION SERVICES IN THE METROPOLITAN WASHINGTON AREA. This directory has been prepared to help the elderly, handicapped and others with special needs to find the agency best able to provide the transportation services they require. It presents an overview of services available throughout the Washington metropolitan area and serves as an information source for agencies or researchers engaged in various forms of transportation planning, particularly transportation planning for the elderly and handicapped and others without access to automobiles. Tax-supported agencies, voluntary organizations, health service providers, non-profit and profit making agencies have been included. Distinctions have been made between organizations with volunteers and those with paid drivers. Inclusion of an agency does not imply endorsement; omission does not imply disapproval. The information contained in this directory is current as of June 1, 1975. It will be periodically updated as time and resources allow. Additions and/or corrections are welcomed. For each organization, the following information is provided: contact person; telephone number; eligibility requirements; geographic area served (description of routes and schedules); operating hours; trip purposes; fare; service type; number of vehicles; types of vehicles; capacity of vehicles; number of persons served; percentage characteristics; length of time providing service; and, whether it is a profit or non-profit organization. /UMTA/

Robinson, M Aronoff, R ; Metropolitan Washington Council of Governments, Urban Mass Transportation Administration, (IT-09-0033) UMTA-IT-09-003-75-1, June 1975, 67 pp; Contract IT-09-0033; ACKNOWLEDGMENT: UMTA, NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-250689

34 133194 MOBILITY OF PEOPLE AND GOODS IN THE URBAN ENVIRONMENT. MOBILITY OF THE HANDICAPPED AND ELDERLY. This report identifies and discusses the travel behavior of the orthopedically handicapped and the elderly in an urban environment. Mobility indices have been developed for various types of handicaps, car ownership and income levels. The usage of common transportation modes has been analyzed in conjunction with type of handicap and purpose of trip. The interrelationship between mobility, mode usage and psychological condition have been measured and analyzed. Barriers to travel as perceived by the handicapped have been identified and analyzed for each travel mode. Preferences for improvement to available travel modes have been documented and related to trip purpose and current mode usage.

Falcochio, J Kaufman, H Kramer, P Lee, B McShane, W ; Polytechnic Institute of New York, Department of Transportation Final Rpt. TR-74-503, DOT/TST-75/114, Jan. 1975, 220 pp; Contract DOT-OS-30095; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-251293/7ST

34 133438 HANDICAPPED AND ELDERLY VERTICAL MOVEMENT ASSESSMENT STUDY. The report discusses the selection and assessment of seven (7) types of vertical movement devices for potential use in older types of fixed rail urban mass transit facilities. The potential utilization of these devices is directed towards an increased usage of transit facilities by physically handicapped and elderly persons. The study concentrates on the technical and cost considerations in the implementation and utilization of various standard (e.g., elevators, escalators, moving walks) and non-standard (e.g., inclined stairlifts, stair climbing wheel chairs) vertical movement devices in providing access and egress for elderly and handicapped persons to three (3) configurations of rapid-rail stations typically found in the older transit systems of the United States. The general conclusion reached in the study is that each station has its own unique character and unique access/egress problems which restrict or enhance the implementation of specific types of vertical movement devices. Hence, the determination of the device option which is technically most effective for a given station, must await the results of a detailed architectural study of the individual station under consideration.

34 134676 SERVING THE TRANSPORTATION DISADVANTAGED WITH DEMAND-RESPONSE TRANSPORTATION. The first section of this paper assesses the nature of the transportation problems of poor, elderly, and handicapped people. It is shown that demand-responsive transportation systems such as dial-a-ride are demonstrably superior to conventional transit in providing for the transportation needs of transportation-disadvantaged people.

The impact of various demonstration projects of demand-responsive transportation is reviewed. Emphasis is on the effect these projects had on serving elderly, poor, and handicapped people. The final section of the paper reports on the role of the federal government in providing demand-responsive transportation to facilitate more mobility among poor, elderly, and handicapped people.

Saltzman, A Amedee, G (North Carolina Agricultural and Technical State U) *Transportation Research Record* No. 559, 1976, pp 1-10, 3 Tab., 22 Ref.; ORDER FROM: TRB Publications Off, Orig. PC

34 135931 MOBILITY AND OLDER AMERICANS: AN ANALYSIS. Recorded viewpoints and demographic characteristics of senior citizens are analyzed and conclusions are presented which relate to mobile patterns attitudes, and causes of mobility problems. Comments are also made on federal transportation programming. Mobility ranked in the top 4 of all problems of older Americans. Income, physical dysfunctions, residential location, and society's insensitivity were some of the more important causes of the problem. The need is noted for an expanded viewpoint towards public transit, and the opinion is expressed that the legally mandated responsibility for meeting needs of the elderly lies with the legally established area transportation body, the local transit authority. A progressive viewpoint must be applied to systems design. Public transit services must include a door-to-door service component, and DOT and state agencies must be able to supply quality technical assistance to local programs to aid with establishment of door-to-door components.

Miklojcik, JL (Michigan Office of Services to the Aging) *Transit Journal* Vol. 2 No. 2, May 1976, pp 41-50, 1 Tab., 1 Phot.

34 135941 VALLEY TRANSIT DISTRICT: ELDERLY/HANDICAPPED TRANSPORTATION. EVALUATION AND IMPACT. A transit system is described which was designed to develop and demonstrate a flexible system which could provide integrated transportation services over a large area, test factory modifications to new buses which could aid the elderly and handicapped in getting on and off the bus and provide safe and comfortable transport, and test a new concept in automated fare collection. The program was also intended to evaluate the mobility impact on individuals and agencies by the transit system. The special needs of the handicapped were studied and endorsed as specifications for the transit vehicles. The transit system uses a credit card fare systems, a special feature of which is the FARESHARE option which allows third parties to share in the cost of the individuals transportation. Positive results were obtained from user surveys oriented toward attitudinal responses. [23 pp 8 Fig., 2 Tab.]

34 136922 CITY OF CLEVELAND NEIGHBORHOOD ELDERLY TRANSPORTATION PROJECT-DIAL-A-BUS. The Neighborhood Elderly Transportation Project establishes

door-to-door local transportation service with vehicles specifically adapted to the needs of older people. Seventeen thousand five hundred (17,500) persons 60 years of age and older reside within the three service areas of Cleveland's Buckeye, Model Cities, and Tremont areas, which total about ten square miles. Revenue service began in mid-March 1975 and by the end of December, 1975, over 100,000 Dial-A-Bus passengers had been carried. This report documents the implementation efforts and actual operational experience during the first 9 and one-half months of revenue service. As a by-product, the project aims to increase the utilization of existing social and health services and to encourage the creation of more of these for use by the elderly because suitable transportation services are available. A related report is 'City of Cleveland Neighborhood Elderly Transportation (N.E.T.) Project--Quarterly Report.' (PB-248 903).

Lake, G ; City of Cleveland, Urban Mass Transportation Administration, DAVE Systems, Incorporated, (UMTA-OH-06-0018) Intrm Rpt. UMTA-OH-06-0018-76-1, Jan. 1976, 125 pp; See also PB-248903.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-253237/2ST

34 137324 GUIDELINES AND CONSIDERATIONS IN PLANNING AND OPERATING TRANSPORTATION SYSTEMS FOR OLDER AMERICANS. The report identifies considerations in planning and operating: (1) Transportation systems for older Americans; and (2) public systems in rural areas. It identifies an approach to transportation planning and a number of elements related to the planning, implementation, and evaluation of that system. The report draws upon the experience with dial-a-ride and special rural transportation system in the Midwest and on literature concerning dial-a-ride and transportation for the elderly and handicapped. It is intended to provide a basic set of considerations, questions, knowledge and expectations about elderly and rural transportation systems.

McKelvey, DJ ; Iowa University, Urban Mass Transportation Administration, (UMTA-IA-11-0002) Working Paper-15, UMTA-IA-11-0002-75-1, Apr. 1976, 69 pp, Tabs.; Revision of report dated May 75.; Contract IA-11-0002; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS; PB-254756/0ST

34 137538 PUBLIC TRANSPORT ADJUSTED TO PERSONS WITH HANDICAPS [Handikappanpassad kollektivtrafik]. The aim of society is that the disabled should be fully integrated. The communications sector is an important field in this respect. This report is the result of a commission of enquiry into this problem. In Sweden, about 250,000 people have such limitations in their physical or mental capabilities that they are seriously disabled as regards communications. Of these, about 20,000 need special solutions for all journeys. Another 750,000 have difficulties in travelling due to some form of disablement. Buses, trains, etc are difficult to get on due to high and steep steps. Space on board is restricted. At stations, differences in level create serious difficulties. People with weak sight or hearing need better visual and audible information. Toilets and washing facilities must be better designed and more easily accessible. The

report suggests measures that can be taken at once as part of normal maintenance, such as fitting of handrails, alterations to sleepers, etc, and measures which can only be taken when new equipment is purchased, such as wider steps, provision for wheelchairs, etc. It is proposed that a special national travel service, by special cars or specially adapted public transport, be made available for the 20,000 most seriously disabled. /TRRL/ [Swedish]

Ministry of Communication, Sweden SOU 1975:68, 1975, 197 pp, Figs., 13 Tab., Photos., Refs.; ACKNOWLEDGMENT: National Swedish Road & Traffic Research Institute, TRRL (IRRD 218363)

34 138152 PUBLIC POLICY AND TRANSIT SERVICES FOR HANDICAPPED PERSONS. Because of increased awareness of the need for transportation for that segment of society whose mobility is limited, there have been increased efforts to establish the funding mechanisms, the management structures, and the operational equipment for such transportation service. However, these attempts, well intended as they are, sometimes have produced less than optimal results because of a lack of (a) knowledge of appropriate solutions to the problems involved, (b) cooperative effort among agencies in some areas, and (c) overall policy direction. This paper discusses efforts being made to overcome these deficiencies. To determine levels of activity in the transit industry, the American Public Transit Association (formerly the American Transit Association) surveyed its transit-operating members for details of all types of specialized services they are providing, not only the demand-responsive services that actually provide mobility but also educational programs teaching handicapped persons how to use transit, research into needs of handicapped persons on a local or statewide basis, and cooperative arrangements with other organizations to serve the needs of the handicapped. The information resulting from the study is viewed partly as a means to assist operators in establishing or expanding their specialized services by providing examples of successful efforts already under way. Perhaps more important, this information should be valuable as an input to the formulation of a comprehensive national policy to better define the appropriate programs for transit operators. Results of the survey are discussed. Also included are details of nontransit and paratransit activities in providing mobility and how the different forms of transportation have been successfully used in different areas. The relationship of these activities to the establishment of policy and regulations by various levels of government is viewed as a crucial factor.

Schnell, JB Braum, PH (American Public Transit Association) *Transportation Research Record* No. 563, 1976, pp 75-88, 11 Ref.; Report prepared for the 54th Annual Meeting of the Transportation Research Board.; ORDER FROM: TRB Publications Off

34 139036 SUPPLEMENT PUBLIC TRANSPORT FACILITIES-AN ALTERNATIVE TO THE TRAVEL SERVICE [KOMPLETERINGSTRAFIKEN-ETT ALTERNATIV TILL FAERDTJAENSTEN]. The travel service was introduced to supplement public transport facilities which cannot be used by the handicapped. Initially, the service was geared to the

needs of those in wheelchairs and special vehicles were provided, but now taxis are increasingly used, and only 15% of those entitled need special vehicles. The aim must be to adapt public service vehicles so that more and more handicapped people can use them. In many rural areas without a bus service, taxis operating on regular timetables are used as supplementary traffic. Trials were carried out to see whether those entitled to travel service facilities can use this supplementary traffic. It was found that by modifying minibuses so that these can accommodate wheelchairs, the two services can be combined to a large extent. To cut down walking distances, supplementary traffic should come as near as possible to customers' homes. In urban areas, the supplementary traffic must be modified so as to be at least partly demand actuated. /TRRL/ [Swedish]

34 141935 LOADING AND SECURING WHEEL CHAIRS IN TRANSPORTING STUDENTS. California has no standard specifications or regulations that specifically address the construction and outfitting of special school buses that transport students confined to wheelchairs. The standard requirements for regular school buses are not suited for buses that carry wheelchairs. Therefore, whenever a new wheelchair bus is proposed, the California Department of Education must issue an exemption from the regular school bus requirement. This practice has led to inconsistency in approved systems. A study was made to assist the department in developing specifications for its wheelchair school buses. In particular, outfitting components, such as loading and securing equipment, were addressed. The study involved visiting 21 organizations including school districts, transportation contractors, and suppliers; documenting systems; and evaluating equipment. This report presents not only findings and specification recommendations but also several questions raised during the study on the behavior of wheelchairs and associated hardware during a vehicular accident. Some of these questions can be answered only by dynamic testing of the equipment.

34 142383 FORECASTING NON-WORK PUBLIC TRANSIT DEMAND BY THE ELDERLY AND HANDICAPPED. This paper summarizes a recent survey of 165 randomly selected elderly and handicapped individuals in the Albany, New York, SMSA. Respondents were administered a short (six minute) questionnaire on non-work travel habits, perceived barriers to travel, and intended travel if barriers were removed. Four disaggregate models were constructed relating total travel and mode choice to system demographic, mode availability, and physical handicap factors. Results show: (1) Contrary to present thinking, the elderly and handicapped vary widely in mobility problems and travel patterns: there is no homogeneity

within each group; (2) Transportation solutions will thus have to be carefully designed and tailor-fit; (3) Travel mobility is primarily a function of physical disability, availability of auto, and the individual's ability to use it; (4) Specific bus service improvements will not materially affect transit demand, but will ease the travel burden; (5) Improvements concentrating on service availability and direct pickup appear to be the most promising; (6) Small-sample disaggregate models can be developed which will predict elderly and handicapped non-work travel and mode choice with a high degree of accuracy.

Hartgen, DT Pasko, M Howe, SM ; New York State Department of Transportation Aug. 1976, 44 pp, 1 Fig., 20 Tab., 11 Ref., 3 App.

34 145610 TRANSPORTATION PROBLEMS OF THE TRANSPORTATION HANDICAPPED. VOLUME 1. THE TRANSPORTATION HANDICAPPED POPULATION, DEFINITION AND COUNTS. Despite an abundance of planning and research literature concerning transportation services for elderly and handicapped individuals, at present no single operational definition of this target group, the transportation handicapped (TH), exists. This report provides a definition of a TH person and attempts to describe the TH population. A review of existing estimates of the urban TH population is presented based on an analysis of four studies. These estimates range from approximately six to nine million persons. A recommended estimation procedure considers three basic categories of the TH population: chronic conditions, acutely disabled, and institutionalized. The travel behavior of the TH population is examined including trip purpose, frequency, residence, choice of mode, and latent demand.

Crain and Associates, Urban Mass Transportation Administration, (UMTA-CA-06-0092) Final Rpt. UMTA-CA-06-0092-76-1, Aug. 1976, 105 pp; Also available in set of 4 reports as PB-258 578-SET, PC E99/MF E99; Contract DOT-UT-60063; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS; PB-258579/2ST

34 145611 TRANSPORTATION PROBLEMS OF THE TRANSPORTATION HANDICAPPED. VOLUME 2. THE ROLES OF GOVERNMENT AND THE PRIVATE SECTOR IN THE PROVISION OF MOBILITY SYSTEMS FOR THE TRANSPORTATION HANDICAPPED. This report examines the conflicting perspectives and attitudes of nine participants involved in improving mobility for the transportation handicapped (TH). These are the handicapped and their advocates, the transit industry which must reconcile the demands of the handicapped with economic realities, the Congress and Federal agencies, state and local governments, the public at large, private providers (taxi, paratransit services), and equipment manufacturers. Federal and state legislation and regulations are discussed. Finally, specific changes and actions needed are presented.

Crain and Associates, Urban Mass Transportation Administration, (UMTA-CA-06-0092) Final Rpt. UMTA-CA-06-0092-76-2, Aug. 1976, 89 pp; Also available in set of 4 reports as PB-258 578-SET, PC E99/MF E99; Contract DOT-UT-60063; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS; PB-258580/OST

34 145612 TRANSPORTATION PROBLEMS OF THE TRANSPORTATION HANDICAPPED. VOLUME 3. ALTERNATIVE PLANNING METHODOLOGIES. This report proposes a general structure for the planning process for dealing with the problems of the transportation handicapped (TH). Flexibility of procedures and the avoidance of unnecessary standardization are emphasized. Planning for the needs of the TH may be incorporated into conventional transit planning or emerge as an independent process. Effective participation by the transportation handicapped and those who serve them (transit and taxi operators, union representatives, local health and social service agencies) is discussed in detail. Use of census data, the National Health Survey, and general population surveys to assess the transportation needs is presented. Procedures for the assessment of current resources and existing constraints are reviewed. Time phasing, plan revision, and system monitoring are also discussed.

Crain and Associates, Urban Mass Transportation Administration, (UMTA-CA-06-0092) Final Rpt. UMTA-CA-06-0092-76-3, Aug. 1976, 54 pp; Also available in set of 4 reports as PB-258 578-SET, PC E99/MF E99; Contract DOT-UT-60063; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS; PB-258581/8ST

34 145613 TRANSPORTATION PROBLEMS OF THE TRANSPORTATION HANDICAPPED. VOLUME 4. TRANSPORTATION SOLUTIONS FOR THE HANDICAPPED. This report examines transportation solutions for the transportation handicapped (TH) through three broad strategies-public transit, alternative special services, and private transportation. The first section presents 51 physical and operational solutions for existing systems. To aid the TH it is necessary to construct groups of solutions. These are then presented as minimum, medium and maximum accessibility combinations for terminals, urban bus or trolley, rail rapid-transit, and intraurban bus, railroad and air modes. The use of a personal vehicle for the disabled who can learn to drive is described. Four problems of the disabled driver are presented along with data on adaptive controls. Six aspects of specialized transportation services and four principal vehicle types are examined. Twelve possible systems based on different combinations of service characteristics and provider type are described. Finally a description is given of two operating systems, one in Sweden, the other in Delaware.

34 147983 SOME PROBLEMS OF ELDERLY AND HANDICAPPED PEDESTRIANS. A PRELIMINARY REPORT OF OBSERVATIONS AND SURVEY. For nearly a year the pedestrian research laboratory at Georgia Institute of Technology has been examining the problems of elderly and handicapped pedestrians. The aim of the project was to identify the hazards and problems that confront elderly and handicapped pedestrians and then to develop and field test appropriate countermeasures. Phase one included a literature survey. Phase two is mainly occupied with data collection to identify the problems and hazards faced by the target subgroup. Phase three focuses on these hazards and problems to examine their nature and why they cause difficulties. Phase four will develop several countermeasures for each of the selected high priority problems. /TRRL/ [/FRENCH]

34 148650 TRANSPORTATION FOR THE ELDERLY AND THE HANDICAPPED IN WISCONSIN; SUMMARY REPORT. A summary of the findings and conclusions of a seven study report are as follows: A specialized transportation industry currently exists to serve the elderly and the handicapped in Wisconsin. These services are characterized by a varying quantity and quality of service daily; unstable funding; high transportation cost; heavy volume on categorical federal and state funds for transportation services; and, uncoordinated service programs which compete for funds, clients and geographical areas to continue their existence. The demand for accessible, low cost transportation by Wisconsin's elderly and handicapped citizens exceeds the existing supply. Inadequate funding to meet operating costs is the most difficult service provision problem. Many barriers exist which limit or prohibit the mobility of the elderly and the handicapped in Wisconsin. These barriers are classified as being economic, educational, institutional, physical, psychological and service oriented in nature. The costs of local and state policy addressing the mobility needs of the elderly and handicapped is a major hindrance to improving their mobility. Lately, additional data must be obtained to assist the State of Wisconsin to address the mobility needs of its elderly and handicapped citizens.

Wisconsin Department of Transportation Summ. Rpt. Nov. 1976, 17 pp; The preparation of this report was financially aided through a planning grant from the Department of Transportation under the Urban Mass Transportation Administration as authorized by Section 9 of the Urban Mass Transportation Act of 1964.; ACKNOWLEDGMENT: NTIS;

34 150549 TRANSPORTATION FOR OLDER AMERICANS-1976. PROGRESS, PROSPECTS AND POTENTIALS. The report summarizes experiences in the period since 1974 with the provision of services for the elderly and handicapped. The report is based on information and data provided by state agencies on aging and witnesses interviewed throughout the country. Major emphasis is placed on funding, coordination and project operations. The report develops estimates of the number of projects and level of funding of transportation services for the elderly under major federal programs, and identifies coordination barriers as spelled out by the witnesses interviewed and by cooperating state agencies on aging.

34 150952 TRANSPORTATION AND THE DISABLED: AN OVERVIEW OF PROBLEMS AND PROSPECTS. The report is an overview of the transportation problems of the disabled, and identifies both problems and possible solutions. Recent efforts are summarized within the framework of the concepts of accessibility and mobility, the scope and nature of the population affected, major policy issues and options are discussed, and some future needs and directions are identified. The report contains a bibliography on the subject area. The report explores the number, age, income, locational (urban-rural and geographic) characteristics, and travel patterns of the disabled. It explores their design problems with various modes of transportation and explores the potentials and costs for retrofitting public transportation facilities and systems. Presently available services are identified along with major sources of funding, and the report then spells out some future directions in terms of design changes, demonstration projects, hardware research, and basic research. Potential training of the disabled in the use of transportation systems are also explored.

Revis, JS Revis, BD ; Revis (Joseph S.), Department of Health, Education and Welfare Final Rpt. JSR-1, Oct. 1976, 120 pp; Sponsored in part by Office of the Assistant Secretary for Planning and Evaluation (HEW), Washington, D.C.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-260369/4ST

34 151174 DETERMINING THE FUTURE MOBILITY NEEDS OF THE ELDERLY: DEVELOPMENT OF A METHODOLOGY. The transportation needs of the elderly are investigated with particular emphasis on the relationships between travel and a variety of lifestyles among the elderly. A methodology for identifying lifestyle groups within a population as a function of travel demands, socioeconomic and demographic characteristics, and residential location patterns is presented. The methodology involves the application of factor and cluster analysis to census data describing the population. Data from Los Angeles County are utilized as a specific case study. Lifestyle groups of the elderly (aged 65 and older) and middle-aged (aged 45-64)

populations are examined for similar characteristics and location patterns. The results suggest that the future mobility needs of the elderly can be anticipated by studying the lifestyles and activity patterns of younger age groups and by forecasting economic and housing trends.

Wachs, M Blanchard, RD Bunker, JB Westfall, M ; California University, Los Angeles, Department of Transportation Final Rpt. DOT/TST-76-T/3, June 1976, 256 pp; Contract DOT-OS-50109; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-262809/7ST

34 151712 TRANSPORTATION SERVICES INTEGRATION PROJECT. FINAL RECOMMENDATIONS AND IMPLEMENTATION PLAN. The study was conducted for the Tri-County Region consisting of Ingham, Eaton and Clinton Counties in Michigan. A very large number of special transportation agencies are involved in serving the elderly, handicapped and low-income populations in the area with apparently no coordination among each other. The report documents a brief outline of interim reports besides decision rules for participation in a coordinated system, role of the Central Coordinating Agency, procedures for making services available to a general user and/or clients of an agency, results of an experimental set up for coordination of services, fare structure and other details.

Tubbs, AE Rajendra, K ; City of Lansing, Tri-County Regional Planning Commission, Urban Mass Transportation Administration, (UMTA-MI-09-0015) Final Rpt. 34 151810 SPECIAL TRANSPORTATION SERVICES FOR THE ELDERLY AND HANDICAPPED DEMONSTRATION PROJECT-BATON ROUGE, LOUISIANA [Final rept. Nov 75-Oct 76]. In July 1972 the Urban Mass Transportation Administration, under its Service Development Program, awarded an 18-month grant to the city of Baton Rouge to demonstrate the feasibility of establishing a modern, cost-effective method of transporting the aged and disabled by means of a specially designed system, separate from conventional public transit, but coordinated with the community's existing public transportation resources. The report details a chronology of what happened leading up to and during the conduct of the specialized services. Programs encountered and steps taken to resolve these problems are presented. Statistics on system clients, trips, and costs are presented for the 12 months of STS system operation. Where appropriate, implications that might bear on the initiation of a similar service elsewhere are set forth.

34 151848 TRANSPORTATION FOR THE ELDERLY AND THE HANDICAPPED IN WISCONSIN. REPORT 1. ANALYSIS OF SPECIALIZED TRANSPORTATION SERVICES. The purpose of this inventory/survey is to provide an overview of existing specialized transportation services available to the elderly and the handicapped, as well as to assist in evaluating proposals for developing and operating specialized transportation services for the elderly and the handicapped. Such tools as the inventory questionnaire and the specialized questionnaire are used; the inventory findings are reported by four major categories: user, operation, finance, and service needs.

34 151849 TRANSPORTATION FOR THE ELDERLY AND THE HANDICAPPED IN WISCONSIN. REPORT 2. STATEWIDE SERVICE DIRECTORY. The Wisconsin Department of Transportation initiated a study with the broad objective of developing a comprehensive statewide inventory of paratransit systems serving the elderly and the handicapped. This is the second report of seven study reports. A statewide listing of 299 specialized transportation service providers serving the elderly and the handicapped is mapped out by the county and the major target group (elderly or handicapped) that each provider serves.

Wisconsin Department of Transportation, Urban Mass Transportation Administration, (UMTA-WI-09-8001) UMTA-WI-09-8001-77-3, Aug. 1976, 119 pp; See also PB-264 376. Also available in set of 8 reports PC E12, PB-264 372-SET.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-264375/7ST

34 151850 TRANSPORTATION FOR THE ELDERLY AND THE HANDICAPPED IN WISCONSIN. REPORT 3. STUDY METHODOLOGY. The purpose of this report is to document the methods and materials used to execute the statewide study of existing transportation services for the elderly and the handicapped. This documentation of the study methodology aims to serve the Department as a useful tool for periodically updating relevant survey data, as well as, for providing explicit background information on how the first statewide survey had been developed and executed. The report contains a chronology of study activity as well as the contents of major surveys, administrative information guides, and program planning that shaped the methodology.

34 151851 TRANSPORTATION FOR THE ELDERLY AND THE HANDICAPPED IN WISCONSIN. REPORT 4. BIBLIOGRAPHY. Report 4 is a Bibliography that cites publications on the subject of mobility for the elderly and the handicapped. The majority of citations refer to publications published after the Urban Mass Transportation Assistance Act of 1970, which established national policy on provisions of mobility for the nation's elderly and handicapped citizens. Most citations are drawn from the literature of the field of transportation planning rather than the medical fields of mental hygiene, vocational rehabilitation, and gerontology.

34 151852 TRANSPORTATION FOR THE ELDERLY AND THE HANDICAPPED IN WISCONSIN. REPORT 5. SURVEY OF NURSING HOMES AND RESIDENTIAL CARE FACILITIES. The Wisconsin Department of Transportation initiated a statewide study in 1975 to learn of the supply of, and demand for, transportation services for the elderly and handicapped in Wisconsin. The Department identified nursing homes and residential care facilities as significant providers of paratransit services to the elderly and the handicapped. This report presents the findings of a transportation-oriented survey of nursing homes and residential care facilities conducted in January 1976. This survey involved the mailing out of a questionnaire to 506 licensed nursing homes and 33 residential care facilities not affiliated with nursing homes. The purpose of this survey is (1) to obtain an overview of transportation services provided by nursing homes and residential care facilities, and (2) to augment the data obtained from the full paratransit industry survey.

Wisconsin Department of Transportation, Urban Mass Transportation Administration, (UMTA-WI-09-8001) UMTA-WI-8001-77-6, Oct. 1976, 34 pp; See also PB-264 379. Also available in set of 8 reports PC E12, PB-264 372-SET.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-264378/1ST

34 151853 TRANSPORTATION FOR THE ELDERLY AND THE HANDICAPPED IN WISCONSIN. REPORT 6. POTENTIAL DEMAND FOR SERVICES. As part of a statewide study of transportation for the elderly and the handicapped, the Wisconsin Department of Transportation surveyed agencies providing transportation to the elderly and handicapped. In order to compare supply with demand for service, the Department developed a model to estimate demand. This report documents the model and the demand estimates it produces. The purpose of this report is to (1) calculate the size of the potential market of elderly and handicapped, (2) identify the number of elderly and handicapped presently being served, and (3) provide the Department and other agencies with data for assessing program needs and evaluating program proposals involving state or federal financial assistance.

Wisconsin Department of Transportation, Urban Mass Transportation Administration, (UMTA-WI-09-8001) UMTA-WI-8001-77-7, Aug. 1976, 54 pp; See also PB-264 380. Also available in set of 8 reports PC E12, PB-264 372-SET.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-264379/9ST

34 151854 TRANSPORTATION FOR THE ELDERLY AND THE HANDICAPPED IN WISCONSIN. REPORT 7. MOBILITY BARRIERS TO THE ELDERLY AND THE HANDICAPPED. This is Report 7 of the comprehensive statewide study of transportation for the elderly and the handicapped that had been initiated in 1975 by the Wisconsin Department of Transportation. The purpose of this report is to (1) develop an understanding of the vehicular-environmental barriers that confront the elderly and the handicapped, and (2) assist in formulating recommendations to improve the mobility of the elderly and the handicapped through the reduction or elimination of the identified barriers.

Wisconsin Department of Transportation, Urban Mass Transportation Administration, (UMTA-WI-09-8001) UMTA-WI-09-8001-77-8, Sept. 1976, 33 pp; See also PB-264 373. Also available in set of 8 reports PC E12, PB-264 372-SET.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-264380/7ST

34 153115 STATEWIDE STUDY OF TRANSPORTATION FOR TENNESSEE'S ELDERLY. In an effort to determine the transportation needs of the elderly and to determine how these needs can be met within the public and private resources of the State, a study was initiated which included a review of current literature, the assembling of pertinent demographic and transportation data from previous studies, and a statewide survey of the elderly. Various alternative systems were analyzed to determine how best to serve the additional travel needs of the elderly. Identification of the most viable transportation systems is followed by their evaluation with regard to economic feasibility, level of service, dependability, physical usability, monitoring capability, manageability, and psychological acceptability. Alternative management structures were investigated and analyzed with respect to the selected combination of transportation alternatives. Funding sources for capital expenditures and operating costs are also discussed.

Kimley-Horn and Associates, Incorporated Apr. 1975, 98 pp, 18 Fig., 24 Tab., 2 App.; Prepared for Tennessee Department of Transportation in cooperation with the Tennessee Commission on Aging

34 153117 SUMMARY OF OHIO'S FISCAL YEARS 1976 AND 1977: METROPOLITAN TRANSPORTATION ACTIVITIES RELATING TO THE ELDERLY AND HANDICAPPED. This update of a 1975 report summarizes the studies proposed in the 1977 unified work programs and indicates to what degree the transportation needs of elderly and handicapped persons are being met in urbanized areas of Ohio. Metropolitan transportation planning activities which emphasize the needs of the elderly and handicapped and the total cost of each

planning activity are listed. Capital purchases for meeting the special transportation needs of the elderly and handicapped are also listed. Programs in Ohio's urbanized areas are briefly summarized, and appendices present excerpts from overall work programs of the Metropolitan Planning Organization for 1977.

Ohio Department of Transportation Sept. 1976, 14 pp, 2 Tab., 2 App.; The preparation of this document was financed through a Technical Studies Grant from DOT, Urban Mass Transportation Administration.; Grant Proj. No. OH-09-8001

34 153930 PUBLIC TRANSPORT FOR HANDICAPPED MORE IN THE PICTURE [Openbaar vervoer voor gehandicapten meer in de belangstelling]. Most means of public transport do not allow for the transport of disabled persons, the costs being often a hindrance. In this article, the transport of heavily and lightly handicapped persons is described and some transportation data are given. For the transport of a group of handicapped people, specially equipped small buses are used most often. /TRRL/ [Dutch]

34 153933 PEDESTRIAN SAFETY FOR THE ELDERLY. ROAD SAFETY COURSES FOR ELDERLY PEDESTRIANS. A MANUAL OF ADVICE FOR ROAD SAFETY OFFICERS. The aim of this manual is to encourage the provision of special courses in road safety for old people. The need for such courses is discussed, and tables show how the number and rate of fatal and injury accidents increase with age. Possible venues for such courses, are mentioned and a list is given of special considerations to be remembered by an instructor dealing with a group of elderly people. Topics are suggested, with regard to crossing the road, using subways or footbridges, central reservations, zebra and pelican crossings and signalized junctions. The need for explaining traffic signals, signs and road markings is discussed, and reference is made to some of the problems drivers have with pedestrians. The manual suggests ways in which the information given can be illustrated with practical instruction, gives a brief account of how publicity may be handled and an example of a typical specimen handout. /TRRL/

34 153968 HUMAN FACTORS EVALUATION OF TRANSBUS BY THE ELDERLY. One of the design goals of the Transbus Program is to provide transportation for the elderly and the handicapped. Tests evaluated the design features of Prototype Bus in comparison to the baseline of a current production bus. Findings from these tests served as a key input to the development of specifications for production. This human factors test program consisted of test subjects (33 elderly volunteers), three prototype Transbuses and a General Motors New Look, Chicago version Transbus, that served as a human factors baseline for comparison with the other three prototype Transbuses. The test results showed mobility (getting on and off a bus) to be the highest

preference score for the elderly. The elderly gave a high rating to the GM prototype for passenger assists, and low rating to the AM General and Rohr because both buses lacked vertical assists in the front of the bus and in the lounge area.

Booz-Allen Applied Research, Incorporated, Urban Mass Transportation Administration, (UMTA-IT-06-0025) UMTA-IT-06-0025-77-2, Transbus-TR-76-002, May 1976, 103 pp; Contract DOT-UT-10008; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-264757/6ST

34 154017 COORDINATING TRANSPORTATION FOR THE ELDERLY AND HANDICAPPED. A STATE OF THE ART REPORT. The Urban Mass Transportation Administration initiated this survey interview study of on-going social service transportation projects serving the elderly and handicapped in order to understand the nature of the coordination problems being encountered, namely, at the local level--that is, at the point of service delivery where coordination appears to be most important and most difficult. This report consists of four major sections: (1) An overview of the nature of the problem and the results of an examination of 26 transportation projects, of which 20 have been developed as case studies; (2) preliminary findings and conclusions based on a telephone survey of the 20 projects; (3) preliminary recommendations for future effort and programs; and (4) an appendix containing the survey form for interviews of the special projects on coordination methods (Appendix A), and detailed case studies of the 20 transportation projects (Appendix B).

34 154041 WHO ARE THE TRANSPORTATION DISADVANTAGED. Who are the transportation disadvantaged? The author proposes the definition--those groups whose same opportunities for development have been hindered, either by omission or commission, by deficiencies in the transportation system. He then asks the question of whether those conditions which make an individual disadvantaged within the general societal context are the same conditions which make one transportation disadvantaged. He discusses income, disability, place of residence and place of employment, automobile accessibility, race, sex, and age as factors which may contribute to transportation disadvantage. The author concludes that only a tenuous case at best can be made that the poor, minorities, handicapped, elderly, women, and youth are really "transportation disadvantaged", but that these groups have certain general disadvantages vis-a-vis society which make them of special concern, in an equity sense, in planning a transportation system.

34 155152 TRANSPORTATION BARRIER PLANNING COUNCIL. TRANSPORTATION NEEDS STUDY REPORT. Tabular data detail agency responses to a survey about transportation services and barriers in Polk County-Des Moines, Iowa. Responses from health care, counseling, and other types of agencies are tabulated separately. Data are presented for clients served, proportion of low income clients, client's needs for special transportation because of physical handicaps, need for special transportation because of low income, and need for transportation because of lack of access to public transportation. Agency responses are also provided concerning expenditures for transportation, transportation services provided, use of volunteers, operation of vehicles, and sources of funds. Each agency was polled about the question of a central transportation agency and the barriers to such an agency.

34 156114 RESEARCH IN SPECIAL PARATRANSIT SERVICE FOR THE HANDICAPPED. This paper discusses the development of the Disabled Adult Transportation System in Edmonton, focusing on the user from two points of view: research and marketing. Three research techniques were used to determine and identify the user--incidence levels, civic census, and a registration system. Each technique is defined and described with a review of its advantages and disadvantages. The underlying philosophy of the marketing program was to involve disabled persons. This was achieved by information meetings, public meetings, and an Advisory Council that included disabled persons. The Advisory Council has met on a regular basis throughout the developmental and operational stages of the system and is considered to be central to the system. /Author/

34 157789 TRANSIT PLANNING FOR THE TRANSPORTATION-DISADVANTAGED IN A SMALL TOWN. High auto ownership rates and low population densities have resulted in large-scale elimination of public transit systems in small towns. This trend exacerbates the mobility problem of the transportation-disadvantaged: the poor, the elderly, the handicapped, and the young. Lumberton, North Carolina, is typical of the transportation situation of towns with a population of less than 25,000. Located along an important Interstate Highway, the town has attracted industries that offer jobs within a few

miles of the town. yet, unemployment rates are high among the carless, predominately Black population of Lumberton. A group of concerned citizens from the transportation-disadvantaged community tried to organize a bus company. The company went bankrupt within 2 months. The Transportation Institute of North Carolina Agricultural and Technical State University performed an economic autopsy and drew up a proposal for an innovative transit program designed to minimize cost and give service specifically to the transportation-disadvantaged. The success of the program depends on the willingness of the City Council to underwrite approximately \$30,000 of operating deficit yearly. The authors suggest that in the case of a low-wage area such as Lumberton the major costs are those of overhead, namely management, and the necessary backup system of extra buses and a maintenance crew. The authors propose that towns such as Lumberton join into a transit consortium with nearby communities and make a joint application for funding from the capital grants program of the Urban Mass Transportation Administration. /Author/

34 158141 ASSUMING RESPONSIBILITY FOR MOBILITY OF ELDERLY AND HANDICAPPED: THE ROLES OF TRANSIT PROPERTIES, TRANSIT PLANNERS, AND SOCIAL SERVICE AGENCIES IN SMALL CITIES. Public policy currently promotes the proliferation of small, uncoordinated programs aimed at agency clients rather than broader transportation services for the community. The purpose of this research is to explore the degree of harmony in actions between transit operators, social service agency personnel, and local transportation planners in small and midsize cities (50,000 to 500,000 population) with emphasis placed upon the perceptions of actors in the system (planners, social workers, and transit operators) about their roles in providing transportation services to the elderly and handicapped. This report purports to test the underlying assumption of revenue sharing advocates that, left to themselves, local agencies will allocate resources efficiently at the local level. The results of this study suggest that this assumption is unwarranted in many cases. This report cites examples of successful interactions between transit planners, social service agency staffs, and transit properties in enhancing consolidated transportation services to the elderly and handicapped. It also documents the more usual pattern of non-interaction which seriously impairs the efficiency of transportation services to this disadvantaged group. Data was obtained from three principal sources: (1) the set of 89 questionnaires; (2) the set of case studies of ten localities; and (3) the two volumes of written submission made to the Chief Counsel of UMTA pursuant to the public hearings on UMTA's proposed "Elderly and Handicapped Regulations" held in 1975.

34 158306 STUDY OF TRAVEL BEHAVIOR OF THE ELDERLY. A study has been made of comparative travel behavior of a group of elderly and non-elderly persons in Buffalo, New York. The study supports the hypothesis that there are no severe changes in travel behavior as one gets older, but that the quality of travel, as opposed to the quantity of travel, deteriorates. The paper analyzes all aspects of travel for 14 non-work activities. Characteristics of the study group, car availability, activity choices, and travel distance and attitudes are discussed.

34 158734 TRANSPORTATION NEEDS OF THE MOBILITY LIMITED. A study to define the public transit needs of the handicapped in northeastern Illinois is reported. Three sources of information were used in the study: census data, a mailed survey to obtain basic information about physical conditions and mobility limitations, and a home interview with a sample drawn from those receiving the mailed questionnaire. The survey instrument was designed to elicit information in six areas: existing travel patterns, health conditions, mobility or ability to get around, latent demand, demographic questions, and attitudes. The findings indicate that all people classified as mobility limited by conventional schemes were, regardless of label, mobile. A total of 63 percent used some form of public transportation and 19 percent actually drove themselves. Over 90 percent depended on others for transportation at least occasionally. In general, the more disabled a person was, the more that person was travel dependent on others. Three major factors with which the physically handicapped have difficulty were identified: vehicle environment, walking, and climbing. It was found that approximately 38 percent of those classed as handicapped have a significant mobility limitation. Mobility limitation varies by geographic location: 46 percent of the handicapped in urban areas are mobility limited, while 30 percent in high density suburban and 35 percent in low density suburban areas are mobility handicapped. A procedure for estimating travel demand for the handicapped was developed. Supporting data are provided in tabular form.

34 159603 TRANSPORTATION NEEDS OF THE DISABLED AND THE ELDERLY--SUMMARY AND REPORT. This study summarizes more than a year of research into the accessibility and utility of transportation for

elderly and disabled people in Seattle and King County. The following areas of study are included: Characteristics of the elderly and handicapped population of King County; transportation needs and problems of the elderly and disabled; the supply of transportation services; and policy recommendations. In addition, four major action areas were selected by the study; each area promoting one or more aspects of mobility for the elderly and disabled individual. The major areas of intervention are: Physical Aspects, Social/Psychological Aspects, Economic Aspects, Legal/Political Aspects, Geographic Aspects. These intervention areas are further broken down and evaluated for their capacity for enhancing mobility. They are accompanied by Recommended Action Agendas that propose specific intervention which are to be refined and developed by the study team in its final "action phase" and by others working in the field.

34 163563 DO ELDERLY DEMAND-RESPONSIVE SYSTEMS, DUPLICATE EXISTING FIXED ROUTE SYSTEMS?. The purpose of this study was to determine the degree to which the specialized door-to-door transit service for the elderly was a duplication of existing fixed route service. The analysis measured the proportion of elderly who could have used the existing fixed route system for their trip making and therefore did not need the door-to-door system. Using this as an operational definition of duplication, the study proposes a number of alternatives which may be implemented to increase service insuring service especially to those who need it. /Author/ McKelvey, DJ Lichtenheld, JA ; Iowa University Tech. Rpt. #45, May 1975, 15 pp, 3 Fig., 6 Tab., 7 Ref.; This report was produced as part of a program of Research and Training in Urban Transportation sponsored by the Urban Mass Transportation Administration of the Department of Transportation.

34 163597 DEMAND FOR SPECIAL TRANSIT SYSTEMS TO SERVE THE RURAL ELDERLY. Regional planning agencies have become increasingly aware of the transportation needs of the rural elderly. A promising solution to some of these problems has been the development of a rural special service transit system that gives elderly persons who lack means of transportation access to crucial social services. A preliminary, important step in planning such systems is estimating demands; unfortunately little demand information is available to aid in making such decisions as selection of vehicles, routing, and scheduling. This paper examines the demand for transportation services for the elderly and presents techniques for approximating travel demands. Methods based on attitudinal surveys, comparative trip rates, and participation frequencies illustrate that the best estimates currently possible are based on average travel behavior. Further, such methods only approximate the many factors affecting demand. Data monitoring to formulate an economic demand model, which

would account for the significant variations of behavior, is suggested by this study as a relevant future research activity. /Author/

34 163601 LIFE-STYLES AND TRANSPORTATION NEEDS OF THE ELDERLY IN THE FUTURE. Several common views of the transportation requirements of elderly Americans are reviewed, and conclusions are reached regarding the older population of the next two decades. While the elderly of today are relatively dependent on public transportation, live at higher densities, have lower incomes, and travel relatively little compared with other groups, there are indications that the elderly of the future may not be similar. Planners wrongly assume that a decline in mobility occurs with aging because of the aging process itself. Rather, people bring certain long-established life-styles into their old age. The mobility patterns of today's elderly reflect life-styles that were developed decades ago, when mobility was limited for all citizens, regardless of age. By contrast, the elderly of the next 20 years will include many suburbanites, many drivers, and many who travel a great deal. Planning and forecasting methods for the future transportation needs of the elderly should not be based on the transportation patterns and needs of those who are currently elderly, but should focus more on those who are now in their thirties and forties and will become the elderly of the future. /Author/

34 163602 ANALYSIS OF A TAXI-OPERATED TRANSPORTATION SERVICE FOR THE HANDICAPPED. This paper analyzes the demand for and cost of a taxi-operated special transportation service for the handicapped. Gross hourly cost is found to be \$6.74 for regular taxi service and \$8.62 for lift-equipped vans. About 1.5 percent of the population would need the special service. One-fifth of the handicapped need the special vans. Demand for this service would take years to develop. After approximately 5 years, demands of 1.4 trips/week/eligible person could be expected. The net cost of such a service for a standard metropolitan statistical area of 3 million people would be approximately \$11 million/year. The net cost of service is very sensitive to the fares charged, to limitations on trip purposes served, and to the advance notice requirement. /Author/

34 164024 ELDERLY AND HANDICAPPED TRANSPORTATION NEEDS IN THE DUBUQUE AREA. The transportation needs of the elderly and handicapped have been met or partially met in urban areas by varied combinations of transit and paratransit services. For the most part, these services have been uncoordinated, and may have been designed and operated for a very specific target group or population. This document denotes the Dubuque experience in the field of paratransit and transit fulfillment of the elderly and handicapped transportation needs, and suggests an alternate path in the attempt to meet those needs. This report includes discussions of travel needs, socio-economic background data, existing services and travel alternatives. /Author/

34 164076 STUDY OF IMPROVED TRANSIT SERVICES FOR HANDICAPPED AND ELDERLY. The CPO undertook this study to investigate public transportation services currently available to the handicapped and elderly population, and to develop a short-term transportation program and long range transportation policies. A survey of approximately 75 social service agencies revealed there is a large unmet transit service need. About eight percent of the unmet need, or 3300 trips per day, require door-to-door service with lifts. Most unmet needs—67 percent or 26,700 trips—call for door-to-door service without lifts. The remaining 24 percent or 9,600 trips could be made on conventional transit if special equipment were added to coaches. Based on alternatives evaluated in the study, a three part program for meeting the needs identified was adopted as part of the Regional Transportation Plan. The program includes the expansion of door-to-door transit service, the coordination of social agency transportation sources and minor modifications of existing vehicles. /Author/

The preparation of this report has been financed in part through a grant from the Department of Transportation, Urban Mass Transportation Administration.

34 164080 MOBILITY OF PEOPLE AND GOODS IN THE URBAN ENVIRONMENT: MOBILITY OF THE HANDICAPPED AND ELDERLY. An evaluation methodology for the analysis of alternative transportation improvements for the handicapped and elderly is proposed. The approach is based on the ability to incorporate the qualitative attributes of transportation systems which are particularly significant to the handicapped and elderly groups. These attributes include comfort and convenience, security and safety, and accessibility. In addition, this

study addresses the issues of demonstration projects planning and offers guidelines for the design of demonstration experiments which can produce results that are capable of objective analytical interpretation. /Author/

34 166131 LET'S END ISOLATION. Examples of community services designed to alleviate isolation among elderly people are presented, together with lists of publications and sources of further information on each type of service. The following services are covered: transportation (special buses or vans, senior center bus services, private cars, reduced fare programs, programs to remove physical barriers in public transportation); senior centers; nutrition programs (group meals, meals on wheels); telephone reassurance; friendly visiting; in-home services (homemakers, home health aides); opportunities to serve (senior citizen employment or volunteer programs); outreach services; and information and referral services. Information relevant to the establishment and operation of each type of service is provided, and examples of programs are drawn from a variety of communities. The booklet emphasizes that elderly people are not all isolated for the same reasons and do not all need the same service. Separate services for the elderly need to be expanded and interrelated in a comprehensive approach to the problem of isolation. References to organizations as well as publications are provided for every topic.

34 166448 INCIDENCE RATES AND TRAVEL CHARACTERISTICS OF THE TRANSPORTATION HANDICAPPED IN PORTLAND, OREGON. The report presents incidence rates, characteristics, and travel patterns of transportation handicapped and able-bodied elderly (65 and over) persons. Tables and discussion are presented on demographics, health problems, use of mobility aids, and trip rates, purposes and modes, and origin/destination patterns. A section is devoted to functional problems in using public transportation vs. handicap classification, health problem and use of mechanical aid. Respondents are evaluated in their ability to use six different transit modes ranging from a fixed-route regular bus to a door-to-door bus with a lift. Wheelchair/walker users are analyzed separately. Data for this report was derived from a 6,000 household survey conducted in Portland. The survey design, questionnaires and field procedures are described.

34 166449 CLEVELAND NEIGHBORHOOD ELDERLY TRANSPORTATION DEMONSTRATION PROJECT. The document is a final evaluation report of the Cleveland Neighborhood Elderly Transportation (NET) System. The Cleveland NET Project was implemented in March 1975 with the purpose of providing personalized door-to-door transportation services for elderly persons within three inner-city neighborhoods. Operations and vehicle maintenance were provided by the Cleveland Transit System/Regional Transit Authority on a daily basis with 12 buses specifically designed and equipped to serve the elderly and the elderly-handicapped. Service was obtained at 10 cents per ride by telephoning a scheduling/dispatching center. The document describes the Cleveland NET Demonstration Project in terms of the description and operation of the transportation system, the operational agencies involved, the test area, and the operational results. It also includes an analysis of the operational problems encountered, the costs incurred, and the suggested means for improving service and reducing the costs. Results of the surveys of users and non-users of the service are also presented in an attempt to assess the social impacts and benefits relative to costs.

34 166625 TRANSPORTATION FOR THE ELDERLY IN NEBRASKA: A REVIEW OF EXISTING AND ALTERNATIVE SYSTEMS. The need for transportation for the elderly in Nebraska and the existing modes of transit with respect to cost, barriers, and target group suitability, were analyzed, and alternative modes of mass transit or systems to service the elderly are suggested. A variety of data sources and literature were used and synthesized in the study. Only one of the six modes of transit for the elderly in Nebraska, Senior Handibus, lends itself extensively to the elderly and their needs. The other five modes, including intracity bus transit, have a different target group suitability, a factor which presents many physical barriers. The alternative modes of transit suggested include the school bus, the coupon taxi, expansion of reduced fare, the transit stamp, the ubiquitous fixed route (involving establishment of new routes in areas not presently served, and removal of physical bus barriers. The first of the three alternatives have the elderly as their target group suitability. Extensive supported data dealing with the quality of transportation, the destination of retired people and the form of transportation taken to get there, comparison of selected intercity and intracity transit company indices (with attention to revenue, cost, patronage, and service); maps, a list of intercity bus companies operating in Nebraska, and other material is appended.

34 166646 TRANSPORTATION FOR THE ELDERLY OR PHYSICALLY HANDICAPPED (A BIBLIOGRAPHY WITH ABSTRACTS) [Rept. for 1964-Aug 77]. Reports on planning public transportation for elderly persons or those persons who are physically disabled are cited. Studies are included of difficulties encountered, special design, and real and potential use of facilities are included. (This updated bibliography contains 147 abstracts, 64 of which are new entries to the previous edition.)

Young, ME ; National Technical Information Service., Springfield, Va. Aug. 1977, 152p; Supersedes NTIS/PS-76/0622, NTIS/PS-75/575, and COM-74-10887.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; NTIS/PS-77/0713/6ST

34 167304 TRANSIT MOBILITY FOR ELDERLY AND HANDICAPPED PERSONS. Elderly persons, who are defined for this study as persons 65 or more years in age, constitute 8.7% of the Sedgwick County population and 9.7% of the Wichita population. The Metropolitan Transit Authority (MTA) provides the elderly and handicapped persons with a half-fare program that is in effect on all lines during all days and hours of service. The purpose of the report was to determine the size and location of the elderly and handicapped population of Sedgwick County, Kansas, to identify the transportation needs and problems, analyze alternative solutions, and, based on these findings, recommend actions designed to improve the mobility of these persons. Major data sources for this study include the annual Sedgwick County Intergovernmental Enumeration, a survey of social service agencies and adult care homes, and a survey of handicapped persons.

34 167457 TRANSPORTATION PLAN FOR THE ELDERLY AND HANDICAPPED. The objective of this study is to determine the transportation needs of the elderly and handicapped population in the St. Louis area and to develop effective ways of increasing their mobility through improvements to the public transportation system. Four steps were followed to accomplish the study objective. The first step was to identify the number and location of elderly and handicapped persons in the St. Louis Region, then to identify specific mobility limitations. The next step was to identify their travel needs, using data from other cities and local sources. The fourth step consisted of establishing a committee of elderly and handicapped persons and their representatives to provide a forum for discussion of the needs of this group. These steps and the elements of the plan for improving the mobility of the elderly and handicapped are discussed along with issues that need to be addressed for effectively meeting these needs.

34 168774 TRANSPORTATION: THE DIVERSE AGED, POLICY REPORT ONE. USCS RESEARCH PROGRAM ON SOCIAL AND CULTURAL CONTEXTS OF AGING. The report is designed for transportation policymakers, planners, social service delivery personnel, and advocates for the aged. It investigates the transportation patterns and problems of older persons. The purpose of the report is to highlight the aged's transportation problems, and to offer possible solutions to mobility dilemmas of many senior citizens. Three different studies were conducted: (1) a survey of 1,269 community residents, age 45-74, sampled from three ethnic groups in Southern California from various socioeconomic levels; (2) 316 decisionmakers involved at various levels in establishing, implementing, or influencing policy regarding the elderly; (3) a cross-cultural anthropological investigation of aging in three foreign countries (Yugoslavia, Tanzania, and Mexico) and of the adaptations made by immigrants growing old in the American culture.

34 169259 PROCEEDINGS OF THE SOUTHWEST CONFERENCE ON COORDINATING MOBILITY PROGRAMS FOR THE TRANSPORTATION DISADVANTAGED HELD IN SAN ANTONIO, TEXAS ON FEBRUARY 1-3, 1977. The proceedings contain the presentations, workshop reports, and recommendations passed by the conferees. The subjects covered in the presentations include federal and state policy on coordination of transportation services; the barriers to coordinated transportation services; problems caused by the lack of coordinated services; potential solutions to the problem of insufficient coordination; the available agency resources for extending or coordinating existing and future services; and specific program alternatives for establishing coordinated services.

34 169685 THE TRANSPORTATION DISADVANTAGED IN OREGON. Most of the poor, the young, the aged, and the disabled are transportation disadvantaged. That is, most of these people do not share the level of mobility enjoyed by most Oregonians. The purpose of this document is to provide a clearer picture of the distribution of these people in Oregon. In addition, the handicapped and elderly are identified as a subgroup of the transportation disadvantaged. This technical document can provide the basis for decision making on where and what kinds of services are needed. A major portion of the document describes a method by which the overlap between the poor, young, aged and disabled can be reconciled. The data which

resulted are given for all counties and for the state illustrated below.

34 172433 GUIDELINES FOR IMPLEMENTATION: ADDENDUM TO ELDERLY AND HANDICAPPED TRANSPORTATION NEEDS. A brief description is given of existing fixed route services and the characteristics of the special service for the elderly and handicapped are detailed. A majority of the elderly and handicapped are able to use regular transit vehicles, and revision of service characteristics relating to bus stops, shelters etc. which would aid their utilization are noted. The special services and facilities should be used only by those certified as transportation handicapped. The reservation procedure, fares, hours of service and vehicles of such a service are described. Other aspects covered here include budget, terminals, orientation for drivers, promotion and marketing, monitoring, and schedule for implementation are discussed. Appendices are provided which describe the transportation programs in Springfield, the list of terminals relevant to handicapped and elderly, eligibility criteria, and selection criteria.

34 172434 A STUDY OF ELDERLY AND HANDICAPPED TRANSPORTATION IN HANCOCK COUNTY. The purposes of this study are to determine the special transportation needs of the elderly and handicapped persons living within the boundaries of the study area, Hancock County, Ohio, and to develop strategies for improving the transportation services presently available in this county. The study includes information concerning the character of the community, estimates of the elderly and handicapped populations, their travel characteristics, an inventory of existing transportation services, a survey of potential financial resources, and an evaluation of the extent that the existing and proposed transportation services will satisfy the transit demand of the transportation disadvantaged. Opportunities for coordination and consolidation of local transportation services are also discussed. /Author/

34 175716 PLAN FOR ELDERLY AND HANDICAPPED TRANSPORTATION SERVICE IMPROVEMENTS IN THE ATLANTA REGION. The recommended plan outlined in this report covers five types of actions to be taken in order to improve transportation services to elderly and handicapped persons in the Atlanta

(Georgia) Region. The five types are management actions aimed at improving the coordination of existing services, financing actions, operation actions to improve efficiency and cost effectiveness, regulatory actions, and public relations actions. The discussion covers the background, organization, and process of the study. Subsequent material deals with the target population and their service needs, service provider needs, user related policy needs, policies developed from a review of Federal regulations, policies evolved from an examination of similar programs, and the analysis of alternatives. Also considered are the various barriers--financial, service, personnel, and attitude--to service coordination and consolidation. The recommended plan which is designed to be implemented over a 5-year period is discussed in terms of the 5 types of actions. A program for monitoring and updating the plan is included. The appendices contain descriptions of the components of a transit service (e.g., service schedules, vehicle occupancy), information on the consumer's view of the costs and service characteristics of a specialized transportation service, and sample data collection forms for the monitoring and updating program.

34 175915 TRANSPORTATION SERVICES FOR THE DISABLED AND ELDERLY. Multipurpose transportation systems for the developmentally disabled and the elderly are the focus of this study sponsored by the New Jersey Developmental Disabilities Council. Trends in the evolving transportation dilemma from 1950 to 1974 are examined on a national scale and in the State of New Jersey, and supporting data are tabulated. Projections are made of employment in New Jersey through 1980 and of the U.S. population through 1990. Transportation problems of the disabled and the elderly are considered, with particular attention given to travel barriers and the provision of transportation services. Kinds of information which may be useful in determining the demand for specialized transportation services are extrapolation from census materials or other secondary sources, information gathered from agencies about their clients, and surveys of disabled and elderly individuals. A basic framework for the design of a transportation system is presented, and it is suggested that multipurpose personalized systems are preferable. It is noted that obtaining funding for special-purpose transportation systems is difficult and that there are also legal and institutional issues to be taken into account. Transportation case studies are appended along with chapter notes and a bibliography.

Brail, RK Hughes, JW Arthur, CA ; New Jersey Developmental Disabilities Council 1976, 231 pp; Available from Center for Urban Policy Research, Rutgers University, Building 4051-Kilmer Campus, New Brunswick, NJ 08903.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; HRP-0023854/3ST

34 176280 SAN DIEGO WHEELCHAIR ACCESSIBLE BUS STUDY [Interim rept. Feb-Apr 77]. The study describes the implementation and early operation of a pilot project of fixed route, wheelchair accessible bus service on two routes of the San Diego Transit system. Five buses of the Transit Authority fleet were retrofitted with wheelchair lifts by the lift manufacturer. Four lift equipped buses are used in the service with one bus held as a spare. Relatively few lift problems have been encountered. Nevertheless, lift design improvements have been and are continually being made to improve its performance and usability. Ridership by wheelchair confined persons has been low and a number of possible reasons for this are enumerated. Wheelchair accessible bus service will incur added operational costs but insufficient experience has been generated to permit estimation of the annual amount.

Casey, RF ; Transportation Systems Center, Cambridge, Mass.*Urban Mass Transportation Administration, Washington, D.C. DOT-TSC-UMTA-77-41, UMTA-MA-06-0049-77-8, Sept. 1977, 50p; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-281087/7ST

34 176298 SUBSIDIZED TAXI PROGRAMS FOR ELDERLY AND HANDICAPPED PERSONS IN THE SAN FRANCISCO BAY AREA. The report examines subsidized taxi systems serving elderly and handicapped persons in six locations in the San Francisco Bay Area. The systems studied are San Leandro, Santa Clara County, Sunnyvale, Palo Alto, Lafayette, and Fremont. These systems are designed to deliver taxi service at a reasonable cost to target groups residing within the program areas. The objectives of the report are: (1) to describe six programs which deliver transportation service to elderly and handicapped persons utilizing the subsidized taxi mode; (2) to identify the essential similarities and differences among these programs; (3) to illustrate, in qualitative terms, the nature of the costs, efficiencies and impacts on taxi operators, subsidizers, and users of the six approaches; and (4) to interpret this information and identify those findings which appear to be transferable to planners in other localities. The subsidized taxi programs are successfully delivering transportation service to elderly and handicapped residents in all locations as evidenced by rising client enrollment and ridership volumes. Overall, response to the programs has been and continues to be extremely favorable.

34 178252 SAN DIEGO WHEELCHAIR ACCESSIBLE BUS STUDY--INTERIM REPORT. This study was performed as part of a series of wheelchair accessible bus implementation. It describes the implementation and early operation of a pilot project of fixed-route, wheelchair accessible bus service. An update of the information contained in this paper is planned in the near future. In 1976, the San Diego Transit Corporation (SDTC), implemented a pilot program to demonstrate the need for a bus wheelchair lift. Two heavily patronized routes were selected for this service. During the first week of the service, ridership averaged slightly less than two trips per day. Shortly thereafter, ridership had dropped to about one person per week. The factors that may explain this include: (1) a lack of advertising of the lift service due to budget constraints; (2) the limited origins and destinations served by wheel chair buses; (3) the difficulty of accessing the bus stops or destinations near the bus stops due to street curbs and hilly terrain; (4) the competition from social service agency transportation services and from the City of San Diego Dial-A-Ride; and (5) the initial unreliability of the service due to late delivery of some of the vehicles and the absence of a back-up vehicle when the lift design improvements were being incorporated. In this study all relevant aspects of the current operation are covered, such as service and equipment, level of service, eco-

nomics, demand, impacts, attitudes, and implications for transferability. The report also contains Appendix A, which is a Dial-A-Ride Passenger Survey. The conclusion is that the life is workable, and is being continually improved, but that a true measure of handicapped and elderly ridership will not be determined until a major portion of the external travel barriers are removed. /Author/

34 178709 TRANSIT OPTIONS FOR THE ELDERLY AND HANDICAPPED. The several transit and paratransit options which could be potentially implemented to improve transportation services to the elderly and the handicapped in North Central Texas were analyzed. This paper summarizes the analysis undertaken for this task and identifies some of the philosophical and technical issues which arise in performing such a study. The elderly and handicapped population was divided into 4 categories: Category I included 70% of the population who could use public transportation--Category II (16%) includes those who could use public transport with minor changes; Category III (9%) includes those who could use public transport with major modification; Category IV (5%) are those who are house-bound and not included in the potential market. Several bus options and paratransit options were considered. The options were designed to lower taxicab fares for eligible patrons. This could be accomplished by a redistribution of funds. It is considered possible to provide for category III individuals through the use of taxicabs at a fraction of the cost of accomplishing the same objective with bus transit. Various approaches apparently exist which would permit a city and its taxicab firm to provide lower fares to the elderly and handicapped without an external government subsidy.

Barker, WG Ryden, TK Watson, FT (North Central Texas Council of Governments) *Transit Journal* Vol. 4 No. 2, Apr. 1978, pp 2-20, 3 Fig., 6 Tab.

34 178788 COUNTY-WIDE TRANSIT DEPENDENT STUDY-LINCOLN/LANCASTER COUNTY, NEBRASKA. This report describes the analyses and findings resulting from a technical study to investigate the special transportation requirements of the handicapped, elderly, and economically disadvantaged persons in Lancaster County, Nebraska. It inventories the existing transportation available to transit dependents, defines target groups and latent trip demand, establishes ridership objectives, and evaluates the costs and benefits of various alternative improvement concepts. The key to the overall focus and purpose of this study is to ensure that the mobility needs of urban and rural transit dependent groups in Lancaster County are being adequately met, and that their role in the planning and development of improved transit services is secured. In order to achieve these goals, a program has been initiated which consists of the following elements: (1) maintain the existing Handi-Bus system (a demand responsive service

to elderly and handicapped persons); (2) institute procedures to increase system productivity; (3) increase weekend and evening hours of operation; (4) implement shared-ride taxi service as a supplement; (5) institute a reduced fare program on fixed-route service for qualified low-income persons; (6) expand Handi-Bus service to rural areas; (7) give additional study to a medical service shuttle on the regular LTS system; (8) expand the Handi-Bus system if shared-ride taxi service cannot be implemented; and (9) ensure that the transit dependent groups are included in the continuing planning process for special transportation needs. The study points out that the program must include continuous review and monitoring and should be updated annually. Appendices A-H are included, and Appendix I, which is a bibliography.

34 179037 INCORPORATING BARRIER EFFECTS IN ELDERLY AND HANDICAPPED NON-WORK-TRANSIT DEMAND FORECASTS. A simple no-computer method is presented for determining the increase in elderly or handicapped non-work transit travel which would occur in response to the removal of any combination of transit system barriers. Data on E & H perceptions of the severity of some 35 transportation system variables, collected in the Albany, N.Y. SMSA, are used to construct the relationship between barrier removal and increased travel. The method of non-commitment is applied to the relationship to estimate true demand. The method is then applied to a series of case applications involving specific barrier removal policies. Results show that barrier removal will have a small effect (2-5%) on total non-work bus travel of the elderly non-handicapped, but a moderate (5-20%) effect on handicapped travel. /Author/

34 179174 TRANSPORTATION NEEDS FOR THE ELDERLY, HANDICAPPED AND LOW INCOME OF MISSISSIPPI. The purpose of this report is to examine the elderly and disadvantaged population of Mississippi and define how transportation fits into their needs for daily living. Essential segments of this study are the identification of existing transportation resources within the state, categorization of deficiencies in existing facilities, and appraisal of future efforts needed to provide the transportation services for the elderly and disadvantaged. In view of the problems of the transportation disadvantaged defined by this study; i.e., need for critical tips due to rural isolation; coordination of existing programs, facilities, and support systems within local government bodies as well as private sources emerges as the most promising approach to providing better services to meet the needs in Mississippi. Five alternatives are noted for coordinating the existing resources of the state: Coordination of social service providers who need

transportation for their clients; coordination of transportation systems and social service agencies who are or could be potential transportation providers; equipment purchasing coordination for all agencies; coordination of site location; coordination and integration of funding sources and user restrictions.

34 181340 IMPLICATIONS OF BART'S ENVIRONMENTAL IMPACTS FOR THE TRANSPORTATION DISADVANTAGED. This is the first of four interim reports to be developed by the Implications for the Transportation Disadvantaged (ITD) Project of the BART Impact Program (BIP). This report focuses on the environmental impacts of BART's construction and operations on the transportation disadvantaged. The special population groups included in the analyses in this report are ethnic minorities (Black, Spanish heritage, Asians and others), the elderly, and the handicapped. Six issues related to possible environmental impacts of the construction or operation of the BART system for the transportation disadvantaged are examined. Information developed in the major project areas of the BIP is applied in the investigation of each issue. (Color illustrations reproduced in black and white)

34 183697 FEASIBILITY STUDY OF THE MOBILITY CLUB CONCEPT IN RURAL AND SMALL URBAN AREAS (TRANSPORTATION FOR THE DISADVANTAGED). This report documents a feasibility study of the Mobility Club concept as applied to a small city and a rural area. The purpose of this overview is to examine the concept in a slightly broader perspective so that results of the study can be interpreted in the context of other geographic areas. The Mobility Club was conceived as a means of providing door to door, demand responsive transportation to the handicapped at low cost. The Mobility Club has two distinctively

separate driver and user groups, and can handle many trip patterns for a variety of purposes. Because of its flexibility, the club can be tailored to incorporate features that make it adaptable to the needs of a particular locality and/or particular groups. Having examined the Mobility Club concept within an urban and rural environment, it was decided that the rural application looked more attractive at the present time. A cost estimate for the rural application showed that potential yearly deficits were within the range of local funding. Key elements of the implementation plan for the local demonstration project include the establishment of intergovernmental and community responsibilities; clearance of relevant licensing or insurance constraints; planning of organizational infrastructure; establish a tentative start-up data and service period; administration of a monitoring program; and, evaluating the system following the end of the service demonstration period.

34 184267 TRANSPORT OF DISABLED PERSONS [Ufoeretransport]. This report is a summary of 8 preliminary notes made for the research project "disabled people in the street environment" (IRRD 604867). The aim has been to make proposals for organizing the transportation service for handicapped persons. The conclusions drawn are: transport of disabled persons is a public responsibility, and a special service should be established in all communities. The service must give the disabled as good transportation possibilities as other people have. In the future this service ought to be operated by bus-companies and taxi-cabs. Directives and regulations for transport facilities used for this purpose should be prepared as soon as possible. Drivers and assistants need special training on how to aid disabled persons. Financially the special transport service should be supported by the government, counties and communities. /TRRL/ [Norwegian]

34 184577 A COMPREHENSIVE TRANSPORTATION PLAN FOR THE ELDERLY AND HANDICAPPED. The major factors that led to the initiation of Tacoma's Transportation Plan for the Elderly and Handicapped were the continued interest given by UMTA to the transportation needs of the elderly and handicapped, and also that Tacoma has been operating a transportation program to assist transportation-disadvantaged individuals since 1973. Therefore, in 1976, the City requested and received funding to support a one-year study to examine the needs of mobility-restricted citizens and to offer a variety of alternatives that might provide the needed services. The study group examined the background of the transportation problems in Tacoma and found that the elderly and handicapped are confronted by numerous barriers that inhibit their ability to travel within the city. The five phases of the Plan were to develop citizen coordination, establish objectives, collect and

analyze census data, develop scenarios for system development, and to generate the selection process. The options for meeting the transportation needs were accessible fixed-route service, demand-responsive transportation operated by public sector, operated privately for profit sector, operated privately for non-profit sector, and multi-modal (combined systems). Before making recommendations, it was necessary to compare these alternatives, from which the most viable option was to be selected. The study group recommended that the City Council consider the combined fixed-route demand-responsive system alternative, which utilizes taxis and the existing bus fleet. /UMTA/

34 184718 TRANSPORTATION FOR THE ELDERLY AND THE HANDICAPPED: THE SAN DIEGO STUDY. The purpose of a recent transportation study in the San Diego region was to estimate the needs of elderly and handicapped citizens and to develop a comprehensive program and policy package to meet those needs. Both the methodology and the recommendations of the study may be applicable elsewhere. Because of the varying financial, operational, and management structures associated with different types of transportation service, demand estimates were built around five categories of transportation service. This classification system directly related limitations on the mobility of different groups of handicapped persons to the types of transportation service required by those limitations. Statistical surveys were avoided. Demand for each type of service was estimated from available statistics, from other studies, and from extensive interviews with social service agencies. The study found that there was heavy demand for services other than conventional, fixed-route bus transit. Because this implied that cost was a major issue, emphasis in program and policy design was placed on the development of cost options. Operational and institutional aspects of the service were also considered. /Author/

34 184719 COORDINATION AND INTEGRATION OF SPECIAL TRANSPORTATION SERVICES FOR THE TRANSPORTATION DISADVANTAGED (ABRIDGMENT). The study conducted in the Lansing, Michigan, area demonstrated that the level of transportation service provided for the transportation disadvantaged (i.e. the elderly, poor, and physically and mentally handicapped) is quite low in comparison with the service offered to the general public through the existing transit system. It further showed that the provision of special transportation service by independently operated agencies resulted in duplication of management requirements and service vehicles, the overlapping of service areas, and service inefficiencies. The development and analysis of alterna-

tive means for providing service indicated that a simple coordination of the operations of these independent agencies would significantly reduce service costs and increase both vehicle utilization and the level of demand satisfaction. The tri-county region is currently in the process of implementing the plan for a minimal level of coordinated service in the Lansing urban area and the rural areas of Clinton, Eaton, and Ingham counties. It is anticipated that the results of this planning study will be applicable to many communities throughout the state of Michigan that are faced with similar service requirements and limited financial resources for implementing special transportation services for the transportation disadvantaged.

34 184720 COSTS OF ALTERNATIVE TRANSPORTATION SYSTEMS FOR THE ELDERLY AND THE HANDICAPPED IN SMALL URBAN AREAS (ABRIDGMENT). Data from 18 systems (both demand-responsive and fixed routes, public and private, profit and non-profit) in cities ranging in population from 25,000 to 500,000 and representing all regions of the United States was collected and analyzed to determine costs per passenger kilometer, per vehicle kilometer and per passenger trip. The purpose of the research was to determine whether or not the theory of U-shaped cost curves (i.e., up to a point, increased volume will result in lower per unit cost) applies to these transportation systems so that public policy about the systems may be changed if necessary. (Current policy tends to encourage proliferation of small-scale units of operation.) The study suggests that, on a cross-sectional basis, transportation programs for the elderly and the handicapped appear to operate at the lowest average unit costs at scales of operation that are considerably larger than those of most systems now operating under federal assistance programs. The data suggest that management costs can be better spread over systems that cover larger geographical areas and deliver more passenger kilometers of service. Although these findings do not result in causal relations, they do suggest that more research is needed on the sources of variations in cost.

34 184721 ESTIMATION OF DEMAND FOR TRANSIT SERVICE AMONG THE TRANSPORTATION DISADVANTAGED. Four techniques are presented for estimating demand for public transit or paratransit service among the transportation disadvantaged. These techniques are grouped in three basic categories: (a) graphic-analytic techniques, (b) mathematical formula-

tion, and (c) regression techniques. The four techniques include estimating demand among the disadvantaged in New York City; determining the effects of barriers on demand in Massachusetts; using noncommitment response techniques to estimate demand if specific travel barriers are removed in Albany, New York; and using regression techniques to estimate demand in rural Pennsylvania. Each technique requires a description of the population to be served, an estimate of their current travel patterns, detailed descriptions of new transportation systems or system improvements, and some overall description of this service area. /Author/

34 184897 THE MOBILITY OF THE ELDERLY AND DISABLED IN GREAT BRITAIN: AN OVERVIEW. This paper summarizes some of the developments of the past ten years which have brought benefits to elderly and disabled people with mobility problems. In the case of the elderly it identifies concessionary fares schemes as having been of considerable importance despite the unfairness of their distribution and value. It is argued that the elderly could be further helped in the future, if the results of recent research on vehicle design, lead to new generations of public transport vehicles which are accessible and comfortable for the widest possible span of passenger capabilities. Those disabled people who are unable to use public transport are now being helped by a new form of benefit called the "Mobility allowance" which is described. However, despite much goodwill the needs of the elderly disabled are inadequately met and this is identified as an important problem to which solutions have yet to be found. /Author/

34 184899 MOBILITY FOR THE ELDERLY AND HANDICAPPED. PUBLIC TRANSPORT AND THE PHYSICALLY DISABLED--THE TRANSPORT OF HANDICAPPED PEOPLE IN WHEELCHAIRS. In this paper two great families of handicapped persons are considered; individuals with reduced mobility able to travel without wheelchairs, and handicapped people in wheelchairs. A functional classification has been constructed for the first family which, based on the physical aptitudes of the individual, shows the limits and the impossibilities with respect to the use of conventional public transport. Solutions and recommendations are given to increase the accessibility of buses to handicapped individuals not using wheelchairs. It is emphasized that this methodology, (the functional classification and

the ergonomic requirements which derive therefrom), can be applied to most situations with which the handicapped are confronted (e.g. in the workplace and at home). The access of handicapped individuals in wheelchairs into public transport has been studied and tested by TREGIE. The authors describe the vehicles which have been used and the necessary conditions which simultaneously satisfy the needs of the handicapped (in urban transport and group travel), operations' considerations (i.e. methods of operation) and the necessary techniques of the vehicle builders. /Author/

34 184900 SWEDISH EXPERIENCE IN MODIFYING VEHICLES AND INFRASTRUCTURE. Suitable modified vehicles and personal assistance are often prerequisites for the disabled and elderly to be able to travel. A commonly used means of conveyance is the taxi-cab. Experimental studies have provided guidelines for modification of these vehicles so that people who have difficulty in walking can use them. Volvo's prototype taxi, which can be used by a person confined to a wheelchair, is described. The problems of entry and exit associated with special vehicles for transport of the disabled and the question of safety for people in wheelchairs during travel by these vehicles is discussed in relation to the results of experimental studies in which different models of wheelchairs, anchored in different ways and containing dummies, have been subjected to crash tests. The results of these investigations have been applied in an experimental car, designed by Volvo, which allows transport of two passengers in wheelchairs at the same time in the back seat and one person who has difficulty in walking in the front seat. Measures aimed at making it easier for the elderly and disabled to travel by town buses and long-distance coaches are discussed in relation to various experiments and practical tests. Different types of buses are described and analysed. Development work on designing better wheelchairs with the aim of facilitating travel is discussed. A special wheelchair that can be carried and lifted is described. The back legs of this chair are collapsible, enabling the chair to be placed, with its occupant, on top of car-, bus-or train-seats. /Author/

34 184902 ADDITIONAL COSTS INVOLVED IN DESIGNING PUBLIC TRANSPORT SYSTEMS. The discussion about the modes of transport for handicapped and elderly persons was very much intensified in West Germany in the last years. The Public transport systems are not convenient for everyone like in many other countries. Special transport services however are not everywhere available. The paper presents some results of a study about the possibilities to adapt public transport systems to the necessities of handicapped and elderly people. Estimates of cost and realization periods were made. /Author/

34 184908 LIFESTYLES AND THE CHANGING TRANSPORTATION NEEDS OF THE ELDERLY IN LOS ANGELES. Transportation plans for the elderly are frequently based upon the assumption that old people are a homogeneous group of central city residents who are poor and dependent on public transportation. Yet, there is evidence that the elderly population is quite diverse. In this paper, the diversity of the elderly is studied using the concept of lifestyle. Lifestyle is defined by a set of socioeconomic, demographic, and behavioral characteristics of a group of persons. A methodology is presented for operationalizing the concept and for identifying unique lifestyle groups among the elderly population in an urban area. An investigation of the elderly population of Los Angeles County was conducted as a case study. Seven dimensions were defined which provided a basis for the identification of seven elderly lifestyle groups. Each group was found to be unique in terms of travel demands and socioeconomic composition. Lifestyle groups were found to reside in specific areas within the county, a necessary condition to the provision of transportation services that vary with location to meet their special needs. A forecast, through the year 2000, of the population and tripmaking patterns of each lifestyle group in Los Angeles showed that diversity will continue to characterize the elderly. Some of the lifestyle areas will show increases in elderly population and tripmaking, while others will show declines.

Wachs, M (California University, Los Angeles) ; Loughborough University of Technology, England July 1978, n.p.; From the Proceedings of the International Conference on Transport for the Elderly and the Handicapped, sponsored by the Transportation Research Board, Transport and Road Research Laboratory, England, and the Ministère d'Équipement (Transports) France.; ACKNOWLEDGMENT: Loughborough University of Technology, England; ORDER FROM: Loughborough University of Technology, England, Loughborough LE113TU, Leicestershire, England

34 184911 CONCESSIONARY FARES ON PUBLIC TRANSPORT IN ENGLAND AND WALES. This paper examines the reasons for providing concessionary fares on public transport for the elderly, blind and disabled, and the advantages and disadvantages of so doing. An objective is suggested. The relevant legislation is examined and this is followed by a description of its effects which have been sufficiently varied in different areas to arouse widespread dissatisfaction. A case study of concessionary fares in Surrey, a "shire" county on the fringe of London, follows, detailing the methods and the problems involved in setting up a unified scheme. It is stressed that there are three parties whose requirements have to be met—the local authority, the bus operator and the concessionaire. The scheme and its results are covered in depth. In conclusion the benefits of a concessionary fares scheme on public transport as a whole are emphasised. /Author/

34 184912 COMMUNITY TRANSPORT PROVISION IN BIRMINGHAM. The paper is basically a descriptive summary of the results from investigations into the nature and extent of voluntary and social services transport in Birmingham. The work consisted of: (i) detailed interview surveys covering 32 voluntary organisations; (ii) a back-up postal questionnaire sent out to a total of 582 organisations. It was sponsored by the Transport and Road Research Laboratory. Although the elderly and handicapped formed a large proportion of the users, there was also a significant amount of transport provided for children and families, youth clubs and other specific groups. Transport services are provided mainly by minibuses (owned or hired) and volunteer drivers using their own cars. Generally the services are provided entirely free to passengers; being financed by local fund-raising schemes and grants. Drives are drawn from a variety of social groups, but recently retired people appear to be the most suitable. The majority of elderly and handicapped people travelling on such services find it physically impossible to use public transport, so that there is little if any duplication. Although voluntary transport in many cases provides for the majority of their travel needs these are generally low because of the extent of in-home services (e.g. meals-on-wheels).

Bailey, JM (Oxford University, England) ; Loughborough University of Technology, England July 1978, n.p.; From the Proceedings of the International Conference on Transport for the Elderly and the Handicapped, sponsored by the Transportation Research Board, Transport and Road Research Laboratory, England, and the Ministère d'Équipement (Transports) France.; ACKNOWLEDGMENT: Loughborough University of Technology, England; ORDER FROM: Loughborough University of Technology, England, Loughborough LE113TU, Leicestershire, England

34 184914 THE ROLE OF VOLUNTARY TRANSPORT. The paper briefly describes the various forms of supplementary transport which may be available to elderly and handicapped people and goes on to discuss the disparity of levels of provision in different parts of the country and the practical problems which arise if vehicles are shared. It is suggested that vehicle sharing and driver recruitment needs to be patiently built up by an organiser attached to a Council of Social Service or other nonspecialised voluntary body and that this is a role which demands considerable initiative and ability. Another approach is to publish an annually updated list of the supplementary transport resources available in an area. Examples are given. Actual and possible changes in the law under which supplementary services operate are described and it is suggested that these may have an important effect on the supplementary transport scene. Other major changes may be set in motion by the reappraisal of the organisation of social services transport which many local authorities are now undertaking and experience has shown that one factor in this reappraisal is a radical review of the proper relationship between public, statutory and voluntary transport. The paper concludes by suggesting that there is an urgent need to appoint experienced and able people (perhaps recently retired professionals working on a part-time basis) to investigate these matters and to promote the co-ordination of voluntary transport resources and District and County level.

34 184915 THE TEXAS EXPERIENCE. The basic concept of this paper is to relate how state government become involved in transportation for the elderly and handicapped, what has been accomplished since its involvement, and the plans for future involvement. Texas involvement began with a study of the problem entitled *Elderly and Handicapped Transportation in Texas—Defining the Problem* published by this Department in February, 1976. The primary purpose of this document was to bring attention to the problem in Texas and to serve as a reference manual for local and area planners. Our study of the problem combined with our involvement in the two grant programs enabled the Department to become aware of the need for more information on the status of public transportation in Texas. This Department in cooperation with two other state agencies conducted a transportation provider inventory and survey to gain this additional information. The results of this survey indicated the need for coordination and consolidation of human services transportation providers to avoid duplication of service. In response to this need, a Resource Advisory Group for Human Services Transportation in Texas has been organized by

eight state agencies and two educational organizations.

34 184917 TRANSPORT FOR ELDERLY AND HANDICAPPED PERSONS. Urban transportation problems focus on the extensive utilization of automobiles, with high social costs, to the exclusion of mass transportation systems. The deterioration of mass transit services has led to serious deficiencies in service for transit-dependent groups. Likewise the proliferation of highways and automobile-oriented facilities has fostered an urban sprawl which makes difficult effective transit operations. In such a setting, attention is frequently given to two groups: the automobile-oriented commuter and the transportation disadvantaged, particularly elderly and handicapped. Programs have been developed to discourage automobile use by the commuter and to encourage his selection of transit facilities. On the other hand, programs have more recently been developed to offer service and equipment advantages to those dependent on transit because of fewer personal alternatives. This paper deals with two such innovations in upstate New York. The first is an extensive system of Call-A-Bus operations in which special vehicles are available on a call basis for use by transit-dependent elderly and handicapped. In such a situation, it has been found that door-to-door services have enabled such persons greater access to transit and to the enrichment of life which comes through an ability to move to work, shopping, and recreation sites. The second program deals with bus-rider education. It is effectively argued that a good number of transportation-disadvantaged need not the specialized equipment or services envisioned in Call-A-Bus operations; but instead, through effective training, can be led to utilize existing mass transit facilities and routes. Such a program has been developed in the Syracuse, New York area and has proved successful in its implementation. These two programs may serve as models for reaching the special transportation needs of the elderly and the handicapped. /Author/

34 184918 MOBILITY OF THE DISABLED IN AN URBAN ENVIRONMENT. The aim of this study is to discover how and to what extent physically handicapped people cope with daily activities within the local area when living at home. An interview survey conducted in an urban area compared the mobility, use of transport facilities, local facilities, and social interaction of 120 physically handicapped people with a control group of 30 able-bodied people. The results demonstrate the need for improved transport facilities for the handicapped; and they indicated that there were three major improvements necessary in transport facilities to allow the handicapped more mobility within the local area: designed standard buses, a more flexible system of door-to-door public transport, and a larger mobility allowance to enable more of the handicapped to run their own car.

34 184919 SPECIAL TRANSPORT SERVICE AND MODIFICATION OF CONVENTIONAL PUBLIC TRANSPORT SERVICES. In this paper handicapped persons are considered to be those with insufficient physical and mental ability to move about freely on existing public transport systems. We have grouped handicapped persons into four main groups; those handicapped in movement, vision, hearing or in other respects. We estimate that 10,000 of the Norwegian population of 4 million is completely dependent on transport in special vehicles. These are wheelchair users, paralysed people, deaf-blinds, people with certain mental conditions and people with serious allergies. More than 100,000 people may with varying degrees of difficulty use trains, airplanes and ships for regional or interregional trips. For local trips they are dependent upon some sort of special transport service. By modifications to conventional public transport services, we estimate savings in yearly operating costs of 30-40 million English Pounds because of the reduced demand on special services. We have, in co-operation with the different groups of handicapped persons, investigated different modes of transport and terminals. One conclusion is that wheelchair users have the most serious difficulties as public transport passengers and that both stick-users and people who are visually handicapped have considerable problems. The aurally handicapped coped quite well. /Author/

34 184922 PLANNING FOR THE TRANSPORTATION DISADVANTAGED: A CLASSIFICATION OF USER GROUPS. Existing services for the transportation disadvantaged in the United States are fragmented among several providers which often do not account for the diversity of the disadvantaged population. A subdivision of the disadvantaged based upon their transportation needs is a necessary starting point for developing coordinated plans that meet the spirit of recent federal guidelines in a cost-effective manner. An alternative approach to client definition is offered which is based upon matching the characteristics of transportation service to the transportation needs of the disadvantaged. Because increasing numbers of persons drive an automobile, its availability is a primary consideration of the classification. Financial condition of the individual is considered to affect individuals who cannot afford an automobile. The disadvantaged may be further subdivided into those who can use conventional transit without extensive vehicle modification and those who cannot. Next, the availability and levels of service provided by the conventional transit system is examined. There is a small percentage of the disadvantaged population that can only be served by door-through-door service. A continuum of seven user subgroups is determined. The implementation of the proposed classification scheme can be used to plan for transportation services to the disadvantaged and would require inter-agency cooperation and an area-wide census of the disadvantaged.

Hood, TC Bell, TL Heathington, KW (Tennessee University, Knoxville) ; Loughborough University of Technology, England July 1978, n.p.; From the Proceedings of the International Conference on Transport for the Elderly and the Handicapped, sponsored by the Transportation Research Board, Transport and Road Research Laboratory, England, and the Ministère d'Équipement (Transports) France.; ACKNOWLEDGMENT: Loughborough University of Technology, England; ORDER FROM: Loughborough University of Technology, England, Loughborough LE11-3TU, Leicestershire, England

34 184924 IMPROVING ELDERLY AND HANDICAPPED SERVICE VEHICLE PRODUCTIVITIES UNDER CONDITIONS OF LOW VEHICLE DENSITY. A very large number of public transport service providers in the U.S. and Canada are either currently operating or are planning to operate demand-responsive transit service for the elderly and handicapped. Customers typically include public and private institutions as well as unaffiliated individuals. The providers are often faced with politically determined, large land areas to be served and limited resources with which to provide the services. In this context, development of methods to improve upon the generally low vehicle productivities experienced to date is of prime importance. The paper proposes an integrated planning, marketing and operating control methodology designed specifically to improve elderly and handicapped transport service productivities under conditions of low vehicle density. In this instance, productiv-

ity is defined as passengers per vehicle service hour, and vehicle density as vehicles operated per unit of land area.

34 184925 PUBLIC TRANSPORT FOR THE HANDICAPPED IN STOCKHOLM. Stockholm County Council is since 1977 responsible for all public transport for the handicapped. The County has a population of about 1.5 million. 67,700 persons, i.e. 4.5 percent of the population are entitled to special transport service either by taxi (62,900) or by special vehicle (4,800). 80 percent of the entitled persons are pensioners. The County Council has accentuated that the special transport service for the handicapped is to be seen more as a matter of transportation than a matter of social service. The service should as far as possible be integrated in the general public transportation. All land public transport in the Stockholm County-including the special service for the handicapped-run by Stockholm Transport (SL), a company owned by the County Council. About 4.5 million special handicapped-transportations have been produced in 1977. The gross costs of the special service were about 200 million crowns. The government subsidizes 25 percent of the costs. /Author/

34 184926 TRANSPORTATION FOR HUMAN SERVICES. This paper presents a case study of a private-non-profit corporation (PNP) in a rural county in the Northeastern United States. This PNP, Call-A-Ride of Barnstable County, Inc. (CAR), initiated a demand-responsive transportation service for the elderly and handicapped in April of 1976 with four operational mini-buses (converted vans with raised roofs, lowered steps, and hydraulic lifts for wheelchairs). As of December 31, 1977, that effort had expanded to 25 mini-buses of which 15 are equipped to accommodate wheelchairs. This enlarged program included transportation for the elderly and handicapped to health care facilities, congregate meal sites, adult day care activities, special education programs, and food delivery for a "meals-on-wheels" program for the elderly. A county-wide demand-responsive public transport

program aimed at the elderly and handicapped was also initiated. Ridership began at 250 trips per month and reached 8849 twenty-one months later. The program brought together nine sources of federal funds through an array of intermediate agencies, added to local sources of support, in order to provide these transportation services for the elderly and handicapped. This paper briefly outlines the history of CAR's development of a varied program of consolidated transportation services in rural Cape Cod, Massachusetts. It explores the problems and opportunities of an integrated program of financial assistance for these services, many of which relate to the emerging interest in elderly and handicapped transportation by the national and state governments and various regional entities. In conclusion, the paper will evaluate how some of these developments affect present and future services for transportation the elderly and handicapped in rural areas of the United States.

34 184927 TRANSPORT FOR THE DISABLED IN WESTERN CANADA. The world's largest transit company dedicated to the sole purpose of mobility for the disabled is the British Columbia Lions' Easter Seal Transport Service. The service has in excess of one hundred vehicles to transport both children and adults. The annual budget is 1.5 million to transport half a million students and two hundred thousand adults. Adult transport is becoming more a government social service and less a charity operation. The total trip costs in Western Canada range from \$5.00 to \$8.50. The vehicles generally carry between 1 and 2 passengers per hour and 50 percent of the vehicle time is spent travelling empty. The high usage by wheelchair patrons and time consuming courtesy service to and from buildings yields an "optimal" passenger rate of 2 passengers per hour. Vehicle productivity and unit costs may be reduced by revising and speeding up access procedures to the vehicle and focusing service on major nodes of demand. The service may be made efficient by employing taxis for all other service for non-wheelchair patrons. Vehicle productivity will in future decrease as cities spread over greater areas and trip lengths increase. Expanding public involvement in, and financing of, urban public transit will no doubt increase the pressure to provide transit services for the disabled. Increasing costs make it imperative that public transit and subsidized private taxi services be blended to provide maximum mobility at minimum cost. /Author/

34 184931 THEORETICAL AND METHODOLOGICAL APPROACH TO THE TRANSPORT PROBLEMS PERCEIVED BY ELDERLY AND HANDICAPPED PERSONS. We have tried, in this presentation, from a synthesis of a number of studies to determine both the needs and hopes of elderly and handicapped persons with respect to travel and to determine the difficulties of using transport, particularly public transport, while concerning ourselves with short trips in the urban area. We have been able to observe that the movement needs and the wish to use non-segregated transport is very important to that part of the population with reduced mobility. Equally we have noted that technical solutions exist to reduce the inconveniences of public transport and similarly to satisfy the needs of those categories of persons under consideration. The definition of needs has led us to emphasize the methodological difficulties raised and the way in which these difficulties are overcome. Also emphasized are the methodological precautions which should be observed in all investigations of needs and the necessity to place demand analysis in its dynamic context. Finally, our approach has led us to recommend that the problem of transport accessibility is seriously considered in the political decisions of the appropriate governmental units, to avoid seeing the decision become rapidly outdated. /Author/

Dessertine, A, President (Housing Association of the Severely Sick); Loughborough University of Technology, England July 1978, n.p.; From the Proceedings of the International Conference on Transport for the Elderly and the Handicapped, sponsored by the Transportation Research Board, Transport and Road Research Laboratory, England, and the Ministère d'Équipement (Transports) France.; ACKNOWLEDGMENT: Loughborough University of Technology, England; ORDER FROM: Loughborough University of Technology, England, Loughborough LE11-3TU, Leicestershire, England

34 184932 TRANSPORT EQUITY AND INEQUITY FOR THE ELDERLY AND HANDICAPPED. Sources of inequity in the provision of transport to the elderly and handicapped are examined, and are seen to originate in the transport planning process, as well as occurring in program implementation. It is suggested that elderly and handicapped needs be integrated rather than added on to regional plans. The paper contains a brief analysis of trip purposes and modal needs of the elderly and modal barrier problems of the handicapped. The need for major expenditures on traditional public transport is questioned. More auto-like transit is needed. Funding sources are seen to be limited, disjointed, and do not go far in improving transport equity. Local decisions must be made on the extent to which transport for the elderly and handicapped will be supported, and then programs to address their problems should be developed. /Author/

34 185421 TRANSPORTATION FOR ELDERLY AND HANDICAPPED PERSONS IN THE WASHINGTON METROPOLITAN AREA. A survey was conducted of persons living within the Washington Metropolitan Area who were 65 or older and/or who had physical or mental disabilities which made it difficult or impossible to use existing buses or taxis. Improvements in the accessibility of Metrobuses, taxis, vans, small buses and alternative paratransit systems were a major goal of this effort. A survey was made to determine demographic and travel characteristics of the target population and identify the handicapping conditions which made the use of buses or taxis difficult or impossible. The gap analysis was used to determine the latent demand for travel. Alternative service concepts were then developed which could potentially meet the latent needs. These alternatives (detailed in the text) were evaluated and combined into seven implementable programs: central information and referral program; advance reservation and subscription service; modification of existing metro-buses; special systems for nonambulatory; taxi services; carpool/van pool; and purchase of buses with lifts and ramps.

34 185424 THE LIFT: SPECIAL NEEDS TRANSPORTATION IN PORTLAND, OREGON. This report covers the first year of a two-year demonstration in which the regional transit authority in coordination with local social service agencies provides curb-to-curb transportation services to eligible elderly and handicapped clients on an advance reservation basis. The demonstration project was designed to test the transit operator's ability to provide specialized service to handicapped and elderly persons and coordinate this service with contracting social service agencies. The report presents time-series data as well as analysis of the project's workability, cost-effectiveness, and impact on all project participants. The issues and analysis procedures are outlined. The project operation and its evolution from its pre-implementation phase are described. The demand and supply of the Special Needs Transportation service are also described. The economics of the LIFT system are analyzed and the projects impact on clients, social service agencies and Tri-Met (the regional transit authority are assessed.) The conclusions are summarized, and information for comparing LIFT with two other modes (taxis and private non-profit providers) are provided.

34 186156 IMPLICATIONS OF BART'S MOBILITY AND ACCESSIBILITY IMPACTS FOR THE TRANSPORTATION DISADVANTAGED. The report examines the mobility and accessibility impacts that the 71 mile Bay Area Rapid Transit System has had to date on the transportation disadvantaged. Three special population groups are the focus of analysis—ethnic minorities, the elderly and handicapped. These groups are of special concern for transportation planning and policy because of either low-income status or mobility related impairments. Findings are reported from the investigation of five issues related to BART's impacts for the transportation disadvantaged on increased accessibility to employment, social, medical, cultural and recreational opportunities. Rapid rail patronage levels by ethnic minorities, the elderly and handicapped travelers are examined. The impact on the handicapped of BART's barrier-free design is investigated. Evaluation of these findings is made in the context of the level, nature, and degree of equity in the incidence of BART's mobility impacts. Based on the findings of the study, implications for the transportation disadvantaged of a regional rapid rail transit investment are presented in terms of policy considerations for other areas in which similar systems may be considered. 34 188944 RURAL ELDERLY TRANSIT MARKETS. In rural areas a significant proportion of elderly people are isolated from social service and recreation centers. Yet special transit vehicles serving the elderly carry only a small percentage of all elderly people. This article sheds light on this apparent discrepancy. An approach to disaggregating the transit demand is described,

and is used to derive upper bounds for demand for a comparison of urban and rural travel data. Special emphasis is placed on how the attractiveness of social services affects travel demand. Interagency panels are proposed as a feasible means for including service attractiveness in demand predictions.

34 189347 TECHNICAL REPORT OF THE NATIONAL SURVEY OF TRANSPORTATION HANDICAPPED PEOPLE. This document represents one portion of a major effort undertaken by UMTA in response to Congressional interest in and legislation for the "planning and design of mass transportation facilities to meet special needs of the elderly and handicapped." It involves a number of parallel and interdependent areas of activity ranging from a national survey to a national perspective of the state-of-the-art concerning transportation of the transportation handicapped population (THP). The purpose of this technical report is to present complete findings on all information areas covered in the National Survey in order to provide specific information for decision makers at all levels. This National Survey is a comprehensive national study using probability techniques and procedures to provide quantified information on the THP in urban areas of the U.S. The information includes the number of THP (7,440,000), their characteristics, their transportation behavior, the perceived barriers inhibiting use of public transportation, and an assessment of solution alternatives designed to improve transportation for the THP. Forty-one in-depth interviews and ten focus group sessions were conducted with leaders and members of groups representing the handicapped. Some of the highlights herein are: (1) Of the 7,440,000 THP, 98% (7,276,000) travel—19% (1,405,000) cannot use public transportation at all, 30% (2,175,000) use public transportation with more difficulty, and 51% (3,860,000) use public transportation with a little more difficulty; and (2) The average number of bus barriers is 6.9, subway barriers is 6.0, and taxi barriers is 3.7. /UMTA/

34 189609 REGIONAL CO-ORDINATION OF THE LOCAL TRAVEL SERVICES FOR DISABLED PERSONS [Regional Samordning av den Kommunala Faerdtjaensten foer handikappede]. This proposal for regional co-ordination of travel services for the disabled within the Gothenburg-region is based upon rules concerning: the right to travel, special conditions, application procedure and treatment, purpose of journey, number of journeys, length of journey, starting time of journey, co-ordination of journeys, booking of journeys, stop during journey, fares, travel company and assistant personnel. In

order to secure the co-ordination the following main principles are proposed: the working out of planning and administration aids for the local member authorities, co-ordination of booking and routing routines, co-ordinating the journeys for handicapped with other transport modes. /TRRL/ [Swedish]

34 190091 DOT RULEMAKING IMPLEMENTATIONS SECTION 504. The Federal Register of June 8, 1978 contained the draft proposed rulemaking by the Department of Transportation (DOT) which would implement section 504 for the Rehabilitation Act of 1973. The proposed regulations mandate full accessibility for handicapped persons on all bus, light rail, heavy rail, commuter rail and other transit systems. In essence, the regulations will require that all new and existing transit facilities and vehicles be accessible to handicapped persons (including wheelchair users) within a number of years specified for each mode. Any system not fully accessible within three years, however, must provide comparable alternative service until the required physical accessibility deadline is reached.

34 190210 MASTER PLAN: TRANSPORT SERVICES FOR PERSONS WITH SPECIAL NEEDS. The overall objective of the study was to develop a planned approach to solving the mobility problems of persons with special needs-the transportation handicapped. More specific objectives were as follows: identify the characteristics and needs of the group of the transportation handicapped; establish the accessibility difficulties of the existing fixed route MBTA service and develop a planned approach for improvements in order to provide increased mobility for this group; identify other existing transportation resources which provide services to this group and develop a planned approach for alternative specialized service (door-to-door and feeder to fixed route) which addresses the unmet mobility needs of this group; provide meaningful participation of advisory groups throughout the planning process and communicate results to a large public forum; and develop an integrated implementation plan. /Author/

34 190995 SUMMARY REPORT OF THE NATIONAL SURVEY OF TRANSPORTATION HANDICAPPED PEOPLE. A major effort has been undertaken by the Urban Mass Transportation Administration (UMTA) of the U.S. Department of Transportation (DOT) in response to Congressional interest in and legislation for the "planning and design of mass transportation facilities to meet special needs of the elderly and handicapped." The total endeavor involves a number of parallel and interdependent areas of activity ranging from a national survey to

identify and quantify the transportation handicapped population to a national perspective of the state of the art concerning transportation for transportation handicapped people. As a first step in this multi-phased program, UMTA funded a comprehensive national study using probability techniques and procedures which provide quantified information on the transportation handicapped population in urban areas of the United States. This information includes the number of transportation handicapped people, their characteristics, their current transportation behavior, the perceived barriers that inhibit using public transportation as often as they would like, and an assessment of solution alternatives designed to improve transportation for transportation handicapped people. The national survey is considered to be a major component of the total endeavor since it establishes a firm base of knowledge on the transportation handicapped population on a national basis, which until now did not exist.

34 191026 TRANSPORTATION FOR THE ELDERLY AND HANDICAPPED. VOLUME II. USER SURVEY RESULTS. In August 1976 the Northwestern Indiana Regional Planning Commission (the Metropolitan Planning Organization) began a process to develop a plan which would meet the transportation needs of mobility-limited people in Lake and Porter Counties. The first phase of the planning process was an inventory of existing transportation (Volume I), and a survey of user needs (Volume II). The number of elderly and handicapped in Lake and Porter Counties is 65,019, the base population for this survey. This report, Volume II, contains tables of numbers documenting in detail the results of a survey distributed to 3,117 people, of which 1,000 were returned. Results are presented in two ways: some tables simply describe questionnaire results, and others present cross-tabulations to many questions. Information is displayed in numerical and literary terms.

34 191297 TRANSPORTATION AND THE ELDERLY AND HANDICAPPED: A LITERATURE CAPSULE. This volume, one in a series initiated by the U.S. Department of Transportation, is intended to make the literature in transportation concerning the elderly and handicapped more accessible to decisionmakers in the community. It includes an introduction to the literature, selected summaries of five detailed studies in transportation for the elderly and handicapped, and an annotated bibliography. Literature selected for identification and annotation is organized according to five categories: overview, needs, programs, planning and policy. Approximately 100 citations are included that date from 1970, and an author index and a listing of

suggested periodicals and other sources of information are provided. Five studies in transportation for the elderly and handicapped are detailed: (1) Transportation for Older Americans-The State of the Art, a comprehensive survey of the transportation problems of older Americans; (2) The Handicapped and Elderly Market for Urban Mass Transit, an evaluation of the urban market for mass transit alternatives to serve the elderly and handicapped; (3) Transportation for the Elderly and Handicapped-A Prototype Case Study of New York State Experience in Activating an Element of a Federal Grant Program; (4) Lincoln Experimental Transportation Demonstration Project, a study of various types of transportation services for elderly and handicapped residents in Lancaster County, Nebraska; and (5) Planning Handbook-Transportation Services for the Elderly, a manual for transportation planning methods and techniques.

34 191338 TRANSPORTATION FOR THE ELDERLY AND HANDICAPPED VOLUME I. INVENTORY AND ANALYSIS. In August 1976, the Northwestern Indiana Regional Planning Commission (the Metropolitan Planning Organization) began a process to develop a plan which would meet the transportation needs of the elderly and handicapped persons in Lake and Porter Counties. The First Phase of the planning process was an inventory of existing transportation (Volume I), and a survey of user needs (Volume II). This report, Volume I of II Volumes, describes the First Phase of the planning process, namely, the transportation situation of the mobility-limited people in Northwest Indiana; it also documents the first planning phase--data gathering and analysis, committee organization, alternative evaluation, and initial recommendation. There are 46 agencies providing some transportation to the elderly and handicapped people, ranging from medical patient reimbursement to special Dial-A-Ride vans to regular bus and train service at reduced rates. The results of a survey of users of the services reveal that half (32,500) of the 65,000 elderly and handicapped in the two counties need better transportation or have none at all.

34 191611 IMPACT TESTING OF RESTRAINT DEVICES USED WITH HANDICAPPED CHILDREN IN BUS SEATS AND WHEELCHAIRS. A series of 16 sled impact tests were conducted at the Highway Safety Research Institute sled facility in order to evaluate the effectiveness of restraint devices and systems currently being used for the transport of school bus and wheelchair-seated handicapped children in the state of Wisconsin. A sled impact pulse of 20 m.p.h. and 16 G's was used for all tests. Eight tests involved wheelchairs in for-

ward-facing and side-facing orientations for head-on and 33 degree oblique impacts. Another eight tests involved forward-facing bus seats for head-on and 33-degree oblique impacts. The results generally point out the ineffectiveness of many currently used devices and systems for protecting the child in the event of a bus collision. In six of the eight bus seat tests the dummy's head struck the back of the bus seat in front. The practice of placing wheelchairs in a side-facing orientation is shown to be a poor one for the protection of the child.

34 191640 REPORT ON SERVICES TO THE ELDERLY. NUMBER 1, TRANSPORTATION--A LOW COST, FARE-FREE TRANSPORTATION PROGRAM. This report is the first in a series on county efforts to help the elderly, sponsored by the Aging Program, National Association of Counties Research Foundation, and a grant from DHEW. Cape May County, on the southern tip of New Jersey, is a resort community in the summer but for the rest of the year the county has only a small scattering of stores, a few service industries, and 15,878 elderly residents. These residents faced many problems because in the winter there was no public transportation in the county. To cope with this problem, Cape May City bought a 12 passenger van in 1970 to help elderly residents get to stores and to doctors' offices. Since then the service has expanded and now most of the free rides are provided by 44-seat school buses that follow six separate routes on fixed schedules. The program employs 10 drivers, called senior assistants, who all have completed special driving courses as well as emergency medical technician training. Costs are currently shared by the county and Federal grants. In 1976 an estimated 120,000 free rides were offered.

34 192099 TRANSPORTATION FOR THE HANDICAPPED: AN ANNOTATED BIBLIOGRAPHY OF THE HOLDINGS OF THE INSTITUTE OF TRANSPORTATION STUDIES LIBRARY, UNIVERSITY OF CALIFORNIA AT BERKELEY. The annotated bibliography is concerned with transportation for the handicapped. For the most part, it represents holdings found in the Institute of Transportation Studies Library at the University of California, Berkeley. A few important works not currently in the ITS Library holdings are included. Compilation of the bibliography was carried out during Spring and early Summer, 1978. A quick glance through the bibliography reveals a few citations prior to 1970. This is not due to a lack in ITS Library holdings, but rather reflects the scant attention paid to the subject before the late 1960's in this country. The belated interest of the 1970's has been spurred on by federal and state legislation, as well as by the disabled themselves. Much attention continues on transportation for the

disabled, and thus much more in terms of publications can be expected in the near future. The bibliography is broken down into broad subject sections, as indicated by the table of contents following. With the exception of bibliographies, all foreign works are listed in a special section.

34 193543 TRANSPORTATION PLAN FOR THE ELDERLY AND HANDICAPPED. This report documents the Council's continuing efforts to explore ways to improve transportation services to the elderly and handicapped of the St. Louis area. Current data on the size and distribution of the elderly and handicapped population is presented and the extent of existing transit and paratransit services documented. The report concentrates on identifying the needs of those elderly and handicapped who represent the market for public transportation services and offers alternatives for meeting the unmet transportation needs of that segment of the population. /Author/

34 195498 AN INVESTIGATION INTO THE TRAVEL PERFORMANCE OF PHYSICALLY HANDICAPPED PERSONS. The study described in this report comprised an investigation of the travel performance and behaviour of 26 persons having various types of physical impairment of a permanent nature. These subjects were observed, recorded and assessed whilst negotiating a pre-selected route which comprised a purposeful journey from Loughborough to Leicester incorporating four modes of transport (pedestrian, bus, car and train). Data relating to speed of performance on individual tasks comprising the route, and the nature and degrees of difficulty experienced during travel, have been analysed in order to provide guidelines in terms of gross orders of priority for the future design and operation of public transport systems more suited to the requirements of physically handicapped persons. Generally, results have indicated that travel tasks which involve raising and lowering the whole body (and especially the former) can be assigned maximum priority for planning action. Walking distances in modal and inter-modal access, and within transport termini, are also designated a high priority. The need to improve the communication of relevant information to the physically handicapped traveller is suggested. /TRRL/

34 195632 THE APPLICATION OF PUBLIC TRANSIT PRINCIPLES IN SUPPLYING HANDICAPPED TRANSPORTATION IN A MEDIUM-SIZED CITY. The authors discuss the set-up and operation of a modified route service to supplement the current taxi-type service for the physically handicapped. Based on user

locations and trip purposes for the "taxi" service, three zones of the city where user density was highest were selected for the new service. Trip purposes indicated that over 60% of the destinations were to a major hospital and the down-town area. The "zone" service goes through eight cycles a day and is comprised of a demand-responsive pickup loop, transportation to destinations and a drop-off loop. Among the various statistics that were analyzed were: time per passenger trip, load/capacity ratio and cost per passenger trip. By comparing statistics with the "taxi" service and maintaining a close rapport with the operators of the service, improvements and changes were made to maximize the benefits of the "zone" service. This new service has improved the usefulness and availability of transportation for the handicapped and decreased costs on a per passenger basis. /TRRL/

34 195889 SAFETY DURING SPECIAL TRANSPORTATION SERVICE TRIPS. VOLUME ONE; TRANSPORTATION IN VEHICLES DESIGNED FOR THE HANDICAPPED. Special transportation is provided in Sweden for those who have difficulty in using the regular public transportation systems. The vehicles used for the special transportation are generally small buses and all are equipped with a ramp or a small elevator to move the passengers into or out of the vehicles. Inside of the vehicle, seats have been removed and special fastening equipment for wheelchairs has been installed. Travel service vehicle transportation can be divided into three main parts: 1) moving to or from the vehicle; 2) moving into or out of the vehicle; and 3) traveling in the vehicle. The University of Goteborg conducted studies on the safety aspect of loading and securing wheelchairs in this type of transportation service. This report covers the wheelchair-securing portion of the study. A related study: Volume Two: Movement In and Out of Special Transportation Service Vehicles (PB 289-132T), deals with safety factors during the movement into and out of the vehicles. In the conducted studies described in this report, dummy-occupied wheelchairs were dynamically tested on a sled simulator while secured by various methods. Six different types of chairs were tested. Crash simulations were made at acceleration levels of 5g, 10g, 15g, and 20g, and all occurring under at least 100ms from onset. The report concludes that satisfactory securement can be provided for forward and rearward-facing wheelchair users on the special transportation vehicles. However, sideway facing is not advisable because of the low tolerance of the human body to side stresses. /UMTA/

34 195939 ELDERLY AND HANDICAPPED TRANSPORTATION OPERATIONS STUDY. This study focuses on the coordination and consolidation of transportation services for the elderly and handicapped in the New Haven, Connecticut area. The report focuses on the areas of vehicle control, financial control, and system evaluation. In some cases, analyses have been up-dated during the preparation of this final report. The proposed near-term system is intended to provide a plan for the integration of services. Initially, it is proposed that this involve services currently offered or planned by three local agencies: the City of New Haven Office of Human Services; the Easter Seal Rehabilitation Center; and the Greater New Haven Transit District. Integration would be accomplished through purchase of service agreements between each agency and a local private transportation operator. This approach represents a cross between system consolidation and system coordination, and attempts to achieve the economies of consolidation while allowing participating agencies to retain a degree of identity and control. A purchase of service agreement based on payment per passenger is also proposed. The vehicles (10 to 12 passenger vans) for the service are to come from a combination of public and private sources. To improve the management of the system, it is proposed that an automated computer-aided scheduling/financial control system be designed and implemented. To facilitate the implementation and monitoring of the service, some degree of coordination between participating agencies is required. This report discusses operating framework, vehicle control, financial control, reporting requirements, cost analysis, and system implementation.

34 197023 PUBLIC TRANSPORT AND THE HANDICAPPED. The author points out that pedestrians of all ages make use of buses, trams, metro's and trains. They are consumers of public transport. Some of these people have a handicap, of which some are temporary and some are for a lifetime. Public transport is managed by healthy people of employable age for healthy people of employable age. The handicapped are a minority group and have little done for them. In this paper a review is given of research, studies and applications of measures which have been taken in various countries for better accessibility and increased safety of public transport for disabled persons. These include, use of audible warning by vehicles when reversing, audible signals at pedestrian crossings, arrangements made for help on train and air journeys, accommodation for wheel chairs on trains and buses and at stations. /TRRL/

34 197111 ELDERLY AND HANDICAPPED TRANSPORTATION STUDY PUBLIC TRANSPORTATION FUNDING CATALOGUE. This catalogue is designed to serve as a reference for public transportation or "special transportation" funding sources. State administered financial and technical aid programs are described, and a number of local tax revenue sources that can be used for public transportation financing are reviewed by analyzing local tax enabling legislation. Federal funding sources are described, and federal programs are listed and described by department or agency and brief excerpts are provided for each funding program. Local tax revenue and other financial resources that can be used to provide local matching funds for state and federal programs are described. The catalogue also describes how certain programs can be consolidated for joint funding as well as funding sources that may be currently unused in the Greater Bridgeport Region. A table is provided which gives a brief summary of Federal Public Transportation Funding Sources. The table indicates whether funds can be used for financing operating costs, capital costs or labor costs, who is eligible under the funding program, and what types are eligible for funding.

34 197146 TRANSPORTATION FOR THE ELDERLY AND HANDICAPPED. The report identifies the transportation needs of the elderly and handicapped, evaluates the current services, and discusses options to meet special transportation needs. It was prepared for local governments to use in the development of their own local transportation plans for the elderly and handicapped. According to the Urban Mass Transportation Administration, local transportation plans for the elderly and handicapped must be prepared and implemented in order for local governments to receive any federal transit capital and operating funds. /Author/

34 197154 ELDERLY AND HANDICAPPED TRANSPORTATION STUDY. VOLUME 4. This report presents a Regional Plan for the improvement of transportation services to the region's elderly and handicapped persons. The Greater Bridgeport Region includes the City of Bridgeport and the towns of Easton, Fairfield, Monroe, Stratford and Trumbull. The plan can be implemented over a 5-year period and specifies: management actions that can be carried out to improve the coordination of currently provided services; financing actions that can provide additional funds for both capital and operating costs required by the provision of improved services; operational actions that can make the provision of existing and improved services more efficient and cost effective; regulatory actions that can eliminate barriers to the improved coordination or consolidation of services; and public relations actions that can be taken to make existing

transportation services known to a broader base of elderly and handicapped persons and that can lead to the identification of persons needing transportation services. /Author/

34 197155 TRANSPORTATION SERVICES FOR THE ELDERLY AND HANDICAPPED, BROWNSVILLE. The information presented herein establishes a data base for planning public mass transportation facilities and services that can effectively be utilized by the City's elderly and handicapped (EH) citizens. It details the findings of a survey questionnaire which was designed to determine the current level of transportation services for the EH in the City of Brownsville. From this detailed evaluation an analysis is made to quantify those EH persons who, because of their impaired mobility, do not have access to transportation services and facilities. The final section of this report discusses operations alternatives to provide demand-responsive service for semi-and non-ambulatory persons. /Author/

34 198140 RESOURCE GUIDE TO LITERATURE ON BARRIER-FREE ENVIRONMENTS. WITH SELECTED ANNOTATIONS. This annotated bibliography provides a guide to the state-of-the-art knowledge and literature on architectural barriers and barrier free design. Every attempt has been made to identify and review all relevant documents through December 1976. The format for citations consists of bibliographic information, descriptors, and an annotation or abstract. The major subject areas contained in the guide are: architecture by type of building and barrier elements; transportation by transit systems, by mode and by fixed facilities, streets, highways and pedestrians; parks and recreation; standards, legislation, and legal matters; general statistics and human factors research; disabilities by type; attitudes of professionals, handicapped persons, elderly persons and the public; aid and devices for handicapped persons; and information resources and audio / visual aids. Citations range from research studies, surveys, literature reviews, books, dissertations, journal articles and other professional literature to more general information for consumers and the public such as pamphlets, booklets, flyers, fact sheets, press releases and manufacturer's specifications. Appendices include listings of travel guides for the handicapped and periodicals and organizations related to barrier free environment or services for the handicapped or elderly.

34 198143 ELDERLY AND HANDICAPPED TRANSPORTATION PLAN. This transportation plan has been prepared to provide direction in meeting the transportation needs of the elderly and handicapped population in Massachusetts' Merrimack Valley Planning Commission (MVPC) region. The federal mandate for transportation planning and the implementation of transportation services for the elderly and handicapped is discussed. Social service transportation is analyzed for the region in terms of regularly scheduled service, volunteer service, and client-restricted service. Information on the available fixed bus route service in the region is presented. Data on the size of the region's elderly and handicapped population, based on the 1970 Census, are also presented. The demand for transportation service through the development of ridership estimates is examined. Various types of transit service and management structures that could be employed to operate a transit system for the elderly and handicapped are noted. Appropriate concepts for the MVPC region are fixed route service, demand-responsive service, and user side subsidy. Cooperation, coordination, and consolidation are viewed as significant alternatives in the operation of a transportation system for the elderly and handicapped. Recommendations for establishing a transportation system for the elderly and handicapped in the MVPC region are offered, including detailed service recommendations and costs. Consideration is given to funding, monitoring, evaluating, and marketing special transportation services. Additional information on the plan for the MVPC region is appended, as well as a social service agency questionnaire.

34 198265 ELDERLY AND HANDICAPPED TRANSPORTATION: LOCAL GOVERNMENT APPROACHES. One of the highest priorities identified by the Transportation Task Force of the Urban Consortium for Technology Initiatives during its first year was providing transportation to handicapped and elderly citizens. The publication describes how a number of localities have dealt with this problem. A wide range of existing innovative local government approaches to transportation for elderly and handicapped persons were investigated and described. Detailed case studies were prepared for most of the services described in the report. No single example presents a complete answer to the problem of mobility for elderly and handicapped persons. However, the examples collectively identify the variety of options which are available to local officials and the need to fit solutions to local situations. In the report, the service descriptions are grouped informally according to the type of service provided in various cities throughout the United States. In the interest of examining the relative merits of each approach, a summary table of key characteristics is provided.

34 198722 COORDINATION OF SPECIAL TRANSPORTATION SERVICES IN WACO, TEXAS. This study of special transportation services and their coordination in the city of Waco, Texas was conducted to: identify agencies involved in the provision of special transportation services, compile detailed information on each agency, analyze data for the purpose of determining whether there were overlapping or duplicative services and whether economies could be achieved through consolidation, and evaluate special transportation service alternatives and select the best one for the Waco area. The target population for special transportation services constituted the elderly, handicapped, and other transportation-disadvantaged citizens. Of 37 agencies initially contacted, 16 returned questionnaires. Information was provided by agency respondents on the scope of services, drivers, vehicles and maintenance, agency budget information, income sources, and agency opinions about various transportation services available in Waco. A demographic survey and an activity center survey were also conducted. Three alternatives were selected as viable for the Waco area: (1) maintaining the existing supply of special transportation services; (2) establishing a single special transportation system; and (3) forming a special transportation system as an integral part of the public transportation system. It is recommended that the third alternative be adopted by the city of Waco. More detailed recommendations in the areas of organizing, operating, and financing a coordinated special transportation system are offered. Survey materials, survey summaries, a description of the estimated ridership demand methodology, and agency data sheets for special transportation services are appended.

34 198921 JOINT HEW-UMTA EVALUATION OF ELDERLY AND HANDICAPPED TRANSPORTATION SERVICES IN REGION IV. VOLUME I. PLANNING AND COORDINATION MANUAL. The major goals of the project were twofold: (1) to evaluate the degree of coordination that presently exists among human service transportation providers, both public and private, with special attention focusing on the needs of older citizens and handicapped individuals; (2) to develop a generic planning, implementation, and evaluation document based on an analysis of findings in six selected sites in the Southeast that would be transferable to any community seeking to more efficiently serve the mobility needs of elderly and handicapped persons through coordinated efforts. Volume I is a 'how to' manual intended for use by those responsible for planning and/or operating specialized transportation systems. Paratransit, elderly, and handicapped transportation; social services transportation; and rural transportation are the categories addressed. The manual explains how to start, plan, operate, and manage a specialized transportation system and how to coordinate the services of one agency with those of others.

34 260638 TRANSPORTATION FOR THE ELDERLY (TOTE) A PILOT PROJECT TO DEVELOP MOBILITY FOR THE ELDERLY AND THE HANDICAPPED. The Transportation of the Elderly (TOTE) Demonstration Project in St. Petersburg, Florida, was initiated for the purpose of improving and increasing the mobility of the elderly and handicapped. This demonstration is being conducted in a 10 square-mile area which houses a target group of 30,000 persons. Reservation, Subscription, Demand Response and Renta-Bus are the 4 door-to-door services being utilized to provide the elderly (60 and over) and the handicapped (no age limitation) with increased mobility. At the conclusion of the project it is anticipated that TOTE will be integrated with the Municipal Transit System to complement the 30 some fixed routes presently in operation within the demonstration area. As a means of control and a method of identifying the riders, a registration program was initiated 4 months before service started. Approximately 7,000 had registered prior to the first passenger pick-up. This figure had increased to 12,626 as of March 31, 1974 and it is expected that close to 20,000 will be registered by the end of the project. Among findings are: the two major outgoing trip purposes for the first six months of operation have been medical/Dental (27.9%) and personal business (25.9%); peak-hours have been between 10 a.m. and noon; and, reservation and subscription services have been used by approximately 85% of the riders during each month of operation. /UMTA/

34 262515 PROBLEMS OF THE CARLESS IN THE UNITED KINGDOM AND THE UNITED STATES. An examination of current population statistics show that in the U.S. more than half of the population is without immediate access to a car, and in the U.K. more than three-fifths of the population is without access to a car. This phenomenon has been accentuated by national investment in both countries in major highway programs. The term carless refers to

more than just households that own no cars. It extends, in households with cars to those without licenses (old and young), the handicapped, and even the licensed drivers who have no access to the family car when it is in use elsewhere (e.g. at work). The most severely affected are those in urban areas and especially the urban poor. Transportation expenses are limited for the poor. Recent dispals of public dissatisfaction and protest are priority. Once the work trip has been satisfied, money for other trips, for the poor, is not always available. One solution to cost-free travel is pedestrianism (walking), but this too is difficult in urban areas where the pedestrian has been overlooked in favor of the car. Solutions to problems of the carless include dial-a-ride, better public transit, and better design of urban form. /Author/

34 263931 METHOD FOR EVALUATING METROPOLITAN ACCESSIBILITY. Improving the quality of urban life requires not only the provision of employment, medical, educational, and recreational opportunities but also a convenient means of access to these facilities for all citizens. This study reports on a prototypical application of a new methodology, called Special Area Analysis (SAA), designed to assess the quality of accessibility in metropolitan areas. Starting with a definition of accessibility in functional terms, this SAA develops measures that focus on the level of accessibility afforded by Boston's present, planned, and programmed urban transportation systems to such essential urban activity centers as major employment districts, medical, recreational, and educational facilities, the central business district, and the airport. In addition, the methodology is applied toward an evaluation of the level of accessibility afforded to specific population subgroups such as low-income and zero-car households. This study demonstrates that the SAA methodology is a useful evaluation tool for use by metropolitan area transportation planning agencies.

34 265262 PROJECT HELPING WHEELS. 'Helping Wheels' (1971-1973) determined the effects of reimbursement on a volunteer driving program and established a system of special transportation services for the elderly which was a reliable, acceptable, and economical means of transporting senior citizens. Reimbursement of 10 cents per mile to older volunteers using personal automobiles significantly increased both the number of drivers and riders. It also developed a network of transportation services, STIR (Senior Transportation in Raleigh), which resulted in reduced bus fares and discount ambulance service.

Gresham, SM Evans, KL ; North Carolina State University, Raleigh, Social and Rehabilitation Service Final Rpt. June 1973, 89 pp; Grant SRS-RD-93-75169; ACKNOWLEDGMENT: NTIS (PB-235628/5); ORDER FROM: NTIS, Repr. PC, Microfiche; PB-235628/5

34 265263 AID TO SENIOR CITIZEN MOBILITY IN EAST ORANGE, NEW JERSEY. AN ESCORT SERVICE. A demonstration project was begun on September 1, 1971 to test the hypothesis of the apparent need for the elderly population for an escort service, a corps of transportation aides, to accompany individuals on public transportation. Because of the apparent difficulty many elderly individuals have in using public transportation (buses, trains, taxis), due to the handicaps of increasing age, it was felt that latent demand of the elderly population for this trip-making could be drawn out by this means. Accordingly, a sample of the population of East Orange, New Jersey, was interviewed to determine current intentions and habits with respect to trip-making; the local transportation system was studied to develop knowledge of its availability and applicability to the elderly population's trip-making propensity, and escort personnel were hired.

34 291142 THE DISABLED TRAVELLER ON PUBLIC TRANSPORT. Constructive suggestions are given for the guidance of operators to meet the needs of disabled persons using public transport. With regard to travel by bus the long-term aim is to stipulate the lowest step height possible. Handrails, bell pushes, fare collection, seating and storage are the subject of experiment. With train travel, handrails and seating are discussed. The department recommends the practice of inviting representatives of disabled people to comment on their experience of existing facilities and to test prototypes for convenience and comfort. /TRRL/

34 300252 TRANSPORT AND HANDICAPPED PEOPLE. A LITERATURE SURVEY PREPARED IN THE DEVELOPMENT AND SPECIAL PROJECTS SECTION, REHABILITATION POLICY AND SERVICES DIVISION, OF THE COMMONWEALTH DEPARTMENT OF SOCIAL SECURITY. Material in this report is covered in three sections. The first (chapter 2) is concerned with the definition of disability and identification of disabled people, both in practice as it is done in Australia and overseas, and in theory, as it might have been done. The second (chapters 3- 6) is concerned with transport barriers on the major transport systems: road, rail, air, "private" and "public". It covers identification of the barriers which make them partly or wholly inaccessible to the disabled, and the attempts to remove these barriers. The third section (chapters 7-8) focuses on the roles of organisations for the handicapped and of governments in bringing about change in the transport system as a whole, and assesses the value of the various approaches that have been adopted. Comments on the applicability of particular approaches to the Australian social and political situation, and to the needs of handi-

capped people in Australia, are made throughout the discussion. /TRRL/

34 300254 TRANSPORTATION FOR THE MENTALLY AND PHYSICALLY HANDICAPPED. PHASE 2. This report was prepared for the South Australian State Health Resources Unit. This phase II study analyses existing transport provisions for mentally and physically handicapped persons, and identifies ways in which the efficiency and effectiveness of transport service for these people can be improved. Recommendations are presented for longer term objectives and policies concerning co-ordinated funding, regionalization of services for the handicapped, need for special transport, payment of fares, satisfaction of latent demand, vehicle specification and modification, use of volunteers, monitoring of services and staggered working hours. Short term actions on improved utilization of vehicles, co-ordinated purchasing of new vehicles and vehicle modifications, use of taxis, contract mini-buses and sales tax exemptions for modifications are recommended. /TRRL/

34 300366 THE VALLEY TRANSIT DISTRICT EVALUATION STUDY: THE EVOLUTION OF A FLEXIBLE TRANSIT SYSTEM. This paper discusses transit service for the elderly and handicapped and low income persons provided by the Valley Transit District in Connecticut. A computer was intended to provide a billing function for the service; and in addition, it was planned that it serve as a tool for more efficient dispatching. However, this never occurred; and the computer, which is not operational at present, is not likely to be repaired in the immediate future. A radio communication system, which was built into each vehicle initially, has been maintained; and it has permitted more efficient dispatching of vehicles as well as immediate notification in case of breakdown of vehicles of malfunction. There has been a problem with the Transit District Vehicles. The original buses, which established a standard in rider comfort and attractiveness that no subsequent units have been able to match, were mechanically unable to meet service demands; and all six of those vehicles have been out of service for at least three years. The second group of vehicles had a similar fate; however, the present fleet seems to be relatively stable. Management of the transit district has been extremely difficult, and marketing efforts have always been minimal and frequently of negative nature. The operating costs have been held remarkably consistent over the past three years, which is due in large part to increased state assistance and growing ridership from new services. Rider revenue has increased throughout the life of the District. Improvements of the Transit District's utilization will be effected, in large part, by more comprehensive coordination of the services with those of other modes.

34 300453 VEHICLES AND SYSTEMS FOR TRANSPORTATION OF DISABLED. Suitable modified vehicles and personal assistance are often prerequisites for the disabled and elderly to be able to travel. Experimental studies have provided guidelines for modification of taxi cabs. Volvo's prototype taxi, which can be used by a person confined to a wheelchair, is described. The problems of entry and exit associated with special vehicles for transport of the disabled and the question of safety for people in wheelchairs during travel in these vehicles is discussed in relation to the results of experimental studies in which different models of wheelchairs, anchored in different ways and containing dummies, have been subjected to crash tests. Measures aimed at making it easier for the elderly and disabled to travel by town buses and long-distance coaches are discussed in relation to various experiments and practical tests. Development work in designing better wheelchairs with the aim of facilitating travel is discussed. A special wheelchair that can be carried and lifted is described. /TRRL/

34 300698 OVERVIEW OF THE SOCIAL SERVICE INSURANCE DILEMMA. ABRIDGMENT. The General Accounting Office estimates that there are 112 federal programs which serve the needs of the elderly and the handicapped by transporting either the service to the client or the client to the service. In addition, there are several programs of the Department of Labor, the Department of Transportation, and programs under the Comprehensive Employment Training Act. The operation of a program is briefly described, and it is shown that efforts to meet intense social needs are totally frustrated by insurance limitations. Insurance limitations problems encountered by social-service agencies are discussed and 6 recommendations which emerge from the study are presented. The impact of the proposed changes on social-service transportation projects are also discussed.

Davis, FW, Jr (Tennessee University, Knoxville) *Transportation Research Record* No. 696, 1978, pp 38-40; This paper appeared in TRB Record No. 696, Rural Public Transportation.; ORDER FROM: TRB Publications Off

34 300714 IDENTIFYING AND SERVING THE ELDERLY AND HANDICAPPED IN RURAL AREAS. ABRIDGMENT. It is noted that more data is available on auto ownership by elderly persons than on the needs of handicapped persons. The relative transportation disadvantage of elderly households is compounded by the high incidence of such households in rural areas. Local social service and welfare agency data can provide details of handicapped persons without access to automobiles. Data on hospitals, clinics and senior citizens offer information on the physical, economic and other characteristics of their clients. In

addition to addresses and other information from these organizations, supplementary data can be obtained from direct surveys. Information obtained from state highway and transportation departments could be used in conjunction with the other sources to identify the primary target groups. Rural inhabitants who are neither elderly nor handicapped and who would desire public transportation may also be identified.

34 301055 USE OF TRAVEL DIARIES IN COLLECTION OF TRAVEL DATA ON THE ELDERLY AND THE HANDICAPPED. ABRIDGMENT. Because other data collection methods, such as retrospective travel surveys and on-board user surveys, have not provided statistically reliable results, a method is proposed whereby each survey subject records in a diary each trip made over a specified and extended period of time, thus precluding memory lapses and reducing random variations. This paper reports on the planning and implementation of a before-and-after survey of elderly and handicapped users of a user-side-subsidy demonstration project in Lawrence, Massachusetts, which incorporates diary techniques. The study plan called for the diary survey to be administered once before the start of the project and then again a year after to monitor changes in travel patterns. The survey field plan had four stages: preliminary screening, field contact and training for the pilot test, conduct and review of the pilot test, and conduct of the main survey. In both the pilot and main survey, a random sample of elderly and handicapped were selected and then contacted for a 2 minute screening interview. The participants were then given the diaries (which, as the result of previous surveys) were designed to be as concise and simple as possible) which were collected once a week. (This continuing contact was later judged to be an important factor.) Major literacy or comprehension problems were not encountered. Ultimately, 195 of the 196 elderly and 90 of the 93 nonelderly handicapped completed the main survey. No diary was rejected because of unusable results or sloppy or suspicious reporting.

34 301934 OPERATIONAL IMPROVEMENTS FOR SPECIAL TRANSPORTATION SERVICES FOR THE HANDICAPPED. This study has two principal objectives: to investigate the factors influencing the effectiveness and efficiency of special public transportation services for the handicapped, and to develop a series of recommendations to improve the operations of these systems. As a secondary objective a permanent information sharing mechanism for special service operators in Canada was to be evaluated. /TRRL/

34 302122 RETROFITTING TRANSIT STATIONS: POTENTIAL OPERATIONAL IMPACTS. Congress has mandated that at least the key stations of rail rapid transit systems in the older urban areas be retrofitted to make them accessible to persons in wheelchairs or otherwise handicapped persons. The potential operational impacts of such retrofitting fall under the areas of safety, security, service, and cost. These impacts are discussed in relation to the retrofit of individual stations, the effects of the individual station upon the system, the effects of the mix of accessible and nonaccessible stations upon the user and the system during the retrofit period, or permanently if the key station approach is followed, and to the perceptions of the user. The safety consequences of an unavoidable mix of accessible and inaccessible stations must be determined. It is noted that anything that adds to station congestion will subtract from the attributes of service. In addition to the impacts of degraded safety and security and service, there is the impact of increased cost. It is concluded that the impact of station retrofitting will not be conducive to increased employee productivity. The transit operator will also face the potential of increased labor costs as a consequence of station retrofit. The observation is made that the potentially high unproductive use of scarce fiscal resources in station retrofit is frustrating.

34 302261 PROCEEDINGS OF THE THIRD UMTA R&D PRIORITIES CONFERENCE, CAMBRIDGE, MASSACHUSETTS, NOVEMBER 1978. VOLUME VIII: ACCESS FOR ELDERLY AND HANDICAPPED PERSONS WORKSHOPS. This is a compilation of material that was presented at the Third UMTA R&D Priorities Conference Workshops on Access for Elderly and Handicapped Persons. Part I deals with planning and regulation and includes discussions of transportation problems of handicapped people and transportation policies and practices as they affect handicapped people. Part II, demonstrations and hardware, includes discussions of concepts under development in the area of transportation for the elderly and handicapped hardware research and development to improve transit for elderly and handicapped travellers, and a critique of research concerning transportation for the elderly and handicapped. This volume contains five resource papers which are summarized in Volume I of this multi-volume work along with summaries of other workshop sessions. Volume I also includes the proceedings of the general sessions and a listing of conference participants. These proceedings (Rpt. Nos. UMTA-DC-06-0157-79-1 thru UMTA-DC-06-0157-79-9) consist of nine separately titled volumes, namely: Volume I: Proceedings of General Sessions and Summarized Reports of Workshops; Volume II: Bus and Paratransit Technology Workshops; Volume III: AGT and Advanced Systems Workshops; Volume IV: Service and Methods Demonstration Workshops; Volume V: UMTA Special Technology Programs Workshops; Volume VI: Rail and Construction Technology; Volume VII: Transit Management Workshops; Volume VIII: Access for Elderly and Handicapped Persons Workshops; and Volume IX: Urban Transportation Planning Workshop.

34 302434 ALTERNATIVE TRANSPORT FOR THE HANDICAPPED IN THE NETHERLANDS. A TYPOLOGY, TEXT AND APPENDICES [Alternatief verkeer voor gehandicapten in nederland. Een typologie, tekst en bijlagen]. Nine categories of alternative transport systems for handicapped (altev) are distinguished: volunteer organizations, taxicab companies, nursing-homes, revalidation centres, homes for the aged and nursing-home combinations, general systems, motor coach companies, residential centres and social work-shops. They are compared regarding technique, organisation, financing, use, efficiency, costs and users. A comprehensive picture of each category is given. Design and course of the project are explained. A separate appendix contains an extensive description of 36 system operators, divided into the nine categories. /TRRL/ [Dutch]

34 302688 THE IDEAL DESIGN OF A SCHOOL BUS STOP. EVERYTHING CONCERNING PLANNING, COSTS, EQUIPMENT AS EXEMPLIFIED BY RINGSTRASSE IN WINNENDEN [Musterbeispiel Einer Schulbushaltestelle. Alles ueber Planung, Kosten, Einrichtung, Dargestellt am Beispiel Winnenden, Ringstrasse]. The documentation reports on an "ideal school bus stop", and the support received from the press and local and central government authorities. It contains the requirements of the adac concerning school bus transport, a review of the dangers and potential accident situations involving children at bus stops, photos which record the improvement of the safety aspect of the bus stop, a layout plan of the bus stop, the new school bus stop sign proposed by the ADAC, a cost plan, press releases from the ADAC, the reaction in the press and the comments of the ministries. /TRRL/ [German]

34 302938 TRAVEL AND THE HANDICAPPED: A PROJECT SUMMARY. A series of related studies of the travel characteristics and problems of physically handicapped people were carried out to identify the scope for improvements in transport provision. This report summarises the findings of these studies. The main forms of enquiry were a survey of organisations for the physically handicapped, a small behaviour study, and surveys of physically handicapped travellers and non-travellers; a bibliography was also prepared. An attempt was made to relate type of disability with travel problems, and also to look at the effect of urban deprivation on the travel patterns of handicapped people. Walking was the most frequently used form of transport, followed by car, then bus; other modes did not provide a significant amount of mobility. The report identifies some of the main problems encountered in travel by handicapped people, of which those associated with the level access appeared to be the most common. Methodological problems encountered with studies of this population are also discussed. (TRRL)

34 302954 TRANSPORT FOR THE ELDERLY AND THE HANDICAPPED-AN OVERVIEW FROM THE LATE 70'S. Over the last ten years, there has been considerable interest in a number of countries in the accessibility and mobility problems of the transport disadvantaged particularly the elderly and the handicapped. The authors summarize the rationale that has been used in the examination of needs and demand and in the provision of infrastructure in the form of vehicles and installations. The paper outlines some of the more important policies relating to the United States, Great Britain, France and a number of other countries. (TRRL)

34 303466 SERVICE QUALITY IMPLICATIONS OF TRANSBUS. The results of this bus service simulation indicated that mobility limited riders of handicapped-accessible buses can cause late bus arrivals, deteriorated reliability or slower bus travel times. The investigation was designed to analyze the purchase of Transbus, a kneeling, wide-door, ramp equipped urban bus. Reasonable levels of transit travel demand for the mobility limited and estimates of the time required for their boarding and alighting of Transbus were used as inputs to a simulation model. Three different types of bus service and different levels of handicapped patronage were combined in a series of experiments designed to test the sensitivity of bus service to delays associated with the boarding and alighting of transportation handicapped persons. The magnitude of the deterioration in the bus service is dependent upon the number and type of handicapped persons as well as the distribution of their arrivals and departures along the bus route. Levels of handicapped ridership between 2% and 5% are enough to consume the time saved by faster boarding times for mobile passengers on the improved buses; higher handicapped travel demand levels affect the performance and reliability noticeably.

34 303943 OVERVIEW OF ACCESSIBLE BUS SERVICES. By December 1978, the number of transit authorities that operated fixed-route, wheelchair-accessible bus services totaled five. This paper is intended to disseminate information about these initial efforts. The majority of the operational data and results are from the experience of the St. Louis metropolitan area with accessible bus service, which was operated by the Bi-State Development Agency. Very few persons who use wheelchairs have used the fixed-route accessible bus services to date. Ridership has averaged only a few trips per day. However, the reliability of the services has been poor and some wheelchair boardings have been denied due to unavailability or malfunctioning of lift equipment. Consequently, judgment of the effectiveness of accessible bus services based on this early experience is premature. Accessible bus operations can have a substantial economic impact. In

addition to the capital cost of the lift equipment, operating costs have increased due to the heavy lift maintenance and repair workload and, to some extent, to the changes in operational procedures that partial accessibility may necessitate. Due to the low number of riders who are wheelchair users, the overall mobility of this population group would seem to be little changed.

34 304642 A METHODOLOGY FOR EVALUATING THE EFFECTIVENESS OF TRANSPORTATION IMPROVEMENTS FOR THE ELDERLY AND HANDICAPPED. The research project is a study dealing with the evaluation of transportation services from the viewpoint of the elderly and handicapped users. The objective of the research is to develop a cost-effectiveness methodology for evaluating existing services and transportation improvements; and to develop suggested service design standards for different types of handicap severity. The transportation services considered are the City Transit System (bus and subway); taxi service; EASYRIDE service; and the amulette service.

34 305539 COORDINATING TRANSPORTATION SERVICES FOR THE ELDERLY AND HANDICAPPED. EXECUTIVE SUMMARY. The summary presents an overview of a two-volume report which examines the nature and extent of legislative barriers and incentives to coordinated transportation services for the elderly and handicapped. Eight federal statutes are analyzed with regard to funding, planning, and service requirements. Incentives for state and local agency participation as well as regulatory reform are recommended for further consideration. Establishment of human service transportation authorities within the states, and Office for Coordinated Transportation in HEW and DOT are proposed. In the context of this report, coordination of transportation means sharing existing transportation resources through interagency cooperative agreements.

34 305540 COORDINATING TRANSPORTATION SERVICES FOR THE ELDERLY AND HANDICAPPED. VOLUME I: STATUTORY AND REGULATORY ANALYSIS OF INCENTIVES AND BARRIERS TO COORDINATING TRANSPORTATION SERVICES FOR THE ELDERLY AND HANDICAPPED. The report contains the findings and conclusions of a two-part study of coordinating transportation for the elderly and handicapped. Part I analyzes the incentives and barriers to coordinated transportation that appear in the statutes and regulations governing eight Federal programs. The document is intended as a guide for planners and providers of human service transportation, to alert them to opportunities for coordination that exist within the framework of the Federal programs included in the study and to the barriers posed by certain regulatory provisions. The model billing and accounting system has been reviewed and discussed in terms of its applicability at the local level with each of the programs included in the study, as well as with officials of OMB, GAO, and HEW.

34 305541 COORDINATING TRANSPORTATION SERVICES FOR THE ELDERLY AND HANDICAPPED. VOLUME II: A MODEL UNIFORM BILLING AND ACCOUNTING SYSTEM FOR COORDINATED TRANSPORTATION SYSTEMS. This is Volume II of a two-volume report which examines the nature and extent of legislative barriers and incentives to coordinated transportation services for elderly and handicapped persons. This Volume contains a model billing and accounting system that could be useful to local agencies and organizations attempting to coordinate their transportation services. This model addresses the common administrative problems (and barriers to coordination) of accounting, allocation/billing, and certification of funding sources. In addition, an analysis of the federal regulations pertaining to fiscal management procedures is provided.

34 305864 A REQUIREMENTS ANALYSIS DOCUMENT FOR TRANSIT VEHICLE WHEELCHAIR LIFT DEVICES. The purpose of the document is to provide guidelines for the design and evaluation of wheelchair lift devices for public transit vehicles (buses and light rail vehicles). Included is an analysis of wheelchair and maneuvering dimensions and their impact on both the lift system and transit vehicle design. Much of the content deals with general safety

considerations and vehicle interior design which are the same for ramp or lift devices. A total of sixty three (63) requirements and recommendations are presented covering the design and operation of the lift, the vehicle lift interface, the vehicle interior, and the reliability and maintainability of the system. In addition, the report discusses evaluation parameters needed to assess the cost of public transit lift devices.

34 307849 ACCESSIBILITY AS THE OBJECTIVE OF PUBLIC TRANSPORTATION PLANNING: AN INTEGRATED TRANSPORTATION AND LAND USE MODEL. An analysis of the system to be planned is carried out. A comparison with a survey on the traffic and transportation models available in the literature, though very voluminous, reveals a lack of a general model-framework for planning public transportation in sparsely populated areas. A discussion is presented of how to evaluate optional plans for the physical and socio-economic structure of a region and concludes that this must be done by means of accessibility. A model is presented which describes the inter-dependence between, on one hand the demand of accessibility of the population, and on the other hand the transportation system, both public and private, and the location of facilities and residential areas. The applicability of some standard transportation and traffic models is discussed.

34 308066 THE VALLEY TRANSIT DISTRICT: SPECIALIZED TRANSPORTATION FOR THE ELDERLY, HANDICAPPED AND LOW-INCOME IN THE LOWER NAUGATUCK VALLEY, CONNECTICUT. A multifaceted demonstration with special emphasis on service to the elderly and handicapped has been operating since January 1973. Valley Transit District (VTD) achieved operational status as a transit district in Connecticut after a demonstration grant ended, and is providing services to its target population and the general public. It has had a large impact on the mobility of a small portion of the target population, with lesser impacts on the general public. This report covers the entire period of the demonstration program.

Four types of service are operated by VTD: fixed-route, demand responsive door-to-door, subscription, and contract services. An automated fare collection system using credit cards and monthly billings was used from 1973-1975. Fare subsidization for handicapped and elderly citizens was facilitated by this computerized system which bills sponsoring agencies. The user-side subsidies and monthly billings were continued after 1975 using manual methods. Of the target population of 12,000, 600 are regular, heavy users of the VTD system. VTD users are mainly low-income and autoless elderly from small households. The system operates 10 vehicles daily; average hourly cost is near \$12. Earned revenues are derived from user-side subsidy funds. VTD has withstood several challenges in regulatory and institutional areas from private bus operators and has expanded services throughout the demonstration. (UMTA)

34 308078 PUBLIC TRANSPORTATION AND THE TRAVEL NEEDS OF WOMEN.

The existing literature relating to women's use of public transportation is reviewed. The kinds of travel needs that should be considered in developing suitable public transit alternatives for women are discussed, and two recent innovations that appear to meet the needs are described. Comments are made on case studies in Seattle, New York and some small cities. The recent innovations discussed are demand-responsive transit and the exclusive lane busways. The demand-responsive service which utilizes smaller vehicles (minibuses or taxis) is better suited to low or medium density areas with dispersed travel patterns than conventional fixed-route bus service. A recent study of an exclusive-lane commuter bus service in Miami revealed that 70% of all passengers are women, 98% of all trips are work trips, and 25% of all passengers did not make the trip prior to institution of the service. Suggestions are made for future research.

34 308780 MOBILITY FOR THE ELDERLY AND HANDICAPPED. FRENCH POLICY IN RELATION TO THE TRANSPORT OF PERSONS WITH REDUCED MOBILITY. As a result of the law of orientation of handicapped persons in 1975, an interministerial working party was set up to survey the problems of transport for the handicapped, analyse solutions and create regulations to implement solutions. The resulting report concerned itself with regulations which are simultaneously concerned with the modification, adaptation and design of both fixed installations and rolling stock, the simplification of administrative procedures and their provision of special financial help to ease the problems of the transport integration of the handicapped. 34 308781 MOBILITY FOR THE ELDERLY AND HANDICAPPED. THE MOBILITY OF THE ELDERLY AND DISABLED IN GREAT BRITAIN: AN OVERVIEW. This paper summarizes some of the developments of the past ten years which have brought benefits to elderly and disabled people with mobility problems. In the case of the elderly it identifies concessionary fares schemes as having been of considerable importance despite the unfairness of their distribution and value. It is argued that the elderly could be further helped in the future, if the results of recent research on vehicle design, lead to new generations of public transport vehicles which are accessible and comfortable for the widest possible span of passenger capabilities. Those disabled people who are unable to use public transport are now being helped by a new form of benefit called the 'mobility allowance', which is described. However, despite much goodwill the needs of the elderly disabled are inadequately met and this is identified as an important problem to which solutions have yet to be found. (Author/TRRL)

34 308783 MOBILITY FOR THE ELDERLY AND HANDICAPPED. TRANSPORTATION PROBLEMS OF THE ELDERLY AND HANDICAPPED: AN OVERVIEW OF AMERICAN EXPERIENCE. This paper reviews the experience in the United States since 1970 as regards the transportation problems of older and handicapped americans. The paper identifies the basic nature of the problem in terms of low income, low levels of auto ownership, poor transit availability, and system design problems. The paper then reviews the scope of the problem in terms of the number of elderly and handicapped, their location geographically and in terms of urban and rural places, and explores some of the implications thereof. A review is undertaken of the transportation systems presently serving the elderly and handicapped including public transit, taxis, school buses, personal transportation via the automobile, special and private systems. The basic characteristics of each of these systems is described covering service, operating levels and costs. Finally, the paper presents an evaluation of present US systems discussing three levels of system activities: funding, institutional, and planning and operational problems. The paper draws some basic conclusions of relevance for other countries. (Author/TRRL)

34 310031 PERSONAL MOBILITY AND TRANSPORT REQUIREMENTS OF THE ELDERLY. This report contains the text of a chapter of a forthcoming book, Towards an older Australia (edited by Anna Howe and to be published by Queensland University Press in 1980). The available evidence on the transport and mobility requirements of the elderly is surveyed and summarised, with particular emphasis on Australian experience. The elderly are shown to have some special transport needs, although their travel behaviour is not so different from the rest of the population as is sometimes thought. The mobility problems of the elderly have more to do with the quality of their travel rather than the quantity of travel undertaken. The decline in personal mobility of the elderly is largely brought about by their failing physical capabilities and their reduced incomes, although environmental considerations also play a part. The elderly adapt to their declining mobility in a number of ways: by concentrating on "essential" trips to the doctor, the shops, or the bank; by confining travel to less congested daylight hours; by shifting to slower modes of travel; and by reducing the distances travelled. Planning which is sensitive to these differences can help to minimise the mobility problems of the elderly and help them to maintain an independent lifestyle. Special attention must be given to the convenient location of essential services, the quality of the pedestrian environment, and improved public transport. (Author/TRRL)

34 310258 TRANSPORTATION FOR THE ELDERLY. This book is the result of a 2 year study to develop a methodology for determining the future mobility needs of the elderly as a function of their future locational patterns and travel behavior. The first chapter on the diversity of lifestyles among the elderly, examines socio-economic and political factors affecting future transportation policy, demographic changes and their consequences, anticipated changes in mobility and the concept and role of lifestyle. Chapter 2 examines the lifestyles of the elderly in Los Angeles County, and Chapter 3 examines the relationships between lifestyle and travel behavior. Current transportation services for the elderly are reviewed including bus service, taxi service and other specialized services. The fourth chapter (the changing social setting of the elderly) covers the analytical framework for the longitudinal analysis, the history of residential location, and the differentiation of cohort, aging and period effects. The sixth chapter covers population forecasting methodology, forecast scenarios and housing market projections. Future travel patterns of the elderly are covered in

Chapter 7. The last chapter (8) reviews the interpretation of transportation needs, national priorities, goals of transportation policy, service coordination, user-side subsidies, and the role of the automobile in the subsidies, and the role of the automobile in the mobility of the suburbanized elderly.

34 310540 STOCKHOLM'S TRANSPORT FOR ELDERLY AND HANDICAPPED: AN INTEGRATED MODEL. Stockholm's programme of special transportation, administered by the Greater Stockholm Public Transport (SL) is composed of three elements (a) a demand responsive service utilizing commercial taxis for individual trips, (b) a fleet of modified minibuses for routine and repetitive trips, both offering door-to-door service, and (c) continued modification of conventional public transport vehicles and equipment to extend their accessibility for handicapped trip makers. Commercial taxi service is described as the primary source of transportation, with 91 per cent of those eligible being provided with special authorization cards. The user pays three crowns, the current mass transit fare to the driver, and the taxi company is reimbursed by SL at the metered rate. Reimbursement controls associated with the 2500 taxis participating in this scheme are described, and statistics provided on journey details and costs. A fleet of 135 modified minibuses caters for those who cannot or need not use taxis, with three quarters of the trips being associated with home to and from school and clinic journeys. Details of the vehicles, journey schedules and driver training are presented. Reference to public transport accessibility indicates the installation of lifts at all subways, and escalators from street and or ticket levels to station platforms. Financing and costs are discussed. (TRRL)

34 311247 ALTERNATIVE TRANSPORT FOR SEVERELY DISABLED PERSONS IN THE CITY OF UTRECHT. AN INVENTORY STUDY [Alternatief vervoer voor zwaar gehandicapten in de stad Utrecht. Een inventariserend onderzoek]. According to the Dutch Central Bureau of Statistics 8.7 per cent of the Dutch population of 5 years and older is physically handicapped. For these persons in society provisions are needed; such as the accessibility of buildings and provisions in traffic, recreation, communication and transport. This report discusses alternative transport requirements for maintaining social contacts for severely disabled persons in the city of Utrecht. The need for such transport is shown by the fact that severely disabled persons can only take part in the social life if transport is available for them. Results of interviews held and possibilities for alternative transport are presented and discussed. Aspects of efficiency and cost of different alternative systems are mentioned. (TRRL) [Dutch]

34 311298 SHARE A FARE: A USER-SIDE SUBSIDY TRANSPORTATION PROGRAM FOR ELDERLY AND HANDICAPPED PERSONS IN KANSAS CITY, MISSOURI. The Share A Fare (SAF) program in Kansas City, Missouri, is a user-side subsidy program designed by the City to provide low-cost door-to-door transportation for the City's elderly and handicapped citizens. The City, acting as broker, coordinated between user and provider by enrolling participants, enlisting providers, and matching the two through the trip scheduling process. Share A Fare began operation in May 1977 and is totally funded through a 1/2, city sales tax designated for transportation purposes. After 20 months of service, SAF has 13,182 enrollees and subsidizes almost 11,000 trips a month. The transportation service is provided by three not-for-profit agencies, two taxicab companies, one for-profit medical provider, and three city-owned vans. The service is available for any Kansas City resident who is 65 years of age or older or physically disabled. SAF participants fall into two major categories: the affiliated rider, who is a client of a social service agency carrier, and the unaffiliated rider, who is a non-client. This final report documents the Share A Fare project during its first 20 months of operation. The purpose of this report is to describe how the project works and to identify key features and their impacts on program success. The study relied upon available data, which included an inventory of services of elderly and handicapped, a project survey, and various project staff reports. Personal interviews were conducted with service providers and all major agencies involved in planning services for elderly or handicapped in Kansas City. Data is presented on project design and planning; operating characteristics; and on the project's impact on service providers, users, and city sponsor. SAF has demonstrated that the City, acting as broker, can effectively coordinate transportation service between users and providers. (UMTA)

34 311816 TRANSPORT SCHEMES. This booklet, intended to help local age concern groups, gives advice on the method and requirements of voluntary schemes to assist the mobility of elderly people. After analysing the activities that need to be supported, bus operators should first be approached with a view to improving existing schemes. If this is not possible, consideration should be given to the possibilities of using private cars, a minibus or community transport. The relative merits of each type of scheme are discussed in detail. Some modifications are suggested to help accommodate the very frail or disabled. A plan of action is outlined once the type of scheme is agreed upon. Examples are given of the design and operation of a centralised and a diffuse car scheme and a jointly operated minibus service. 34 312263 PROJECT MOBILITY FIRST-YEAR EVALUATION: FINAL REPORT. Project Mobility (PM), a one year demonstration project of demand-responsive transportation serving the transportation handicapped, is summarized and evaluated. The report addresses the quality of PM's service, its impact on the users' lives, the cost and its comparability to other innovative handicapped transportation systems. The registration procedure for potential PM users is discussed and the three classes of certification are explained. The characteristics of its users and the reasons given by other persons for non-use are presented with the opinions of current users. The operational data from Project Mobility's first year of operation is summarized, including ridership figures, trip purposes, travel patterns, productivity and vehicle utilization. The level of service is measured, based on vehicle and passenger reliability, the time between reservation and pick up, the number of trip denials, and travel time or trip length. Monthly costs of the project are given, also. Six case studies of selected users are given with information based on three interviews held throughout the year. Five other demand-responsive systems are then described and compared for Project Mobility. The service and performance standards prescribed for the project are summarized briefly. Future planning is addressed with special consideration given to estimation of the transportation of the handicapped, unmet needs, coordination with other para-transit services, future expansion costs and the impact of wheelchair accessible buses. Eight final recommendations, based on the evaluation, are made regarding the future of Project Mobility.

34 312270 TRANSPORTATION OPTIONS FOR THE MOBILITY DISADVANTAGED IN RURAL GEORGIA. The general relationships between and among 1) mobility, 2) personal income, 3) work activity in rural areas were examined, and the manner in which locations and time intervals impeded access to work and determined personal revenues and expenses was considered. Case studies were made of some counties in rural Georgia and of persons who are economically disadvantaged because their personal mobility limits and excludes locations and time intervals in which work is accessible to them. A series of policy proposals to solve the problems are proposed. The study demonstrated that personal mobility was a limiting factor on personal income and work activity particularly in rural areas and small places. Among the actions that were recommended are the following: an advocacy role should be assumed by economic development administrator and planners to enhance work mobility; the spatial dispersion relating non-worker and other potential employee residences to a proposed industrial or commercial activity should be determined; limitations to 1973 Federal-Aid Highway Act should be recognized; limits of demand-responsive and paratransit should be reviewed prior to implementation; and a personalized automobile grant program is technically possible for a spatially dispersed population.

34 312621 TRANSPORTATION SERVICES FOR THE ELDERLY. A PLANNING GUIDE PREPARED FOR THE N.C. GOVERNOR'S COORDINATING COUNCIL ON AGING. This planning guide is designed to aid communities and service agencies in their choices for setting up transportation services for the elderly. Preliminary steps involve defining service objectives, and may also involve determining need; several alternative methods of predicting demand are discussed. Alternatives to actual service include the special bus for the elderly. This service may be provided directly by the coordinating agency and include vehicles such as specially equipped vans, school buses, and station wagons. Cost, revenues, and legal issues of such service are discussed in depth. Another alternative is the reduced fare program whereby older adults may ride existing public transit at a reduced fare. Volunteer services, with private groups providing transit alternatives to the elderly are also discussed. Tables list federal, local, and private funding sources for providing transportation for older Americans.

34 312868 TRANSPORT AND THE ELDERLY: REQUIREMENTS, PROBLEMS AND POSSIBLE SOLUTIONS. This report examines the travel patterns of the elderly, and the problems which the experience the travelling in relation to those of the population as a whole. Data from a TRRL survey among old people in Guildford, and the 1975/76 National Travel Survey are used to show that even though the travel patterns and requirements within the elderly population vary considerably from person to person, they are similar in many respects to those of other people without cars. Problems occur mainly among a small group who experience serious constraints on their ability to travel while at the same time having an urgent need for mobility. It is suggested that the possibility of concentrating a greater proportion of the available resources on this group might be considered. Solutions could take the form of a special transport or home-based support service. The remainder of the elderly population, and younger people with a similar choice of transport modes, would benefit from improvements to conventional public transport and the walking environments, as well as from more conveniently located facilities. 34 313249 EQUITY IN URBAN TRANSPORTATION. The paper examines the various aspects of the equity issue in urban transportation, an issue which has become increasingly controversial in recent years. A number of data sets are analyzed to determine the extent to which poor, elderly, or handicapped persons suffer from sub-standard levels of mobility. The authors then assess the cost-effectiveness and political feasibility of a range of alternative policy measures designed to increase the mobility of these disadvantaged groups.

34 315277 TRANSIT STATION USE BY THE HANDICAPPED: VERTICAL MOVEMENT TECHNOLOGY. Transit station use by the handicapped is one area of concern affected by Section 504 of the Rehabilitation Act of 1973. Within any given transit station facility, problems related to vertical movement of level change (i.e., stairway and ramp width, ramp grades, stairway tread, height of risers, and use of escalators and elevators), especially for the handicapped, can be most critical. The Reston conference addressed some of these problems in light of existing and potential vertical movement technology. New transit systems or modifications to existing systems can incorporate appropriate designs to solve level-change problems that will accommodate Section 504 requirements. Design solutions for new stations may also be applicable to the adaptation of older stations. (Author)

34 316805 DATA BASE STUDY FOR THE IDENTIFICATION AND QUANTIFICATION OF TRANSPORTATION HANDICAPPED PERSONS IN CANADA. This study provides a comprehensive data base for the identification and quantification of transportation handicapped (th) individuals in Canada. The data base consists of tabulations of the population of th individuals for Canada and for 58 cities/areas in Canada. Further, tabulations of demographic, socio-economic and transportation characteristics are given for the the population in Canada. The study comprises four volumes. The first of these contains the main study report while volumes two and three provide detailed supporting information. The fourth volume is a summary report. (TRRL)

34 318342 AN EVALUATION PACKAGE FOR SPECIALIZED ELDERLY AND HANDICAPPED TRANSPORTATION SERVICE. In order to evaluate the multitude of specialized elderly and handicapped transportation systems now operating in Massachusetts, the Massachusetts Executive Office of Transportation and Construction (EOTC) developed a special service evaluation package. Objectives, measurement criteria, and standards were established, and questionnaires were designed to compare system performance with the measurement criteria and standards. The questionnaires include a ridership survey and a questionnaire for the transportation program administrator. The evaluation package was applied to 11 different special systems operating in the greater Springfield, Massachusetts area for the Pioneer Valley Transit Authority (PVRTA).

34 319341 RECENT EXPERIENCE WITH ACCESSIBLE BUS SERVICES. Fixed-route, standard-sized buses equipped with level-change mechanisms to transport wheelchair or semiambulatory passengers between the ground and the bus floor level are currently in service in 23 locations in the United States. This paper includes a brief description of the services in place and a discussion of experience with their operation. Data are limited due to the newness of many of the services and the fact that few transit operators collect the kind of information that is most useful for evaluation. Available data have been collected to inform planners and operators of future accessible bus services of the policy issues and operational impacts they probably will face and the level of ridership they initially can expect. A few findings can be stated: (a) Lift reliability has improved substantially through the emergence of new lift designs and modifications to existing models and (b) ridership continues to be low, with most transit operators reporting between one and three lift-assisted boardings per day. Most of these trips are taken by few regular riders. The economic impact varies considerably among operators, depending on the reliability of the particular model of lift operated and whether schedule changes were instituted specifically for implementation of the accessible buses. At current lift-utilization rates, accessible bus service will not significantly affect transit operations. (Author)

34 319531 PUBLIC TRANSPORT IN KINGSTON, JAMAICA AND ITS RELATION TO LOW INCOME HOUSEHOLDS. This report is based on a study of public transport in Kingston, Jamaica, carried out with the cooperation of the Jamaican government. It is one of a series of similar studies in developing countries carried out by TRRL. The results of local investigations into the organisation and operation of the conventional bus undertaking and of the privately-operated minibuses are described and Jamaican government survey data are used as a basis for analysing the characteristics of the users of the two different services. An analysis of the attitudes of passengers, as elicited from this survey and from in-depth research with low income households, helps in formulating the ways in which both bus and minibus services may be improved. The role which public transport plays in the lifestyle of low income households is discussed with particular reference to expenditure on transport compared to other budget items. The Jamaican findings are compared with previous studies of the role of paratransit in two cities in South-East Asia. (a) (TRRL)

34 322254 ELDERLY AND HANDICAPPED TRANSPORTATION STUDY. The objective of this study is to identify the transportation needs

of the elderly and handicapped in the McAllen, Pharr, Edinburg Urbanized Area. The study details the findings of a survey questionnaire which was designed to identify transportation provides now available as well as transportation required but unobtainable for elderly and handicapped. Recommendations voiced by the elderly at the White House Conference on Aging Community Forums are also included. The community forums were held in each of the cities in the study. The conclusion of the study deals with operational alternatives to provide for the transportation needs of elderly and handicapped, both ambulatory and non-ambulatory.

Lower Rio Grande Valley Development Council Aug. 1980, 50p, Figs., 4 App.

34 322477 ANALYTICAL MODELS FOR COMPARISON OF ALTERNATIVE SERVICE OPTIONS FOR THE TRANSPORTATION HANDICAPPED. Recently much debate has been generated over the issue of public transportation service for the transportation handicapped. In particular, older rapid rail systems have been required to make key stations accessible to the handicapped. However, a waiver of this requirement is permitted in cities where the handicapped community and local officials work out an alternative service system with equal or better station accessibility. In this context, it is the purpose of this paper to present a comparative analysis of a door-to-door demand responsive system and feeder/fixed-route service, two of the service options which are expected to represent acceptable alternatives to "key transit station accessibility" requirements. The comparisons evaluate alternative scenarios of doorstep accessible transportation for the transportation handicapped using analytical models. The results of the comparisons clearly indicate the relative advantage of door-to-door demand-responsive systems over the combination of a feeder and an existing fixed-route system. In particular, when compared to a feeder service, the direct door-to-door service is likely to be less costly, because it requires a smaller fleet and to provide a more desirable service, because it does not entail transfers. 34 322653 AN EVALUATION OF METRO'S SPECIAL TRANSPORTATION SERVICE PROGRAM FOR THE ELDERLY AND HANDICAPPED. This report presents an overview of Metro's planning and management of the Special Transportation Service Program (STSP). Also, it contains discussion of the Taxi Scrip Program and the Van Program. Findings and recommendations of the study are summarized and financial implications of selected recommendations are discussed. The study found that there is no position within the Metro organization with overall authority for the management of the STSP. Some operational functions, such as maintaining contact with taxi and van operators, are not performed. Except for this evaluation, no one has been monitoring or evaluating the total program to identify and correct specific problems or to provide overall program direction. It is

recommended that Metro should create or designate a position within its authority to manage the STSP, and it should be in a section which is clearly responsible for managing transportation programs. Since the taxi and van programs are very different from bus operations, it is also recommended that Metro consider establishing a Special Program or Para-transit Operations Section with the function of developing and operating all transportation programs that supplement regular bus service and to coordinate elderly and handicapped services provided by Metro.

34 323365 TRANSPORT FOR HANDICAPPED PEOPLE [Les transports au service des handicapés]. This publication reproduces the text of the report of the working group set up by decision of the 18th August 1975 for considering transport facilities for handicapped people. The integration of handicapped people in the professional environment and in society is conditioned by the autonomy granted to them. The problems of the transport of handicapped people are reviewed and possible solutions suggested: modification of existing public transport modes, creation of special public transport modes, use of individual transport. 34 325916 ADAPTING PUBLIC TRANSPORTATION SERVICES FOR DISABLED PERSONS [Tilpasning af de kollektive trafikmidler til handicappede]. The Committee on Communications of the Nordic Council deals with the problems of disabled persons' travelling conditions in public transport. Among the disabled those who are wheelchair-bound have the greatest problems. The new DSB high-speed trains will be fitted with lifting platforms which can raise a chair from ground level, with WC which can allow wheelchair access and a special compartment with removable chairs to give space for wheelchairs. The lifting platform, which has a capacity of 400 kg, is described. When not being used, the wheelchair lift can be pushed under the car floor. [Danish]

34 326348 EVALUATION OF THE EASYRIDE SPECIALIZED TRANSPORTATION SERVICE. The evaluation of the EASYRIDE demonstration project was funded by the Urban Mass Transportation Administration, through the Transportation Systems Center. The project took place on the Lower East Side of Manhattan in New York City. EASYRIDE began operation as a pilot program in June 1976. After receiving its complete vehicle fleet, it began full scale operations in April 1977. During the first two years of the demonstration project, there was no required passenger fare; however, donations were accepted. This evaluation report covers the first two full years of operation, which was from June 1977 through May 1979. The Vera Institute of Justice was the grantee for this project in which door-thru-door demand-responsive transportation service was provided to elderly and handicapped residents of the Lower East Side. The door-thru door nature of the project refers to the fact that EASYRIDE drivers will leave the vehicle to assist passengers boarding and alighting from the vehicle. Service was provided by five fully accessible lift-equipped vans and five regular vans. Most of the drivers for the EASYRIDE project were graduates of the Wildcat Corporation program which trains rehabilitated ex-offenders and ex-addicts for work on public service projects.

34 326476 IMPLICATIONS OF BART'S (BAY AREA RAPID TRANSIT'S) IMPACTS FOR THE TRANSPORTATION DISADVANTAGED. The project has examined the implications of the impacts that the 71 mile Bay Area Rapid Transit System has had to date on the transportation disadvantaged. Three special population groups are the focus of analysis--ethnic minorities, the elderly and handicapped. These groups are of special concern for transportation planning and policy because of either low-income status or mobility related impairments. This report integrates the study of BART's impacts on the transportation disadvantaged in each of four major impact areas examined in previous interim project reports--environmental, mobility, economic and land use. Findings are reported from the investigation of twenty-three issues related to the entire range of BART's impacts on the transportation disadvantaged. Evaluation of these findings is made in the context of the level, nature, and degree of equity in the incidence of BART's economic impacts.

34 326486 TRANSPORTATION OPTIONS FOR THE ELDERLY AND HANDICAPPED OF PUEBLO. Conducted to aid the development of a transportation system to adequately serve the elderly and handicapped population of Pueblo, Colo., this study consisted of a survey of 189 agencies involving types of transportation services for the elderly and handicapped, a demographic analysis of the Pueblo area, projections of elderly and handicapped populations for the next 20 years, and analysis of travel patterns of the target population. A number of inadequacies or gaps can be cited particularly with regard to restricted passenger coverage, limited service capacity, scheduling and dispatching procedures, inadequate facilities, lack of uniform operating data, and inefficient route assignments. An array of service alternatives are proposed to close these gaps. A single purpose system whose transportation vehicle operates between one or more origins to one destination, a fixed route system (transportation supplied along an established route at pre-determined times) which is used by most public transportation systems, and personalized service, possibly requiring advance registration for pickup or operating on a demand-response basis are mentioned as options and discussed in terms of accessibility and effectiveness in getting a client to a precise destination. Organization and operational alternatives possible for offering special transportation services to the target group include accessible bus, subsidized taxi, public-operated paratransit, and private, nonprofit paratransit. When all of these options were evaluated on the criteria of funding availability, quality of service, legal considerations, and cost approximations, results showed private, nonprofit paratransit to have the greatest potential for meeting the needs of the disadvantaged. Study data and recommendations are provided.

41 050046 TRANSPORTATION, AUTOMATION, AND SOCIETAL STRUCTURE. The author points out that only when we learn to understand much better the dynamic interaction between new transportation systems and the structure of our communities can we take full advantage of transportation's potential as a really effective tool in our quest for a finer quality of life for our citizens. The opportunity to do so is much enhanced by the recent rapid evolution in transportation from its centuries-old pattern of unconstrained growth paced by key advances in propulsion and new rights of way to a new age of finesse in which automation will bring, from existing rights of way, higher capacity, greater safety, and far better service at lower cost through automated system and total-trip management. In parallel, the discipline that has helped us predict well the dynamic behavior of such mostly physical systems as air-traffic control may add some helpful insight into such critical questions as the long-range effects of transportation on urban structure, where nontechnological factors dominate. Leadership belongs to the communities; the federal role is to provide support in generic ways. It is hoped that new Department of Transportation programs in technology-and-planning-tool sharing and in university support will be helpful.

41 054721 THE IMPACT OF THE PHILADELPHIA-LINDENWOLD RAPID TRANSIT LINE ON AUTOMOBILE USAGE. This paper examines new data now available and concludes that there has definitely been a decrease in peak-hour bridge usage by automobiles. The paper further considers what would be the impact on automobile bridge traffic if the line were to shut down, noting that there has been considerable growth in the Jersey suburbs since the line was completed.

Allen, WB (Pennsylvania University, Philadelphia) *Traffic Quarterly* Vol. 28 No. 1, Jan. 1974, pp 21-35, 2 Fig, 2 Tab; ORDER FROM: Eno Foundation for Transportation, Incorporated, Westport, Connecticut, 06880 Repr PC

41 054760 THE DEMAND FOR COMMUTER RAIL TRANSPORT. The study focuses on the short-run market demand for commuter rail service. In the short run, the total market demand for transport can be assumed constant, because there is insufficient time to adjust locational factors such as employment and residence that determine one's transport needs. Empirical evidence was obtained from the Boston area. Methodologically: (1) a theory of consumer demand for commuter rail transport is developed; (2) a model of market demand is developed; and (3) the results of least squares regression estimation of the parameters of the demand equation are presented and evaluated. The strong significance of the income and relative travel time variables suggests that rail demand is most sensitive to changes in time cost, whether these changes result from changes in travel time or in the opportunity cost of this time. Moreover, commuters tend to place greater emphasis on time-minimization for peak-hour trips, which are generally work trips, than on the more occasional, leisure-oriented, off-peak trip. Evidences of this are the signs on the income coefficients, which suggest a higher opportunity cost for peak time, and the comparatively greater magnitudes of the peak relative travel time coefficients. Thus attempts to divert auto commuters to rail transport by decreasing rail travel time should have a higher probability of success during the peak period, when in fact there is greater traffic congestion. Within the higher income range, where presumably private transport is used for the home-station trip, higher income levels are associated with increased rail demand. The middle-income commuter may opt for auto commutation, not because he judges rail transport to be unsatisfactory, but because, given his valuation of time, auto transport has a comparatively low total cost. If this interpretation is correct, the reduction of home-station travel time through the provision of efficient public transit to and from suburban rail stations should tend to increase rail demand.

41 054806 CITIZEN GROUPS, PUBLIC POLICY AND URBAN TRANSPORTATION. The article deals with the reactions of the population to projects for the creation of means of transport, the methods which the citizens may employ to make their views known, the disadvantages in allowing transporters' pressure groups to draw up the transport policy, the futility of the arguments often brought forward to justify expensive investments in transport, particularly in roads.

41 056881 COMMUTER PERCEPTIONS OF PUBLIC TRANSPORT WORK JOURNEYS. Commuter perceptions of certain public transport peak-hour performance characteristics are quantified for samples of car-owning public transport users and car users in six randomly selected areas of the Dublin conurbation. The existence of roadside survey data (for buses) and timetables (for trains) permitted an analysis of the degree of distorted perception of in-vehicle times, waiting times, and costs. Results show that the use of objective performance data on public transport modes in urban transportation planning models needs to be questioned, because actual times and costs seldom reflect the subjective images of commuters.

41 057931 REDUCING THE NEED FOR TRAVEL. The report identifies the alternative ways of accomplishing the reduction of urban travel and urban travel needs. The underlying reasons for travel are analyzed. Candidate solutions to reducing travel are described. Candidates are grouped into three classifications: communications substitutes, changes in the location and structure of cities; rescheduling of work hours. A fourth alternative, that of reshaping the need for travel through increases in the cost of travel by auto and re-education of the public plays a major role in the proposed Urban Mass Transportation Administration program.

41 071765 LIFE-STYLE FACTORS BEHIND MODAL CHOICE. Conventional modal-split models used by transportation planners and engineers have been based on socioeconomic indices and relative travel time and cost characteristics for the alternative modes of travel. Further refinement of these models to include the particular needs of autoless groups such as the poor and elderly include sociocultural factors. This paper describes how life style can affect modal choice and uses the behavior of young inner-city residents to focus attention to the potential contribution of this factor. A dimension for ordering life styles has been found useful in community studies. This dimension orders life styles between extremes of mainstreamer and activity seeker. It is hypothesized that the former

life style would be more compatible with using public transit than the latter.

Notes, C *ASCE Journal of Transportation Engineering* Proceeding Vol. 99 No. TE3, 9953, Aug. 1973, pp 513-520; ACKNOWLEDGMENT: ASCE Journal of Transportation Engineering; ORDER FROM: ESL, Repr. PC, Microfilm

41 071980 SIMULATION OF THE RELATIONSHIP BETWEEN CERTAIN SOCIAL FACTORS AND TRANSPORTATION IN A LOW INCOME AREA. The intent of this paper is to model a typical urban ghetto in terms of three variables: education, health and income, and to simulate the behavior of these variables over a ten-year period. A fourth variable, the effect of accessibility generated by an improved transit system, is then introduced in order to determine the effect of this component upon system performance. From this analysis it is hoped that a number of insights will emerge concerning the development of urban ghettos and the effect (or lack of effect) of transportation in helping this development.

41 080251 TRAVELTIME BUDGETS AND MOBILITY IN URBAN AREAS. The study tests by empirical comparative analysis the concept that tripmakers have a stable daily traveltime budget and discusses the implication of such a budget to transportation modeling techniques and the evaluation of alternative transportation systems. After verifying the stability of the traveltime budget for both macro and micro conditions, the responsiveness of travel demand to system supply is developed and formulated. Many known travel factors, such as the levels of mobility, modal choice and trip purpose splits, are then explained by a unified behavioral mechanisms. One of the many conclusions that are presented in the study is that extreme care should be exercised in evaluating policy decisions such as speed reductions and pricing policies without first establishing the sensitivity and responsiveness of mobility to such restrictions. This conclusion is of special significance at this time when fuel shortages threaten mobility.

41 080263 SOCIAL SERVICE AGENCY TRANSPORTATION STUDY. Previous studies of transportation need of the North Carolina Piedmont Triad area indicate that low income, carless residents of urban centers and hinterland are very dependent on other auto drivers for mobility. Bus service accounts for no more than 30% of trips taken by carless residents despite a wide network inside city limits. Taxis or 'catching a ride' are alternate modes upon which the carless have come to depend. Studies have shown that these people without access to cars have difficulties getting to medical facilities, manpower training programs and getting children to recreational programs. Social service agencies in Greensboro,

North Carolina, have identified the needs of low income residents and each agency has its own program which has attempted to solve the problem of immobility among its clients. With the cooperation of 24 agencies, surveys were conducted to answer questions related to the transportation resources currently at the disposal of the agencies. Recommendations were put forth and hypotheses tested. Models for alternative consolidated systems for improving transportation services of agencies are presented and advantages and disadvantages examined.

41 080342 LENGTH OF WALKING DISTANCES AND DISTANCE BETWEEN STOPS: THEIR INFLUENCE ON THE ATTRACTIVENESS OF PUBLIC TRANSPORT. Walking distance as a factor in providing adequate public transportation is closely related to distance between stops (stations), route (line) alignment and land use planning. The size of the catchment area of a stop, i.e. the area from which passengers come, is expressed in geometrical terms. The position of the stops in their urban environment defines the catchment area of a route; in the ideal network, the catchment areas of parallel routes would overlap. Data relative to walking distances have been obtained empirically and are based on many years of experience; further investigation of the subject is suggested.

41 080424 BART IMPACT PROGRAM: METHODOLOGICAL APPROACH FOR DEFINING THE GENERALIZED NO-BART ALTERNATIVE (GNBA). The Generalized No-BART Alternative is the hypothetical transportation system judged most likely to have resulted in the Bay Area in FY 1976 if BART had not come into existence. The purpose of the paper is to explain how MTC intends to define the GNBA and the role to be played in the process by findings from the decision history of BART. It is structured in three parts: (1) Introduction to basic concepts and criteria; (2) overview of methodological approach and guidelines for implementation; and (3) application of criteria for defining the GNBA.

41 080641 PATTERNS OF MOBILITY OF WORKING POOR. This study examines the transportation problems faced by low-income residents in Greensboro, N.C., with special em-

phasis on the autoless worker. A survey revealed a strong auto-orientation among lower income families. Of the autoless respondents, more than half used someone else's automobile as a principal mode for the journey to work. An important segment of the working poor were "captive riders" to the transit system. These workers were typically older, more likely to be female than male, more likely to be Black than White. There appeared little significant difference between the average hourly wages of auto-owning and carless workers. Consequently, any alternative transportation system for the city would have to charge low fares in line with the current fare structures.

Saltzman, A Kidder, AE (North Carolina Agricultural and Technical State U) *ASCE Journal of Transportation Engineering* Vol. 100 No. TE1, Proc. Paper 10760, Aug. 1974, pp 769-780, 1 Fig., 12 Tab., 7 Ref., 1 App.

41 080646 REVIEW OF SOME ANTICIPATED AND OBSERVED IMPACTS OF THE BAY AREA RAPID TRANSIT SYSTEM. The report briefly summarizes some of the most important impacts of the Bay Area Rapid Transit System as revealed by a survey of the Technical and Nontechnical Literature. The report has been prepared as a Reference and Planning Guide for the BART Impact Program. It describes both anticipated Impacts that have been stated by Public, Officials, Planners, and Observers since BART was planned more than a decade ago, and actual Impacts as reported in newspapers and in the few Technical Studies of Bart Impact that have been already performed. No attempt is made to prove or disprove the statements about Impacts that have appeared in print. About 100 technical and planning reports and 4,500 newspaper articles were scanned.

41 080746 TECHNICAL IMPLICATIONS OF TELECONFERENCE SERVICE. Definitions of separated-groups teleconferences, as opposed to person-to-person video telephone service, are reviewed. The teleconference facility, in terms of an audio mode, a graphics mode, and a video mode, can have an impact on the interactive, interpersonal communication process. Recent audio and audio/video teleconference experiments are summarized. Teleconferencing is not viewed as an alternative to transportation by urban planners or urban transportation demand forecasters, at least for the remainder of this century. The absence of design information and research results for the separated-groups teleconference service telecommunication facility tends to support that view.

41 080813 URBAN TRANSPORTATION IN SOUTH FLORIDA. The proceedings are presented of a forum for debate of transportation problems in the South Florida urban region especially pertaining to the urban centers of Miami-Ft. Lauderdale-Palm Beach. The forum of public officials, planners, business leaders and

citizens suggested and debated recommendations on policy and facility. The results of the discussions indicate that decision-making by both public and private sectors is being undertaken within a new and broadened context requiring major participatory format. Among the urban transportation aspects considered are, the planning process, public transportation as a solution to the transportation problem, urban pollution, congestion and mobility, and the social-economic integration of diverse population groups.

41 081001 TRAVEL PATTERNS OF SUBURBAN HIGH SCHOOL MALES AND PROGRAMS TO INCREASE THEIR MOBILITY.

A study of the travel behavior and mode preferences of 50 male teenagers documents their lack of dependence on public transit. They prefer private or personal transportation modes such as walking and automobile travel. Trip logs, budgets, and other information were collected during weekly panel discussions designed to investigate traveler characteristics, needs, and problems. Panelists were 15 to 18 years old, lived in three working-class Boston suburbs, and had varying degrees of access to public transit and automobiles. Similar conclusions about travel patterns were drawn in each town. Automobiles and walking were preferred modes even where good transit was available. Teenagers' responses to available transportation and their expenditures to achieve mobility reflected their degree of interest in travel. That is, currently mobile teenagers travel more than less travel-oriented, but otherwise similar, youth if transportation is provided. Maturing working-class travelers felt compelled to secure their own transportation, even at high cost, because their parents and communities seemed unwilling to provide transportation that permits informal, off-peak, and unchaperoned travel. Bus and rail transit service, dial-a-bus systems, and other forms of public transportation seem unable to accommodate teenagers' needs for short-range, fast, and spontaneous tripmaking. Expanded programs to improve pedestrian facilities and ease access to automobile travel would most likely satisfy the travel requirements of the teenage subgroup.

41 081010 SOCIOECONOMIC AND TRAVEL CHARACTERISTICS OF DIAL-A-RIDE USERS. Ten socioeconomic characteristics of the average daily users of the Dial-A-Ride system in Haddonfield, New Jersey have been obtained and compared with the characteristics of the residents of the entire service area. Five questions were asked on the trip characteristics, including frequency of Dial-A-Ride use during the week and weekend, trip purpose, trip distance, and the usual means of transportation. Ratings and rankings of seven Dial-A-Ride system characteristics were obtained using a seven-part semantic scale. This information was obtained by means of two on-board surveys that were conducted on 10 July

1973 and 18 September 1973 by employees of The MITRE Corporation.

41 081594 BEHAVIORAL DEMAND MODELING AND VALUATION OF TRAVEL TIME. ATTITUDINAL DATA. The role of attitudinal data in urban transportation planning was reviewed in this workshop report. The goal of the workshop was to propose stages of research in the investigation and development of a forecasting methodology that associates observed travel behavior with the attitudes of the population toward system attributes and policy variables. The attitudinal models had to satisfactorily relate to the real world and provide a design-directing process in contrast to the present methodology that evolved as a resource-allocation process. It was considered that a valid model of the decision process must (a) include the variables on which people base their decisions, (b) possibly combine sets of these variables into more basic dimensions (multivariate techniques), and (c) describe how people actually use the dimensions or variables to make travel decisions. To implement research results, an evolutionary process of behavioral model development was recommended. This strategy would require improving the modal-choice methodology. This could be accomplished by a modal-choice model which derives choice patterns on the basis of behavioral measures rather than, or in addition to, physical dimensions. This model would provide a true abstract representation of travel modes to facilitate predictions of demand for new as well as existing modes. By directly or indirectly incorporating appropriate measures such as comfort, convenience, and reliability into the prediction algorithm, a significant increase in the explanation of variance over existing models would result.

Demetsky, MJ (Virginia University) *Transportation Research Board Special Reports* No. 149, 1974, pp 21-24; Presented at a conference in South Berwick, Maine, July 8-13, 1973, sponsored by TRB, DOT and the Engineering Foundation.; ORDER FROM: TRB Publications Off, Repr. PC

41 081611 DISAGGREGATE BEHAVIORAL MODELS OF TRAVEL DECISIONS OTHER THAN MODE CHOICE: A REVIEW AND CONTRIBUTION TO SPATIAL CHOICE THEORY. In recent years, considerable effort has been spent on the disaggregate, behavioral modeling of travel decisions. Much work has centered on intraurban mode-choice decisions and on home-based person trips for work purposes. Disaggregation has been accomplished by a focus on the travel behavior of individuals or of subgroups of the urban population; subgroups are defined by either socioeconomic characteristics or class of residential location. Preliminary attempts

to incorporate more realistic assumptions about human behavior in traditional models have led to probabilistic approaches and to the a priori specification of perceived time, comfort, safety, convenience, and other variables as factors influencing mode choice. Attention is now being paid to the measurement of the disaggregate, behavioral modeling of intraurban travel by: (1) collating and reviewing literature to assist with decisions other than mode-choice applications in the trip generation, trip distribution, and route assignment phases of current transportation planning; (2) focusing attention on the importance and salient features of spatial choice models in these contexts, particularly destination choice models for shopping, recreational, and social trips; and (3) outlining research problems and strategies.

41 081829 VARIATIONS IN PSYCHOLOGICAL RESPONSES TO CHARACTERISTICS OF BUS SERVICES. This study was undertaken as a part of a Florida Department of Transportation (DOT) bus demonstration project in Clearwater, Florida. It was intended to provide psychological data as inputs to analysis and design of public transportation systems. The bus system serviced a low-density urban region in which many elderly people lived. A survey for obtaining consumer inputs was administered at home to 145 users and nonusers of the bus system. Three other variables (in addition to user status) were studied: age, sex, and health status. Large differences were found on responses to various transportation-related concerns or annoyances. Non-users were more concerned about injury and health risks, annoyances, and long-time pressures (e.g., delays). Oldest respondents were more concerned about injury and health risks and about short-time pressures (e.g., not being able to move more quickly enough). Less healthy persons also reflected this latter concern. Because of the large number of persons in the elderly (sometimes infirm) category, it was suggested that consideration of the needs and limitations of these persons is clearly advisable in the design of transportation systems.

Olsen, WT Smith, S (Florida State University, Tallahassee) *Transportation Research Record* No. 513, 1974, pp 8-14, 3 Fig., 1 Tab., 7 Ref.; ORDER FROM: TRB Publications Off, Repr. PC

41 083347 THE EFFECT OF IMPROVED SERVICE ON THE BUS TRANSIT RIDERSHIP IN THE GREATER LAFAYETTE AREA. This report was for the purpose of studying the effects of new equipment and improved routing on the type of riders and their attitudes toward the local transit system, the Greater Lafayette (Indiana) Transportation Corporation. The report analyzes the change in characteristics and attitudes of the riders, both old system riders and new riders. Two on-board surveys were conducted, one before the initiation of the new system (March 1973) and one afterwards (October 1973). The results of the data

gathered showed a trend change in public transportation for the Greater Lafayette area. Daily ridership had more than doubled since the ribbon cutting ceremony and was still increasing. In areas where improvements in service had been made, rider attitudes had improved. Attitudes toward the driver were the most positive of any area. In terms of service dependability, the rider again expressed a more positive attitude. As for efficiency and convenience of the service of the service, riders indicated that the system was performing well. The type of person found on the buses was changing with increased ridership. The new rider drawn to the system were, for the most part, younger, had more education, and had a higher family income when compared to those who had been riding for more than a year. And, an increased percentage of new riders had other means of transportation. Appendices of the report include the questionnaire and results of the administration of the questionnaire.

Merritt, JC ; Purdue University, (IN-11-0001) UMTA-IN-11-0001-73-3, Dec. 1973, 44 pp; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-238939/AS

41 083588 ATTITUDES AND ATTITUDE CHANGE TOWARD BUS TRANSIT SYSTEMS. The purpose of this report, according to the author, is to show that attitude measurement can provide meaningful information and that it should be a basic part of periodic evaluations of bus transit systems. The data for this study were 2 attitude surveys conducted for the Greater Lafayette (Indiana). Transportation Corporation: one before major system changes and one after system changes were completed. It was hypothesized that: (1) attitudes of the bus riding public would be significantly more favorable after changes in the bus system were made as compared to before changes were made; and (2) differences in attitudes would be related specifically to those parts of the system that had been changed. 566 bus riders took part in the first survey in Mar. '73 and 704 riders took part in the second survey in Oct. '73. The questionnaires were presented to the bus riders by the drivers during the afternoon of the survey days. It was found that attitudes did change significantly in a favorable direction between the first and second surveys. The data show significant change even when the demographic characteristics of the population, which had also changed, were held constant. Greater change was shown for those attributes that were directly affected by system change than for those indirectly affected by system change. The use of the questionnaire results in providing information for future planning is also discussed. Tables, a bibliography and appendices are included. /UMTA/ Dietvorst, TF ; Purdue University, (IN-11-0001) Univ. Res. 41 083723 THE SYNTHESIS OF AN URBAN TRANSPORTATION SYSTEM BASED ON SOCIETAL CRITERIA. An urban transportation system is proposed to satisfy societal criteria of greater mobility, safer travel, lower energy consumption, less pollution, personalized travel, and conservation of the urban fabric. The system is synthesized, for the most part, using elements already developed through research in the areas of

electric vehicle and PRT. Emphasis is given to new components developed to make the synthesis possible. The system can offer in the not too distant future an advantageous alternative to conventional automobile-roadway transport.

41 083812 THE URBAN CIRCULATION NOOSE. This book contains a series of essays on the role of transportation and communication in the changing social conditions of growing metropolitan areas. The topic treated here is vital because current indications are that changes in urban systems are accelerating, but not necessarily toward resolution of existing social conflicts and problems. The fundamental and encompassing role of urban circulation as it interacts with changing social issues is too little recognized and appreciated by both the interested layman and the urban and transportation policy planner. It is therefore the purpose of this book to provide insight into some of the more critical social, and hence human, implications of urban transportation and communications. Three themes are interwoven into these essays. One is the role of circulation as it lays the basis for the spatial organization of people and their activities in urban areas. A second is spatial organization as it influences social organization. Third are the transportation and communication systems and their evolution as they precipitate social stress.

41 083972 LOCATION OF THE CARLESS. This paper identifies the "carless" and shows where they are and what transportation alternatives exist for them. More than 65 percent of the U.S. population are carless. Data from Buffalo, New York, serve to indicate the relations among carlessness, median income, race, age, and accessibility of public transport. For the study area, the public transport system, which has a development consistent with the traditional pattern of urban growth, no longer adequately serves the needs of those who rely on it most. Examination of the extent of carlessness in the suburbs shows that the problem of mobility among suburban households may be more severe than that in the inner city.

41 084709 SUCCESSIVE OVERLAYS-A SMALL CITY TRANSIT SURVEYING PROCESS. A study was conducted in the city of Paducah, Kentucky, to estimate its transit potential. The first aim in the program was quantification of demand, which was achieved by means of a postal card survey. In order to define on a map those areas with a significant propensity for using transit, the technique of "successive overlays" was used. The first step was to evaluate the socio-economic characteristics of an area which would indicate ridership potential. The indices

chosen were: 1) the number of passenger cars per dwelling unit; 2) average income; 3) females from 16 to 24 years; 4) persons over 62 years; and 4) dwelling units per acre. The best single indicator of transit patronage was found to be the number of passenger cars per dwelling units. Average income was also a good indicator, especially in combination with vehicle ownership. Each index was recorded on a transparent map and when these were superimposed on the area map, the shaded portions indicated the areas with the greatest transit potential. The postal card questionnaire was then sent to residents of these areas. After the data from this survey was analyzed, it was compared with the overlay data, and was found to correlate quite well. The overlay data tended to overestimate transit potential in some areas. In addition to this method being a valuable tool for small city planners, it is also a relatively low-cost survey.

41 090542 PHASE I-RESEARCH PLAN. INSTITUTIONS AND LIFE STYLES PROJECT. BART IMPACT PROGRAM. The report is a research plan outlining central institutions most likely to be affected by BART, most feasible for study, and most likely to produce findings of transferability to other settings for policy-related decisions. Second, selected aspects of various kinds of life-styles are reviewed and suggestions and hypotheses presented for further study of both institutions and life-styles (I and LS). The methodologies are designed to inter-connect from different angles in the study of the same problem, with a combination of ethnographic, observational, and survey research supplemented by document monitoring and analysis.

41 092223 EXPLORATORY NETWORK ANALYSES OF BART'S IMPACTS UPON ACCESSIBILITY. The objective of the study was to (1) make a preliminary assessment of BART's impacts on areawide accessibility, and (2) evaluate the use of network-based accessibility measures as an impact analysis technique. Accessibility measures were based on estimates of zone-to-zone travel times and transit fares derived from networks developed for the 1971 'pre-BART' and 1976 'post-BART' highway and transit systems. The accessibility measures were expressed as simple indices, weighted by the size and characteristics of the resident population in the origin zone. Comparisons of the accessibility indices were made for both peak and off-peak travel times for selected destination zones in the BART service area. The selected zones represent the locations of important employment centers, shopping facilities, and hospitals. Assessments were made of BART's potential accessibility impacts on the racial minority, elderly, and low-income populations as well as the generation population.

41 093013 TRAVEL PATTERNS AND PROBLEMS OF SUBURBAN HIGH SCHOOL MALES: EXPLORATORY STUDY OF THE PHYSICAL MOBILITY OF A POPULATION SUBGROUP, WITH RECOMMENDATIONS. Teenagers' travel behavior and their transportation needs and preferences were investigated in three working class Boston suburbs having different levels of transit service. Fifty male high school students met in weekly panels to discuss where, when, how, and why they traveled, how much it cost them, and other travel-related information. The report recommends long-term, direct participation of all traveler subgroups in transportation planning and management. Expanded programs to improve pedestrian facilities and ease access to automobile travel are concluded to be most likely to satisfy the travel requirements of the teenager subgroup.

41 093750 ATTITUDES TOWARD METRO-RAIL IN THE WASHINGTON AREA. This report includes the major findings of a study carried out in late winter and early spring of 1975 to assess public attitudes in the Washington area toward the Metrorail system in various stages of its construction in different parts of the community. The study used standard survey research techniques in which samples of the population were interviewed about their transportation habits, their priorities for improvements in local transportation, their views about Metrorail and aspects of its operation, their own prediction about the likelihood of their using the system and their opinions about methods of financing Metro's construction. The interviewing was carried out by the field staff of The Washington Survey, the local research facility of BSSR.

41 093912 DATA NEEDS FOR MEASURING THE IMPACTS OF NEW TRANSPORTATION SYSTEMS: THE BART EXPERIENCES. The BART Impact Program is a comprehensive, policy-oriented study and evaluation of the impacts of the San Francisco Bay Area's new rapid transit system, BART. The Impact Program has just completed its initial phase of planning and investigation, and is now evaluating its results, research strategy and analytical methods developed thus far.

Markowitz, J Reynolds, M ; Metropolitan Transportation Commission, Department of Transportation, Department of Housing and Urban Development WP-18-1-75, Aug. 1975, 22 pp; Contract DOT-OS-30176; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-2477-9/1ST, DOTL NTIS

41 093913 THE BAY AREA RAPID TRANSIT SYSTEM-CURRENT STATUS AND IMPACTS. The report reviews the history of the BART system, describes the kind of service the system provides, discusses the difficulties of impact measurement, reports the early findings about BART's effects on travel, and describes how BART is seen by residents and policy-makers of the area. The Bay Area Rapid Transit system has only been in operation on all of its lines since September 1974. The inherent design of the system as a long-distance, commuter rail facility means that BART by itself could not possibly live up to some of the inflated expectations held for it, nor produce some of the dramatic impacts which had been predicted. As BART solves its operational problems, it will become a key element in the total regional transportation system of the Bay Area, and is likely to prove to have been worth its cost.

41 094017 URBAN DATA BOOK. VOLUME I. URBAN DATA: ATLANTA-MIAMI. A quick reference compilation of certain population, socio-economic, employment, and modal split characteristics of the 35 largest Standard Metropolitan Statistical Areas (SMSA) in the United States is presented. The three basic groups or urban data presented are population, socio-economic, and employment. The population data include population totals and densities for the various segments of each of the individual SMSA's (CBD, Central City, Urbanized Area, and SMSA). Also included are population totals by concentric urban rings and population density plots (dot, contour, and isometric views). The urban ring data combined with the population density plots can be used for identifying existing urban corridors. The socio-economic data compiled by concentric urban rings include: median female and male age, proportion of population 65 years and older, median family income, number of households and families, number of home-owners and renters, average home value and average rent paid, and auto ownership. The employment data found in this report include: home-to-work flows, employment and worker densities, and a modal split distribution for each of the 35 SMSA's.

41 094241 HOW TO SET UP A LOCAL PUBLIC TRANSPORTATION SERVICE IN YOUR COMMUNITY. Intended for small urban and rural areas, the document describes the steps necessary to set up public transportation services. Such subjects as estimating costs, obtaining funding, marketing the service, subsidizing a taxi operator, setting up a non-profit corporation to run the service, and developing the required forms for transit record-keeping are covered. The objective of the study was to provide a simple, straightforward guidebook for local officials and private groups to use in establishing public transit services.

41 094636 DEVELOPMENT OF METHODOLOGY FOR THE ASSESSMENT OF BART'S IMPACTS UPON ECONOMICS AND FINANCE RESEARCH PLAN. This is a research plan for the Economics and Finance

Project, one of the six major components of the BART Impact Program, a comprehensive, policy-oriented study and evaluation of the impacts of the San Francisco Bay Area's new rapid transit system. The Economics and Finance Project will determine the impacts of the construction of BART, the transportation service it provides, and the bond issues and taxes that finance it, on the regional economy and on specific economic sectors. It will also assess impacts on employment, productivity, business activity, the cost of public borrowing, public willingness to incur debt for other purposes, and the distribution of tax burdens among socioeconomic sectors of the population. In the Research Plan, one or more work elements are defined for each of the enumerated factors. The discussion of each element includes a description of a model of the determinants of the impact, expectations as to measurability of the impacts, a consideration of alternative study methodologies, and a recommendation of a preferred methodology.

Bergsman, J Muller, T McGillivray, R Garn, HA Metropolitan Transportation Commission, Department of Transportation, Department of Housing and Urban Development, Urban Institute PD-22-7-76, Mar. 1975, 45 pp; Prepared by Urban Inst., Washington, D.C.; Contract DOT-OS-30176; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS; PB-250719/2ST, DOTL NTIS

41 095261 POTENTIAL IMPACTS OF RAPID TRANSIT AND PUBLIC RESPONSES TO RAPID TRANSIT PLANS. An analysis is presented of potential impacts of rapid transit systems, and some ways in which such an analysis can aid in achieving widespread public support for the rapid transit system itself. The analysis of the rapid transit plan developed for the St. Louis region is analyzed and its potential impacts are specified. A comparison is made of these impacts with preferred system features and goals desired by the region's residents. This report is not only a case study of a rapid transit planning experience, but also a description of several innovative planning procedures, especially in the area of identifying potential coalitions among regional factions so that support for the proposed system could be increased.

41 096549 HUMAN FACTORS IN URBAN TRANSPORTATION SYSTEMS. Urban growth and the development of the megalopolis have forced a re-examination of all urban transportation systems in terms of their ability to satisfy human needs and preferences. Encouraging the re-emergence of public transportation in cities requires a total assessment of the physical and behavioral characteristics of the user population as well as their economic, social, and esthetic preferences. This population includes many groups not normally considered in human engineering design, such as the physically or functionally handicapped and the aged. Existing data are reviewed and research needs are identified for the design of urban transportation systems.

Hoag, LL (Oklahoma University) *Human Factors* Vol. 17 No. 2, Apr. 1975, pp 119-131, 7 Tab., 31 Ref.; ACKNOWLEDGMENT: Human Factors;

ORDER FROM: ESL, Repr. PC, Microfilm

41 096576 RAPID TRANSIT AND OFFICE DEVELOPMENT. The Lindewold rapid transit service has had a considerable impact upon the commercial office market in the Philadelphia region. The line is acting simultaneously to consolidate the Philadelphia central business district as a prime office location and to promote the development of new suburban office locations. All the implications of these developments will require further analysis. It is suggested that theoretical and empirical analyses of urban rapid transit impact might well be tested in the Philadelphia region and that a complete appraisal will require the passage of more time.

Gannon, CA Dear, MJ *Traffic Quarterly* Apr. 1975, pp 223-242, 2 Fig., 6 Tab.; ORDER FROM: ESL, Repr. PC, Microfilm

41 096602 WASHINGTON, D.C., METRO: AT WHAT REAL PRICE THE "BENEFITS"? There is general public enthusiasm for a rapid rail transit system in Washington, DC, primarily because it would reduce surface congestion at rush hours. METRO, as it is now designed, may nevertheless prove to be a poor second choice to the automobile by suburban commuters for destinations other than the CBD and, at the same time, fail to provide satisfactory service for the transit-dependent. If downtown employment projections (and consequently, planned patronage) are not realized, the "benefits" of METRO will in no way justify the costs of the inflexible fixed-track system.

Brooks, EG (Institute for Defense Analysis, Evaluation Div) *Transportation Planning and Technology* Vol. 2 No. 2, 1973, pp 105-119, 45 Ref.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL, Repr. PC, Microfilm

41 097113 TRANSPORTATION CONTROLS AND THE SPATIAL STRUCTURE OF URBAN AREAS. The long-run effects on cities of changes in the cost of moving people are examined. Two kinds of policies are compared: those that increase the cost of travel by car, and those that improve the quality or reduce the price of public transportation. The paper argues that the former are likely to reduce auto travel more quickly. However, these policies are also more likely to cause the economies of central cities to decline more rapidly than they would otherwise. A policy of improving and subsidizing public transportation would tend to slow their rate of decline. So far as the economies of central cities are concerned, there is a set of measures that appears to be most damaging. These are the ones that increase the cost of auto travel to central cities or their core areas relative to the cost of auto travel elsewhere in standard metropolitan statistical areas. Reductions in the supply of downtown parking, special taxes on such parking, tolls to the downtown areas, are examples of such measures.

Coldstein, GS Moses, LN *American Economic Review* Vol. 65 No. 2, May 1975, pp 289-294

41 097290 DISAGGREGATED BEHAVIORAL VIEWS OF TRANSPORTATION ATTRIBUTES. The assessment of attitudes toward various attributes of urban transport alternatives is of interest because of (a) the relation between personal behavior toward transport systems and the perceptions and preferences of individuals

toward attributes of the alternatives, (b) the possibility of developing policy-sensitive prediction models, and (c) the compatibility of output from attitude research with ongoing disaggregate behavioral model development. The current investigation applies all individual-differences scaling model to a set of perceptual similarity judgments of an automated urban transportation system to find groups of respondents with a homogeneous viewpoint. The perceptions of 7 distinct groups of respondents were represented by Euclidean distance models. The points of view of the different groups could be identified both by the number of dimensions and the relative position of attributes for their corresponding spaces. Across the axes of the perceptual spaces for the 7 groups, 3 major classes of attributes could be defined: basic transport service, personal luxury service, and general amenities. Satisfactions with modes of a proposed urban transportation system could be predicted from the projections of the attributes on the axes of the spaces, and in addition the particular classes of attributes that differentially contributed to satisfaction with a given mode could be determined. Finally, the potential contribution of the technique for evaluating impact models was demonstrated by the investigator, which indicated those activity pattern and socioeconomic variables that were not uniformly distributed across the 7 homogeneous perceptual groups.

Dobson, R (General Motors Research Laboratories) Kehoe, JF (University of Southern California) *Transportation Research Record* No. 527, 1974, pp 1-15, 6 Fig., 4 Tab., 35 Ref.; Report prepared for the 53rd Annual Meeting of the Highway Research Board.; ORDER FROM: TRB Publications Off, Repr. PC

41 097292 CONSUMER PREFERENCES FOR AUTOMATED PUBLIC TRANSPORTATION SYSTEMS. This paper investigates the attitudes of a cross section of residents of a metropolitan area toward 3 automated transportation systems. Respondents to a home interview survey evaluated their satisfaction with each system according to 12 attributes such as travel time, comfort, automatic control, and privacy of the vehicle. Respondents also evaluated their over-all satisfaction for each system and projected their possible use of these systems. In the first phase of the analysis, the interrelations among the respondents' perceptions of the system attributes are examined. Five latent factors are determined through factor analysis to describe the attribute satisfaction ratings: level of service, comfort and privacy, degree of automatic control, out-of-pocket cost, and options and amenities. These factors are consistent for both work and shipping trips. In the second phase, reported overall satisfaction for work and shopping trips is explained in terms of the attributes through the use of linear additive models. Level of service is a significant descriptor of overall satisfaction for work trips; comfort and privacy and options and amenities are added descriptors for shopping travel. The final phase of the analysis uses a nonlinear estimation technique to explain the allocation of work and shopping trips by the respondent. This technique revealed, as did the linear additive model, that satisfaction with a mode is dependent on trip purpose.

41 098028 PSYCHOLOGICAL DESIGN FACTORS IN URBAN PUBLIC TRANSPORTATION VEHICLES. Recent trends in transportation have shown a reluctance to accept public transportation as a viable alternative to the automobile. Even some advanced systems such as BART have not been well received. A major source of this reluctance has been attributed to the failure to successfully meet the psychological needs and preferences of the traveler in designing passenger compartments of public vehicles. A discussion is presented on important psychological variables such as personal space, situation control, esthetics, perceived safety, privacy, and forced interaction with other travelers. Recommendations are given for improving the design of urban public transportation vehicles.

41 098595 TRAVEL TO WORK. On any given working day the daytime population of the 50 largest United States cities, as a group, increases by seven percent, based on 1970 Census data. The effect of the comings and goings of workers on a city's population was especially notable in New York City, where the population of Manhattan (New York County) rose by two-thirds every work day. More than 5.4 million people—about 30 percent of the 18.8 million people working in the 50 largest cities of the United States—resided in the suburban areas of these cities. Only slightly more than one-third of the workers in the northeast used a car for traveling to work, compared with more than two-thirds in the north central region, and more than three quarters in the south and the west. On the average, over half of the resident workers in the seven cities of the northeast used public transportation, two-thirds of these workers used railroads and subways.

Metropolitan Life Insurance Company Stat Bulletin Vol. 56 June 1975, pp 206

41 099246 WORKSHOP 5: THE USER'S PERSPECTIVE. The purpose of Workshop 5, which viewed the evaluation of urban public transportation from the user's perspective, was to identify appropriate dimensions of consumer satisfaction and ways to measure the responsiveness of transportation service to consumer requirements. This report of the proceedings of Workshop 5 identified the following research projects as being necessary for an adequate evaluation of urban public transportation: (1) measuring the quality of public transportation service; (2) identification of public transportation consumer groups; (3) monitoring and evaluation of public transportation systems; (4) translation of mobility requirements of user groups into specific transportation service characteristics; (5) potential for diversion of automobile commuters to public transportation; (6) information system requirements of transportation system consequences; (7) assessing benefits of a public transportation system for users and the community at large; (8) demand elasticities of user groups as related to service attributes; and (9) measurement of convenience for auto access.

41 099334 SOCIAL COMPLEXITY AND TECHNOLOGICAL CHOICE: THE BAY AREA RAPID TRANSIT SYSTEM. There are two strategies in planning transportation for a metropolitan area; one is flexible and can adapt to future changes in the area. The second adopts a particular technology and the area must adapt to it in the future. The Bay Area Rapid Transit System is an example of the inflexible strategy. In this case community leaders decided that improving transportation in the area, thus improving accessibility, would save San Francisco from decay. The flaw in the decision making process was that even though consultants were used, they designed and implemented on particular form of transit system rather than deciding what the future needs of the region would be and then deciding what mode would best fit those needs. The choice of rapid rail implies a political strategy. A bus system would have been more flexible, less expensive, use already existing and multipurposes facilities. The building of a rail system forces development, growth and prescribed uses of land. Technology becomes an independent variable in political decision making because it forecasts what the future will be. This is called technocracy; rule by technology. The author proposes a socio-political impact statement which would report probable consequences of a proposed investment in a particular technology.

41 125209 YOUR CITY-YOUR CHOICE. A PUBLIC OPINION SURVEY FOR SOUTHAMPTON CITY. Southampton City Council undertook an extensive public opinion survey on such issues as traffic restraint measures, new road construction, improvements to public transport

and the relative priority of investment in alternative transport facilities. This article describes the care with which the questionnaires were framed, and comments on questionnaire comprehension, respondent characteristics and reliability. It appears that only a small minority of the public have sufficient understanding of the problems to formulate a meaningful transport policy of their own. It is suggested that public participation will be more effective if alternative overall packages of policies are presented, together with a simple description of how each package would affect everyday life. /TRRL/

41 125359 SOCIO-ECONOMIC CHARACTERISTICS AND TRAVEL PATTERNS OF NON-DRIVERS RESIDING IN METROPOLITAN MELBOURNE. The purpose of this report is to present the findings of a study undertaken as a first step towards gaining an understanding of the transportation needs of the little considered non-driving members of the population. These are people who do not have the use of private transport, except perhaps as a passenger, and are therefore reliant on public transport for their independent travel needs. Data used for the study were collected in household interviews carried out for the 1964 Melbourne Transportation Study. Non-drivers were initially separated into three categories: (a) persons from non-vehicle households; (b) unlicensed adults from vehicle-owning households too young to obtain a licence. There were three major aspects to the study. The first involved determining what proportion of the population is comprised of these non-drivers and the extent of their contribution to motor transport use. The second was concerned with establishing the socio-economic characteristics of each non-driver group. The third involved an attempt to determine how far non-drivers are disadvantaged relative to drivers by not having independent use of private transport.

41 126425 DISTRIBUTION OF BENEFITS OF PUBLIC TRANSIT PROJECTS. The paper examines the basic issues related to efficiency and equity and reviews the existing techniques of including income redistributive effects in the evaluation of public projects with the objective of determining their applicability to the ease of urban mass transit projects. The current techniques of estimating the benefits of rapid transit as well as conventional bus systems and the quantification of their distribution among the various socioeconomic groups of beneficiaries are examined. It is pointed out that in the case of urban transportation projects, it is necessary for practical reasons to extend the concept of an equitable distribution of income to that of mobility or the opportunity to travel. Two alternative procedures based on the criteria of the dependence of individual groups on particular modes for different purposes are suggested for analyzing the distributive effects of urban transportation projects.

41 126483 THE ECONOMIC COST OF COMMUTING. The economic costs of work trips to the central business districts of 33 urban areas of more than one million population are compared according to mode of transportation. The four modes considered are automobile, rail transit, bus transportation, and vanpools. Cost data are based on information available as of January 1, 1975, and results are expressed in terms of dollars per one-way person trips of 5, 10, 15 and 20 miles. A detailed discussion of the 10-mile trip is presented to illustrate the approach used. Results show that automobile travel has a comparatively low cost only when there are sufficient vehicle occupants to share the cost. For the 10-mile trip the estimated cost per person for a single occupant automobile is \$3.71, while for the 2 to 6 occupant automobile the cost decreases from \$1.86 to \$0.62. Rail transit is relatively expensive, with the per person cost for the 10-mile trip ranging from \$2.25 with bus access to \$3.29 with kiss-and-ride access. The cost per person for the 10-mile trip by bus transportation ranges from \$1.76 for conventional service to \$2.95 for a busway system with kiss-and-ride access. The most economic means of commuting is the eight-or-more person vanpool with a cost per person for the 10-mile trip of \$0.54. Calculations showing how these costs were determined are included in an appendix to the report.

41 126814 TRANSPORTATION DECISION-MAKING: A GUIDE TO SOCIAL AND ENVIRONMENTAL CONSIDERATIONS. An integrated approach is presented for systematically incorporating social, economic, and environmental factors into transportation planning and decision making. The timely identification is stressed of the nature, magnitude, and incidence of these potential factors so that in all phases of transportation planning, alternatives may be developed that avoid or minimize adverse effects and that take full advantage of opportunities to increase benefits. The early, effective, knowledgeable involvement of the public to clarify issues and to aid in the development and evaluation of proposals is emphasized, and the effective use is stressed of expertise and resources both of the transportation agency and of other agencies with maximum flexibility and openness. The report also stresses the consideration of a range of transportation improvements involving various types of highway facilities, other models, transportation regulations, controls and constraints, and the no-build option. A systematic evaluation process, and the documentation of work performed and decisions made are crucial, and institutional arrangements and decision-making are important. The planning approach and techniques presented here are based on the following findings: the overall process through which social, economic and environmental considerations are

brought into transportation planning and decision-making is as important as the particular techniques used for predicting impacts; issues of social equity must be explicitly recognized and taken into account in transportation decision-making; different groups can be expected to have different interest and different priorities. System plans should be defined using a strategy of implementation decisions being made over a period of time, thereby enabling options to be kept open longer. Periodic reassessment of decisions should be built into all stages of system studies. Objectives for all phases of a transportation planning and design process are listed, a 4-phase study strategy is proposed, and the roles of the transportation professional are reviewed.

41 127011 **ECONOMIC CRITERIA FOR MAINTAINING MODIFYING OR CREATING URBAN OR SUBURBAN PUBLIC TRANSIT SYSTEMS** [Critères économiques pour le maintien la modification ou la creation de services de transports publics urbains ou suburbains]. Professor Beeseley, of the London Graduate School of Business Studies, author of the report, presents the latter as a sequel to his communication, under a similar title, to the 4th ECMT Symposium held at the Hague in 1971. This 1st study showed more particularly how public-transport subsidies alleviated certain social costs such as those occasioned by traffic congestion, and contributed to a redistribution of incomes in favour of lower-income groups. In his report, the author reviews and comments on a whole range of studies covering: the effects of subsidies on various aspects of urban life and development; the flexibility of public-transport services, in terms of fares, frequency, and efficiency; their flexibility set against the private car; what he calls their "operational role" and the possibility of taking the value of this "role" into consideration. The exchanges of views are a critical survey: of the justification given for the subsidies, of their sometimes unexpected effects; of the alternatives to subsidies; of the conditions for the subsidies to be efficient; of the pattern to be given them: equipment, operating, inclusive or special-purpose subsidies; finally, of the role of the controlling authorities these subsidies imply. In conclusion, the Round Table stresses the need for studying the problem in the general framework of transport as a whole and of the conditions of town life. [French]

41 127697 **ECONOMIC AND ENVIRONMENTAL ASPECTS OF PERSONAL RAPID TRANSIT-A FURTHER STUDY**. A parametric study of system variables of personal rapid transit (PRT) networks is presented. The analysis examines the effect that the detour penalty associated with one-way networks has on system ridership. A preliminary estimate of the potential PRT ridership from kiss-and-ride access is given. The analysis further considers modal split, reduced-auto emissions, cost per mile, benefit-cost ratio, electrical-power requirements as dependent variables. Independent variables are population density, trip length, PRT operating and fixed costs, mesh spacing, auto speed, perceived-auto-mileage cost, parking cost, PRT speed and fare. Particular attention is paid to the effects that parking cost, auto speed, perceived-auto-mileage cost and trip length have on the dependent variables. /Author/TRRL/

41 127810 **URBAN TRANSPORTATION AND DECISION MAKING-A COMPARISON OF THREE CASE STUDIES IN BRITAIN**. In spite of the impacts that new transportation facilities have upon the economic, social and political structures of established urban areas, the decision process leading to policy formation and plan implementation has received little, if any, attention. Case studies of three county boroughs in Britain having different urban transport policies suggest that the decision making process is dominated by groups and individuals who attempt to implement policies which benefit the sectional interests which they represent. Within a changing relevant environment, local technicians, politicians and community groups compete and form coalitions in order to acquire authority and implement their own notions of justice and equity in the adaptation of the built environment. 41 127884 **THE CONTINUING EVOLUTION OF URBAN TRANSPORTATION**. This exploration of the countiuing evolution of urban transportation, describes the prime determinants of the direction and rate of change in urban transport and examines the existing generic transport options and their future roles. Changes in urban transport will evolve steadily but relatively slowly for the foreseeable future. The nature and rate of such change will be largely determined by rates of change in urban form, in socio-economic conditions and in resource constraints. However, it is possible that the physical environment, economic and social conditions may coalesce into a sufficiently compelling force to override this gradual change. The nine principal determinants of the future of urban transportation are: inertia, demography, distribution of economic activity, constraints on transport side-effects, consumer preference, promotion of the general welfare, technology, financial resources and institutional mechanisms. Transport is identified as a function

subject to strict control by public administrations which can be used as an instrument in achieving new objectives for urban form and social interaction.

Hamilton, CW (Battelle Columbus Laboratories) *Ohio Transportation Engineering Conference Vol. 29 Apr. 1975*, pp.56-65, 2 Fig, 6 Tab.; Proceedings of the twenty-ninth annual Ohio Transportation Engineering Conference, conducted by the Department of Civil Engineering, in cooperation with the Ohio Department of Transportation.

41 127886 **MEASURING SOCIAL IMPACTS OF URBAN TRANSPORTATION MODES: A VALUE APPROACH**. Proceedings of the Twenty-Ninth Annual Ohio Transportation and measuring existing or held values of residents of impacted areas and users of transportation systems, discusses the theoretical aspects of the differences between value-behavior and verbal-value failings. The contingent conditions associated with quantification of values, requirements for such quantification, and identification of some alternative quantifying techniques are examined, and two useful matrix forms for displaying values (for the public presentation of quantified values) are described. The objects of the values are specified as those positive and negative social impacts which accrue to alternative transportation modes. A figure is used to explore valuing for alternative transportation modes assuming continued growth of dispersion points and continued growth of points of conflux in many spatially segregated areas. Valuing related to the automobile, public transit, and rapid transit is illustrated. The importance is emphasized of the precise identification and measurement of valuing activities in transportation planning and other social variables in the planning process.

41 128257 **THE INFLUENCE OF PUBLIC TRANSPORT ON CAR OWNERSHIP IN LONDON**. This paper discusses the development of a statistical model of car ownership in London which included public transport quality as one of its variables. Two broad sets of variables are

distinguished: household factors and planning factors. The two basic statistical approaches taken are (a) time series (analysis of changes in car ownership over time); and (b) cross-sectional (analysis of differences in car ownership at one point in time between different areas or socio-economic groups). The model, which excludes residential density, explains, at least in part: (a) the tendency for income/density models to underpredict the increase in car ownership during the 1960's and (b) the instability of the income models of J.J. Bates.

Fairhurst, MH (London Transport Executive) *Journal of Transport Economics and Policy* Vol. 9 No. 3, Sept. 1975, pp 193-208, 5 Fig., 1 Tab., 8 Ref.

41 128573 PUBLIC TRANSPORTATION IN THE SCHOOL CURRICULUM. The rationale for public transportation education is set forth, the goals for such education are described, and the ways in which government and the transit industry could help achieve the goals are outlined. The five ultimate goals which education should achieve are: motivate youngsters to use transit for the benefit of the common good; expand travel options of the public; promote personal, social and political action by citizens to ensure the adequacy, safety and efficiency of transit; promote transportation safety; and reduce vandalism of public transportation vehicles and facilities. Instrumental goals which must first be achieved are also listed. These relate to provision of information on transit availability, alteration of stereotyped thinking about transportation issues, setting of priorities, feelings and attitudes associated with the use of cars, and the understanding of social, political and economic factors related to public transportation systems. The government and transit industry could provide educational services and promote curriculum development.

41 128807 A BEHAVIORAL ANALYSIS OF TRANSPORTATION: SOME SUGGESTIONS FOR MASS TRANSIT. Behavioral principles are outlined and used to analyze bus riding and car driving. It is concluded that transportation behaviors are chains of responses, consequences (reinforcers and punishers), and discriminative stimuli, and that alterations of these components will influence ridership. It is suggested that manipulations such as free transit and exclusive bus lanes will attract the carless more than car drivers. Analysis indicates that systems such as Dial-a-Bus and Park-and-Ride have potential for competing with the car because these systems reduce the delay of reinforcement and the adverse consequences associated with bus riding. /Author/

41 129520 THE URBAN TRANSPORT DILEMMA. This paper examines methods which could reduce the present undue dependence on the private vehicle for urban travel in New Zealand. In addition to engineering, social and political issues are discussed. Reference is made to the importance of public participation in town planning objectives. Solutions discussed include

radial and inter-suburban bus routes, and the promotion of walking and cycling as urban travel modes, over distances of up to 1800 M and 2 to 3 km respectively. /TRRL/

Williman, A *New Zealand Engineering* Vol. 30 No. 1, Jan. 1975, pp 19-24, 5 Fig., 1 Tab., 10 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 213507)

41 129566 TRANSPORT AND SOCIAL EQUITY. The author reviews the problem of the integration of transport needs into a social and economic environment and suggests that the remaining gap lies in social equity or "fairness". The article also discusses the manner in which levels of income and social status act as constraints on personnel opportunity through the use of a transport facility. The effect of social inequality on a way of life in a stratified society is examined and it is suggested that transport systems are needed which reflect society's priorities where group interests are represented. /TRRL/

Roberts, J *Built Environment* Vol. 4 No. 2, Feb. 1975, pp 95-98, 1 Fig., 1 Tab., 3 Phot., 22 Ref.; ACKNOWLEDGMENT: TRRL (IRRD-214673)

41 129994 A PILOT STUDY OF A METHOD FOR TESTING THE PUBLIC IMAGE OF FORMS OF TRANSPORT. After a brief review of the use of psychological tests of attitude in transport, this report outlines a method which employs schematic human faces. Its use in a pilot study to test the image of forms of transport held by residents in two housing estates is then described. The results of this study are not entirely unambiguous, but suggest that the bus user may be less highly regarded than the car user. It is recommended that the test itself should be refined before wider use is made of it. (A) /TRRL/

Chapman, RA ; Newcastle-Upon-Tyne University, England, (0306-3402) R&D Rept. Work Paper No. 10, May 1975, 31 pp, 4 Fig., 10 Tab., 28 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 215986)

41 129997 BETTER TOWNS WITH LESS TRAFFIC. This article is concerned with the OECD traffic conference to be held in mid-april 1975. It is primarily concerned with the survey of traffic management measures in 300 cities which was conducted in preparation for the conference, and two examples (Besancon and Nagoya) of a series of case studies of particular cities that were planning comprehensive measures to limit car use, improve public transport and abate nuisances. Besancon (population 135,000) is improving public transport and environmental conditions. Reference is made to a system of licences to control access to the city center (costing \$730,000), to its \$520,000 pedestrian precinct scheme and changes in its public transport services. Nagoya (population 2.3 million) shows environmental traffic measures deployed over an exceptionally wide area. Improvements include a 4-year plan which is designed to shift emphasis from cars to public transport and the elimination of through traffic from areas suffering from accidents, noise or other traffic problems. Results of before and after surveys of accidents and noise are given, and of the progressive effect of the 4-year plan on traffic inflow and outflow in a 2.4 sq kilometre area of the city. /TRRL/

41 130415 ECONOMIC RELATIONSHIPS AMONG URBAN TRANSIT MODES. Economic relationships among demand-actuated, scheduled-route, and rapid transit services are examined to determine where the operating economy justifies intensive capital investment in permanent facilities. Analysis of national experience in the more heavily populated urban areas discloses that per capita ridership is much greater in areas served by rapid transit than in areas served only by street transit service, which in turn generates far higher levels of per capita ridership than demand-actuated service. The relationships cover common situations. Unique situations (e.g., New York's unusual costs and densities and San Francisco's experimental technology) are not included. Public acceptance is measured by comparing paid ridership with population and by reference to census data on the percentage of work trips made by transit. A general similarity between the two sources is evident, but rapid transit ridership outside New York is understated because of policies involving free transfers from buses and streetcars to rail transit. This does not impair city totals, however, in which transfers are not counted as additional trips. Costs are measured by financial records based on the number of vehicles operated. The usual denominator of vehicle miles (kilometers) varies based on speed or slowness, and hourly values vastly understate the cost of service provided only during peak hours when employees must be guaranteed pay for 40 hours/week. The results are empirical but appear to be realistic.

41 130420 WHAT ROLE FOR CITIZENS? Citizen participation can and does take a variety of forms and will result in different roles for citizens in planning and policy-making processes. This paper describes and compares the citizen participation strategies used in two recent regional transportation planning projects in King County, Washington. The purpose of this analysis is to determine how citizen participation strategies differ according to the planning issue and its importance in the community and how such strategies provide different opportunities for citizens to become involved and to influence the planning process. The analysis and comparison focus on several key aspects of the programs: recruitment techniques, structure and process of involvement, and the citizen's role and impact on the planning process. The analysis finds that where the issue, such as the airport study, is important in the community a loosely structured, citizen-defined involvement program is more effective. Advocate planners are beneficial in this instance. For a nonsalient, or less visible, issue such as the countywide transit plan, a more tightly structured involvement program that emphasizes educating citizens is effective in stimulating citizen input. This strategy relies on planner-defined activities with all citizens playing the same role. The information for this analysis is

based on a survey and study done in the Metro 1980 transit planning study and on involvement in the initial stages of the

41 133452 AN EQUITY EVALUATION MODEL FOR URBAN MASS TRANSPORTATION: AN ASSESSMENT OF THE SPATIAL AND SOCIAL DISTRIBUTIONS OF BENEFITS AND COSTS. This report deals with the distribution question, i.e., the distribution of resources among members of society. Public investment decision-making in the provision of impure goods (those public goods which intrinsically incorporate a spatial dimension) is discussed and a public investment model which describes investment issues as both a production and a distribution question is presented. Then, an alternative public investment model, the Equity Evaluation Model (EEM) which examines public investment as a distribution question, is examined. The mathematical foundation of distributional analysis, particularly the link between aggregate and distributional analysis, is discussed. The three stages of the EEM are detailed which special attention to the selection of a proper equity criterion by which competing public projects are to be evaluated. A case study application of the EEM is presented through the examination of the geographic setting of Pittsburgh and the alternative public projects, three mass transit proposals. The social and economic environment of Pittsburgh region is described and the results of conventional benefit/cost evaluations of the projects are presented. The distribution of benefits and costs is determined for each of the three proposals using the EEM. Net change in the distribution of real income is calculated and evaluated in terms of equity. The projects are compared and the most equitable project, according to the author, is chosen. Finally, the concepts of the report are integrated with an emphasis on an understanding of the key role played by spatial forces in the distribution of real income. The model is evaluated in terms of methodological soundness and its overall appropriateness to the equity paradigm. Future applicability of the model is discussed.

41 134511 FACTORS AFFECTING CHOICE OF TRAVEL MODE. Society is contemporarily demanding intensified study of both private and public travel modes. Transport planners are being questioned on the validity of large expenditure on limited access roadways. They are also being asked the social consequences of substantial investment in urban public transport. To make an objective assessment of the public-private transport issue, a sound understanding of the mode choice decision-making process is necessary. Unfortunately, most of the current literature on mode choice is directed towards extolling the virtues of one particular type of model. This paper presents a wider approach and attempts to give an understanding of the mode choice decision-making process and to define a base for the sound evaluation of mode choice models. (A) /TRRL/

41 134731 PERCEIVED ATTRIBUTE IMPORTANCE IN PUBLIC AND PRIVATE TRANSPORTATION. A group of 500 mail panel respondents rated attributes of two generic classes of innovative urban transportation systems on a seven-point importance scale. A factor analysis of the data resulted in seven interpretable factors to describe the variance of the 40 public transportation attributes and five factors to describe the variance of the 34 private transportation attributes. These latent dimensions of importance were shown via discriminant analyses to have relations to the socio-economic characteristics of the panel respondents. Discriminant analysis was also used to reveal perceptual differences between the two system alternatives with respect to 16 common attributes.

41 134881 INTEGRATED ECONOMIC-SOCIAL-ENVIRONMENTAL PLANNING. This paper deals with the practical application of integrated economic, social, and environmental analyses to transportation planning for a municipal government, corridor planning for a state department of transportation, and national-level

planning for an overseas federal government. Each project was real, not theoretical or part of advance planning. Two of the projects were responsible for the U.S. Department of State request for a paper on the subject to the 1972 U.N. Conference in Stockholm on the Human Environment. First, the paper is based on an attempt to improve and broaden the understanding of integrated analysis. Three projects are used to point out selected and particularly difficult problems. Next, the paper describes the philosophical basis for and approach to integrated analysis. Key aspects and issues are reviewed by using selected references to identify strengths and weaknesses with specific elements of the approach. A special effort is made to identify and rank the more important elements of the approach so that planners might draw some inferences or conclusions on the utility of important elements as well as the overall approach. Finally, the paper concludes with answers to questions on what the results of the integrated analyses were, how the decision makers reacted to the results, and what decisions were made concerning the projects that were directly traceable to parts or all of the approach and integrated analysis. The paper refers to other theoretical and applied efforts. Emphasis on actual experiences and practicality is maintained throughout the discussion.

41 135207 ON THE PROFITABILITY OF URBAN AND SUBURBAN LINES [Ueber die Wirtschaftlichkeit von S-Bahn Strecken]. The increasing deficit recorded in short-distance public transport, has brought the economic aspects of these services to the fore. Criticism of investment in urban railway and underground networks, and a number of contradictions observed, suggest that a general analysis should be made of the profitability of these railway systems, and in particular, an examination of the factors liable to influence the engineer when planning, preparing and constructing such systems. Based on indices, the author explains the interdependence of factors of management economy, and gives an overall view of cost-utility studies for urban railways, together with recommendations on criteria of comparison for assessing alternative short-distance transport investment. 41 135936 METHODS OF PREDICTING LOCAL DEMAND FOR NEW RAPID TRANSIT SERVICES. Two models developed (by the Illinois Department of Transportation IDOT) to predict local travel demand as well as four alternative approaches (by the Chicago Transit Authority CTA), are summarized. All analyses emphasize empirical travel patterns and are formulated to predict future levels of ridership on new rapid transit lines based on actual demand levels on existing rapid transit facilities. In one IDOT method, a linear regression model was constructed to predict local ridership on a rapid transit line as a function of the population and employment densities of the line's service area.

The second IDOT method expressed local ridership on a new rapid transit line as a function of diversion from parallel bus routes. The CTA methods were formulated to address the following: demand models for rail rapid transit system optimization study; treat branches of the same route as single lines; avoid the use of a systemwide proportion of local trips; and develop a relationship between existing and local ridership and population and employment with a degree of correlation which can be used to predict local trip generation on new lines.

41 135939 AN ALTERNATIVE APPROACH FOR ESTIMATING THE HOME BASED TRIP PRODUCTIONS IN URBAN TRANSPORTATION PLANNING. Trip generation is one of the important stages within the framework of conventional urban transportation planning package. Zonal Regression method and household regression method are the most commonly recommended procedures for estimating the future trips. Notable drawbacks in both these methods have been spotted out, specially in the adoption of mechanistic rather than a logical approach. Individual is the basic decision-making unit and the model should incorporate his/her characteristics. After studying the socio-economic conditions prevailing in India and their implications on travel demand, an Individual Regression model has been formulated. The population of the study area has to be disaggregated into a set of groups based on individual's travel traits and characteristics before the models could be developed for each of the groups separately. To investigate the capability of the proposed method, full scale Home Interview survey was conducted in Roorkee town. The experiment was so designed as to assist in calibration of models and in verification of their performances. The data were used in developing the Individual models, as also Zonal and Household models. The tests have revealed that the proposed hypothesis has produced satisfactory results, in relation to other methods.

41 136427 URBANISATION AND TRANSPORTATION IN JAPAN, A SHORT HISTORY. During the past century the growth of urban population has increased transport demands. Better developed transport modes have promoted urban growth so that urbanisation and transportation have been mutual catalysts. However the development rate of urban transport has lagged and Japanese cities face serious transport problems. The article describes separately the growth history of cities and urban transport over the last 100 years. The principal factors contributing to city growth are examined and related to corresponding developments in urban transport. With the increased volume of traffic, problems of noise, exhaust emission and vibration have be-

come more serious. The government has been forced to introduce legislation and is conducting research into new transport systems. The author concludes that although short term measures are being taken to improve transport the only real solution is a re-structuring of cities. /TRRL/

41 137336 THE CENSUS AND TRANSPORTATION PLANNING: SURVEY OF EVALUATIONS AND RECOMMENDATIONS AS TO THE USEFULNESS OF THE 1970 CENSUS DATA IN URBAN TRANSPORTATION PLANNING. The purpose of the project is to evaluate the usefulness of 1970 Census data for urban transportation planning with special emphasis placed on evaluating the 1970 Urban Transportation Planning Package. The project seeks to: (1) Identify urban transportation planning-related data from the 1970 Census; (2) evaluate the uses of those data in urban transportation planning; (3) identify user problems; (4) identify alternative sources of these data products; and (5) develop a series of recommendations for the 1980 Census. Personal and telephone interviews with ten state, and twenty-five substate regional agencies and three university and private consultants were used to generate the desired information. The experiences and opinions of the interviewees were compiled and summarized into a series of recommendations for the 1980 Census.

41 137451 PERSONAL MOBILITY AND TRANSPORT POLICY. A social policy on transport must be directed towards the needs of human beings moving from place to place in their daily lives, and particularly to the needs of those who have difficulty in doing so. It must particularly favour those modes which minimise noise, pollution, accidents, congestion and the reduction in the ability of other people to move around. In order to achieve these goals, firstly, considerable political will is required. Secondly, A considerable amount of the mobility currently enjoyed by the motorist must be surrendered, for the level of personal mobility of people without cars can not otherwise realistically be raised. The only fair solution is an equitable transport policy, based on social and environmental goals as well as those of efficiency and economy.

41 137476 THE SHAPE OF TOMORROW: A STUDY ON THE FUTURE OF URBAN TRANSIT SYSTEMS. The article discusses the future development of urban transit systems in Canada, the most significant of which is the proposal by Ontario to develop intermediate capacity transit (ict) systems. Designed to handle

6000-20000 passengers per hour, these systems have possible application in the nine largest Canadian cities. Using estimates based on households in the main cities, figures are given which indicate that such systems should be installed within the next 12 years during a time of maximum estimated city growth. Based on estimated distribution of income the possible future trend of car ownership and urban growth is examined. In order to attract higher income households to the proposed ict system two transport options are considered based on either general peripheral growth with feeder mini-buses or concentrated growth with short distance walking as the likely feeder mode. Preliminary designs for ict systems are considered, based on these two options showing specification, costs and performance characteristics. /TRRL/

41 138147 CONSUMER ATTITUDES TOWARD PUBLIC TRANSIT. Transit planning requires a high level of input from the public. Market survey research has been found to be a very useful and simple tool for collecting and analyzing data on key user groups and public opinion segments. Therefore, the objectives of this study were to identify and weight the factors that jointly influence the use of public transportation and, with this information, to formulate guidelines for both marketing and policies of transit operations. In summary, a transit system must, if it is to solve urban transportation problems, be designed to provide service that is attractive and competitive in a consumer-oriented market and socially concerned society. This paper reports preliminary results from a 1972 study conducted in Orange County, California. Changes have been made in the questionnaire, and a more detailed market segmentation study was conducted in 1974.

Fielding, GJ Blankenship, DP Tardiff, T (Orange County Transit District, California) *Transportation Research Record No. 563, 1976, pp 22-28, 2 Fig., 9 Ref.*; Report prepared for the 54th Annual Meeting of the Transportation Research Board.; ORDER FROM: TRB Publications Off

41 138148 CHARACTERISTICS, ATTITUDES, AND PERCEPTIONS OF TRANSIT NONUSERS IN THE ATLANTA REGION. Immediately after transit fares in Atlanta were reduced, transit ridership increased dramatically, exceeding the previous estimates by 50 percent. Total ridership for the 6-month period following the March 1, 1972, fare reduction was almost 15 percent greater than that for the equivalent period in 1971. The fare reduction program of the Metropolitan Atlanta Rapid Transit Authority (MARTA) generated considerable local and national interest, and research was designed to measure the effect of the fare reduction and subsequent transit service improvements on ridership. The study effort consisted of two surveys: (a) an on-board interview of transit riders and (b) an in-home survey of households in the two-county transit service district. This paper deals exclusively with the in-home survey. The MARTA in-home survey dealt with two principal areas of inquiry to complement the on-board survey findings. The first area consisted of the

characteristics of transit nonusers as well as their attitudes toward and perceptions of transit. In addition, the in-home survey was designed to determine whether the characteristics, attitudes, and perceptions of nonusers were significantly different from those of transit users. The second area dealt with why the increase in ridership was not even higher and what actions would be necessary to attract additional riders.

Byrd, JP, IV (Metropolitan Atlanta Rapid Transit Authority) *Transportation Research Record* No. 563, 1976, pp 29-37, 9 Tab.; Report prepared for the 54th Annual Meeting of the Transportation Research Board.; ORDER FROM: TRB Publications Off

41 138337 THE EFFECT OF A SUBWAY ON THE SPATIAL DISTRIBUTION OF POPULATION. This research determined the effect of the original subway line on the spatial distribution of population in Metropolitan Toronto. The comparison made is between a mass transit system and a road (rather than expressway) system. By using 1951, before the subway opened, and the same type of population figures in 1956 and 1961, after the operations began, it was found that the construction of the subway altered the spatial form of the area. The line was initially built through a low-density area which was primarily commercial. It was found that redevelopment of urban land is a protracted process and effects of transit service are slow in manifesting themselves.

41 138899 THE FUTURE OF THE CAR. A personal view is presented by the author who believes that car-ownership can continue to grow despite arguments that have been put forward based on the effects of the energy crisis. Data is given on the number of cars licensed and scrapped and changes in size, depreciation rate and price. The author concludes that the resilience of the car market means that growth is inevitable but asks whether it should be permitted. It is suggested that increase in car-ownership and usage should be developed in the best manner for society as a whole, increasing mobility and amenity for all sections of the community and not penalising those who have to rely on public transport. /TRRL/

41 138979 SOME GENERALIZATIONS AND APPLICATIONS OF THE VELOCITY FIELD CONCEPT: TRIP PATTERNS IN IDEALIZED CITIES. This paper discusses the velocity field concept and seeks to extend its descriptive power by introducing the continuous analogue of the traditional link speed-flow relations used in transportation studies. By solving the resulting velocity field equations self-consistently in terms of land use and socio-economic factors, and various policy variables, the profile of this field, which reflects the spatial distribution of congestion in an urban area, may be found. The velocity field is computed in a circular city with a single ring road in order to identify its optimal radius. Car parking and public transport "no fares" policies are also considered to illustrate various aspects of our approach. (A)

41 139044 URBAN COMMUTING: CONGESTION AND CATECHOLAMINE EXCRETION. Male passengers regularly commuting to Stockholm by train were interviewed on two mornings at different levels of congestion, before and after the introduction of petrol rationing in 1974. One group travelled the whole length of the route, the other travelled halfway. Subjective experience was gauged by self ratings, and physiological stress was measured by catecholamine concentration in urine. The results showed that discomfort increased as the train approached Stockholm and the number of passengers rose. Perceived congestion increased with the square of the number of passengers. On both trips, adrenaline levels were lower in the group travelling a longer distance, and they were higher in both groups when the train was more crowded. This supports previous findings that stress in travelling by train depends more on social and ecological conditions during the trip than on its length or duration. /TRRL/

41 141072 A CAUSAL MODEL FOR ESTIMATING PUBLIC TRANSIT RIDERSHIP USING CENSUS DATA. This paper applies a causal perspective to the study of travel behavior through the use of path analysis. The study develops a model of public transit use for work trips in the Raleigh and Durham, North Carolina Standard Metropolitan Statistical areas. The model is estimated with data from the 1970 Census of Population and Housing. It is successful in explaining 85 percent of the variance in use of public transportation. Auto ownership is the most influential variable determining use of public transportation. However, the causal analysis demonstrates that auto ownership is itself determined to a large extent by other variables in the model, particularly percent black, median income, and level of transit service. Therefore, these variables have a substantial indirect effect on transit use mediated through auto ownership. /Author/

41 141241 SOCIAL ASPECTS OF URBAN TRANSPORTATION: A BIBLIOGRAPHIC REVIEW. This annotated bibliographic review which presents data categorized in seven sections, concentrates on works which represent a seminal contribution to the field, offer worthwhile empirical findings, demonstrate a unique well-implemented methodology, contain new and useful insights, or employ a multidisciplinary approach. Section one of the report identifies issues which have led to attempts to relate social research and social insight to the solution of transportation problems. Studies specifying alternatives and evaluating them are presented as well as writings initiated by protests at major transportation projects. Writings which summarize and integrate the ideas presented above are also included. The review of literature on impact studies covers aspects such as community and neighborhood disruption, dislocation and relocation, environment and aesthetics. Transportation disadvantaged (low income groups, elderly, handicapped, children) which has attracted little research attention, is covered. The characteristics and purpose (work trip, non-work trip) of urban travel are reviewed and the choice and use of alternative transportation modes (automobile vs transit, walking; bicycling) are examined. The history and characteristics of the transit industry are described, pricing, policy-making, marketing and public relations are covered, and information is presented on service, design modifications, labor relations, crime and vandalism. Transportation planning is the central topic of the last section which covers models, plan and program evaluation, community liaison and citizen participation, application of social science concepts and techniques, new technologies, the automobile, adapting transit to need, relating transportation to urban development, and adjusting to urban lifestyles.

41 141293 A SYNTHESIZED TRIP-FORECASTING MODEL FOR SMALL-AND MEDIUM-SIZED URBAN AREAS. Because of the high monetary and time costs associated with home-interview surveys for urban transportation studies, planning analysts have sought to model travel demand by using other data sources such as 1970 census worktrip data. The purpose of the research reported in this paper is to examine trip distribution functions that may be appropriate for estimating zone trip interchange in small-to medium-sized urban areas. Several functional forms of travel impedance were investigated. For the city sizes studied, model accuracy is shown to be relatively insensitive to the form of the travel impedance function. Analytical deductions are used to develop a calibration technique for a 2-way, constrained gravity model using the simple negative exponential function. Calibration of the model can be accomplished without using extensive origin-destination survey data. The model is tested by using data from actual studies, and an outline is suggested for calibrating the distribution model by using the 1970 census data.

Zaryouni, MR (Rensselaer Polytechnic Institute) Kannel, EJ (Illinois University, Urbana) *Transportation Research Record* No. 569, 1976, pp 87-95, 2 Fig., 1 Tab., 15 Ref.; ORDER FROM: TRB Publications Off

41 141367 CITIZEN PARTICIPATION IN TRANSPORTATION SYSTEMS PLANNING. The Southwestern Pennsylvania Regional Planning Commission (SPRPC) has developed a long-range comprehensive transportation plan for a six-county region, encompassing 4,500 square miles and 2.4 million people. The final plan draft evolved from a series of consecutive planning cycles. The Cycle I testing and evaluation of transportation plans led to a Cycle II highway and transit system; Cycle II served as the basis for the second cycle of planning and the eventual recommended plan. In an effort to produce a transportation plan which achieved that elusive balance between technical and human elements in the planning process, SPRPC committed a special staff team and the necessary supportive resources to develop a program of citizen involvement (CI). For 18 months the CI team engaged a variety of groups and individuals in Pittsburgh and Allegheny County in meetings and small work sessions to secure community input to the plan. This report will describe the strategy employed by the CI team to include citizens in systems planning. The report will document the CI team's activities and evaluate the results.

Southwestern Penna. Regional Planning Commission No Date, 36 pp, 6 Fig., 5 Phot., 1 App.

The preparation of this report was financially aided by the Pennsylvania Department of Transportation, Federal Highway Administration, Urban Mass Transportation Administration, and in cooperation with the Counties of Allegheny, Armstrong, Beaver, Butler, Washington and Westmoreland as well as the City of Pittsburgh.

41 141405 PRAGMATIC EVALUATION OF TELEPHONES, ACTIVITY SCHEDULING, AND OTHER STRATEGIES TO MODIFY TRAVEL BEHAVIOR OF POPULATION SUBGROUPS (ABRIDGMENT). Social science literature and information from a comprehensive case study of a population subgroup's physical mobility were used to forecast behavioral responses to 8 strategies to overcome problems associated with urban transportation. Strategies included substituting telephone calls for trip making, reducing family household and personal stresses, reducing tensions from poor home design, increasing home-centered activities, expanding home deliveries of goods and services, increasing spatial distribution of trip generators, improving the household location decision, and rescheduling school and work activities. The case study population was male high school students from working-class Boston suburbs. These strategies appear unlikely to be implemented on a large scale. Formidable opposition from parents, town residents, and institutions (especially in working-class communities) is anticipated. Costs, adult indifference, and a lack of respect for teenagers and the importance of these strategies are key barriers to be overcome. Even if these strategies manage to be implemented, empirical evidence is lacking that reductions in trip generation, trip distances, peak-hour travel, and other strategy objectives will actually occur. Fundamental sociological and psychological factors

associated with the causes of travel behavior will remain unchanged. Optimistic predictions of the impacts of these strategies should therefore be avoided. Behavioral changes are likely to occur very slowly among non-middle-class subgroups. Transportation planners should consider trying to accommodate existing behavioral patterns rather than count on their modification.

Gurin, DB (Urban Mass Transportation Administration) *Transportation Research Record Conf Paper* No. 583, 1976, pp 29-35, 16 Ref.; Prepared for the 54th Annual Meeting of the TRB held in Washington, D.C.; ORDER FROM: TRB Publications Off

41 141411 TRANSPORTATION PLANNING AND STATUS OF TRANSPORTATION USER SUBGROUPS. Consideration of the social status of transit user groups as something more than a marketing characteristics leads to discussion of the workability of certain basic transit planning goals and means. Distribution and maintenance of the quality of a resource (transportation) are viewed as functions of primary user group status, altruism, and power of the controlling agency. Race and sex are basic social status variables. Four user groups are examined—white and nonwhite males and females. Travel behavior and attitude data are presented from the 1960 and 1970 censuses for 11 cities and from a home-interview survey conducted in Trenton, New Jersey, in 1973 (N = 548). Census data show that increasing proportions of minorities use transit over the period of general decline of transit systems. Also shown is the high level of dependence on this declining-quality transit system by the lowest status users. The Trenton attitude and behavior data show that improvements in transit are likely to draw only low-status users and that their increasing presence might further discourage use by high-status travelers. Furthermore, only direct restrictions on automobile use are likely to turn high-status travelers to transit. The uncomfortable conclusion of this analysis of planning ends and means is that planning to provide a system primarily for those without alternative or placing faith in being able to attract riders to transit by dealing only with transit system attributes is shortsighted. To be successful over the long term, a system must be substantially used by high-status groups who will probably not be users by choice.

41 141495 ADJUSTMENT AND MOBILITY OF ELDERLY POOR AMID DOWNTOWN RENEWAL. Basic information is provided on the subpopulation of non welfare poor and on one type of residential arrangement. The informal social structures, adaptive mechanisms and spatial mobility in a hotel for non welfare poor are examined, and a set of recommendations are developed that emphasize planning strategies geared to the adaptive strengths of the marginally subsistent, but self-reliant poor. It is noted that citizen participation in urban renewal and relocation should be increased. Citizens aged 65 and over should be able to ride buses for half fare and

to buy a monthly bus pass at half the regular rate. This would not only benefit individuals on low income but also increase ridership. A minibus or dial-a-ride system for the elderly, possibly in collaboration with a taxicab company, should be established for those who are not adequately served by the bus system.

41 142140 PRIORITY, INNOVATION AND RESTRAINT: SOME EMPIRICAL RESULTS. This discussion and review does not claim to be exhaustive, it simply attempts to draw together the information that is readily available on the most common types of priority, innovation and restraint, and to review it in terms of the overall objectives of (a) has public transport benefited and (b) have car users been persuaded, or cajoled, into leaving their cars at home. The discussion is organized under the following three headings: bus priorities (priority intersections, bus lanes); innovations (park-and-ride, dial-a-ride, superbus); and restraint (restricting car use). /TRRL/

Heggie, IG ; Oxford University, England *Monograph* No. 2, Oct. 1975, 23 pp, 9 Tab., 17 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 220730); ORDER FROM: 7605275

41 142357 SEGMENTATION ANALYSIS OF TRANSIT USERS AND NONUSERS (ABRIDGMENT). In a survey to evaluate factors that influence the use of public and personal transportation modes, a stratified random sample of households was used to ensure accurate spatial representation. Various techniques, including market segmentation analysis, were used to ascertain the attitudinal framework, which plays a key role in the use of transportation by Orange County Transit District residents. The survey identifies various demographic and psychographic profiles that may impact current, future, private and public transportation modes. The following are some of the key areas of concern identified by the survey: Social class and status analysis; funding public transit; psychological automobile captivity to transit dependency; vehicle availability and trip market profiles; conceptual awareness and anticipated use; anticipated demand for public rapid transit; marketing and advertising public transportation; advertising awareness and media analysis; message content and impact of advertising by selected media.

41 142358 CITIZEN OPINIONS ON PUBLIC TRANSPORTATION ROLES, SERVICE, AND FINANCING. This report summarizes the results of a recent statewide public opinion survey conducted in 1000 households across New York State. Topics addressed include opinions on public transit performance, transit needs, public participation, transit users, automobile-oriented policies, and funding sources and financing. Results of the survey indicated that (a) New York State residents think that regular dependable local bus service is the most important transit need, (b) transit is used most frequently by middle-income (rather than low-income) groups,

and (c) there is strong support for special services or lower fares for the elderly and handicapped. / Author/

Box 405, Oxford, Indiana, 47971

41 142940 BENEFITS AND COSTS OF URBAN TRANSPORTATION: HE WHO IS INELASTIC RECEIVETH AND OTHER PARABLES. The determinations of incidence of benefits and costs of an urban transportation improvement and its financing are discussed. Important to policy makers are two main issues: How does one determine who benefits and who pays for transportation improvements, and how can information on the benefits and costs be used to formulate better urban transportation plans? Economists do what in welfare economics is assessment of overall benefits and costs. Policy makers are also interested in who receives these benefits and who bears the costs. Economists need to refine their methods to assure more rational public policies.

41 144034 PEAK-PERIOD TRAFFIC CONGESTION: OPTIONS FOR CURRENT PROGRAMS. The report describes options available within the present state of the art, compares their probable costs and benefits, and makes specific recommendations for solutions to different types of peak-period congestion. Twenty two individual techniques in eleven major categories are identified. They include social approaches, socioeconomic approaches, sociotechnical approaches, and technical approaches. The techniques were considered relative to their benefits and costs. Their effectiveness in treating different congestion problems was measured. Two aspects of timing of

impacts were considered. Nine categories of indirect benefits and disbenefits were identified as factors that should be weighted in decision to implement any of the techniques. The study concluded that: individual techniques should be packaged with other supportive techniques to create a cumulative or even synergetic impact; the relationship between peak-period traffic congestion and number of critical societal problems should be investigated and clarified; research is needed in the indirect benefits and disbenefits and the institutional constraints inherent in a number of techniques. To accomplish the last task eight packages of effective combinations of congestion-reducing techniques were selected and evaluated. The package which focused on transit treatments is rated as having the highest over-all applicability to the full range of common peak-period congestion problems, as well as being of moderate cost, and providing benefits to the community. The package which focused on land use changes presented the best permanent solution to congestion as well as many other critical urban problems.

41 144104 TRANSPORT-ACCOUNTABILITY AND CONSUMER CHOICE. To a large extent transport in the United Kingdom, especially transport of passengers, is seen as a public service. Market forces are not allowed to have much sway; and the result is that in many cases the benefits received by society do not match the costs. The fact that British rail is running at a vast loss is obviously important, but much more important is the fact that British rail is using society's resources in ways which are extravagant and wasteful. The contention of this article is that such waste will persist unless operations are made subject to market forces, and that these forces can best be brought to bear by competition. It does not necessarily follow that all sections of the industry should return to private enterprise, although such an idea has much to support it. It does mean, however, that many of the units should be smaller than they are at present.(a)

41 145003 INCREASE IN PUBLIC TRANSIT USE KEYS TO REVIVAL OF CITY CENTERS. A study is reported which noted two important steps which will encourage the use of public transportation: concentrate jobs and services in compact downtown centers; and increase the density of neighborhoods near the downtown area, especially around existing or potential bus or rail stops. The study also found that limiting automobile use does not necessarily increase transit riders. The study separately details costs both in dollars and resources of operating taxis, dial-a-bus, local buses, express buses, streetcars, light rail transit and commuter trains. The need is expressed for the right pattern of development which requires appropriate zoning by local officials and good site selection and design by private developers and public agencies at all levels of government. If the nation will strengthen its cities, then good transit service can be provided even in small urban areas and at suburban residential densities. The report notes that rail is preferred to buses and the feasibility of rail transit should be investigated for the largest downtowns and of streetcars on their own rights of way for medium-sized cities. The study is summarized in a booklet: Where Transit Works.

41 145012 CHARACTERISTICS OF NEW YORK STATE TRANSIT USERS. Studies using data from a 1000-household survey (in 1974) on public attitudes and transit usage found that more than 80% of all work trips in New York City are taken by transit. However, the characteristics of riders of the different modes varied. Subway riders exceeded bus riders 3 to 1, and the former are represented by middle income groups who were young, white males. Bus riders earned more than \$9,000 per year but were older and mostly female. Both classes of riders owned few automobiles. Transit also carries 49% of all non-work trips; the auto carries 44 percent. Buses carry twice the non-work trips that the subway does. In the rest of the state, only 50% of non-work trips are carried by bus.

41 147316 TRANSPORTATION AND TRAVEL IMPACTS OF BART: INTERIM SERVICE FINDINGS. BART IMPACT PROGRAM. PHASE I. The 71-mile Bay Area Rapid Transit (BART) System, serving San Francisco, Oakland, Berkeley and their suburbs, is the first regional-scale rapid transit system to open in the United States in 50 years. The final link of the system opened for service in September 1974. This report summarizes BART's initial impacts on regional transportation system performance and travel patterns. The report deals with the effects of interim BART service over the period September 1972 through June 1975. Impacts are assessed in terms of BART's design and operating characteristics; its service levels; changes in accessibility; the level and nature of BART's ridership; impacts on travel by bus and automobile; impacts on the service provided by the rest of the transit system; and impacts on traffic congestion. BART's capital costs, interim operating costs and revenues, and interim energy consumption are also analyzed. (Color illustrations reproduced in black and white.)

41 147453 THE ATTITUDES OF HOUSEHOLDS WITHOUT CARS TO PRESENT-DAY PUBLIC TRANSPORT [Billoesa hushaalls attityd till dagens kollektivtrafik]. Households which cannot or will not use a car to travel have lately received greater attention in the planning of traffic in general and public transport in particular. It has also been found that this category is numerically larger than had been thought. It has been found in surveys that (1) those without cars are more satisfied with the design of local public transport than those with cars; (2) 6 out of 10 people in households without cars thought public transport should have a prior claim to public resources, but only 4 out of 10 believed this would happen; (3) irrespective of the type of household, one third of those asked considered that improvements in public transport should be financed by increased taxation; (4) in both categories, dissatisfaction with public transport centred on service frequency, placing of routes and fares. Old age pensioners would prefer shorter distances to stops, ease of getting on and off, access to seats, and no interchanges. Young people wish to have greater frequency and later services. Both old and young had a negative attitude towards cars in town centres. /TRRL/ [Swedish]

41 147652 THE USE OF ECONOMICS IN URBAN TRAVEL DEMAND MODELLING: A SURVEY. This paper attempts to survey the recent innovations in urban transport planning & in particular to demonstrate the increasing importance being attached to economic analysis in the travel forecasting procedures employed. The article begins by setting out traditional economic notions as they relate to travel, progresses to illustrate their practical limitations for planners and then considers the applied work which has been attempted in this field. The paper is critical of the traditional sequential forecasting procedures and attempts to present a balanced picture of the current state of explicit demand modelling which has a firmer foundation in economic theory. /Author/TRRL/

41 147859 TAMING THE TRANSPORT TIGER. Mechanised transport uses nearly 20 percent of the useful energy available in Britain, and almost one third of the petroleum products. Although the contribution of transport to economic and social progress is often ignored, the author examines means of minimising energy requirements by increasing efficiency of power plants, substitution of scarce or expensive fuel, and reducing demand. It is unlikely that battery powered vehicles could be made to function more efficiently than those powered by the internal combustion engine. Energy savings by a shift to rail transport would be small if road journeys at either end of rail travel were not eliminated. There is little sign that less expensive public transport can attract those with private cars readily available. The author argues that the demand for transport may reflect a failure to organise society efficiently and equitably; transport restraint may force a re-examination of the present pattern of activity with a resultant improvement in the style of life. /TRRL/

41 147865 PUBLIC VERSUS PRIVATE TRANSPORT. This book compares the economic and environmental characteristics of public and private transport modes, and reviews the potential for modifying modal split in each of the main sectors of the transport market. Opening with a review of the traditional "track-cost" argument on the relative merits of public and private transport, the author concludes that it is the comparison of costs and benefits of future infrastructure changes rather than historic revenue and cost comparisons that is relevant to the issue of choice of modal split. A consideration of the relative pollution and resource depletion caused by different modes furthers the conclusion that normal commercial criteria do not provide a good way of allocating resources in the transport sector. Alternative methods of modifying modal split are then considered. A chapter is devoted to each of the main sub-divisions of the transport market. On urban passenger transport it is concluded that a strategy based on major use of public transport rather than large-scale road building is feasible and has many advantages. In the inter-urban and rural passenger market, whilst there is evidence of resource misallocation the problem of how to deal with it is harder to resolve. Although much freight traffic is captive to road transport given patterns of institutions and land use- there is likely to be scope here too for beneficial changes not only in modal split but also more generally in methods of freight handling. The final conclusion is that it is only by looking at specific locations and specific traffics that the question of optimal division between public and private transport can be resolved. /TRRL/

41 148068 COMMUTING ACCIDENTS IN THE STOCKHOLM REGION 1971. A preliminary study on an interdisciplinary project "commuting accidents" is presented. One part of the project concerns the commuting system, the other medical aspects of the accidents. The aim of the project is to study all sorts of accidents with personal injury occurring on commuting modes. The summary is concentrated on one group of the population, women who commute using public means of transportation. They were 21% of the working population but they had 38% of the time of impairment. This difference depends on a higher risk-figure and a longer average time of impairment. This study did not explain this difference, but the results hint that the strategic parts of the journey are the walks to and from the stopping-places. Especially dangerous was the walk to the stopping-place and to work. /TRRL/

41 148088 TRAFFIC IMPACTS OF WORK SCHEDULES CHANGES: A REDISTRIBUTION MODEL. This paper considers how one may estimate changes of traffic volumes at specific bottlenecks of the urban transportation system which would occur as a result of work schedule changes. An estimation procedure disaggregating trip volumes of traffic counts according to their generators i.e. workplaces is first established, followed by assignment of trips to small-scale time intervals. The staggering algorithm developed in this study is heuristic by nature. The data requirements of the model described here do not go far beyond the level of a carefully designed conventional work staggering campaign. In addition to employment and work schedule data, the model uses information on the transportation network-in the elementary form of a travel time matrix-and on the spatial distribution of the residential population. The time distribution of arrivals and departures is also considered. The results of the application of the model and the staggering algorithm to the morning peak of the Karlsruhe public passenger transport system are discussed.

This paper appears in "Urban Traffic Models", which is a publication containing the Proceedings of Seminar N of the Summer Annual Meeting at University of Warwick, England during July, 1975.

41 148094 COST BENEFIT ANALYSIS, ACCESSIBILITY, SOCIAL EQUITY AND SATURATION LEVELS. This paper discusses two problems associated with cost benefit and environmental analyses used to compare transport proposals: the error inherent in calculation which depends on subtracting numbers which are large compared with their difference; and the impossibility of making objective decisions when the various data describing consequences cannot be

related to each other. The first problem could be minimized by rejecting high cost proposals when the likely range of benefits includes zero. The second problem can be overcome by assigning cash values to the benefits gained by persons on arrival at destinations. It is suggested that any benefit formulation should conform with the law of diminishing returns. This leads to a final benefit calculation which favors proposals which provide social equity rather than the reverse. The need to recognise saturation levels beyond which increases in benefit are meaningless to the individual is briefly discussed.

Witherington, PF; Planning and Transport Res and Computation Co Ltd P122, July 1975, pp 171-179, 5 Ref.; This paper appears in "Urban Traffic Models", which is a publication containing the Proceedings of Seminar N of the Summer Annual Meeting at University of Warwick, England during July, 1975.

41 148102 COMFORT AND CONVENIENCE IN TRAVEL DEMAND MODELS: SOME RECENT ADVANCES. A psychological approach to the quantification of qualitative attributes is described. The basis of the method is to use quantitative comparisons made by subjects about stimuli to develop scales that describe the amounts of the qualities possessed by the stimuli. Two principal subgroups of the approach are available: a unidimensional scaling based upon an initial restrictive assumption that the attribute to be measured exists in a one-dimensional space and can be described along a linear continuum; and multidimensional scaling which may be used to define the dimensionality (in a Euclidean space) of the attribute. Three research tasks are identified: testing of the scaling concept in a transportation situation; fitting of the resulting scale values or indices into a travel demand model in order to determine whether there is a relationship between revealed behavior and perceived attribute ratings of alternative travel modes; the mapping of the psychological scale values onto engineering specifications and testing the resulting proxy variables in a revealed behavior nexus. The results are reported of testing the first 2 tasks and their application to the formulation of a convenience index and a comfort index.

Stopher, PR (Northwestern University, Evanston); Planning and Transport Res and Computation Co Ltd P122, July 1975, pp 263-272, 1 Fig., 2 Tab., 29 Ref.; This paper appears in "Urban Traffic Models", which is a publication containing the Proceedings of Seminar N of the Summer Annual Meeting at University of Warwick, England during July, 1975.

41 148439 TRAFFIC GENERATION FROM LAND DEVELOPMENT PROPOSALS. The purpose of this paper is to simulate and predict the changes caused in the existing commuter travel pattern by new land development schemes within framework of a specific community. Particularly, this study is concerned with developing a residential location distribution model with special emphasis on the effect of socioeconomic factors of commuters on the travel time parameter of the model. The findings of the study may be helpful to the siting of new land development activities in the existing infrastructure of an urban system. The parameters of the model developed clearly indicate that the workers of a low socioeconomic group generally have more tendency to

live close to the place of employment as compared to high socioeconomic groups. The low group may choose to live close to the place of employment depending on neighborhood affiliation, land use infrastructure, type of housing, transit availability, or merely because the part of the income spent on commuting seems disproportionately large.

41 148979 FORECASTING INDEPENDENT VARIABLES: RESPONSIBILITIES AND TECHNIQUES. This report summarizes the economic activity forecasting undertaken to support urban transportation planning in Upstate New York metropolitan regions. Analysis of responsibility for economic activity forecasting is also developed with consideration of intraregional and interregional policy implications. Recommendations are developed indicating the appropriate responsibility for economic forecasting, considering staffing capabilities of both the Metropolitan Planning Organizations and the Planning and Research Bureau of the New York State Department of Transportation. A technical section that briefly describes techniques previously used to forecast economic activities for use in urban transportation planning is also included. The techniques described are not meant to be exhaustive, but may be considered for use by those charged with economic activity forecasting. /HSRI/

41 149512 ATTITUDE-BEHAVIOR MODELS FOR PUBLIC SYSTEMS PLANNING AND DESIGN. This exploration of the potential applications of behavioral choice models in the planning of public systems, focuses on choice models involving attitudinal variables. The areas of application of these models include environmental design, structures and general cost-benefit analysis of systems. Methods of scaling preference and perception responses elicited through popular survey instruments are evaluated. Models are then investigated for explaining overall preference or choice of alternatives in terms of perceptions of the characteristics of the alternatives. An empirical example is presented in which policies concerning improvements in public transit bus system can be initially formulated using information obtained from an attitudinal model of urban residents' choice of travel mode for their work and shopping trips.

Golob, TF Recker, WW; General Motors Research Laboratories Rept. No. GMR-1906, 38 pp, 6 Fig., Refs.

41 149699 MOBILITY EVALUATION FOR URBAN PUBLIC TRANSPORTATION. The paper discusses the concept of mobility relative to the provision of transportation services. Mobility calculations of potential value to current evaluation procedures are outlined. An example is given of a typical mobility calculation. The model has been focused on a corridor line-haul system and results suggest that such a system will not

markedly improve existing transit mobility systems. The authors suggest that other methods should be explored before policies are finalized. The study includes a match factor between occupation and employment type in accessibility to employment. Alternative feeder transit systems to the corridor line with an improved collector service in the suburbs could increase mobility. /TRRL/

41 149780 GENERAL PUBLIC BEHAVIOR AND ATTITUDES, PART III: A REGRESSION ANALYSIS OF THE REASONS FOR USING MASS TRANSIT. This analysis which considered those individuals for whom there was real choice of methods of going to work, bears out a previous set of univariate analyses in which convenience seems to be the determining factor in whether or not a particular individual will use mass transit when it is available. The study indicates that only by making mass transit more convenient, or by making automobile transit less convenient, will it be possible to get individuals to go from individual automobile use to mass transit. The results discussed here are applicable to the Northeastern and Midwestern U.S. The most important nondemographic variable by a substantial margin was data relating to the question: "how serious a problem is heavy traffic jammed highways?" Persons using mass transit facilities think it is more important to spend money on mass transit while those using highways think it more important to spend money on highways. The most important demographic variables relate to the area in which an individual lives, with Northeasterners being more likely to use mass transit than midwesterners.

41 149886 A REINTERPRETATION OF THE 'ATTITUDE' APPROACH TO TRANSPORT-MODE CHOICE AND AN EXPLORATORY EMPIRICAL TEST. A theory of cognitive structure is presented which is potentially capable of providing a conceptual framework for the study of transport behaviour, and by making use of this theory and the models derived from it, problematic areas in attitude and attribute research in transportation are discussed. An exploratory empirical study is described which successfully tests some of the relationships inherent in the theory in a transport context. Significant correlations were observed between overall attitude towards use of a travel mode and the products of evaluation and belief strength summed over a short series of perceived outcomes of use of that mode. The content, strength, and associated evaluations of salient beliefs about use of a travel mode were monitored during a period of change in the conditions of the service. Predictable changes in belief structure were observed, demonstrating the sensitivity of the techniques used. /Author/TRRL/

Thomas, K (Cranfield Institute of Technology) *Environment and Planning Analytic* Vol. 8 No. 7, 1976, pp 793-810, 8 Tab., 29 Ref.; ACKNOWLEDGMENT: TRRL (IRRD-224069)

41 150438 PURPOSE, MODE, TIME OF DAY. Data obtained from the Chicago-Northwestern Indiana 1970/1971 home interview survey were analyzed, in order to measure certain basic characteristics of travel in the eight county study area. Specifically, the location, purpose, mode, and the time of occurrence of travel were investigated. In 1970, the number of trips occurring within the area surveyed in 1956 was about 30.5 percent greater than that observed in 1956, with most of the increase centered in suburban areas. Trips with nonwork purposes, other than to home, increased proportionately more than trips to work between 1956 and 1970. Trips with nonwork purposes constituted 38.0 percent of the total in 1970 compared to 36.1 percent in 1956, while trips to work accounted for 18.5 percent in 1970 and 20.4 percent in 1956. Among the nonwork trip purposes, shopping trips exhibited the greatest increase in relative frequency, while trips for personal business decreased the most in importance. From the 1970 data, it was observed that the amount of work travel decreased with increasing household income, except for households with very low income. The auto served as the dominant, all purpose mode throughout the region. The portion of trips by transit, including school bus, dropped from 24.3 percent in 1956 to 15.3 percent in 1970, with usage of transit from nonwork travel decreasing more than that for work. Like mass transit usage, the auto occupancy rate declined from 1.57 in 1956 to 1.47 in 1970. As observed in the 1956 survey, travel in 1970 peaked during the morning and evening work rush periods. However, in 1970 the peak periods were somewhat less pronounced, with midday travel increasing in importance. In addition, peaking of travel was observed to occur after the evening rush period in the 1970 data, but not in 1956. Throughout the study of 1970 travel data and its comparison with 1956 observations, the effects of the growth of auto usage were highly apparent. The auto largely made the suburban life style possible and, with expanding auto use, development in suburban areas mushroomed, as

reflected by the observed jump in the importance of suburban trips. Likewise, the great convenience of the auto mode undoubtedly was a factor in the observed increase in the level of midday (non-work) travel. The decline in auto occupancy can also be traced to greater auto availability. Of course, a direct consequence of increased auto use was the relative decline in travel on the mass transit modes. In general, then, it appears that the increased availability of the automobile, and the accompanying facilities to handle it, has had a major influence on the nature of urban travel.

41 150548 CITIZENS' ATTITUDES TOWARDS ANCHORAGE LOCAL GOVERNMENT AND ISSUES OF PUBLIC POLICY: A COLLECTION OF REPORTS [Final rept]. This report is a collection of seven reports prepared by the Anchorage Urban Observatory to provide public attitude information to the municipality of Anchorage. The first report presents a broad discussion of citizen attitudes toward public services in Anchorage. The second report looks at public safety and the police function of government. Citizen support for the public library system is the focus of the third report. The fourth report deals with public attitudes toward taxes and taxing alternatives. Report number five examines citizen attitudes toward local government employees. Citizen involvement in local government is the subject of report number six. The seventh, and final, report provides an attitudinal comparison between general macro-level policy orientations, specific program implementations, and behavioral spending orientations.

41 153392 PROGRAM DESIGN TO DEFINE RIDE QUALITY REQUIREMENTS OF SURFACE TRANSPORTATION VEHICLES. A plan was developed for evaluation of the relationship between ride and ride quality of vehicles currently used in public transportation systems and new prototypes. The components of ride as the physical environment and ride quality as passengers response were defined and articulated. Three settings were recommended for conduct of research: a simulator, rides by captive passengers and rides by revenue passengers. A procedure was described for the implementation of experimental studies. Key features involved accumulation of a growing data bank describing ride-ride quality relationships and forecasting results of future experiments from the data bank. An experiment was conducted in the NASA Langley simulator to examine the relationships between ride vibrations derived from actual railway track signatures and ride quality as rated by subjects. When the design was replicated, comfort ratings by subjects were highly reliable. Subjects could discriminate between stimulus amplitudes for continuous rough track and diamond crossings; they could not discriminate amplitude variations well for roll. These data fail to show that subjects can discriminate well between the different types of vibration that define ride.

41 153961 BART IMPACT PROGRAM DATA CATALOG. The document is a description of all of the data sets that have been collected or used by the various parts of the BART Impact Program. It is divided into sections according to study areas or projects within the overall program. These areas and all of the data sets within an area contain subject keywords which appear in the index, in addition to identification keywords. This catalog is intended for use by persons who wish to access the data itself. It contains information about the physical form of the data and its physical location, plus an abstract of each data set which may be quite lengthy. (Portions of this document are not fully legible.)

41 154011 A GUIDE FOR CITIZEN PARTICIPATION IN TRANSPORTATION. The means of achieving meaningful citizen participation in the transportation planning process involves more than the legally required public hearing. The various publics affected by a project in the planning purview area must first be identified and contacted: for such identification and contact a variety of methods are available. A number of processes and techniques are useful for insuring significant and concrete citizen participation in the planning process. These processes and techniques must be used bearing in mind the type of citizen energy used and the nature of the publics involved. The best psychological climate for planner-public rapport is one of mutual respect, co-operation and maturity. This climate is largely the responsibility of the planner.

41 154040 THE SPECIAL STUDY OF ETHNIC MINORITIES IN THE BART IMPACT PROGRAM. The paper is an examination of one aspect of the BART Impact Program, its evaluation of impacts of the system on ethnic minorities. It is primarily a discussion of the rationale for the inclusion of specific ethnic minority concerns in the overall evaluation program. The BART Impact Program is a comprehensive assessment of BART's impacts on the social and economic life of the San Francisco-Oakland metropolitan area. Goals of the program are to elucidate the relationships between public transit and community development and assess costs and benefits of a rail rapid transit system. Specific objectives of the BIP are to determine what the impacts are, who is affected, why anticipated results are or are not occurring, and how this knowledge of BART may be useful to decision makers. (Color illustrations reproduced in black and white.)

41 155371 IMPACTS OF BART ON BAY AREA HEALTH CARE INSTITUTIONS. BART IMPACT PROGRAM. The report describes the effects of Bay Area Rapid Transit System (BART) upon local health care institutions, as determined by surveys of patient travel to medical care facilities having varying degrees of public transit and BART service. Administrative personnel were also interviewed to discover and report upon institutional policy-making responses to the presence of BART.

41 155726 HOW TO MEASURE THE VALUE OF YOUR AIRPORT. An "Airport Economic Impact Study" technique which was pioneered with major airports serving air carriers is described. Depending upon enthusiasm and resources, a general aviation airport can adapt the idea. Basically, the study consists of a survey of all the individuals and businesses deriving an economic benefit from the airport, a compilation of their responses, and a publication of the results. Great care should go into preparing the list of those to be surveyed and the questions to be asked. Concepts to be kept in mind while constructing the study are the roles of an airport as an employer, a taxpayer, a purchaser of local goods and services, a lure to new industries, a benefit for current businesses, and a stimulus to travel. The basis for the list of those to be surveyed will include airport management, airport employees, airport users (home-based private and corporate operators, air taxis, commuter airlines, non-scheduled transient aircraft, airport-related businesses), local economic development organizations, U.S. Postal Service (for airmail figures), and others who receive or generate community revenue through the airport. Sample questions which may be asked are listed and discussed.

41 156017 INTRA CITY ORIGIN-DESTINATION TRAVEL SURVEY OF DELHI. This Paper deals with the results of an origin-destination intra-city travel survey conducted in Delhi in the year 1969 by household interview. The population characteristics, existing travel demands, travel characteristics of the journey made by the residents within the study area and the factors influencing the travel patterns in the city have been discussed. The study also reveals the role of socio-economic factors in the choice of mode of transport and travel characteristics. It also points out the need of improving the mass transportation system for achieving a desirable transportation balance. /Author/

41 156132 ATTITUDINAL MODELING OF TRAVELER BEHAVIOR: APPLICATION OF THE INFORMATION INTEGRATION APPROACH OF EXPERIMENTAL PSYCHOLOGY. Transportation researchers are becoming increasingly aware of the role of subjective judgment processes in traveler behavior. Experimental psychology, in general, and the information integration approach, in particular, have developed methodological tools and theoretical models for investigating human judgments in a variety of contexts. These models relate cognitive and affective components of human judgment to behavioral intentions and thus represent a single-phase attitudinal modeling approach. The present paper summarizes four recent experimental studies in which subjective perceptions and integrations of system characteristics are related to behavioral intentions for highway driving, car buying, car-bus mode choice, and carpooling. A theoretical framework is developed within which attitudinal factors can be related to human judgments in transportation. /Author/

41 156253 N.J. RAILROADS PASSENGER SURVEY, 1974. In the Spring of 1974, the Port Authority, with the cooperation of the New Jersey Department of Transportation, the Tri-State Regional Planning Commission and the New Jersey commuter railroads sponsored a comprehensive survey of the New Jersey railroad passengers. This survey covered more than 100,000 rail patrons who were making eastbound trips on a typical weekday. It obtained data describing the patrons' entire trips, not just the rail portion. Information such as mode, distance and time of access to rail stations, parking at stations, mode of distribution at terminals, trip purpose, occupation and income, employment, residence mobility and much more was gathered in addition to the traditional data obtained in an origin and destination survey. This report summarizes the results of this survey for all passengers boarding Penn Central, Central Railroad of New Jersey, Reading, North Jersey Coast Line or Erie-Lackawanna commuter trains. In many cases, data is presented by individual railroad thus showing differences between patrons, facilities and conditions specific for each railroad.

41 156892 REACTION OF PASSENGERS TO PUBLIC SERVICE VEHICLE RIDE. A series of questionnaire studies is described which was carried out on passengers in public service vehicles in the United Kingdom, particularly cross-channel hovercraft, helicopter and train. The effectiveness of the different rating techniques employed is examined and it is demonstrated that useful and reliable information can be obtained on the effects of such physical parameters as

vibration, vehicle motion and noise using rating methods which involve no external standards. Some results obtained from analysis of the survey returns are presented. /Author/ /TRRL/

41 157752 NON-USER PREFERENCE FOR IMPROVEMENTS, AND ATTITUDE TOWARDS FUTURE USE OF A BUS SYSTEM. This study was designed to determine transit non-user preferences towards improvements of the bus system in the Milwaukee area. The study was undertaken at the time when the bus system was still privately owned. Fare increase, reduction of service and decline in ridership has been the path, for the private system to stay in operation. Public acquisition of the system was being contemplated at the time of the study and was finally consummated in July of 1975, when Milwaukee County acquired the system. A questionnaire was distributed by mail to four study areas in Milwaukee, Wisconsin. The study areas all had existing bus service; however, their population constituted a majority of non-users for work trips. The study queried the non-user of the "most desired improvement," instead of the use of a preference scale to assess the need for improvements, and to measure the impact of improvements on ridership. This study concluded that a potential market does exist among non-users--approximately 40% being likely to use an improved system. In addition, a systematic relationship does exist between the areas of residence and the respondent's major preference in system improvement, giving rise to a desired improvement profile in each area. The study has also explored the factors which contribute to the willingness of the commuter to change mode and use an improved bus system. /Author/

41 157787 IMPROVING JOB ACCESS FOR THE URBAN POOR. Transportation planners are beginning to learn that different population groups have different travel needs. This paper summarizes what has been learned about the work-related travel requirements of the metropolitan poor. It begins with a description of likely travelers, the already motivated poor; their preferences for good jobs paying at least \$2.20 per hour; and the types of available jobs, most of which are unpleasant jobs paying unacceptable wages around \$1.60 per hour. The needs likely to be faced by poor people when they have to travel-in search of work, to apply for a job, and to commute-require flexibly routed and scheduled vehicles. The suitability of buses, car pools, and private autos to meet these needs is considered, and their availability and service inadequacies are identified. Programs are recommended to reduce the need to travel for work-related purposes, to foster self-help transportation by facilitating car ownership among non-car owning households, and to provide better transport options such as taxis or dial-a-bus systems for those who cannot help themselves. /Author/

41 157825 A DISAGGREGATE MODAL-SPLIT MODEL FOR WORK TRIPS INVOLVING THREE MODE CHOICES. This paper describes a disaggregate mode choice model with three travel modes: drive alone, car pool, and transit. A number of alternative model specifications were tested and the results analyzed. In general, the coefficients of in-vehicle time, out-of-vehicle time, and costs agree closely with the results of similar studies. Estimated coefficients of variables not included in previous logit model studies are also presented: Of these convenience, comfort, and flexibility influenced mode choice but mode unreliability and household income did not. Work location, cars per driver, and sex were the only socioeconomic variables for which statistically significant coefficients were found. Coefficients and models were also estimated for various subpopulations of commuters. The determinants of mode choice for CBD workers were different from those of non-CBD workers. differences in the cost and time coefficients among travel corridors and income classes were also examined. The estimated models were validated by successfully predicting the mode choices of the commuters for whom the model were estimated, of other commuters, and, finally, of commuters for whom changes in the level of service were made available. /Author/

41 158954 SYSTEMS MODELS FOR TRANSPORTATION PROBLEMS. VOLUME III: A COMPUTABLE COMMAND-CONTROL SYSTEM FOR A SOCIAL SYSTEM [Final rept. Jul-Aug 75]. The spectral characteristics of the urban center--at the level of the family, the functional organized units of society, and the essential compartment balances of the urban center--are spelled out in greater detail. These compartments are food, materials, energetics, manpower, productive function, economic balance, and technology governing the system. Ideal Carnot cycle efficiencies are characterized for the basic cyclic processes in each compartment.

41 159325 EXPERIMENTAL DESIGNS AND PSYCHOMETRIC TECHNIQUES FOR THE STUDY OF RIDE QUALITY. A major variable in both the cost of any new transportation system and rider acceptance of the system is the ride quality of its vehicles. At this time, there exists no

set of objective criteria which would allow the transportation system designer to determine what level of ride quality would be considered acceptable by a wide variety of potential passengers. The purpose of the study was to establish statistically acceptable techniques for the development of methods for relating physical measures of vehicle vibration to passenger estimates of ride quality.

41 163017 EVALUATION OF THE RELOCATION ASSISTANCE PROGRAM FOR BUSINESSES AND INSTITUTIONS DISPLACED BY HIGHWAYS. The provisions of the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 were implemented by the Texas State Department of Highways and Public Transportation effective January 8, 1971. Since then, many of those displaced by highways have received relocation assistance provided by the act. The Texas Transportation Institute evaluated the effectiveness of this relocation program, and this paper presents the findings from data collected by personal interviews with those associated with businesses and institutions displaced by highway projects in several urban and rural areas in Texas. The sample is composed of 101 business relocatees and 7 institutional relocatees. The characteristics of a typical business are sole proprietorship, retail operation, fewer than 10 employees, single outlet, at least 50 year existence, renting facilities, and \$100,000 or less annual gross sales. The results of the survey indicate that over 75 percent of the respondents relocated their businesses and continued in operation for a while; 60 percent of those that ceased operations could not find suitable replacement facilities; and a majority of those that relocated thought the overall quality of facilities and neighborhood conditions were better or remained the same, even though almost half of them had to increase monthly payments for facilities. Most of the relocatees thought that relocation payments adequately covered relocation expenses, but over half of the owners thought that property payments were not enough. About 30 percent mentioned unsolved problems (mainly financial). Most of the relocatees expressed no need for additional relocation services, gave the program a substantially high rating, had a satisfactory relation with the relocation personnel, and felt pleased with the relocation experience. /Author/

41 163605 PUBLIC INVOLVEMENT IN PARATRANSIT PLANNING. Repeated rate increases, allegedly declining levels of service, and growing community dependence on public transit due to rising costs of living and energy shortages

brought the Dade County, Florida, taxi system under sharp criticism. Transportation planners found that analyzing the situation and recommending corrective measures were complicated and difficult because of the largely unregulated, traditionally private-enterprise nature of the taxicab industry. A taxi study task force was, therefore, established that consisted of industry representatives from fleets of every size, local governmental officials, and (after a series of public hearings) interested citizens. Administrative and regulatory alternatives and possible operational improvements were presented to the task force for review and comment. The alternatives ranged from partial to complete control of the taxi industry by Dade County. The task force concluded that uniform county regulation of taxicab service was essential and legislation providing for county control of the taxi industry was passed by the Florida General Assembly in June, 1974. A model ordinance to establish a taxicab bureau with county jurisdiction was then submitted to the taxi task force and later approved and passed in modified form by the county commission. By late 1975 the county became involved in rate making and also in requesting the taxicab industry to provide service to the transportation disadvantaged. An important outcome has been the continuance of the taxi force, which perpetuates cooperation among citizens, government, and industry concerning transportation service issues that affect all. /Author/

Hinds, DH Wulkan, A (Metropol Dade Co, Fla Office of Transp Coordinator) Schimpeler, CC Corradino, JC (Schimpeler-Corradino, Associates) *Transportation Research Record* No. 618, 1976, pp 41-46, 3 Fig., 1 Tab.; This article appeared in *Transportation Research Record* No. 618, Transportation Issues: The Disadvantaged, the Elderly, and Citizen Involvement.; ORDER FROM: TRB Publications Off

41 163606 CITIZEN PARTICIPATION IN TRANSPORTATION SYSTEM PLANNING: A CASE STUDY. Techniques for citizen involvement are discussed in the context of the traditional urban transportation planning process. Deficiencies in past approaches to citizen participation and planning efforts are identified. A case of a current project in which an intensive effort is being made to achieve citizen participation as part of a small urban area study is reported. The citizen participation program seeks to identify the appropriate roles for citizen input to a multimodal system plan. The project demonstrates techniques and identifies weaknesses in both the citizen participation process and the planning process. Preliminary findings and recommendations are presented. /Author/

Miller, JH (Pennsylvania State University, University Park) *Transportation Research Record* No. 618, 1976, pp 47-52, 7 Ref.; This article appeared in *Transportation Research Record* No. 618, Transportation Issues: The Disadvantaged, the Elderly, and Citizen Involvement.; ORDER FROM: TRB Publications Off

41 163607 CITIZEN PARTICIPATION AND ROLE OF PUBLIC HEARINGS. This paper describes and comments on the procedures followed by state transportation agencies before and after public hearings on highway projects. Information was obtained through interviews with

public hearing officers, or their equivalents, in state highway and transportation departments. Items addressed include hearing administration, prehearing strategies, hearing formats, and post-hearing strategies. Hearing officers interviewed were also asked to submit written copies of their agencies' public hearing strategy and any other material pertinent to public hearings or citizen participation. From the information gathered, we have assumed that the procedures described are currently in use unless otherwise stated. State transportation agencies have either one of two administrative operations for conducting public hearings: 29 agencies have centralized administrations in which mandates emanate from the central office, and 21 agencies delegate the responsibility for hearings to district or regional offices. The trend is toward the use of independent moderators at public hearings, especially if the hearings are likely to produce controversy. The most efficient and widely used prehearing technique is the informal prehearing meeting, which all 50 agencies use in some form. Thirty-nine agencies hold hearings at night but only 3 agencies conduct morning hearings. Although the formats for public hearings held by state transportation agencies are similar, 12 agencies recess at the midpoint for 30 min to 1 h to answer questions, informally. /Author/

41 163662 RADICAL DIFFERENCES IN COMMUTING BEHAVIOR: NEW EVIDENCE FROM THE PANEL STUDY OF INCOME DYNAMICS. Data from a national probability sample of metropolitan families reveal sharp racial differences in distance from home to work, commuting time, commuting speed, and mode of transportation. Black household heads are bound to spend about 25 percent more time commuting per hour worked than do whites, even though blacks on average live slightly closer to their place of employment. The proportion of black workers using public transportation is three times the whites' proportion, and reliance on this slow mode of transportation accounts for about half of the difference between whites and blacks in commuting time and commuting speed. The paper mentions some housing market and labor market implications of the findings. /Author/

41 164231 THE ECONOMICS OF URBAN TRANSPORT. An attempt is made to analyse the economic problems arising in urban transport and to outline the economic principles upon which solutions may be formulated. In the introduction, urban transport is defined together with its relation with urban development in Britain and its control. The various topics discussed cover: urban traffic congestion, road pricing, the economics of parking and traffic management, urban public transport, urban freight movements, transport and the urban environment, urban transport planning and modelling, transport in-

vestment appraisal, and urban transport policy. An extensive bibliography is appended. /TRRL/

41 164279 HUDDERSFIELD BUS STUDY-SUMMARY REPORT. This report summarizes the findings of the Huddersfield urban bus study. This major study of bus operations in Huddersfield was commissioned by West Yorkshire County Council and West Yorkshire Passenger Transport Executive, and was completed by LGORU in 1976. The study involved three main phases. First, a series of surveys was carried out, giving a comprehensive review of travel needs in the town and the role of the bus system in meeting those needs. Next, investigations were made and recommendations devised for immediate improvements to the bus network. Finally, studies were made of the likely effects of long-term trends and national and local policy over a longer time period. These three phases are reported fully in the three main volumes of the study report. Technical reports have also been produced covering specific aspects of the analysis. This report is set out in three chapters, which cover the three phases of the study and is a summary of the findings of the whole study. These chapters are followed by a brief summary of the most important conclusions and recommendations we have derived. /Author/TRRL/

41 164377 DEMANDS FOR PUBLIC TRANSPORT MODES [Efterfragan av kollektiva transportmedel]. The main purpose of this study was to find out the attitudes of the individual to different qualities of the present transport modes. Interviews regarding behaviour and attitudes of travellers, cost dependence and the willingness to change from private to public transport have been carried out. From these interviews models describing the traveller's choice between private and public transport have been derived. The models comprise explanation and convenience factors. Empirical data applied to the models show that

the convenience factor is of great importance for the choice behaviour of travellers, while the explanation factor describing the fare systems is less important. /TRRL/ [Swedish]

41 165570 FORECASTING CAR OWNERSHIP. Accurate estimates of future car ownership are important because the level of car ownership is a primary determinant of personal mobility, modal split, total vehicle miles of travel and energy use in the transport sector. Different methods of forecasting car ownership are reviewed and their forecasts compared. Income and the cost of motoring are suggested to be the key explanatory variables with minor influence from saturation effects. Public transport availability may be an additional important factor for urban areas. As the unit of ownership is commonly the household, forecasting household car ownership rather than on a per capita basis may be more behaviourally consistent and allows consideration of the difference between the marginal utilities of the first and subsequent cars with a household. A summary of some earlier unpublished work presents a model, and its results, for forecasting urban car ownership using these ideas. Extensions of this model are proposed to forecast total car ownership. These extensions take into consideration the effects of differences in household structure and location and the causes and consequences of a move to smaller cars. While no completely formulated and calibrated model is put forward, a framework is presented which may suggest future research work using data from the 1976 census. /TRRL/

41 165575 PATRONAGE ESTIMATION FOR STREET PUBLIC TRANSPORT. There is a need for public transport operators to have an accurate estimate of patronage levels for any proposed new route. The high costs involved in establishing new routes, requires that the limited funds available to operators for improvements are allocated in a rational way. An accurate estimate of the potential patronage is the first step to ensure this. This paper reviews current methods for patronage estimation. Large public operators have used the results of metropolitan-wide, land-use and transportation models to highlight deficiencies in their networks. Some problems from the operators viewpoint in using this type of forecast are described. The development of alternative methods for patronage estimation is outlined. The adaptation of the four-step modelling approach to transport planning is discussed together with the possible use of both direct demand and disaggregate behavioural models. Details are given of the application of these techniques to a case study. The suitability of the models to more general applications is outlined. /TRRL/

41 165629 STUDIES OF THE SOCIAL EFFECTS OF CAR OWNERSHIP AND CAR TRAVEL [Studier Oever Bilsomens Sociala Effekter]. This report describes the studies made into the social effects of car ownership and car travel. Part 1 investigates theoretically the influence of car traffic on physical urban structure. Part 2 deals with the social effects of car traffic, with special reference to those without a car. After a general treatment of car ownership in Sweden, there is a description of the relationship of children, the old, the handicapped and women to cars, and the effect of car ownership on the labour market, shopping and leisure. Part 3 discusses theoretically the image which people have of their town, and the way car traffic affects this. Part 4 examines two specific areas with regard to trips to work, in relation to public transport facilities and the location of workplaces. /TRRL/ [Swedish]

41 165688 PUBLIC INCONVENIENCE : ACCESS AND TRAVEL IN SEVEN SYDNEY SUBURBS. This monograph is about access in Sydney and the travel of residents getting to places of employment, schools, shops, health services, sport and recreation. The main purposes of the work are (a) to measure how conveniently these activities and facilities are located in relation

to where people live, (b) to see whether the process of urban development has resulted in a 'fair' distribution of facilities throughout the metropolitan region, and (C) to describe the journeys made on foot, by public transport and by private transport, and to assess the transport problems that arise when residents have poor access. /Author/IRRD/

41 167393 SYSTEMS MODELS FOR TRANSPORTATION PROBLEMS. PART II. THE SOCIAL PHYSICS FOR MODERN SOCIETIES: THE ROLE OF THE CITIES. The objective of the research was to make use of a physically based social systems model, developed earlier, to study the determinants of city sizes and their national interactions. In particular, information on the role of a transportation system in affecting city sizes was required. In this second part, the relation between the urban settlements and a potential mapping that is related to the land (its population density, material and energy resources, activities, products, and consumption) is outlined. The dependence of the urban settlement distribution on long-distance international trade is discussed. The emergence of a new major social institution, the large corporation which is competitive with the urban settlement, is discussed. The socio-economic effects of transportation systems, and their modernization is described.

41 168060 ATTITUDE SURVEYS, TRANSIT PLANNING, AND AUTOMOBILE-USE CONSTRAINTS. This paper summarizes the procedures, findings, and implications of an attitudinal survey of existing and potential transit users. Employees at work places having different levels of transit accessibility and different industry classifications were sampled about (a) the characteristics of a desirable transit service, and (b) the conditions under which they would use such a service. The approach used here appears to be more cost-effective and more accurate than the traditional home interview or bus rider attitude and market-research studies and was useful in market segmentation for transit-system planning purposes. Radical differences were found between transit users and nonusers in regard to acceptable transit-service levels. Even with a level of service acceptable to non-users of transit, most automobile drivers conditioned a change of regular modes of travel to work on motor-fuel supply restraints. /Author/

41 168063 ANALYSIS OF USER RESPONSE TO THE 1975 NEW YORK CITY TRANSIT-FARE INCREASE (ABRIDGMENT). This paper describes how before and after survey data were used to supplement aggregate ridership counts in describing the effects of a fare increase on patrons of the New York City transit system. While the overall rate-of-ridership decline may be sufficient for a financial analysis, the growing recognition of the role of transit in economic, social, and equity issues requires more in-depth understanding of the kinds of people who ride less or sacrifice mobility when transit-fare increases occur. Two surveys, one before the fare increase was announced and another 3 months after its implementation, allowed the analysis of a before and after pattern of transit use by a given sample of riders. (Except for those derived by inference, data on the effects of fare increases on the various groups of riders and the types of trips abandoned did not previously exist for the New York City transit system.) The author concludes that the 1975 transit-fare increase resulted in ridership reductions in roughly equal proportions from all major socioeconomic and demographic groups. The survey results support the theory of automobile availability as a major determinant in mode-choice decisions. The over representation of riders from double fare zones among the changers emphasizes the urgency of a comprehensive transfer policy to mitigate the effects of two fares on this group of riders.

41 168092 THE DECLINE IN PUBLIC TRANSPORT-CAN WE ARREST IT? The article considers the effect of some aspects of rail transport planning policy upon major conurbations. Commuters are the most important single consumer group, about 63 per cent of the LTE revenue and 77 per cent of British rail revenue in peak hour travel. The author discusses the basis used to determine the level of fare increases on commuter routes. The related issues of subsidies and staffing are examined; conditions vary considerably over the country but it is apparent that often labor and other resources are maldeployed. There is still a lack of co-ordination between surface British rail services and LTE buses and tube trains. A full study into the cost-effectiveness of subsidies for commuter fares is needed. It is explained how even small savings on subsidies could have serious implications on public revenue and expenditure accounts in large conurbations. Reasons are given why public transport should play a much greater role in the planning of conurbations and travel patterns within them. Greater emphasis should be put on the importance of commuter traffic.

41 168148 URBAN TRANSPORTATION SYSTEMS VIEWED AS SOCIAL SERVICES DELIVERY SYSTEMS. The recognition of urban transportation systems as social services delivery systems represents a major change in urban

transportation planning. This recognition emerged incrementally over the last 50 years and it is founded in the size of modern metropolitan areas, in the nature of the technology of urban transportation systems, and in the socioeconomic, demographic, and psychosomatic characteristics of urban populations. The acceptance of urban transportation systems-in both their highway and mass transit components-as social services delivery systems (SSDS) implies major changes in urban transportation planning requirements and in the evaluation of such systems. Six such major requirements are identified and discussed in this paper (universal availability, public determination of the level of service, universal funding, local planning and accountability in management, public determination of priorities, efficiency and effectiveness in committing and dispensing public funds). In addition a more comprehensive framework of a social evaluation of the urban transportation systems is presented and discussed. (a) /TRRL/

41 168922 THE IMPACT OF BART ON THE COMPETITIVE ADVANTAGE AND EFFICIENCY OF BAY AREA BUSINESS OPERATIONS. This technical memorandum evaluates the economic effects of BART's transportation service on the competitive advantage and efficiency of Bay Area business operations. The scope of the analysis includes potential economic impacts resulting from improved transportation service and accessibility for workers to jobs, impacts of regional competitive advantage due to locational advantage or regional image, and possible economic efficiencies associated with BART service. The study methodology, which is also documented, includes a shift/share analysis of Bay Area employment since 1962, extensive interviews with industrial and commercial Decision makers, and four case studies. 41 169620 AN EVALUATION OF POLICY RELATED RESEARCH ON CITIZEN PARTICIPATION IN MUNICIPAL SERVICE SYSTEMS: OVERVIEW AND SUMMARY. The project was conceived and structured as a means of providing municipal managers, interested citizens, and the academic community with concise reviews of the state-of-the-art and knowledge base concerning citizen participation processes in each of eight municipal service systems. This overview monograph includes: a statement of definitions and operational assumptions regarding the settings for citizen participation, a review of the state-of-the-art of the citizen participation literature, a summary of major policy relevant findings and recommendations, and suggestions for future research.

41 169705 THE URBAN TRAVEL DEMAND FORECASTING PROJECT. PHASE I FINAL REPORT SERIES, VOLUME VI. ATTITUDES, BELIEFS, AND TRANSPORTATION BEHAVIOR. This volume includes detailed descriptions of several studies based substantially on subjective data, reflecting travelers' beliefs, attitudes, and intentions. Research topics were: (1) the importance of various travel attributes as influences on choices among car, bus, and BART commuting, and (2) attitudes reflecting basic preferences for auto and transit travel. Chapter 1 presents definitions of beliefs, attitudes, and intentions for use throughout the text and it discusses the relationships of the concepts to each other, to objective measures of physical phenomena, to the concept of utility, and to behavior. Chapter 2 describes a study of ten different travel attributes and their relative importance as influences on choices among car, bus, and BART for traveling to work in the San Francisco Bay Area. Attributes include cost, total travel time, dependability, relaxation, safety from accidents, use of time while traveling, flexibility, seat availability, safety from crime, and waiting time. Chapter 3 describes two studies of attitudes related to the basic characteristics of auto and transit travel-characteristics that do not vary substantially for different trips. References, tables, and figures are included.

41 172150 CRITICAL FACTORS INFLUENCING THE DEMAND FOR TRANSIT. This report identifies the direct, as well as latent demand for public and mass transportation services, and assesses the factors which are critical to developing expanded transit usage. Individual and behavioral characteristics explaining transit demand are assayed, as well as transit system and population characteristics influencing the demand for mass transportation. Transit demand forecasts by transit leaders are also included. The most significant personal and attitudinal characteristics which predict bus ridership are: the lack of an automobile, close proximity to a bus route and positive evaluation of buses relative to automobiles. The two indicators most explanatory of patronage for conventional buses: the lack of automobile, and the lack of limiting physical disabilities. The propensity to use buses among current nonriders was examined to determine the most critical factors that influence a decision to switch to public transportation. Three behavioral demand forecasting models are outlined for examining alterations or improvements in transit service. Macro-level indicators for demand forecasting were also assessed. Two systematic demand models for estimating daily ridership are presented.

41 172522 ACCESSIBILITY MEASURES AND THE SOCIAL EVALUATION OF URBAN STRUCTURE. The measurement of accessibility and travel patterns in urban areas is described. The methodology presented includes graphical measures of physical accessibility, a numerical index of accessibility that is consistent with graphical measures, residents' accessibility weighted by transport availability, and the relationship between accessibility and travel behaviour. Some empirical results are presented for access and travel to male and female jobs in Sydney, with the use of data collected for the 1971 census of population and for the Sydney area transportation study. The consequences of some alternative arrangements of land use and plans to improve public transport on residents' accessibility are investigated. It is argued that accessibility measures are a useful aid to planners and policymakers in the social evaluation of urban structure.(a) /TRRL/

41 172877 THE EFFECTS OF URBAN TRANSPORTATION CHANGES. This paper uses a general equilibrium simulation model of residential land use to study the long-run effects

of transportation changes in a closed city. The effects considered here include the aggregate benefits from the income distributional impact of the changes, in addition to the induced alternations in the physical characteristics of the city and in the location and modal choice of different income groups. The paper breaks new ground in its treatment of modal choice in a location theory model. An interesting point brought out in the simulations is the welfare-interdependence of different groups resulting from their spatial interaction. /Author/

41 172878 AN ANALYSIS OF CITIZEN ATTITUDES TOWARDS THE ESTABLISHMENT OF BUS SERVICE IN THE CITY OF ROSWELL, NEW MEXICO. This report is based upon the discussion concerning potential usage and mean number of automobiles per family. Further, if the system required a tax increase to maintain operation, the majority of the population would accept the additional cost. This is evidenced by the fact that 47.6 percent of those surveyed said they would pay additional taxes as opposed to 38.7 percent who would not. According to the multifrequency results relating to age and races, the majority would support a tax increase if necessary. Based upon the multifrequency distributions of age, income level and ethnicity, the system would have a broad base of support. In most cases, there was a clear majority in favor of a bus system and the necessary tax increases to support it. Regarding handicapped individuals, it is evident that they believed a mass transit system would help relieve their unique transportation problems. This is illustrated by the fact that 62 percent of the families with handicapped members said they would use the system, 72 percent said they would favor the use of municipal funds for the project, 60 percent would support a tax increase, and 58 percent of the families with handicapped members with severe transportation problems said the bus would solve those problems. The findings of this study indicate a high degree of citizen support. This support justifies further studies into areas such as operating costs and tax considerations.

41 173302 THE COMPREHENSIVE APPROACH TO TRANSPORT. The author investigates how does an individual transport user measure value for money, and how can telling people about transport assist this exercise. As an example, the success achieved by the Oxford City Council in their balanced transport policy which followed public unacceptability of a proposed road through Christ Church Meadow is discussed. The author develops the theme that a comprehensive approach to transport can only be successful if the community at large is aware of the value of money to the community of the many approaches to modes of travel within a community. Examples are given of the measures taken within the City of Oxford to improve the freedom of movement for pedestrians and motor vehicles by the provision of park-and-ride facilities, re-

served bus and cycle lanes and the understanding of land use implications for transport. The question of communication is discussed in relation to the changes in the method of government grants towards transport that have evolved following publication of the Local Government Acts of 1972 and 1974, and the need to inform the community at large of future transport policies and programmes. /TRRL/

41 173309 THE EFFECT OF FREE PUBLIC TRANSPORT ON THE JOURNEY TO WORK. The travel habits of public transport employees who had free travel concessions on public transport were compared with those of similar groups of workers who had to pay fares in seven provincial cities. The study used linear logit models to examine the effect of the many different travel and socio-economic factors on mode choice between car and public transport for the journey to work, on car availability for the journey to work, and on single and multiple car ownership. The results suggested that socio-economic variables were very important in explaining car ownership and availability, but less so in influencing mode choice, while the difficulty and cost of the public transport journey appeared to have an important effect on mode choice and car availability, and less so on car ownership. The best estimate of the effect of providing free public transport for the control group is that car use by peak-hour commuters who do not need their car at work would be reduced by 22 per cent, that 10 per cent of those workers who had a car available for the work journey would no longer have the choice and would travel by public transport if it were free, and that car ownership among commuting households would be reduced by a statistically non-significant 3 per cent. Much additional information on the factors influencing travel behaviour was also obtained, including estimates for the value of travel time of 50p per hour for time spent walking or in a public transport vehicle, 13p per hour for time spent driving to work, and 200p per hour for time spent waiting for public transport, though this latter figure is known to be an over-estimate. /Author/TRRL/

41 174107 LONGITUDINAL CHANGES IN PUBLIC PREFERENCE FOR ATTRIBUTES OF A NEW TRANSIT SYSTEM. This paper reports the results of a longitudinal study of public preference for attributes of a new bus system in Chapel Hill, North Carolina. A "before-after" approach was used to collect attitudinal, socio-economic, and travel data from a sample of residents. Multidimensional scaling was used to construct structural representations of the respondents on the basis of their preferences. These structures were interpreted using behavioral and socio-economic variables. The

analysis was performed with both "before" and "after" data sets, and a comparison of the results indicates that the patterns of preferences changed greatly between the two surveys. This result implies that market segment characteristics changed with exposure to the new bus system. /Author/TRRL/

41 175093 TRANSPORTATION AND URBAN ECONOMIC DEVELOPMENT. These discussion materials are prepared as part of a general review of key policy and program considerations underlying transportation and urban economic development. Their purpose is to help EDA in sorting out its role and potential contribution in the urban transportation arena. To this end, a specific objective of this document is to identify policy, program and administrative initiatives for EDA in the urban transportation field, including ways transportation can work to enhance urban economic development. A related objective is to summarize in the process: the present and prospective assistance policies and programs of the Urban Mass Transportation Administration and the Federal Highway Administration; previously federally-funded transportation programs and projects with a bearing on urban economic development; and local transportation planning practice, evolving roles of major participants in the process, and ways economic development entities are involved at area-wide (i.e. metropolitan areas) and sub-area (e.g. central city) levels.

41 175205 SOME SOCIAL ASPECTS OF PUBLIC PASSENGER TRANSPORT. Each type of passenger transport tends to be used predominantly by a limited number of identifiable groups of people, each for their own specific purposes. This paper reviews some of the existing data on the patronage of conventional stage bus services to identify the groups that comprise the market for bus travel. It is shown that about one sixth of bus passengers are children, one third men and one half women. The purposes for which bus trips are made is shown to vary between different types of area, but nationally to include about 35 per cent for work, 10 per cent for education, 21 per cent for shopping and 16 per cent for social purposes. It is shown that a major reason for not using a bus is having a car available. A similar analysis is made of the patronage of five experimental dial-a-bus services. It is shown that these have attracted considerable numbers of passengers to public transport, though only slightly from private cars. A higher than normal proportion of dial-a-bus passengers are women. There is little evidence of dial-a-bus services being used in ways that are different to the use of frequent conventional bus services, or of them satisfying a market that could not be satisfied by conventional buses. However, dial-a-bus is attracting passengers who more nearly represent a cross-section of the community served, than do passengers on conventional buses. (Copyright (c) Crown Copyright 1977.)

41 177146 THE IMPACTS OF FEASIBLE STAGGERED WORK HOURS AND COMPRESSED WORKWEEK POLICIES ON HIGHWAY NETWORKS, TRANSPORTATION ECONOMICS, ORGANIZATIONS AND EMPLOYEES. This study determines feasible work schedules of staggered work hours and 4-day workweeks and investigates their impacts on the operational efficiency of a highway network serving a high-density employment area in a medium size city. A sample of 140 employees from the main office of N.Y.S.D.O.T. in Albany, N.Y. were surveyed in September, 1976. Using 110 valid responses, the statistical algorithms Automatic Interaction Detection and Trade-Off, were used to determine the most important variables shaping attitudes toward flexible work hours and 4-day workweeks, and the schedules supported by the majority of employees. Traffic simulation techniques were then used to estimate changes in the operational efficiency of the transportation network and travel costs based on present and future traffic conditions. Results show that support for alternative work schedules stems from the desire to reconcile one's work and personal activities. The results show that out of 21 variables, the most important factors influencing favorability of alternative work schedules are leisure time, income, family size, age, congestion levels and carpooling. The most favored work schedules were found to be the 5-day-flexible, the 4-day-flexible, and the 5-day individual-specific-times programs. The greatest highway impacts of these schedules occur within a ring of two miles radius from the office site. The effect is less evident as the distance from the complex in-

creases. The estimated systemwide transportation economic benefits are over \$3 million (1976\$) per year, accruing to commuters during the peak hour, especially those who participate in flexible or 4-day work programs. The impacts on the organization and its employees are generally anticipated to be positive, especially on employee leisure, family time, job satisfaction, productivity, savings on gasoline, and rush hour commuting. However, the effects on employee fatigue and inter-intra-agency communication may be somewhat negative. /Author/

Tannir, AA ; New York State Department of Transportation Res Rpt. 129, Aug. 1977, 223 pp, 16 Fig., 43 Tab., 4 App.

41 177155 SOCIAL SERVICE AGENCY TRANSPORTATION SERVICES: CURRENT OPERATIONS AND THE POTENTIAL FOR THE INCREASED INVOLVEMENT OF THE TAXI INDUSTRY. This study analyzed the current transportation operations of social service agencies in three prototype communities in Texas: urban, rural, and rural with urban interface. The study was designed to identify and analyze the costs of direct provision of client transportation by social service agencies and to develop comparative cost indices for the same or similar classes of trips if delivered by alternative providers, including taxi operators, transit systems, and non-profit providers. Common classes of trips were identified, categorized by major operational characteristics and two sets of cost data were developed for trips directly provided by social service agencies to their own clients; actual costs and perceived costs. Actual cost figures, including expenses borne externally or through grants, were developed to allow policymakers to effectively evaluate the costs of direct transportation provision by social service agencies. Recognizing that Federal and state subsidies existed and would be used, perceived cost figures were developed to allow social service agencies to compare the advantages of alternative service provision to their out-of-pocket costs. While no one provider was found to be cost-effective for all types of client trips, it was found that some social service agencies were operating inefficient or ineffective transport systems and should actively consider an alternative provider. /Author/

Cox, WL Rosenbloom, SL ; Texas University, Austin Final Rpt. 41 177357 CAR AVAILABILITY AND USAGE: A MODAL SPLIT MODEL BASED ON THESE CONCEPTS. This paper examines the influence of one variable, namely car availability, on modal split modelling. After a general introduction on the background to modal split and some of the problems with the existing approaches, a microlevel examination is made of the patterns of car usage during the day and during the week, disaggregated by purpose and household type. From this, the choice situation based on car availability is hypothesized and modelled by a category analysis approach. Certain policy measures are then input into the model, and the

changes in terms of modal split assessed. Finally the importance of car availability in modal split modelling is summarised. /Author/TRRL/

41 177382 POLICY IN TRUE PERSPECTIVE. The article examines the purpose of transport policy and its consideration of the quality of life. It is argued that more attention should be directed towards analyzing the broader consequences of changes in transport policy and the nature of forces regulating them. A number of anomalies between present-day transport policy and practise are discussed covering public transport, car production, road construction, energy conservation and road safety. It is suggested that the parameters within which transport objectives are planned should be broadened and objectives set within the wider goals of society. /TRRL/

41 178322 AN EVALUATION OF THE IMPORTANCE OF TRANSIT SERVICES TO MINORITY GROUPS IN SELECTED TEXAS CITIES. The results are presented of a survey which assessed the travel needs and other factors influencing the perceptions of minority (i.e., black) transit riders, determined their transportation needs, assessed the importance of public transit, and which attempted to quantify and measure the impact of their lower economic status and low level of automobile ownership on mobility. The findings tend to support the hypothesis that minority low income transit riders are constrained in their mobility by their economic predicament, the multiplicity of their travel behavior, and certain characteristics of the public transit system (e.g. no service to the suburbs where employment opportunities have moved from the central city in recent years). Policy implications and some suggested remedies, such as "feeder" subsidiary transit networks for implementing the findings are also presented.

41 178740 ATTITUDES TOWARD TRANSIT SERVICE IN SMALL URBAN AREAS. An analysis of the attitudes of residents of several small urban areas toward transit improvement was conducted in an attempt to identify groups with similar preferences. The groups were described by several demographic characteristics: age, sex, auto owned. Two methods were used: a comparison of the preference rankings of each group across the cities; and discriminant analysis to identify groups with similar attitudes. The results indicate that there is some similarity within certain demographic groups, across the cities. However, respondents as a whole exhibited great similarity of preferred choices, irrespective of demographics or city. The two most preferred improvements were special vehicles for the handi-

capped and reduced fares for the elderly and handicapped. It is concluded that there exists some similarity in the attitudes towards transit improvement among the cities, but the development of any distinct groups proved impossible with the limited set of demographics available for use in this study. /Author/

41 178750 TOWARD THE DEVELOPMENT OF AN ACCOMMODATION SERVICE POLICY. Continued public support for ever-increasing operating deficits of transit service demands that uneconomic services be curtailed. Nevertheless, a certain amount of service may be justified in terms of community welfare as "accommodation" to particular user groups—those which are dependent upon public transportation for mobility. This paper suggests that transit agencies no longer need make this judgment intuitively. A rigorous set of decision-making rules which test uneconomic routes or services for their efficacy in meeting community-welfare demands is presented. Under these rules, routes are successively evaluated against five criteria: operating ratio, effectiveness, intensity, captive riders and community welfare. A case study of the application of this algorithm to a medium-size transit system is presented to illustrate the method. The procedure, by specifying the threshold values for each parameter, may be adapted to the needs of any transit system—every segment of the system can be continually re-examined to determine whether the drain on financial resources is justified by the contribution made to community mobility. /Author/

41 178751 FUTURE RIDERSHIP ON NEW YORK CITY'S RAPID TRANSIT SYSTEM (ABRIDGMENT). As a necessary step in the analysis of possible future requirements for the New York City rapid transit system a model to estimate ridership on the system is developed. Analysis of historic data reveals that annual ridership on the system is positively related to employment in the Manhattan Central Business District (CBD) and to the level of transit service, measured in car-miles; it is negatively related to the number of autos registered in New York City and to the transit fare, measured in constant dollars. These four variables explain 80 percent of the year-to-year variation in ridership. A relationship for peak hour ridership was also developed. The elasticity of demand with respect to CBD employment is found to be 0.75, with respect to fare, -0.25, with respect to service, 0.13. Statistically, the relationship of subway ridership to fares and to CBD employment is very strong. The relationship to auto registrations is weaker and to service weaker still. Because the model developed

relates to the economic health of the CBD and to the ownership of the automobile, it is particularly relevant to the current National goals of downtown revitalization and energy conservation. For example, it is shown that a resurgence in Manhattan CBD employment to 1969 levels would increase ridership by some 10 percent. Similar increases in transit would occur if a gasoline shortage eliminated the automobile as a CBD commuting mode. To explore alternative estimates of future ridership eight combinations of the independent variables are examined, including stable and declining CBD employment, stable and declining fares, and unconstrained and energy-constrained automobile ownership. The results suggest long-term changes in current ridership ranging from a 9 percent loss to a 34 percent increase. /Author/

41 179025 WHO PAYS THE HIGHEST AND LOWEST PER-MILE TRANSIT FARES? Transit fares paid per mile by different transit users are considered as the basis for uncovering inequities under present flat fare transit structures. Using data collected from a 1975 survey in Albany, N.Y. the ridership profile is studied to determine what inequities exist, and how they are related to rider characteristics. Automatic Interaction Detection (AID) and tabular summaries were used to determine the power of various independent variables to explain the variation of cost-per-mile. Variations in cost-per-mile for each individual variable are also studied. The key finding supports conventional wisdom: the short-trip, non-peak hour, non-work, inner city, urban rider who is generally less well off in society and is dependent on the bus as the only means of affordable transportation, is paying much more per mile for his bus trip than the longer trip, work trip, suburban rider. Thus, people requiring bus service most and least able to pay are being charged at the highest rate under current flat fare structures. /Author/

Leutze, CB Ugolik, WR ; New York State Department of Transportation Res. Rpt. 136, Feb. 1978, 35 pp, 5 Fig., 19 Tab., 9 Ref.

41 179040 COMPARISON OF ATTITUDES TOWARDS TRANSIT SERVICE IMPROVEMENTS IN SEVEN SMALL URBAN AREAS. An analysis of the attitudes of residents of several small urban areas towards transit improvement was conducted in an attempt to identify groups with similar preferences. The groups were described by several demographic characteristics: age, sex, autos owned, family size. Two methods were used: a comparison of the preference rankings of each group across the cities; and discriminant analysis to identify groups with similar attitudes. The results indicate that there is some similarity within certain demographic groups, across the cities. However, respondents as a whole exhibited great similarity of preferred choices, irrespective of demographics or city. The two most preferred improvements were special vehicles for the handicapped and reduced fares for the elderly and handicapped. It is concluded that there exists some similarity in the attitudes

towards transit improvement among the cities, but the development of any distinct groups proved impossible with limited set of demographics available for use in this study. /Author/

Weiss, DL Neveu, AJ ; New York State Department of Transportation Res. Rpt. 119, June 1977, 19 pp, 1 Fig., 7 Tab., 4 Ref.

41 179053 PUBLIC TRANSPORTATION OPERATING ASSISTANCE; EVALUATION AND OPTIONS. Since public transportation service provides numerous benefits to the economic, social, environmental, and transportation sectors of New York society, its continued availability to all New York residents is essential. The current transit operating assistance program has maintained fares and service levels, but has not generally provided for fare reductions or service increases. While adequate for 1974, the current program will fall short of needs for 1975. A number of inequities in the current program have been identified and solutions recommended. In 1973 Transit operating deficits (costs of operation minus revenues from riders) for New York State were about \$263 million for bus, subway, and commuter rail. Unless strong actions are taken to hold down rapidly rising costs of transit operations, these deficits are expected to rise to about \$642 million by 1975 and \$1,324 million by 1980, assuming that current fares and service levels are maintained. A continuing State program of operating assistance is recommended to insure the availability of public transportation service to all New York residents. The other recommendations are an incentive program to decrease transit ridership; and an incentive program to encourage and improve transit service. /Author/

41 179385 PUBLIC ATTITUDES TOWARD TRANSIT FEATURES AND SYSTEMS. An attitudinal survey was made in the Dallas-Fort Worth metropolitan area in 1973-1974 to obtain representative public attitudes toward a comprehensive array of urban public transit features and systems. The sample population surveyed were demographically representative of the area. The questionnaire was structured such that the reasons for some of the attitudes could be deduced. It consisted of a series of questions about transit features or operational elements and a section about whole transit systems. An unbiased, informative audiovisual presentation accompanied the administration of the questionnaire, calling attention to various human factors, aesthetics, economics, and innovations regarding public transit. The questionnaire also incorporated a provision for quantification of attitudes by adding a question about money to be invested in a transit-system feature to the usual qualitative scale of answers. The importance scales were compared to the money-investment scales by using factor analysis, regression analysis, and other techniques. The five transit systems in the questionnaire were improved bus, dual rail, other-tracked vehicle, dual mode, and demand responsive (bus). This type of research is consistent with a contemporary philosophy of system development that emphasizes user-oriented techniques as an approach to enhancing public transit usage. /Author/

41 179522 PASSENGER TRANSPORT AND SOCIAL INTERVENTION. Reductions in public transport services, increased fares and highway congestion have led to three kinds of intervention: regulation and licensing, financial support and control and taxation of alternatives. The history and effectiveness of each method are discussed. The basic mechanism for controlling stage and express carriageway bus services is still the 1930 road traffic act, but the concept of cross-subsidisation between routes and runs at different times of the day is now difficult to apply. The 1968 act created new management structures for the bus industry and took large sections into public ownership. It also allowed both bus and rail services to be subsidised. The Railways Act 1974 altered the financial basis to bring the UK in line with EEC practice and widen the scope for the payment of grants to British Rail. Although capital grants became available for new transport infrastructure, it is now unlikely that wholly new commuter systems will be developed. It is concluded that the present decline in public transport usage and operation in the UK will continue because there is no determined application of positive subsidies or control or taxation of alternatives.

41 179827 THROUGH THEIR EYES, PART II: THE PEOPLE SPEAK. A survey was conducted that examined the attitudes of American citizens towards transportation problems. The survey focused on determining the habits of Americans in using public and private transportation options. It was also designed to surface the population's general attitudes towards transportation problems, and how these problems related to other national issues. Specific attitudes and perceptions of individual transportation modes and frequently considered solutions and alternatives were also included. The report provides an overview of the survey results and explores some of their implications for the development of future transportation programs. The issues include a discussion of acceptable alternatives, the automobile, carpooling, public transportation, financing transportation improvements, the rail system and, a look at the future.

41 179915 FACTOR ANALYSIS OF SOCIO-ECONOMIC VARIABLES IN TRIP GENERATION MODELS. Factor analytic study of the body of data obtained from home interview surveys show that only a few factors adequately represent the meaning explained by several socio-economic variables normally utilised in the development of trip generation models. Study involving males and females of different

occupational groupings and for various trip purposes has exhibited that there exist four basic traits identified as prosperity, stage in life cycle, facility for movement and location in the urban area explaining the meaning offered by various socio-economic indicators. Stepwise multiple regression analysis is performed on the same data to ascertain the variables that enter into the equations, and it is observed that there is a possibility for some of the correlated variables to enter into the final models. It is shown that when the independent variables are correlated with each other the factors present much more reliable and meaningful interpretation of the model formulation than normally possible through multiple regression techniques. /Author/TRRL/

41 180546 HIGHWAY AND FREEWAY PLANNING: SOCIAL AND ECONOMIC EFFECTS (A BIBLIOGRAPHY WITH ABSTRACTS). The reports cited in the bibliography deal with various socioeconomic facets associated with development of highways and arterial roads in urbanized and rural areas. Subjects include right of way acquisition and homeowner displacement, public attitudes, social impact on residential areas, economic aspects, and benefit cost analysis. Economic impacts are noted on local areas, such as Indian reservations, Appalachia, and villages. A number of local community studies are included for comparative purposes. (This updated bibliography contains 94 abstracts, 23 of which are new entries to the previous edition.)

41 180901 ECONOMIC IMPACTS OF BART CAPITAL AND OPERATING EXPENDITURES. The 71-mile Bay Area Rapid Transit (BART) system is the first regional scale rapid transit system to open in the United States in over 50 years. This technical memorandum assesses the economic impacts of BART's \$1.5 billion capital expenditures and \$60 million annual operating expenditures on the Bay Area's regional economy. The report documents the changes in regional output and employment in the nine-county San Francisco Bay Area, in each of 50 sectors, as a result of BART's expenditures. Two input-output models were developed of the San Francisco Bay Area, one for 1967 and one for 1974, to test these impacts. The models and the methodology for formulating them are described. BART's impact on employment opportunities during construction and its permanent staff is evaluated. The impact of BART's construction expenditures on construction wage rates within the region is also analyzed. (Color illustrations reproduced in black and white)

41 182457 COMMUTING AND RESIDENTIAL RELOCATION IN THE METROPOLITAN FRINGE. In most empirical studies of commuting behaviour, commuting flows are seen to be responsive to the spatial patterns of residence and work sites. Drawing upon the residential relocation literature, it is suggested that the rates of change of these spatial patterns over time also affects the pattern of commuting. An empirical investigation is described which uses data on commuting flows from fringe areas into the Municipality of Metropolitan Toronto in 1964 and 1971. Recent residential relocation is found to have a significant effect on the level and direction of commuting. Further, this effect is found to be similar in 1964 and 1971 suggesting a stability in commuting behaviour. /Author/

41 183129 THE SOCIAL AND ECONOMIC COSTS OF NOT HAVING PUBLIC TRANSPORTATION. The recent energy problems, environmental concerns and traffic congestion associated with auto-oriented transportation have revived interest in public transit. However, the overall costs of not having public transportation often are hidden or "shadow" costs which are not fully explored in decisions to obtain, or to discontinue, transit service. A means of further quantifying these distributive social and economic costs is necessary, so that city and state transportation decisionmakers can more ably determine the transit needs of specific groups and the levels of public transportation service required. /GMRL/

41 183137 TRANSPORTATION ECONOMICS AND PUBLIC POLICY: WITH URBAN EXTENSION. This book tries to integrate the three main aspects of public sector transportation analysis and decision-making-pricing theory and policy, cost theory and measurement, and investment choice-and to develop policy guidelines on the basis of welfare maximizing principles and real world complexities and constraints. Numerous empirical examples and case studies are provided to illustrate applications and suggest ways to bridge the gap between everyday data

limitations and the theory and concepts presented. Extensions to some aspects of urban transport economics and general urban economics are contained in Part 4. /GMRL/

41 183945 FACTORS AFFECTING MODAL CHOICE DECISIONS IN URBAN TRAVEL. This paper develops some further tests of the effects of prices and disaggregated time-related characteristics of public versus private transportation on individual modal choice behavior, as well as factors which differentiate households according to auto availability, income and occupational status. Parameter values pertain to a travel survey conducted in five parts of the Buffalo metropolitan area. Estimates are obtained by using logit and probit estimation techniques.

41 184312 BUS PATRONAGE: CAR OWNERSHIP IS IMPORTANT. This article is a response to an article by Heggie and Bailey (see IRRD no: 224579) in which they asserted that "increasing car ownership has not contributed to declining public transport patronage in the way that is normally assumed". The author feels that Heggie & Bailey's analysis omitted the important factor of the substantial arresting effect of increasing real income on falling numbers of stage passenger journeys. Further evidence needs to be found to indicate that overall, bus passengers are not very responsive to fares changes. The unexplained downward trend in stage bus usage, and the similarly unexplained upward trend in car ownership require further investigation in the author's view. /TRRL/

41 184341 CONSUMERS AS PARTICIPANTS IN TRANSPORTATION PLANNING. Legal requirements for public participation in transportation planning increase the opportunity for transportation consumers to influence the design of systems they will use. However, the implementation of these requirements may also increase the possibility that system design will be dominated by the opinions of outspoken groups. This study postulates that public participation is biased, and seeks to test this proposition using data from an Oregon survey consisting of approximately 2400 respondents. Using automatic interaction detector and cross tabulation analyses, different participation rates were uncovered for groups identified by demographic, attitudinal and behavioral variables. /Author/TRRL/

41 184342 THE IMPACT OF CAR AVAILABILITY ON URBAN TRANSPORTATION BEHAVIOR. Travel demand estimates that derive from the traditional sequential process often derive their values from some consideration of household car ownership. This variable may be misleading in that not all who live in households with cars may have access to a car; conversely, not all in households without cars are captive solely to other modes. It is proposed that another variable, car availability, be used in planning studies, to provide more accurately a description of an individual's access to a car. In a recent study, this variable took a two-dimensional form. One dimension considers how the car is available (driver, rider, or not at all) and the other describes the frequency with which it is available (from always to never). From this description, it is noted that a small percentage of people in car owning households have little access to cars, while a significantly high percentage of those in autoless households do have access to cars a great deal of the time (albeit as passengers only). The constrictions of availability affect the frequency with which someone will do a set of activities, and the mode by which he travels to his activities. Distinctions are shown to exist between car owners, non-car owners, those to whom a car is available and those to whom it is not, using activity frequency as a discriminator. It is seen that as car becomes less available a greater percentage of trips are used for fewer activities. Further as car becomes less available the selection of modes for these activities becomes more apparent. Car is used exclusively for a few selected purposes, then there are trade-offs to bus and walking depending on both car availability and trip purpose. No group then can be thought of as singularly transit captive. Comparisons are made between levels of availability and also between availability and ownership. /Author/TRRL/

41 184374 FACTORS INFLUENCING THE INDIVIDUAL'S CHOICE OF TRAVEL MODE [Trafikanter val av faerdmedel-faktorer som bestammer valet]. The aim of this study was to determine the factors most strongly felt by individuals in their choice of travel mode within a city (Malmoe in Sweden), and by motorists in their choice of parking place. The problems were analysed by the use of behavioural models (logit models), of which several were systematically tested. Nearly 5000 people gave detailed accounts of their behaviour during 24 hours, and 12000 single trips were covered in this way. Each trip chain contains 19 explanatory variables, such as: bus waiting time, bus interchange time, weather index, number of cars in the household, straight line distance, the scarcity of parking places, cost of parking, running cost car, cost bus etc. Detailed attention is also given to the purpose of the trip. The author's main findings are that bus waiting time, bus interchange time, cost of parking and difficulties in finding parking place appear to be factors of importance when an individual makes his mode choice. Finally, comparisons are made with other studies covering similar problems conducted in cities in Europe and USA. The report comprises an English summary of ten pages. /TRRL/ [Swedish]

41 184593 SOCIAL DIFFERENTIATION AS A KEY TO ASSESSING THE SOCIAL EFFECTS OF TRANSPORT RELATED CHANGES. Social impact of (1) a change in accessibility to specific services and/or (2) disruption or community severance due to transport and related changes, will vary with individual and household characteristics: command of resources, class background, ethnic background, stage in life cycle, lifestyle orientation, etc. Census data on such characteristics are manipulated by multi-variate analysis to explore areal differentiation of Melbourne at CCD level and to yield frameworks for (1) initial assessment of impact of projects and (2) monitoring of potential "trouble spots". Allied with other techniques of social analysis, these frameworks can assist policy and project evaluation, and the planning of impact amelioration. /Author/

41 184647 ENVIRONMENTAL IMPACTS OF BART AND PEOPLE'S RESPONSES. Results are intended for use in Federal transit policy making, in improvement of transit system design, and in simplification of the transit planning process. The study identified specific combinations of BART attributes and characteristics of its surroundings responsible for impacts. Adverse impacts included noise from trains on aerial trackways in quiet neighborhoods and the inconvenience and danger of large volumes of traffic and on-street parking by BART patrons in residential areas near some stations. Environmental benefits were largely visual, arising from the system's landscaping, linear parks under some of its aerial tracks, and encouragement of downtown street and pedestrian environments.

41 184952 EFFECTS OF SUBWAYS ON URBAN FORM AND STRUCTURE. A general equilibrium model was built which shows how the locations of employment and residences are related to alternative transportation systems. The model was applied to different size cities. The analysis suggests that the construction of a subway system will not necessarily result in the revitalization of the central business district (CBD) or in the reversing of the trend toward suburbanization. Although land rent is generally higher in the city without subway systems than in the city with subway systems, the steeper rent gradient at the peripheries of the former, along with other findings, suggest that the rate of suburbanization of the city without subway systems is not significantly higher than of the city with subway systems.

41 185632 APPLICATIONS OF THE NEW ALTERNATIVE FUTURES PLANNING CONCEPT. Instead of using a point estimate of the future where all parameters have unique values, the method of alternative futures planning suggests that plans be developed based on several plausible futures. This paper discusses the concept, mentions some national level applications, and describes three varied local and regional applications. The first application description is of the long-range transportation system plan being done in Northeastern Illinois. Three futures for the region instead of one are being studied. These multiparameter futures are systematically defined. The second description is of a rail-network optimization study. Here future capital budgets and mode choices are being combined to define nine alternative futures. The last application described is an evaluation of the proposed discontinuation of service on a rapid-transit branch line. The branch is located in an area of urban decline which does, however, have the potential for massive redevelopment. The discontinuation was evaluated under various population futures for the area. After detailing these applications, the paper stresses the commonalities in the applications of the concept. The concept is not only viable but essential to decision making under an uncertain future. 41 185780 EXECUTIVE SUMMARY: BENEFIT-COST EVALUATION OF AN INTRA-REGIONAL AIR SERVICE IN THE BAY AREA AND A TECHNOLOGY ASSESSMENT OF TRANSPORTATION SYSTEM INVESTMENTS. The benefits and costs that would result from an intra-regional air service operation in the San Francisco Bay area were determined by utilizing an iterative statistical decision model to evaluate combinations of commuter airport sites and surface transportation facilities in conjunction with service by a given commuter aircraft type in light of area regional growth alternatives and peak and off-peak regional travel patterns. The model evaluates such transportation option with respect to criteria of airline profitability, public acceptance, and public and private non-user costs. In so doing, it incorporates information on modal split, peak and off-peak use of the air commuter fleet, terminal and airport costs, development costs and uses of land in proximity to the airport sites, regional population shifts, and induced zonal shifts in travel demand. The model is multimodal in its analytic capability, and performs exhaustive sensitivity analysis.

41 186226 STUDY OF HOUSEHOLDS' LOCATION DECISIONS. The paper examines BART's effects on households' location decisions in San Francisco's Mission District, suburban Walnut Creek, and East Oakland. In each study area, randomly selected households that had moved in the 1975-76 period were interviewed by telephone to determine factors affecting moving and location decisions, the relative importance of BART in neighborhood choice, current and prior commuting patterns, workplace location, and socio-economic characteristics of respondents. Reasons for moving from one neighborhood to another are summarized, and BART's role in the decision-making process is described, with particular attention to the issue of who is influenced by BART. A multiple regression model explaining the importance of BART in residence choice in terms of workplace location, current and prior BART use, work trip length, occupation, age, income, ethnicity, and household composition also is presented. The paper closes with assessment of policy implications. (Color illustrations reproduced in black and white)

41 189463 THE COSTS OF URBAN TRAVEL IN CANADA [Les couts des déplacements urbains au Canada]. This report presents quantitative estimates of the costs of urban travel, including both private out-of-pocket costs and social costs, such as congestion, accidents, energy depletion and the provision of those roadways and parking facilities whose costs are not borne by the individual. The trip-maker's value of time is also taken into account. The estimates are based on conditions in Canadian urban areas in 1975. A

comparison is made between the costs of trips by automobile and by transit for 4 specific cases illustrative of typical urban trips. In general, the total costs of using transit are found to be below those of the automobile for trips into or out of the urban core during peak periods. For trips not oriented toward the core area or for trips in non-peak periods, transit costs are still below those of the automobile, but only if no consideration is given to travelers' time. /Authors/

41 190486 STUDY OF THE HOUSING INDUSTRY. BART IMPACT PROGRAM. The working paper addresses BART's effects on the housing industry in nine areas: Daly City-Pacifica, Mission District, Fruitvale, Walnut Creek, Hayward, Fremont-Union City, Pittsburg-Antioch, Richmond, and East Oakland. Changes in housing supply and demand during the period 1962-76 are analyzed using building permit records, bank loan disclosure statements, BART Passenger Profile Survey data, and aerial photographs, supplemented by key informant interviews with residential developers, apartment managers, planning directors, and others knowledgeable about the housing market. The relationship between these findings and other topics yet to be addressed in the Land Use and Urban Development Project also is examined. (Color illustrations reproduced in black and white)

41 190487 STUDY OF EMPLOYERS' LOCATION DECISIONS. The working paper examines BART's influence on employers' location decisions in the three-county BART service area. Individuals who had participated in or who were familiar with their firm's location decisions were interviewed, and relevant interviews from other studies of the BART Impact Program were reviewed. Specific issues addressed include BART's direct and indirect effects on location decisions, BART's influence on centralization or decentralization of businesses and industries, and the extent to which firms have located near BART in order to gain visual exposure. (Color illustrations reproduced in black and white)

41 190914 TRANSPORTATION CASE STUDIES OF CITIZEN PARTICIPATION. The report demonstrates the current concept of citizen participation in transportation by an analysis and evaluation of four multi-modal transportation projects that have involved citizen participation programs. The selected projects are: (1) Proposed Pulaski Expressway, which demonstrates an extensive citizen participation effort in the development of the Environmental Impact Statement for the planned urban freeway link; (2) New York-Philadelphia AMTRAK Service, which illustrates the citizen participation efforts in formal public hearings; (3) West Chester Pike Bus/Car-pool Lane, which originated from a mandate of the Clean Air Act and involved citizens in a project feasibility determination for a plan that would benefit a metropolitan downtown area at the expense of suburban inconvenience; and, (4) Lindenwold High Speed Line, which involved a voluntary citizen participation process for a fare increase proposal.

41 191033 STUDY OF RETAIL SALES AND SERVICES. The study focuses on how BART is influencing the distribution and volume of retail sales in the BART service area. Shoppers in six retail areas were surveyed to ascertain how their shopping patterns had changed since BART service began. Retailers throughout the BART service area were interviewed to determine whether BART influenced their location decisions or retail sales. Sales tax data in seventeen retail areas were analyzed to search for sales trends associated with proximity to BART. (Color illustrations reproduced in black and white)

41 193969 PERCEIVED AND ACTUAL COSTS OF OPERATING CARS. The perception that drivers have of car operating costs is an important factor in determining modal split characteristics. Theoretical figures derived from discriminant analysis models suggest that drivers perceive only petrol costs, but this has not been corroborated by detailed surveys. This report examines in detail perceived and actual journey to work petrol costs of a sample of London commuters. The perception is also examined of related factors, such as petrol consumption and distance, in an attempt to throw some light on the perception mechanism itself. /Author/TRRL/ Malecki, AM (Metra Consulting Group Limited) *Transportation (Netherlands)* Vol. 7 No. 4, Dec. 1978, pp 403-415, 2 Fig., 4 Tab., 5 Ref.; AC-

41 194054 SOCIAL AUDIT OF PUBLIC PASSENGER TRANSPORT [Sozialbilanz im Oeffentlichen Personennahverkehr]. The customary methods of cost analysis undertaken by public utilities, with its total concentration on profit, provides only a limited perspective of the actual operating factors. Thus, in these calculations, the public utility aims of the public transport operator are not expressed. For this reason, an approach was devised for an actual public transport authority, which is termed "social audit". In addition to general discussions and possible expressions for this special authority, the authors present economic cost benefit analyses and output-orientated evaluations. /TRRL/ [German]

41 194130 TRANSPORTATION ENERGY SCENARIO ANALYSIS TECHNICAL MEMORANDUM NO. 2: HISTORICAL RATES OF CHANGE IN THE TRANSPORTATION STOCK. This report examines historical rates of change in the transportation stock as a result of the introduction of new or improved technologies. Organized by mode, it highlights selected technological changes in motor vehicles (including automobiles, trucks, and buses), light and heavy rail transit, rail passenger and freight systems, commercial and general aviation, merchant shipping, and pipeline systems. As appropriate, these improvements are related to salient features of the technology under examination, the transportation system into which it was introduced, and general social or economic conditions. As a tool for long-range planning in the area of technology commercialization, the document is intended to provide background material against which to gauge maximum and likely rates of change (or acceptance) that may be anticipated following the introduction of new or greatly improved transportation technologies.

41 194468 TRAFFIC PLANNING IN AN ENERGY CRISIS. STAGGERING OF WORKING HOURS IN LARGER URBAN AREAS [Trafikplanering foer energikris. Spridning av arbetstider i stoerre taetorter]. In the event of an energy crisis the public transport system has to be able to cope with the increase in work trip demand from people that normally use their own car to work. The estimated output increase potential of the public transport system is 30%, which is far below the expected 300% increase in work trip demand in an energy crisis. The one remaining possibility is to spread the travellers' working hours. This paper describes and presents the results of a study that was conducted in the city of Soedertaelje, Sweden. The purpose of the study was to determine the energy savings potential of spreading the travellers' work hours. A matrix of the total number of work trips was

obtained from the public census, and the distribution of work hours was found from a questionnaire that was sent to firms in the area. The utilization and the reserve capacity of the public transport systems was obtained through observations. It was found, that by increasing the output by 30%, and changing the work day by half an hour for 3000 of the city's 20000 employees, it is possible to reduce the consumption of energy needed for work trips by 65%. /TRRL/ [Swedish] Transportnaemnden Monograph 1978, 67 p., Figs., 13 Tab.; ACKNOWLEDGMENT: TRRL (IRRD 238348), National Swedish Road & Traffic Research Institute

41 194488 MOBILITY FOR MAN AND SOCIETY. DOCUMENTATION. The symposium included the presentation of papers, commentaries and roundtable discussions. The topics covered include: Mobility and Imagination; Patterns of Mobility Among Hunting, Gathering People-An Ecological Comparative study of Bushmen and Pygmies; Mobility and Today's Technological Civilization; Searching Stable Parameters for the Control of Human Mobility; Characteristics of Excessively car-oriented people; Mobility and Human performance; Behavioral Patterns of Car Use in Relation with Residential Choice; Size, Density and Distribution of a City as an Environment of Mobility; Mobility in Present-Day Society; Seeking Stability in a Living Filter Man-Auto System; The Economic Aspect of Mobility Needs; Planning and Mobility; Higher Cost and Higher Mobility; Streets Without Cars; A Few Thoughts on Mobility in Urban Transportation Planning; Mobility for Humanity; The Lost World of Transportation; Mobility and Immobility; Mobility, Environment Man.

41 194533 FLEXTIME TRAVEL CHOICE: A LITERATURE REVIEW AND FRAMEWORK FOR ANALYSIS. The study outlined in this paper will examine several aspects of time related travel demand. The research has been motivated by a desire to better understand the temporal aspects of transportation peaking, and through this understanding, to offer some remedial strategies to lessen peakings' adverse impacts. The study has been divided into two principal research areas--temporal management and temporal response. Temporal management implies the use of variable work hours programs such as flextime, staggered work hours, and the four-day work week for the purpose of congestion relief. Temporal response refers to the ways that travelers may respond to changes in the transportation system. The remainder of the paper documents the progress of the research in the area of temporal management and variable work hours. It reviews previous city-wide studies (New York City, Ottawa, Toronto, Vancouver, and others) and employer programs. It concludes with a description of the direction of future research.

ment of Transportation.

41 194617 THE ROLE OF CITIZENS IN IMPLEMENTING TRANSPORTATION PRICING. This is a report of a conference session dealing with the role of citizens in implementing transportation pricing. The session resulted from activities of the Committee on Citizen Participation to help implement research findings or transportation policies by improving general awareness and understanding of the research or policy. Schemes for pricing transportation facilities are summarized and reviewed here. For example, the Urban Mass Transportation Administration's experience with pricing to control traffic in several cities is summarized. Pricing approaches considered include parking licenses, morning peak surcharges, parking space charges, and revenue taxes. Experience indicates that these concepts are not now generally accepted or implementable. In Berkeley, an investigation to identify locations where pricing might alleviate traffic congestion failed for several reasons: public misunderstanding, uncertainty by the city council, and sponsorship by a non-local organization. In Madison, Wisconsin, some of the impacts of road pricing were estimated and analyzed. Failure of road pricing schemes to proceed apparently resulted from lack of understanding, especially by people who would have benefitted from reduced traffic in their neighborhood or better transit service. The session identified factors contributing to the demise of pricing schemes and made suggestions for implementing similar adventures in the future. For example, costs imposed by road-pricing are more likely to stimulate opposition than the benefits are to stir up positive response. /Author/

41 194619 THE BERKELEY EXPERIENCE: "POST MORTEM". An UMTA transportation pricing study was approved by the Berkeley City Council but was never implemented due to vehement public opposition. There appears to be three factors leading to the very abrupt halt of the study: misunderstanding three factors leading to the very abrupt halt of the study; misunderstanding by the general public of the concept, the City Council was surprised by the sudden negative reaction, and lack of time to develop local grass roots support.

Olson, ML (Urban Institute) *Transportation Research Circular* No. 205, Mar. 1979, pp 3-4; This paper appeared in *Transportation Research Circular* No 205, *The Role of Citizens in Implementing Transportation Pricing*; ORDER FROM: TRB Publications Off

41 194620 THE MADISON EXPERIENCE. Members of several citizens commissions who in 1976 had voted not to continue a pricing study in Madison, Wisconsin, were interviewed a year later about the reasons for their decision. The reasons tended to revolve around such factors as the image of the city (i.e. "toll booths in the streets") questions of equity, concern about bus operating costs, and adverse comments from constituents. Apparently those in support of the idea felt less strongly about it than those opposed; the former made little effort to generate community support, leaving opponents with little to do to stop the studies.

41 194621 CONCLUDING COMMENTS ON THE BERKELEY AND MADISON EXPERIENCE. This presentation briefly enumerates some of the lessons learned from the Berkeley and Madison experiences. Discuss the concept with community leaders and local media representatives good at communicating potentially controversial ideas on a one to one basis before holding larger meetings to avoid public misunderstandings. Have a good ombudsman or "lightning rod person" to answer citizens' questions. Be open to making changes in a concept as a result of feedback from the community. In addition to the usual citizen participation and transportation literature, policy analysis journals have had articles on Washington based health, education and housing projects which flounder on the local level which would be useful.

Higgins, T (Urban Institute) *Transportation Research Circular* No. 205, May 1979, pp 5-6; This paper appeared in *Transportation Research Circular* No. 205, The Role of Citizens in Implementing Transportation Pricing.; ORDER FROM: TRB Publications Off

41 194622 A POLITICAL SCIENTIST'S COMMENTARY ON THE BERKELEY/MADISON EXPERIENCE. The experience with transportation pricing in Berkeley and Madison is a classic example of the political phenomenon whereby people are more likely to respond to sudden or large negative direct impacts (e.g. the inconvenience to motorists caused by a pricing scheme) than to long-term indirect benefits (e.g. better air quality or energy conservation). For this reason, the outlook is bleak for elected officials ever implementing pricing schemes.

41 194623 PANEL DISCUSSION OF THE CONFERENCE SESSION AT THE 57TH ANNUAL TRB MEETING. Public participation must be initiated during the earliest stages of the program planning. The existing organizational structures should be employed as a mechanism for accomplishing meaningful citizen involvement and great care should be taken to avoid a segmented concept in the introduction of a new project. Any proposal as complex as transportation pricing should be incorporated with regional or areawide planning. It is difficult to justify radical new concepts without first relating the benefits of such concepts to a total transportation package. The study presented as a great deal of merit; however, it should now be obvious that implementation of such projects will be extremely difficult in the absence of public support. /Author/

41 194624 PANEL DISCUSSION OF THE CONFERENCE SESSION AT THE 57TH ANNUAL TRB MEETING. In the opinion of the author the fate of pricing proposals in Madison and Berkeley stems from a failure to devote sufficient resources to consider, before the fact, the behavioral response of communities, especially in relationship to such sensitive issues as transportation planning.

Davis, S (Atlanta University) *Transportation Research Circular* No. 205, May 1979, p 8-9; From *Transportation Research Circular* No. 205, The Role of Citizens in Implementing Transportation Pricing.; ORDER FROM: TRB Publications Off

41 194625 PANEL DISCUSSION OF THE CONFERENCE SESSION AT THE 57TH ANNUAL TRB MEETING. It is felt that a reason for the lack of public support for pricing schemes in Madison and Berkeley was a confusion of planning with implementation. Citizen participation is an integral part of the planning process, not a public relations tool to sell a preconceived plan. The pricing schemes were imposed from above, rather than growing out of the citizen participation activities.

41 196003 EFFECTS OF TRANSPORTATION SERVICE ON AUTOMOBILE OWNERSHIP IN AN URBAN AREA. A disaggregate automobile ownership choice model is applied to estimating the elasticities of automobile ownership with respect to household income, fixed costs of automobiles, travel times on urban roadways, and public transit service in a case study urban area. Focus is on the aggregate stock of automobiles held by all households and on the distribution of households owning zero, one, two, and three or more autos. Automobile ownership behavior of sociodemographic segments in the total population is also compared. Results indicate that the total number of automobiles owned is approximately three times more sensitive to household income than to automobile travel times. Furthermore, automobile ownership is twice as sensitive to automobile travel times as it is to public transit travel times. Finally, the automobile ownership decisions of inner-city dwellers and older families are more sensitive to all of these factors than are the decisions of suburban dwellers and younger families. It is demonstrated that transportation policies affecting urban traffic efficiency and public transit service are likely to impact on automobile ownership and these impacts will vary with geographical location and population sociodemographic segment. /Authors/

41 196421 SHOPPING DISTRICT TRANSPORTATION STUDY. The central portion of Bergen County, New Jersey, is unique in that it contains one of the highest concentrations of suburban retail commercial activity in the nation. To develop a recommended public transportation program for the shopping centers, a five step work program was performed. The first step involved a description of the existing transportation setting. This work element involved a review of previous studies as well as an extensive data collection effort including the conduct of numerous surveys and field observations. The next step was the development of service standards to assess the adequacy of existing transit services. These yardsticks were then used to pinpoint deficiencies in existing intermall transit services. The third study step was the formulation of several alternative transit plans and an examination of these schemes on the basis of operating performance and other relevant criteria. As a result of the prior task, a recommended plan was identified in sufficient detail to assure its implementation. The last step involved the preparation of a report describing not only the study findings and conclusions, but also the data collection and analysis techniques. The subsequent chapters of this report represent the performance of this last study effort. /Author/

41 196495 TEMPORAL STABILITY OF MODAL CHOICE MODELS. A number of methods for evaluating the temporal stability of travel demand models are outlined. Several of the methods are applied to disaggregate modal choice models for CBD work trips in Detroit for 1953 and 1965. Graphical analysis is used initially to evaluate the probability of using the bus, auto driver, and auto passenger modes as a function of travel time difference and autos owned. Based on the graphical analysis, binary choice models using linear regression are developed and tested statistically for temporal stability. Chow's tests for the equality of two sets of regression coefficients confirms the graphically observed lack of temporal stability. Improved specification of the auto driver model by including the variable, number of transit captives, does result in temporal stability. The lack of excess time and cost variables limit the generality of conclusions based on the models developed. Compatible data for a third time period are necessary to test fully the temporal stability assumption.

41 196670 APPLICATIONS OF VARIABLE WORK HOURS IN THE TWIN CITIES METROPOLITAN AREA. ABRIDGMENT. This paper describes a study conducted in 1976 to investigate the application of variable work hours in the Minneapolis-St. Paul metropolitan area. Although the primary focus was on the activity, travel, and transit routes of the central business district, suburban applications were also considered. The specific objectives of the research were to identify: possible benefits with respect to

transit operations, the degree to which traffic congestion could be decreased, any impacts on high-occupancy vehicle use, and institutional impediments to the implementation of variable work hours strategy. From the results of the study, it was concluded that: an extensive compulsory staggered work hours program has the potential to reduce the size of the bus fleet required and to reduce traffic congestion in the Twin Cities area; an areawide variable work hours program in a central business district characterized by diverse activity would be extremely difficult to implement under current conditions without substantial employee incentives or government dictate; a variable work hours program may cause a mode shift in work trip travel away from public transit, car pools, and van pools; and selective, individual-employer programs of variable work hours to reduce local traffic congestion or better schedule transit service appears to have the best chance for current implementation in the Twin Cities metropolitan area.

41 196809 THE MAIN FUNCTIONS OF TRANSPORT [Les grandes fonctions du transport]. Transport is not an end in itself: it is necessarily linked to another activity (work, leisure, culture, commerce, family life). Furthermore, each journey is composed of a chain of successive elementary transport steps. Transport planning involves the linking of the options constituting the transport policy to the socio-economic objectives being pursued. From the point of view of the policy choices which are the elements of a real transport strategy, the author successively studies: urban transport, inter-urban public transport, transport and business logistics, transport and foreign trade. /TRRL/ [French]

41 196824 POTENTIAL MARKET AND DEMAND FOR ELECTRIC VEHICLES. The potential demand for electric vehicles as an alternative to the conventional car must be considered within the constraints set by their performance characteristics, particularly their limited range. Thus, the potential demand which they might satisfy would be for shorthaul intra-urban trips. Urban dwellers represent a major proportion of the Australian population; nevertheless, they are responsible for a significant proportion of non-urban car miles. The growth in multi-car households suggests that at least the second (or subsequent) vehicle may have a dominantly urban task, which would possibly be performed by an electric vehicle. Current cost and performance specifications of electric vehicles suggest however, that they will achieve very limited market penetration. /TRRL/

41 197153 ECONOMICS OF URBAN TRANSPORTATION. For people who live and work in Canadian urban areas, the major concerns with urban transportation are rush-hour congestion, pollution, and availability of public transit. Most of the important issues in urban transportation economics involve the use of government pricing, regulatory, and investment policies to deal with congestion, pollution, and public transit. The purpose of this monograph is to enable the reader to analyze and evaluate these public policy issues in Canadian urban areas. Chapters II and III present information on urban travel patterns and their determinants, particularly modal choice behavior. The discussion in these chapters provides background which is essential in evaluating the public policy issues which are analyzed in the following chapters. Chapter IV presents an economic analysis of the major pricing issues in urban transportation, including marginal social cost pricing of transportation facilities in the presence of congestion and pollution, and subsidization of public transit. Chapter V analyzes several important government regulatory policies, including regulation of roads to improve bus service, regulation of taxis and trucks, and automotive emission controls. Chapter VI applies the technique of cost-benefit analysis to the evaluation of transportation investment decisions, including expressway construction, railway relocation, and the choice between automobile, bus, and rail rapid transit systems. Finally, Chapter VII presents a critique of urban transportation planning practices. /Author/

41 197340 BART IMPACTS ON TRAVEL BY ETHNIC MINORITIES. BART, the 71-mile Bay Area Rapid Transit System, serving San Francisco Oakland, Berkeley, and their suburbs, is the first regional-scale rapid transit system to open in the United States in over 50 years. This report is one of a series assessing the impacts of BART on transportation and travel in the Bay Area. This report assesses BART's impacts on travel by ethnic minorities by analyzing data from (1) conventional large-scale travel surveys and (2) special "field station" data collection efforts conducted by participant observers in ethnic minority communities. The latter were conducted in the predominantly Spanish-heritage Mission District of San Francisco and the predominantly

Black city of Richmond. Minorities use BART rather less than suggested by their representation in the total population of the area served. Most minority BART riders are young, well-educated and have relatively high incomes, and like the white majority ridership, travel largely to central city destinations. Low-income disadvantaged minorities use the system little.

41 197462 A STUDY OF TRANSIT RIDER CHARACTERISTICS. The report presents the results of a set of transit rider surveys conducted in a relatively well-served, intense transit environment. The bus surveys conducted used an on-board distribution of a mail-back questionnaire which requested the following types of information: basic trip data; alternatives; demographics; and other characteristics. The surveys covered four fixed route bus routes (two in Queens and two in Brooklyn) and one rail rapid transit line on Staten Island. The intent of the bus surveys was to relate the ridership observed to both the source population and the ridership of other services, and to deduce differences which might be specific to the mode and/or which might be useful in planning services. The survey of the rail rapid transit line was generally comparable, but there was another objective of equal importance in this case: a detailed study of the specific origins and destinations on the service of both stations on and off and original origin and final destination. Results from other studies done previously or concurrently are integrated to provide a systematic view of the range of transport alternatives available to the individual in the environments studied. The ridership studies were complemented by an extensive origin-destination study on the rail rapid transit service. The report also discusses basic ridership characteristics, frequency and time, and articulation with other modes.

41 199014 STAGGERED WORK HOURS STUDY. DESIGN AND IMPLEMENTATION OF STAGGERED WORK HOURS IN MANHATTAN. VOLUME I-EXECUTIVE SUMMARY--PHASE 1. The concept of staggered work hours is a proven "low capital-intensive" method of reducing transportation congestion. Experience has shown that the staggered work hours program in Manhattan has not only reduced congestion on transportation systems, but has improved efficiency in business operations by reducing lobby congestion and

improved employee attendance, punctuality and morale, all of which are additional non-cost benefits. The objective of this study was not only to further the staggered work hours program in the New York-New Jersey region, but also to determine means and methods to assist other communities in establishing their own staggered work hours program. This report, Volume I, provides a concise description of the work conducted during the study and includes the principle findings, a comparison of staggered work hours, flexible work hours, the four-day work week, and highlights the state-of-the-art of staggered work hours programs in the United States and abroad, based on a comprehensive survey of more than 200 cities throughout the world.

41 199016 STAGGERED WORK HOURS STUDY. DESIGN AND IMPLEMENTATION OF STAGGERED WORK HOURS IN MANHATTAN. VOLUME III-STAGGERED WORK HOURS MANUAL--PHASE 1. The report, Volume III, is intended to present an overall methodology for designing, implementing, and evaluating a staggered work hours program in an urban area. This volume is organized to cover the most important considerations involved in setting up a program in order to provide decision makers with the guidelines and tools necessary to first identify the need for a program, and then to promote, implement, and evaluate it.

41 240244 THE SOCIAL FUNCTION OF REGIONAL TRANSPORT--THE POSSIBILITY OF RECONCILING ECONOMIC AND SOCIAL CONSIDERATIONS IN THE OPERATION OF REGIONAL PUBLIC TRANSPORT UNDERTAKINGS. OCCUPYING A POSITION BETWEEN THE NATIONAL RAILWAYS AND URBAN TRANSPORT, AND WITH AN AVERAGE JOURNEY LENGTH OF 10-20 KM, REGIONAL TRANSPORT COMPETES WITH THE PRIVATE CAR. IT IS RECOGNIZED THAT THE JOURNEY TIME FROM HOME TO WORK IS THE IMPORTANT FACTOR IN DETERMINING THE CHOICE OF PRIVATE OR PUBLIC TRANSPORT. RESERVED LANES AND MORE ATTRACTIVE BUSES (WITH NOISELESS ENGINES, COMFORTABLE SEATS, GOOD LIGHTING, SMOOTH ACCELERATION AND DECELERATION) WILL HELP IN THE COMPETITION. THE GROWTH AND SPREAD OF POPULATION AND THE EMPHASIS ON THE QUALITY OF LIFE, HAS CONFERRED A SOCIAL FUNCTION ON PUBLIC TRANSPORTATION. THERE IS A NEED FOR PUBLIC TRANSPORT TO BE STRENGTHENED AT THE EXPENSE OF THE PRIVATE CAR. GOVERNMENT RESPONSIBILITY IN THE SPHERE IS NOTED. PUBLIC TRANSPORT IS DISCUSSED IN RELATION TO THE PROBLEMS OF USE OF CAPACITY, TIME DISTRIBUTION, FREQUENCIES, AND LOSSES INCURRED BY WAGE INCREASES. THE INDUSTRY MUST BE MADE TO CONFORM TO CERTAIN GOVERNMENT REQUIREMENTS SUCH AS EFFICIENCY. THE ATTITUDE OF THE GENERAL PUBLIC TO PUBLIC TRANSPORT IS DISCUSSED AND THE FINDINGS OF AN OPINION SURVEY IN THE NETHERLANDS ARE SUMMARIZED. THE RELATIONSHIP OF REVENUE, TRANSPORT FARE AND GOVERNMENT CONTRIBUTIONS TO REGIONAL TRANSPORT IS CONSIDERED. IT IS CONCLUDED THAT THE EEC MUST GIVE EFFECT TO ONE OF THE PROVISIONS OF A REGULATION WHICH STATES THAT WITHIN 3 YEARS OF ITS COMING INTO EFFECT, A DECISION MUST BE MADE AS TO THE MEASURES TO BE TAKEN REGARDING PUBLIC SERVICE OBLIGATIONS FOR TRANSPORT ACTIVITIES NOT COVERED BY THE REGULATION. THERE IS A NEED FOR COLLABORATION OF ALL SUPPLIERS OF PUBLIC TRANSPORT AND THE SUBSIDIZING AUTHORITIES AND THE FORMATION OF CONURBATION-WIDE TRANSPORT COMMUNITIES IS SUGGESTED. FARE INCREASES IN REGIONAL TRANSPORT MUST NOT EXCEED THE LEVEL NECESSARY TO OFFSET INFLATION, AS OTHERWISE

THEY WOULD TEND TO DRIVE AWAY PATRONAGE. FOR HIGH QUALITY FAST PUBLIC TRANSPORT, COMPREHENSIVE INFRASTRUCTURE IMPROVEMENT MEASURES MUST BE ADOPTED. THEY ARE: PRIORITY IN PULLING AWAY FROM STOPPING PLACES; THE CONTROL OF TRAFFIC SIGNALS BY TRANSPORT VEHICLES; AND RESERVED BUS LANES. HIGHER VEHICLE QUALITY, ROLLING STOCK, STATION AND STOPPING PLACE FACILITIES, WILL INCREASE THE ATTRACTIVENESS OF PUBLIC TRANSPORT. IN VIEW OF THE SOCIAL FUNCTION OF PUBLIC TRANSPORT, GOOD CONTACT BETWEEN THE TRANSPORT UNDERTAKING AND THE AREA POPULATION IS URGED.

41 260219 PUBLIC PARTICIPATION IN URBAN TRANSIT SERVICE. The trend in transit operations is toward public ownership and operation of services. The only questions are: when, how, and how much. The trend in public operations is to establish regional authorities or taxing districts with a provision of service to the urbanized area and to proportion taxes to the population served. Comparative statistics indicate that: (1) Large transit systems have fleets of reasonable age regardless of ownership; (2) smaller systems show private systems having fleets over 15 yr of age, and public operations with average fleet ages under 7 yr; (3) private systems provide service more efficiently than public operations with number of passengers carried per vehicle mile at 3.32 for private systems compared to 2.91 for public operations; (4) the number of annual transit rides per capital versus is higher for private systems (40.1 vs 34.2); (5) private systems have more employees per unit of service and per vehicle owned; and (6) private systems are more productive in terms of the number of passengers served.

Ferreri, MG, Executive Vice President (Simpson and Curtin Incorporated) *ASCE Journal of Transportation Engineering* Vol. 99 No. TE4, Proc. Paper 10121, Nov. 1973, pp 701-710, 1 Fig., 5 Tab.; This publication was presented at the July 17-20, 1972, ASCE National Transportation Engineering Meeting, held at Milwaukee, Wisconsin.

41 260284 REGINA TELEBUS STUDY. THE IMPACT OF TELEBUS. A study of the social and economic impact of a Demand Responsive public transportation system as related to the urban community is presented. The study includes related interests such as community attitudes, mobility of transit dependant segments of population, car ownership, and residential location and occupancy. Section II of the report relates to the overall physical structure of Regina with implications for urban land use planning and neighborhood development. /NTIS/

41 260615 BEHAVIORAL ANALYSIS AND TRANSPORTATION PLANNING: INPUTS TO TRANSIT PLANNING. A distinction is drawn in this paper between behavioral information regarding feelings, attitudes, opinions, and the like and more sophisticated types of data dealing with individuals' intentions to respond in certain ways given certain configurations of stimuli (transportation variables). A methodological example as to how the first type of data--informational level data--can be collected and utilized in system planning is presented. Specifically, data collected along the lines of traditional attitude surveys is collected in an attempt to monitor changes in public "satisfaction" with the Iowa City, Iowa, bus system before and after major system innovations. Implications of the collection and analytical procedures are discussed.

41 260930 PLANNING URBAN TRANSPORTATION SYSTEMS FOR PRODUCTIVITY, EFFICIENCY, AND QUALITY OF SERVICES. This paper reports on current work and analysis of the problem carried on at the Transportation Studies Center of the University of Pennsylvania. Although the work has not yet been completed, the work undertaken enables the author to suggest that a new approach in urban transportation planning and a new type of urban transportation plan, based on studies of efficiency, productivity, and quality, may prove to be what the field needs for the 1970s. The urban transportation system is segmented into the network, the primary services offered, and auxiliary services.

41 261520 URBAN TRANSPORT: STUDIES IN ECONOMIC POLICY. CHAPTER 1: ESTIMATING THE SOCIAL BENEFIT OF CONSTRUCTING AN UNDERGROUND RAILWAY IN LONDON. CHAPTER 2: THE VICTORIA LINE: SOCIAL BENEFIT AND FINANCES. Chapters 1 and 2 comprise Foster and Beesley's classic papers (first published in 1962 and 1965) on estimating the costs and

benefits to be obtained from construction of the Victoria line. In the first paper these costs and benefits are discounted over the life of the investment at three alternative discount rates. Calculations include assessments of generated traffic and attempts to include comfort and convenience valuations. The problems associated with this type of cost-benefit assessment were extensively covered both in the paper and in the subsequent discussion. The second paper arose in part from discussion of the first, and examines the effects of different methods of financing the project, emphasizing the difference between social and financial returns. It is concluded that a high proportion of social benefits would be lost if finance were obtained from a flat-rate percentage increase in fares. These losses could be reduced or eliminated if differential charging was applied to peak and offpeak periods, if Victoria line fares were increased more than other fares, or if congestion prices were imposed on roads. /TRRL/

41 261711 THE CASE FOR PROVIDING SUBSIDIES FOR PUBLIC TRANSPORT. This paper offers a general outline of the case for subsidising public transport. Two main transport problems are distinguished: the declining image of public transport and the high social costs, especially in urban areas, of increasing car usage. A balanced strategy is required for the development of both public and private transport. The precise nature of this strategy must reflect the differing needs of different communities and be determined by human values as well as engineering efficiency, profitability and economic demand. Three kinds of subsidy are distinguished and briefly discussed: support for capital expenditure; subvention to daily operation and management; and subventions to help poor areas, regions or persons (eg concessionary fares). It is concluded that subsidies are a useful and flexible tool in the attainment of a comprehensive coordinated transport policy capable of meeting the needs of society. A discussion follows. /TRRL/

41 262521 REFLECTIONS ON CITIZEN INVOLVEMENT IN URBAN TRANSPORTATION PLANNING: TOWARDS A POSITIVE APPROACH. The purpose of this paper is to explore an important and unique role which community participation and involvement can play in a revised transportation planning process. A review of diverse views about community participation, as well as a critique of the current urban transportation planning process, reveals that the former has played, primarily, ad hoc opportunistic and diverse roles, and that the latter is in desperate need for dynamic, subjective, "impact" information--required to assess attractive transportation systems. The contributions of several disciplines--economics, operations research, management science, political science, public administration, and others--are reviewed to assist in the development of a conceptual framework for a new community participation role, as a provider of key information to the

planning process. An eclectic, experimental approach is recommended to explore the possibilities further. /Author/

41 263893 THE EVALUATION OF AMENITY IN RELATION TO TRANSPORT COSTS AND BENEFITS. THE PAPER DISCUSSES MEANS OF MEASURING AMENITY COSTS AND BENEFITS RESULTING FROM ALTERNATIVE TRANSPORTATION PROJECTS THAT ACCRUE TO MEMBERS OF THE COMMUNITY OTHER THAN ACTUAL USERS OF THE TRANSPORTATION SYSTEM ITSELF. METHODS ARE EXAMINED OF BRINGING INTO SUCH ANALYSIS CERTAIN OF THE OTHER COSTS AND BENEFITS COMING UNDER THE GENERAL HEADING OF AMENITY. FIRST A REVIEW IS MADE OF THE TREATMENT OF AMENITY IN TRANSPORT COST-BENEFIT ANALYSIS AND THEN OF THE NEED TO WIDEN SUCH ANALYSIS BEYOND THE ITEMS OF AMENITY TO THE WIDER RANGING REPERCUSSIONS OF TRANSPORTATION ON THE COMMUNITIES, ALTHOUGH THIS WOULD STILL NOT BE WIDE ENOUGH SINCE TRANSPORTATION SHOULD BE VIEWED AS PART OF URBAN AND REGIONAL PLANNING, AND SO SHOULD ITS EVALUATION. THE MAIN OBSTACLE TO THE APPROPRIATE TREATMENT OF AMENITY IN TRANSPORT COST-BENEFIT ANALYSIS HAS BEEN THE DIFFICULTIES OF MEASUREMENT. THE PROBLEMS SURROUNDING SUCH MEASUREMENT ARE EXPLORED AND SO IS THE NEED FOR MAKING THE MEASUREMENT IN MONEY TERMS. AN ACCOUNT IS GIVEN OF THE RESEARCH ADVANCES BEING MADE IN THE MEASUREMENT OF THE TRANSPORT IMPACT ON AMENITIES.

41 263928 CORRELATION OF SOCIOECONOMIC FACTORS WITH CORRIDOR TRAVEL DEMAND. Current interest in public transit to alleviate the urban transportation problem requires more research about the effects on urban structure of new modes. The purpose of this paper is to examine one aspect of this: the internal relationships between the socioeconomic characteristics of commuters and the transportation service characteristics they value in their mode choice to work. Specifically, the study is concerned with (a) the correlation of selected socioeconomic factors of individuals with their choice of travel attributes and (b) the effect of socioeconomic factors in causing car drivers to shift mode. Canonical correlation analysis illustrates that each modal group using a transportation corridor has unique socioeconomic characteristics and that these are related to the attributes of the transportation system. Car driv-

ers are less dependent on system attributes than bus riders, and therefore planned changes in the system (such as the introduction of rapid transit) will have less effect on this group than on bus users in terms of use of the system. There is also some indication that changes in bus frequency would have an effect on car ownership in a given corridor. Statistical tests, using discriminant analysis, on a subsample of automobile drivers indicates that the socioeconomic characteristics of an individual probably exert an influence on his tendency to shift mode and on his sensitivity to specific transportation service level changes in the system. In particular it was found that as income levels increase the tendency to shift mode decreases. The findings of the study have implications for mode split planning, travel demand modeling, and urban structure.

41 263953 HOME INTERVIEW UPDATE AND SELECTED OPINION POLL. During 1963-64, the Tri-State Regional Planning Commission conducted a survey of households in a 1 percent random sample of occupied housing units and other special dwelling places in the New York metropolitan region to determine travel habits. Data obtained from the survey have subsequently been used to develop travel forecasts and plans for highways and transit. The 1972-3 home interview update conducted in Brooklyn was undertaken primarily to test the cost and reliability of updating key data items in the 1963-4 estimates. Three methods of data collection, all based on at least one face-to-face contact between an interviewer and a respondent member of a household, were used in the update survey. A qualitative measure of the overall stability of trip generation rates between 1963 and 1972 was provided using simple cross-classification analysis. Total person or household trips were cross-classified by the number of automobiles available (owned) by the household, structure size and household size. In general, the relationships between the independent and dependent trip generation variables were invariant over the two time periods. Chapters of the report include an introduction, findings, estimates from 1972 sample and data collection methods, trip generation rates, analysis of walk trips, analysis of travel behavior and the use of Downtown Brooklyn, and the relative effectiveness of data collection methods. Twenty-five tables are presented.

41 264616 LAWSUIT CHALLENGES TRANSPORTATION PLANNING PROCESS. The Atlanta Coalition of the Transportation Crisis, the Eighth Ward Civic Association, Inc., the Inman Park Restoration Inc. and four individuals have filed suit challenging the master planning process of the Atlanta, Georgia region. They charge that the plan fails to allow sufficient input from citizens, that there is a failure to consider alternatives and the DOT has not renewed the

Atlanta Regional Commission's certification of the regional planning process for 1974. The cause of action is to enjoin DOT from approving the plan which would then cut off federal aid and they seek an injunction against two Georgia transportation agencies to prevent them from planning, designing or constructing and tollways until the regional plan has been approved. DOT will file answers to these contentions by late May. This case has broad implication as a precedent.

41 267004 REDUCING THE TRAVEL REQUIREMENTS OF THE AMERICAN CITY: AN INVESTIGATION OF ALTERNATIVE URBAN SPATIAL STRUCTURES. Little attention has been given to investigating the potential for gradually restructuring the city so as to reduce its built-in requirements for transportation. This report investigates this potential by analyzing the transportation requirements of some alternative urban spatial structures. The effort is to deal with what are perceived to be the basic causes of urban transportation transportation requirements instead of examining only the symptoms of these problems. A computer-directed search procedure was developed and tested using 2 simple urban structures. These experiments form the basis for an investigation of a larger urban structure based on the 1970 urban pattern of the western part of King County, Washington. This study has demonstrated that a simple search algorithm can be a useful tool for finding spatial structures that have desired characteristics. Results indicated that by moving about one third to on half of the people and about one third of the jobs to other locations, very substantial reduction (50 per cent or more) in travel requirements could be obtained while also improving overall access levels. While structural changes of this magnitude aren't feasible in near future, many cities may be growing by this much in the next 20-30 years. The potential for non-transportation solutions appears to be a significant but projections, initial transit system design and a theoretical According to the author, what is most needed now is a way of identifying

particular locations where it would be most beneficial to encourage new people/jobs to locate and orient programs and policies to encourage growth there.

41 267021 LINEAR CITY RAPID TRANSIT AS A DETERMINANT OF URBAN FORM.

The purpose of this study was to forecast and describe some of the physical planning implications of implementing innovative types of public transportation in the Dallas-Ft. Worth region. In this context, the authors have sought to document in this report conclusions about some of the physical implications of the use of rapid transit to structure new forms of urban development and to depict, in words and images, impressions of the increased quality of life possible in these transit-structured communities. The study approach consisted of developing generalized concepts for structuring new urban growth based upon transit, and then particularizing these concepts by applying them to specific parts of the Dallas-Ft. Worth region. The initiation of this process involved gathering an extensive inventory of physical, economic and demographic data on the geographic area chosen as the focus of this study.

41 300046 PUBLIC TRANSPORT IN URBAN AREAS-A BENEFIT OR DISBENEFIT? Despite increased investment in public transport in urban areas and attention to its management, public transport is seen as being at a cross road in that the discrepancy between costs and revenue is so large that the community may react against subsidising the deficit amount. Past trends which led to the current deficit problems of public transport authorities are examined and future deficit prospects illustrated showing the limited impact of even substantial fare increases. Although operational and policy measures can be used to minimise operating costs and perhaps increase patronage, deficit confinement in the future will require a major review of urban public transport objectives, service levels and fare structure. /Author/TRRL/

41 300095 URBAN CONSOLIDATION : A PRELIMINARY APPRAISAL OF ITS POTENTIAL FOR DEALING WITH STRATEGIC TRANSPORT ISSUES. Urban consolidation is a radical policy for redirecting future growth in households from low density peripheral locations to medium density housing in middle ring suburbs. It offers transport benefits to households who divert, but its strategic significance is likely to be small in the light of expectations of reduced population growth. In addition, its implementation would be constrained by the resistance of local government in middle ring suburbs and by consumer preference for a detached house and garden. It is argued that urban consolidation is symptomatic of a tendency toward achieving radical change by focussing on future growth. However, the major transport task now concerns the urban fabric. /TRRL/

41 301052 TRAVEL DATA FROM THE U.S. CENSUS: A NEW FOUNDATION FOR TRANSPORTATION PLANNING. The 1980 U.S. Census of Population and Housing will include the largest source of urban transportation data ever available for a single point in time. To properly use these data requires that planners understand the difference between census definitions and those commonly used in transportation. This paper describes those differences as well as the data that will not be included in the census. It recommends methods of local data collection that can supplement the census data to complete the measurement of total travel. Finally, it proposes a method of keeping the census commuting data up to date without extensive inventory data for 1980. The method is suitable for small urban areas as well as large metropolitan regions. /Author/

41 302271 THE IMPLICATIONS OF TRANSIT INVESTMENT ON URBAN DEVELOPMENT, SOUTHEASTERN MICHIGAN. This study of the implications of transit-induced development patterns was intended to synthesize available information on the proposed transit alternatives for Southeastern Michigan. An investment in additional transit capacity in Southeastern Michigan would accomplish a number of regional objectives. It would stimulate the economic vitality of the region, improve accessibility, reduce traffic congestion, maintain air quality, provide for the flexibility to conserve energy, and slow urban sprawl. The Southeastern Michigan Transportation Authority has proposed six transit alternatives which are designed to fill transportation needs as well as this more comprehensive set of objectives for the future of this important urbanized metropolitan area. Each of the alternatives include improvements to the existing public transit system: small bus; express bus; feeder bus; commuter rail; and the addition of a downtown people mover for circulation in Detroit's central business district. Four of the alternatives also include a light rail system which differs in length and in the extent to which its alignment is subsurface. A major issue in public discussion has been the magnitude of the development which

would be stimulated within the region's urban core as a result of an investment in transit. Two purposes govern the analysis: 1) to interpret the findings of previous impact analyses in terms of the urban economic, environmental, and transportation policies and 2) to define the magnitude of the shift from suburban jurisdictions and to discuss the implications of these shifts in relation to the relative share of the cost borne by suburban communities or counties. This report discusses and analyzes the need for transit improvements, the policy context of these improvements, land use and urban development impacts, public service implications, financial and fiscal impacts, and equity considerations.

41 302414 ESTIMATING SOCIOECONOMIC IMPACTS OF TRANSPORTATION SYSTEMS. This study develops a methodology to estimate the socioeconomic impacts of multimodal transportation plans and programs in Maryland. The impacts include government expenditures of plan implementation, socioeconomic impacts of expenditures (i.e., personal income, employment, and population), displacement of businesses and households, and land use, accessibility, safety, and socioeconomic impacts of new transportation services and facilities (i.e., personal income, employment, and population). The programs evaluated include the Port of Baltimore; Baltimore-Washington International Airport; general aviation airports; rail (commuter and intercity) facilities; mass transit (bus and rail rapid transit); Interstate, primary, and secondary highway systems; low-capital improvements; and operating programs. The methodology consists of 26 impact-estimating equations, each of which was developed for statewide, regional, and county levels of detail. As a test application, the equations were used to evaluate the impacts of a 20-year \$10-billion Maryland transportation plan. Socioeconomic impacts related to expenditures and new facilities or services were shown to generate \$18 billion in personal income over this period with an average annual employment impact of 48000 jobs and an average annual population impact of 100000 people. The Baltimore region experienced the largest impact (83 percent of total statewide impacts). The Baltimore city and Baltimore county areas experienced 60 percent of the Baltimore region's impact. 41 303076 IMPLICATIONS OF FUEL-EFFICIENT VEHICLES ON RIDE QUALITY AND PASSENGER ACCEPTANCE: WORKSHOP PROCEEDINGS WOODS HOLE, MASSACHUSETTS, SEPTEMBER 6-8, 1978.

Four workshops were conducted under the auspices of the Transportation Research Board. The topics of discussion included ride quality and passenger acceptance problems associated with enhanced fuel efficiency of automobiles (Group A) and aircraft (Group B); shifts in intermediate range (100-500 miles) travel for automobiles to public transit (Group C); and implications of increased size disparity for ground transport freight and passenger vehicles using shared guideways (Group D). In each group, major problem areas were identified and strategies for conducting pertinent research were outlined. A glossary of technical terms and a list of workshop participants are also included in the report.

41 303478 ACCESSIBILITY AND BEHAVIOUR: INITIAL CASE STUDIES.

ARRB Project 268, social impact of transport related changes, is using a case study approach to explore the relationships between (1) accessibility to local services (schools, shopping, public open space etc), (2) accessibility to metropolitan-scale services (employment, tertiary education, etc), and (3) residents' behavioural responses to different levels of these accessibilities. From that exploration, it is hoped that behavioural responses to future changes in accessibility can be predicted, so that social effects of transport related changes can be assessed. The case study areas are contrasting residential areas in metropolitan Melbourne. This paper is intended as a progress report on the study. It specifically examines the relationships between accessibility and behaviour in three of the case study areas: in Springvale (low educational and professional status, early in the family life cycle, with generally poor accessibility to public transport), Camberwell (high educational and professional status, late in the life cycle, with generally good accessibility to public transport), and Northcote (low to middling educational and professional status, middling to late in the life cycle, and with part of its area well endowed with public transport). From this examination, speculations are advanced on the significance of the revealed relationships, thus on the likely social effect of future possible transport related changes on the three case study areas. 41 307760 PASSENGER REQUIREMENTS AND ERGONOMICS IN PUBLIC TRANSPORT.

The basic requirements and comfort parameters of users of public transport are discussed with reference to results of some recent field investigations. The needs for city transport were found to consist of primary service associated with time saving and convenience, informational clarity, physical requirements, and environmental factors. The priorities of such needs were variable according to the purpose of travelling, such as commuting, visiting, shopping, business, and others; and also the users' occupations. The comfort of passengers riding a train was shown to be composed mainly of postural, mental, and microenvironmental components, to which differences in the class, journey purpose, car-type, and age of passengers significantly contributed. Comfort was also dependent on the journey length, changing at around 3 hours from the journey start. A field experiment showed that physiological responses and discomfort scores of passengers were remarkably enhanced when the crowding exceeded a certain limit, over which transport planning to avoid crowding would be a primary need. It is thus necessary to meet the dynamic needs of passengers, taking into account also discomfort resulting from newly mechanized systems. /Author/TRRL/

41 308011 URBAN ROAD PLANNING-SOME CURRENT CONSIDERATIONS.

This paper discusses some current considerations in urban road planning. In general, these considerations stem from the limited finance available for roadworks, the increasing emphasis on sociological and environmental aspects, evolving community attitudes and concerns, and current uncertainties in those matters that will affect future travel. The changing road planning process, and some matters relating to protection of longer term options for future road improvements, are discussed. Some aspects of travel forecasting, including the future outlook for energy for transport, are mentioned. Evolving procedures for assessment and evaluation of proposals, and for community participation, are described, and some compensation matters are also discussed. /TRRL/

41 308076 INSTITUTIONALIZATION OF MASS TRANSPORTATION IN THE COMMUNITY.

The findings which are presented here are based on a literature review, a questionnaire

survey of 150 public transit agencies, and on-site interviews with managers and board chairmen of transit agencies. These findings are relevant not only to the uncertainty of local finance problems, but also to the continuation and improvement of mass transportation services in the nation. The importance of local support for transit is noted and the differences between institutions and organizations are discussed. The process of institutionalization is outlined, including the establishment of the transit organization, the understanding of the community environment, the development of the institution, the developing of links with outside groups and individuals, the developing of support, institutionalization, and providing feedback to check on the success of institutionalization. A major stumbling block to institutionalization is that building community support in nonoperational ways is usually not an explicit goal of transit management.

41 308079 BACK TO THE CENTRAL CITY MYTHS AND REALITIES.

This collation of available statistical data for speculation on the urban future, focuses on demographic trends and their policy inclinations. The future demand for central city transportation is a function of its resident population, of non-resident workers, and non-residents attracted to the city for a variety of non-job related purposes. The various aspects discussed include the decelerating population growth, changing household formations, population change determinants, and the net migration criterion. Central city aspects such as shrinking population, shifting importance, age structure shifts, household types, income shifts, and employment trends are discussed. It is noted that there has been little, if any, abatement in the broader centrifugal forces depleting the city. The dominant phenomenon of the 1970s (preceding the 1979 energy crisis) has been the resynthesis of the metropolitan activity system to the outer fringe adjacent to the circumferential transportation band. More dispersed, peripheral nonmetropolitan population growth may in part be considered "surrogate" metropolitan growth dependent on transport links to the new circumferential metropolitan economy. The spatial form of the latter exurbia appears as undocumented metropolitan extensions or outcroppings along new or improved transportation routes. The city core transportation issue is being blunted by a decline in need.

41 308519 EVALUATING THE EXPECTED RETURN-AS WELL AS THE RISK-OF A PROPOSED TRANSIT INVESTMENT.

A study was conducted at Kent State University to determine the feasibility of offering bus services to students who travel long distances to and from the main campus. Two services were selected for detailed study and a marginal cost-benefit analysis was made to predict the net returns for each of these services. Expected ridership was estimated using survey responses and an attitudinal demand model. The results of the model yielded valuable risk and return information. The 95%

confidence interval width of \$1238 reflected the uncertainty of the estimate for net revenue. The downside risk (chance of income loss) is essentially zero. An interesting result of the model is that the true expected return of \$1431 is not equal to the net cost-benefit figure of \$1647. In addition to the risk-return information, the probabilistic modeling approach is a very good technique for including difficult to define and intangible benefits such as reduced road congestion and lower pollution. The framework for the model is ideally suited for sensitivity or what-if analyses. One of the most positive features of the approach, however, is that the results are easily understandable to decision makers who do not have extensive quantitative backgrounds.

41 308568 TRAVELER ATTITUDE-BEHAVIOR IMPLICATIONS FOR THE OPERATION AND PROMOTION OF TRANSPORT SYSTEMS. Alternative hypotheses on how traveler attitudes relate to system usage are examined to infer strategies for the operation and promotion of transport systems. Two different transport modes (carpools and buses) and two different data sets are analyzed. The analyses highlight the differential roles of perceptions of system attributes and modal affect in accounting for traveler behavior. In addition, the mutual dependence of attitudes and behavior on each other is confirmed. After these relationships are empirically demonstrated, some practical operational and promotional implications are developed. It is noted, for example, that system improvements by themselves can be insufficient to produce desired changes in system usage. Two specific promotional strategies that can complement system improvements and help increase system usage are described and linked back to the analysis of traveler attitude-behavior relationships. 41 309099 PUPIL AND REGIONAL PUBLIC TRANSPORT [Scholier en streekvervoer]. The decrease of the number of passengers on public transport depends greatly on the degree of vehicle ownership. Therefore public transport must be made more attractive for those persons having no car, such as children going to school, old people and commuter traffic. In this report the use of public transport modes by pupils in the age range 12-16 years is studied in a special region. In summertime the bicycle and the moped are the most used transport modes. In the winter only the bus is a real alternative, but even then pupils prefer to go by bicycle or moped. Measures for a better scheduling of the bus related to school hours and stops in the neighbourhood of schools are recommended. /TRRL/ [Dutch]

41 309192 WHAT ARE PEOPLE SAYING ABOUT IMPROVING OLD OR MAKING NEW? The paper examines the influence of the community, working through the political system, on environmental, social and financial factors in the road planning process. It is generally assumed that society as a whole has shown a preference for the low cost upgrading of the existing system in the developed urban areas, but there are exceptions to this. Local community viewpoints often differ according to whether or not their environment is affected by existing traffic conditions or alternatives under scrutiny. These situations can pose a conflict for the planner-the responsibility to the different communities on the one hand, and the responsibility to the authority on the other. The paper examines how community attitudes can be determined and how they influence decisions. The authors present some of the practical lessons they have learnt from working in open participatory studies. (TRRL)

41 310165 VOLUNTARY AND SOCIAL SERVICES TRANSPORT IN BIRMINGHAM, REDDITCH AND BROMSGROVE. This report is concerned with the use of small vehicles for providing communal transport as a form of welfare. A postal survey, supplemented by personal interviews, was carried out in Birmingham to identify the pattern of transport provided by voluntary organisations. Data were collected on vehicle-type, cost and finance, drivers, users, trip purposes, and the development of the service. It appeared that most services were associated with some social or recreational service provided for particular clients, although the characteristics of clients varied considerably between different voluntary organisations. Journeys to suit personal requirements were less common, and there was little diversion from public transport. Levels of vehicle utilization varied considerably, and the potential for improving the provision of such transport by better co-ordination between organisations is discussed. The operation of social services department transport in two areas was also studied. This is a sector of transport provision which has grown in a relatively unplanned way in recent years, as a function ancillary to domiciliary and day-care provision. A number of problems for both types of transport supplier are identified in the context of fleet management, organisation and finance. (Author/TRRL)

41 313857 THE SOCIETAL COSTS OF CONGESTION IN NEW YORK CITY, WITH APPENDICES. The report is a study of the problem of vehicular congestion on the island of Manhattan with emphasis on its Central Business District. It defines the nature of Manhattan's congestion, traces its growth over the past century, assesses its costs, and evaluates various abatement strategies. The approach is in the manner of a case study of the impact of street congestion on the economic, social and environmental health of the city's residents. Abatement strategies considered include several dealing with traffic management and goods movement, uniform bridge tolls, free transit fare zones, and the development of extensive pedestrian areas.

41 314231 DETERMINANTS OF NEIGHBORHOOD QUALITY: AN ANALYSIS OF THE 1976 ANNUAL HOUSING SURVEY. Using 1976 Annual Housing Survey data, this paper assesses the contributions to overall neighborhood quality of peoples' evaluations of environmental conditions and public services. The analytic model takes into account (1) the extent to which the presence or absence of conditions influence ratings of neighborhoods, (2) the relative importance of condition and service evaluations in explaining overall neighborhood ratings, and (3) the extent to which the evaluations in households with different background characteristics differ in importance in explaining overall neighborhood ratings. Findings suggest that most Americans are quite content with their neighborhoods; in fact, four in five rated them as either excellent or good. The presence or absence of neighborhood conditions (as measured by respondent's perceptions) account for only one-sixth of all variations in neighborhood quality ratings. People's feelings about conditions around them are more significant to their assessment of neighborhood quality than are perceptions of local government services. Most important among these conditions are neighborhood and housing upkeep, street noise, and crime. Among public services, police protection, public transportation, and health-care facilities are most valued. Population subgroups differed significantly in their ratings of neighborhoods--poorly educated, young black renters were most likely to give negative overall neighborhood ratings. Ratings by selected attributes did not vary significantly. These findings stimulate several suggestions: (1) future surveys should contain questions covering combined attributes, (2) the use of a different battery of evaluative questions for rural and

urban neighborhoods should be considered, and (3) questions on persons' intentions to move from their present residences should be added. Study data and a bibliography are provided. (Author abstract modified).

41 314364 THROUGH THEIR EYES, PART II: THE PEOPLE SPEAK. The report provides a summary of American attitudes toward transportation and various transportation policies, and is based on a survey conducted in December 1977. The survey found Americans expected major changes in their life style and that transportation was supposed to be a major contributor to those changes. The report finds a strong distaste for mandatory solutions to transportation problems, particularly gas taxes or fuel rationing. The public would also seem to support additional investment in public transportation relative to highways, in highway maintenance, and in rail systems. The report contains backup tables, and excerpts from the survey instrument used to develop the data.

41 315010 A SURVEY OF AMERICAN ATTITUDES TOWARD TRANSPORTATION. The U.S. Department of Transportation sponsored a major survey to examine the attitudes of American citizens toward transportation problems. The survey used a specially designed sample of 1538 people, chosen to represent a valid cross-section of the American adult population. The survey focused on determining the habits of Americans in using public and private transportation. It also covered the perceived relationships between transportation and other national issues as well as specific attitudes toward individual modes. This report contains the full results of the survey, as well as descriptive material on the sampling techniques involved. (Author)

41 315159 DELAWARE RIVER PORT AUTHORITY TRANSIT IMPROVEMENT PROGRAM. VOLUME II: ENVIRONMENTAL AND SOCIAL PLANNING. TECHNICAL STUDY. The Delaware River Port Authority (DRPA) has been engaged, since June 1970, in progressing a comprehensive Mass Transit Study which was directed toward developing specific recommendations regarding the DRPA Mass Transportation Development Program. This three-volume study contains the eleven regional transportation-related technical studies conducted by the DRPA and sponsored by UMTA in coordination with the Delaware Valley Regional Planning Commission. Volume II, this report, contains the following project/final reports: 1) Environmental Impact Analysis (II); 2)

Improvements for Better Serving the Elderly and Handicapped (IX); and 3) Environmental Improvements to the Existing PATCO System (X). This report contains information regarding the projects evaluated environmentally, namely, the Philadelphia-Mt. Laurel Line, and the Philadelphia-Glassboro Line. The report examines methods of serving the elderly and handicapped and high speed rail transportation facilities operated by PATCO (Port Authority Transit Corporation); SEPTA (Southeastern Pennsylvania Transportation Authority); METRO (Washington Metropolitan Area Transit Authority); and MARTA (Metropolitan Atlanta Rapid Transit Authority). The report also reviews the need and recommends methods for providing environmental improvements to the existing PATCO system, such as noise abatement; station modification; user information services; landscaping for aesthetic improvements; and modifications to existing parking facilities.

41 316685 A REGIONAL TRANSIT PERSPECTIVE: PHASE 1. TRANSIT SERVICE AREA COMPARISON TO REGIONAL SOCIO-ECONOMIC AND TRAVEL CENTER PROFILE. This technical report reviews various aspects that are related to the public transportation systems in the OKI Region, an area encompassing nine counties in Ohio, Kentucky, and Indiana. These various aspects include the identification of those areas served by public transportation (i.e. either served by a demand responsive system or within a quarter mile of a fixed bus route) and the identification of major travel generators (e.g. colleges and universities, major places of employment outside the CBD's, hospital complexes, major shopping areas, high school, and cultural centers). Also, in those areas not currently served, several factors which would indicate a need for public transportation are analyzed. These include population density, level of automobile ownership, and percentage of the population that are minority groups, elderly and/or low income and hence more likely to use public transit.

41 317414 AN ASSESSMENT OF THE BAY AREA RAPID TRANSIT (BART) IMPACT PROGRAM. This report is a brief summary of assessment of the BART Impact Program conducted by the Metropolitan Transportation Commission of the San Francisco Bay Area. Two federal agencies funded the Impact Program, started in 1972 to collect and analyze information about effects of this large public-works project so that the effects of Bay Area Rapid Transit could be understood and dealt with in its own region and so that other areas planning and operating rapid transit systems might benefit. The principal contributions of this study of effects of a major

new rapid transit system on a major metropolitan area can be found in its development and analysis of information about environmental effects, the effects on transportation and travel behavior, and the high costs of operating BART. Least successful elements dealt with effects of BART on land use, urban development and the local economy which are all long-term effects not sensitive to short-term study. The BART Impact Program demonstrates the importance of conducting impact studies of the effects of various transportation projects during implementation and suggest a method financing such investigations.

41 318092 TRANSPORTATION USERS: DEMANDS AND NEEDS. 1964-FEBRUARY, 1980 (CITATIONS FROM THE NTIS DATA BASE). The bibliography covers research on the needs and demands of transportation users. These users include the general public and specific groups including the elderly, the poor, commuters, and students. Most of the studies are concerned with urban mass transit systems and methods to predict their passenger usage. Studies covering specific localities as well as the U.S. in general are included. Predictions and needs of user groups are researched through questionnaires, counting techniques, and mathematical models. (This updated bibliography contains 170 abstracts, 26 of which are new entries to the previous edition.)

41 318164 AN ANALYSIS OF USER COST AND SERVICE TRADE-OFFS IN TRANSIT AND PARATRANSIT SERVICES. The Xenia Model Transit Service served as a test of several alternative transit services operated in a small city setting. This project was undertaken as an aid to the evaluation of transit and paratransit systems in Xenia, Ohio, and as a test of a new technique for assessing travel demand. The technique, direct utility assessment, was designed to test a new method for assessing user trade-offs in costs and service based on attitudinal methods. A tradeoff survey was administered as part of a home interview survey. Data from the tradeoff survey were used to develop separate equations for each sample respondent to explain and describe their tradeoffs over transit fare, travel time, walk distance, type of service, and headway. An aggregate equation was also developed, assuming that all respondents shared common tradeoffs. These equations were employed to retrospectively predict changes in transit system patronage (since 1974). Both sets of models performed well, producing forecasts that were in the same direction and range of experience, although magnitudes were somewhat different.

41 319277 MANCHESTER TRAVEL-TO-WORK SURVEY: SURVEY METHOD AND PRELIMINARY RESULTS. A travel-to-work survey of 3000 employed adults was carried out in three areas of greater Manchester. An inner area and two outer areas were selected for the study. This report gives a resume of the survey method and presents preliminary results on the differences of socio-economic characteristics and travel behaviour in the three study areas. The preliminary results show that the main components of travel behaviour (such as mode, journey distance and journey time) varied considerably between the three areas. Workers living in the inner area made much more use of public transport than those living elsewhere in the metropolitan area. The use of a car as the main mode of transport to work is generally higher in outer areas. It is notable that although the levels of motor vehicle ownership and licence holding are similar in the inner area and in Wythenshawe, car use is much higher in the latter area. The report also shows that journey distances were higher in Wythenshawe than in the inner area (specially for bus journeys). However, in the traditional suburb of Swinton and Pendlebury where the local employment base is strong, people tend to live and work in close proximity and journey distances were shorter than in the inner area and the proportion of walk journeys was high. Despite the shorter distances, the average journey time in the inner area was greater than that in Wythenshawe. (a) (TRRL)

41 319577 TRANSPORT STUDIES AND THE QUALITY OF LIFE. A definition of transport studies is offered with the claim that the purpose of this field of study is to obtain understanding that can be used to help to improve the economic, social, and physical conditions of people's lives to the extent that these are affected by the transport system and its use. A number of examples of this process in action in the fields of transport

planning, operation, and safety are described and discussed, emphasising how the achievement of improvements depends upon understanding not only what changes are likely to be beneficial but also how people will respond to attempts to bring about these changes. The examples are concerned with injury to occupants of colliding vehicles, accidents associated with driving after drinking alcohol, the competition between activities and movement for space in congested urban areas, and the operation of a main radial route into a city centre. In conclusion, current attempts to assess the wide range of effects that transport changes can have upon the quality of life are related to the writings of Jeremy Bentham, whose thinking contributed strongly to the foundation of University College London 150 years ago. 41 319622 PASSENGER DATA COLLECTION MAKES ECONOMIC SENSE. Data needs to be collected and analysed as an aid to county council and bus operator management decision making. The authors describe the development and use of a system introduced by the county of Glamorgan some three years ago. A Swiss perforated data punch machine is used because it is easy to operate, is reliable and produces a computer compatible punched paper tape which needs to be changed only once a week. Uniformed bus company staff are used to operating the machine to collect data from every passenger on selected trips. The paper tape format is discussed and examples are given of its use of codes to denote such items as passenger class, type of ticket, trip purpose and waiting time. A zoning system has been developed for the county, with bus stops "pooled" into groups of up to nine located within individual zones. A suite of computer programs is used to produce a selection of bar charts and origin/destination matrices. Two types of survey have been employed-regular sampling and specific surveys. It is estimated that 100000 interviews will be completed annually from 1980 producing data that can be used to monitor proposals from the market analysis project (map) in addition to other schemes. 41 322222 URBAN ACTIVITIES, TRAVEL, AND TIME: RELATIONSHIPS FROM NATIONAL TIME-USE SURVEY. Results are presented on how people allocate time for their out-of-home activities, including related travel. The information is derived from analyses of the daily activity patterns of urban residents recorded in a 1975 national time-use survey. The analyses indicate a variety of relationships between out-of-home activity time, travel time, and household variables for weekdays and weekends. They also suggest broad out-of-home time budgets and travel-time budgets for households and persons. The detailed activity descriptions in the data base required considerable aggregation, the best results for which came from functional activity groupings rather than traditional land-use-based trip-purpose groupings. These functions were

related to scheduling and planning characteristics of the activities as well as their potential for substitution of individual participants. The analyses do not substantiate the fixed daily work schedule assumed by some activity analyses. Rather, daily work time is quite variable, and this variability is a primary independent variable explaining allocation of time to other activities. The relationships between these activities and work time were strengthened by the inclusion of in-home work time, confirming that some in-home household activities will affect out-of-home behavior. 41 322679 METRO IMPACT STUDY II. This report is the second in a series of studies evaluating the potential for land use changes and new development in the vicinity of Metrorail stations. It was funded by the Urban Mass Transportation Administration (UMTA) of the U.S. Department of Transportation. The information contained within this report has been reviewed by and received valuable guidance from the staffs of the Washington Metropolitan Council of Governments (COG) and the Urban Mass Transportation Administration. The primary purpose of this report is to address the types of land uses and activities which will be encouraged and explain how the proposed character will be integrated into the existing area fabric. The report covers 12 Metrorail stations in the District of Columbia. They are Foggy Bottom-GWU, Farragut West, McPherson Square, Federal Triangle, Archives, and Eastern Market all on the Orange Line of the regional system. Additional stations covered, all on the Red Line, are Friendship Heights, Tenley Circle, Farragut North, Rhode Island Avenue, Brookland, and Takoma. The report is divided into five sections, one for each ward discussed in this volume. Recommendations are directed towards long range goals and concepts and provide a framework for future development around the stations. There are three main sections included in each station analysis. In the first section, existing conditions and trends are analyzed. In the second section, planning problems are illustrated and potential development sites located. The third section offers proposals and recommendations concerning the long term kinds of development that should occur. These studies represent initial concepts and plans which, if carried out, could create viable community service centers related to rapid transit. (Author)

41 322799 THE DIFFERENTIAL IMPACT OF RESIDENTIAL LOCATION ON CHOICE OF MODE IN THE SAN FRANCISCO BAY AREA. The effect on location of residence when different forms of public transport are available in an urban region was examined with reference to the San Francisco Bay region. A survey was made of new residents with their

choice of location possibly being based on accessibility to the following modes: Bay Area Rapid Transit, Southern Pacific commuter trains, and bus. A model of modal choice was developed and conclusions of the study are listed.

McCarthy, PS (Purdue University) *Logistics and Transportation Review* Vol. 16 No. 1, 1980, pp 33-58, 2 Fig., 7 Tab., Refs.; ORDER FROM: British Columbia University, Canada, Faculty of Commerce, Vancouver V6T 1W5, British Columbia, Canada

41 324321 FACTORS INFLUENCING THE USAGE OF URBAN MASS TRANSIT. The interrelationships of situational variables, attitudes toward using public transportation, and specific object attributes were analyzed using multiple discriminant analysis. The analysis showed that "regular" users of the public transit system were those who used the system four times or more per month, and that these "regular" users hold similar attitudes to those who never use the system. The data also show that individual attitudes assume a more significant note in modal choice behavior than the more limited one assigned by other studies. Several classes of variables may be necessary to adequately predict ridership behavior. These classes relate to attitudes about specific attributes present in a particular transit system, general attitudes about the transportation system, and the socioeconomic and demographic characteristics of the rider. Travel behavior is a complex set and accurate predictive models should include not only the above mentioned, but also interrelated environmental elements. For the transit manager, this implies a coordinated market approach and a redefinition of what a public transit system is, and should do.

41 324463 TSM AND AUTO DISINCENTIVES IN RESORT AREAS. Destination resorts accommodate a large proportion of America's indoor and outdoor recreational activities. The very success of such major recreational attractions often creates substantial automobile-related conflicts with the quality of the attractions themselves, and with the cities or towns which form a part of their context. Experience has shown that high quality public transit alone is not likely to lure substantial numbers of tourists (or local residents) from their cars without auto disincentives. Based on a series of destination resort studies, a systematic approach to "controlling" automobile impacts through TSM has been developed. The analysis is based on disaggregating local travel, targeting specific trip-makers, and calibrating a combination of auto-disincentive measures. Pitkin County, Colorado, the site of Aspen and Snowmass, constitutes one of the largest year-round, automobile-based outdoor attractions in the country. Recently, the County embarked on an ambitious investigation of ways to "manage" the automobile through a wide range of auto disincentives. Based on an analysis of visitor and resident behavior, programs were developed including direct and indi-

rect measures aimed at both pre-arrival and on-site travel behavior. Innovative physical, economic, and regulatory measures were combined into strong and moderate disincentive programs with the help of citizen groups. These programs were tested along with transit improvement for their effectiveness in reducing congestion, noise and air pollution, and improving mobility and the quality of the visitor experience. The County has adopted a strong program and is seeking funding for implementation. The Pitkin County experience illustrates an approach which may be useful in other contexts. (Author)

41 325206 ATTITUDES AND URBAN TRAVEL BEHAVIOR: A CASE STUDY IN TRENTON, NEW JERSEY. This paper presents some results of an urban transportation-related attitude survey of Trenton, New Jersey. Changing views on the relationship of attitude and behavior are examined. The complexity of the relationship is stressed, as well as the multiplicity of factors affecting behavior and the importance of interaction among attitudes. The survey of Trenton's travel behavior is described.

41 325754 THE PUBLIC IMAGE OF PUBLIC TRANSPORT BY RAIL AND ROAD [Image de marque des transports collectifs ferroviaires et routiers]. The results of interviews carried out in different social groups has allowed the psycho-sociological factors which influence the attitudes of population groups towards local public transport to be analysed. The analysis is made in terms of the requirements for movement according to three variables: habit, obligation and desire. The dominant image is of the attachment to public transport and more particularly to transport by rail. [French]

41 325940 FINAL POLICY AND PROPOSED GUIDELINES ON CITIZEN PARTICIPATION IN LOCAL TRANSPORTATION PLANNING. With this notice, DOT issues a Policy Statement on Citizen Participation in Local Transportation Planning, as well as Proposed Guidelines on that subject. The Policy Statement clarifies and strengthens DOT's existing position of encouraging citizen participation in transportation planning. The Proposed Guidelines would support and amplify the Policy Statement by identifying and explaining key elements of active citizen participation; all concerned segments of the public are invited and urged to comment on these Proposed Guidelines. The Policy Statement will apply to all DOT requirements for citizen participation in the local transportation planning process. The Proposed Guidelines would also apply to the same require-

ments. These requirements are listed in the Appendixes. Appendix A lists Federal-aid programs; these are programs whose laws and regulations require State and local agencies using DOT funds to provide for public involvement in transportation planning and project development. Appendix A also includes brief explanations of how Federal-aid programs are administered in various DOT operating administrations. Appendix B lists other DOT requirements for citizen participation. 41 326475 THE ECONOMIC AND FINANCIAL IMPACTS OF BART (BAY AREA RAPID TRANSIT). The economic impacts of the San Francisco Bay Area Rapid Transit System's (BART) capital and operating expenditures on the Bay area's regional economy are assessed. The hypothesis that rapid transit in the Bay area would have an impact on regional economic development was not supported. Capital expenditures on BART, however, have had a positive short-term impact on the region's economy. The cost of building and equipping BART was about \$1.5 billion, of which \$1.2 billion was spent in the nine-county Bay area. Including all secondary impacts of this construction, the total increase in goods and services purchased in the region was \$3.1 billion between 1964 and 1976. Construction expenditures increased employment opportunity for minorities in the construction trades, but did not necessarily enhance minority job skills. BART's transit expenditures will have a total impact on the regional economy, including all the secondary sales and income generated, of nearly \$149 million per year, including an increase of nearly \$52 million annually in personal income.

41 326478 IMPACTS OF BART (BAY AREA RAPID TRANSIT) ON BAY AREA INSTITUTIONS AND LIFESTYLES. The report focuses on the effects of BART on the Social Institutions and Life Styles of Bay Area residents. The project addresses the impacts of BART on three primary institutional spheres and their clients: local political institutions including community responses to BART; Institutions of Higher Education and their students; and Health Care Institutions and their clients. The study of life style impact focuses upon direct and indirect impacts of BART upon the use and experience of different transportation modes, commuters, household routines, family routines, and the family as an institution. BART has had limited impacts on Bay Area life styles and social institutions. It has had the greatest impact upon commuters from suburban residential communities to the central business districts of San Francisco and Oakland.

41 330166 SHORT-TERM IMPACTS OF A SUBURBAN RAIL RAPID TRANSIT STATION: STUDY RESULTS FOR SILVER SPRING, MARYLAND. Results of a before-and-after study for the Silver Spring station of the Washington, D.C., Metro rail rapid transit system are presented. The study focused on the short-term impacts on the Silver Spring business district of the initiation of rail service and coordinated changes in collector and community transit services. Findings are reported for several impact categories, including transit use, changes in travel habits, traffic and parking impacts, and the community's perceptions of Metro. There were significant initial increases in transit use in the station service area: about 100 percent for regional service and about 200 percent for local services. The percentage of transit work trips to Silver Spring increased from 10 to 13 percent. Approximately 40 percent of midday nonwork trips made by Silver Spring employees into the District of Columbia were made by Metro. Surveys at the station show that a significant proportion--approximately 60 percent--of Metro riders in the morning peak period get to the station by bus and another 16 percent walk. Parking became the most serious negative impact of the station; 1500 daily parkers were added to the parking supply in Silver Spring, which increased the peak-hour occupancy for long-term spaces from 80 to 92 percent. However, this was partly offset by increased use of transit to Silver Spring. Special attitudinal surveys of Silver Spring businesses and residents indicated that, in

spite of short-term problems, the overall impact of the station was positive. (Authors)

41 330167 PHILADELPHIA CENTER CITY COMMUTER RAILROAD CONNECTION. The city of Philadelphia has undertaken major construction to connect two separate commuter railroad systems in Center City to offer ubiquitous access to commuters. The rationale of such great investment in so small an area is explored. The basic theoretical justification is determined by the benefit/cost ratio, but physical impacts on passengers and service providers are also analyzed. Time saved is not evaluated in dollars. Commuter time savings produce no cash dollars to amortize costs but do generate more revenue and less expense, the net effect of which is favorable. The obvious direct advantages are not sufficient in themselves to fully justify the investment. The greater single positive factor is the revitalization of the Philadelphia central business district east of City Hall. This has already begun and is being coordinated with project construction. The city is expected to benefit by more than \$20 million/year in real estate and wage tax increases. Highway traffic will benefit from reduced congestion. Numerical values have been refined by various analysts over a period of 20 years. Data are based on final engineering plans, regional planning studies, and the author's work on the subject. To date, most of the actual construction bids have been near or below estimates, inflation notwithstanding. Double-digit

inflation may change this, but 90 percent of the contracts have now been let. The strategic importance of careful operational implementation in achieving the best results is also analyzed. (Author)

41 330257 SPATIAL ECONOMIC BEHAVIOUR. THE MICROECONOMIC FOUNDATIONS OF URBAN AND TRANSPORT ECONOMICS. The aim of this text is to provide a rigorous introduction to the analysis of various decisions involving a spatial dimension, and to integrate them more closely into a unified theory of spatial economics. There are four parts to the development of the analysis. First the economics of choice is extended to consider simple decisions about choice of travel mode and destination, residential and other locations and activities with a spatial dimension. Following this, various complications are introduced to cover choice under uncertainty, the theory of search, and conflicts between different groups of decision-makers in local economies. In the third part an attempt is made to relate the various sectors of the local economy together in both equilibrium and disequilibrium adaptive frameworks. Finally the various themes are drawn together with suggestions for future methods of analysis and planning in spatial economics. (TRRL)

42 046369 TORONTO PUTS PUBLIC TRANSPORT FIRST. Transport policy in Metropolitan Toronto has swung from highway to public transport orientation in recent years. Cancellation of the half-completed Spadina expressway in 1971 has been followed by increased support for public transport operators, and more controversially by a search for new intermediate rapid transit technology. Tom Parkinson, who represents the Toronto Transit Commission on the Metropolitan Toronto Transportation Plan Review, discusses these changes and their effect on existing and planned commuter rail, rapid transit and tramway services.

42 046703 STATEWIDE TRANSPORTATION PLANNING. The emerging statewide transportation planning process is described and compared to a typical transportation needs study. The view taken is that the statewide transportation planning process represents the gradual merger of transportation needs studies with the urban transportation planning process. Statewide transportation plans are now being developed for single modes, i.e., highways, considering (1) User as well as nonuser goals; (2) the formulation of alternative systems; (3) analytical models to predict the demand for future travel; and (4) comprehensive evaluation criteria. Also, traditional highway needs studies are being replaced by the National Transportation Planning studies which represents a starting point for estimating total transportation multimodal needs. As experience is gained with single mode transportation planning Studies, emphasis will be expected to shift to multimodal planning.

42 046713 A SURVEY OF URBAN ECONOMICS. A large literature has grown up in urban economics in the last decade. It can be broadly classified into: 1) studies of the growth, composition (industry and population), and spatial form of urbanized areas; and 2) analyses of problems such as congestion, discrimination in housing and employment, and the fiscal difficulties of cities. This paper concentrates on the former, where the contributions from other disciplines have been as important as those from economics. Part One of the paper deals with models of growth and intra-urban land use. Part Two is devoted to

urban simulation and efforts to build large scale statistical models for analyzing, among other things, the impact of alternative government policies on patterns of urban development.

42 046857 URBAN RAILWAYS IN LARGE CITIES: REFLECTIONS BEFORE THE LAUSANNE IRCA/UIC CONFERENCE. It used to be a rule of thumb in discussions about "urban" (usually underground) railways a generation ago that at the 2 million population mark a city was beginning to feel the need for an underground system; but the rise of the private motor car has already made something more like 1 million the "threshold" point, and Rotterdam and Oslo have found underground lines to be needed well before reaching the million mark. The suburban services of main-line railways make their contribution to big-city movement in different proportions.

42 046998 PATRONAGE AND REVENUE ESTIMATES FOR THE SAN FRANCISCO AIRPORT ACCESS PROJECT. In many cities around the world concurrent growth of air transportation and congested urban development around airports have created an urgent need for fast, reliable, and safe ground access between airports and areas which they serve. This paper discusses a particular aspect of ground access for San Francisco International Airport—an extension of the San Francisco Bay Area Rapid Transit System for about 10 miles (16 kilometers) from its existing terminus at Daly City. Background for the problem, the approach to solving it, and one major aspect of the solution thus far, the development of patronage and revenue estimates, will be described.

42 048013 URBAN TRANSPORTATION PLANNING. A major crisis confronting today's cities is the complex problem of transportation. Movement of both people and goods becomes increasingly slow, costly, unpleasant, and dangerous each year. Yet a wide knowledge gap exists between those with experience in transportation planning and those responsible for making decisions in the area. This book is specifically designed for those who need to know: engineers, urban planners, economists, government executives, businessmen, civic and political leaders. Focusing on overall planning methods rather than on specifics that change from city to city, Mr. Creighton discusses the large body of systematic knowledge now available about travel, land use, and transportation networks, and its significant implications for metropolitan and regional planning. He emphasizes the need for close coordination between transportation and land use planning, treats basic problems and policy issues of transportation, and describes the critical steps in the urban transportation planning process.

42 048190 THE MAKING OF CITIES. Until recently planning was a technical subject understood only by professionals and specialists. But nowadays planning problems in general, and urban problems in particular, are invading every aspect of life. More and more people of all kinds want to be able to understand the issues and to participate in debate and action. It is of course impossible to participate effectively without understanding the subject. And the subject of planning is extraordinarily complex and hard to grasp. Urban planning has undergone radical changes in recent years and is now using a highly sophisticated methodology with its own language which is virtually incomprehensible to the uninitiated. As the planning process diversifies, so the range of disciplines which come together in the planning team expands—physical planners, architects and engineers are joined by, amongst others, economists, sociologists and management scientists. Within this context, a vast new literature has been produced in recent years by professional planners and specialists for their professional colleagues in an effort to advance the frontiers of knowledge in various fields of planning. Chapter 8 deals directly with urban transport, and chapter 13 has material on urban transportation planning.

42 050660 MULTIMODAL NATIONAL URBAN TRANSPORTATION POLICY PLANNING MODEL. This multimodal version of the model system of the Transportation Resource Allocation Study employs aggregate modeling techniques that treat each urban area as a single

analysis unit. A level of investment is specified, and within that level are mixes of 4 types of transportation facilities: freeways, arterials, conventional bus, and rapid transit. For each alternative, travel projections are made on the basis of both socioeconomic variables and the nature and extent of the transportation system. Travel is split between automobile and transit modes. System performance measures are estimated on the basis of the interaction of system supply and travel demand. Travel times and costs are calculated for each mode. In addition, the model calculates external effects such as land consumed, air pollution, and fatalities. The model tested the effects of 12 alternatives consisting of 4 mixes of transportation facilities for the 63 urbanized areas that will have populations of more than 500,000 in 1990.

42 051508 ESTIMATION OF OUTPUT MEASURES FOR TRANSPORTATION SECTORS: 1947 AND 1958. The report provides detailed historical estimates of private and for-hire transportation activities for 1974 and 1958. The detail matches that of other work on the Department of Transportation input-output model for 1965 and 1970 with projections to 1980. Thus, the data are useful for developing trends which can be compared with projected future growth. The report is also valuable in that it presents data sources and methodologies which can be used in further developing historical series on transportation activities.

42 051555 THE ROLE GROUND TRANSPORTATION CAN PLAY IN THE AIRPORT SITE SELECTION PROCESS. This paper relates significant aspects of the mass transit system analysis activity associated with the recent South Florida Airport Site Selection Program. The configuration, performance, cost, and service characteristics of the quasi-conceptual ground access transportation systems continually represented one of the main decision factors as the Review Authorities deliberated on each candidate airport site. Discussion of the transportation system impact on these deliberations is essentially the prime objective of this presentation.

42 051895 TRANSPORTATION PLANNING IN 1875: THE AMERICAN SOCIETY OF CIVIL ENGINEERS AND THEIR PLAN FOR RAPID TRANSIT IN NEW YORK CITY. This paper is concerned with an early example of urban transit planning. During much of the period before the Civil War, American cities were restricted in their spatial growth by the absence of a system of public transit. Cities such as Boston, Philadelphia, and Pittsburgh were essentially "walking cities" with very high densities in their core areas. In the 1840's and 1850's, however, the development of omnibus lines, of streetcar systems, and of commuter railroads allowed a number of middle and upper class urbanites to move from the central city to less congested residential areas. Increased distance separated workplace and residence, and journey to work patterns by public transit developed. The omnibus and the horsecar, however, due to their relatively slow speed, did not solve the transit problems of large cities. New York City, especially, which more than doubled in population from 1840 to 1860, suffered from high population densities and congestion. The result of this situation was a plethora of proposals for rapid transit, some of which provided for subways, others for depressed roadways, and many for elevated roads. The profusion of plans for a New York rapid transit system motivated the American Society of Civil Engineers to appoint a committee in 1874 to investigate the question and to make recommendations. The ASCE committee examined seventy-five proposals and recommended the building of an elevated system, one line to run along Third or Fourth Avenue east of Central Park and one to run along Seventh, Eighth, or Ninth Avenues west of the Park. The report had a large impact on the deliberations of the New York Rapid Transit Commission of 1875 which authorized the building of New York City's first successful elevated rapid transit lines. These lines penetrated relatively unpopulated areas, allowing the city's population to spread beyond the previously built-up sections.

42 051899 TRANSIT PROGRAM FOR HOUSTON. The City of Houston organized the "Transit Action Program" to evaluate the feasibility of specific transit improvements in the Houston urban area. The work and report are a continuation of preliminary transportation and transit planning done by the Texas Highway Department and the Houston-Galveston Area Council. However, Transit Action Program work is the first in-depth investigation in recent times of short-and long-range mass transit needs. The new technical work has been complemented by a major effort to involve the community to a degree not commonly attempted, with significant and satisfying benefits from a better understanding of citizen attitudes and desires.

42 052067 AMERICAN GROUND TRANSPORT. A PROPOSAL FOR RECONSTRUCTING THE AUTOMOBILE, TRUCK, BUS, AND RAIL INDUSTRIES. This report, which was presented to a Senate Subcommittee, is primarily concerned with competition in the transportation industry. It contains sections on the demise of street railway and interurban electric railway systems, of the political opposition to rapid transit, and on the replacement of New Haven electric locomotives by diesels. The report blames the economic power of certain auto makers for many of the present day transportation problems in the U.S.

Snell, BC ; Government Printing Office 27-540 0, Feb. 1974, 103 pp, Tabs, Photos, Refs; Presented to the Subcommittee on Antitrust and Monopoly, Committee of Justice, U.S. Senate, Feb. 26, 1974.; ORDER FROM: GPO, Repr PC

42 053734 ECONOMIC BALANCE SHEET. To improve rail passenger services in the large conurbations, it is necessary to undertake certain operations, or carry out certain projects. The term operation (or project), is understood to mean an investment and operational programme. The economic balance sheet must enable a reply to be given to the following questions: (a) Financial justification of the operation: is the operation envisaged worth the trouble, or is it worth-while from an economic point of view? (b) Choice of the optimum date for carrying out the operation: should, from the economic point of view, the proposed investment be made immediately, or at what date in the future? (c) Choice between various alternatives for an operation: of a number of alternatives for the same operation which arise, which is to be preferred from an economic point of view? (d) Classification of several operations which it is possible technically to carry out simultaneously, which are those to which preference should be given from an economic point of view?

42 053760 S-BAHN IN HAMBURG. Renowned for its integrated transport system, Hamburg is now concentrating on developing its S-Bahn system. The responsibility for the provision of public transport in the Hamburg conurbation is vested in the Hamburger Verkehrsverbund (HVV). This body was established in 1965 and is responsible for planning, marketing, and publicity, together with the organization and financing of public transport. There are eight partners in the HVV and it is they who operate the bus, express bus, tram, U-Bahn, S-Bahn and ferry services. The Hamburg conurbation covers approximately 50 km by 60 km (30 miles by 40 miles) and has a population of 2.4 million.

42 054344 COMMUTING PATTERNS OF INNER-CITY RESIDENTS. This article reports on the extent of suburban jobholding by inner-city residents in six major U.S. cities and the mode of transportation they use to get to those jobs. The proportion of inner-city workers who commuted to suburban jobs ranged from about one-tenth in Houston and New York to more than one-third in Los Angeles. In each of the areas, inner-city men were more likely to travel to suburban jobs than women. In every area except Los Angeles, a larger portion of blacks traveled to the suburbs than whites. The role of transportation in determining where inner-city residents usually work is difficult to isolate, since other influences were clearly present.

42 054452 AN ANALYSIS OF SYSTEM TRADEOFFS TO IMPROVE ACCESS TO SPECIAL GENERATORS. The objective of the study is to identify the role of alternative transportation systems in providing access to special areas, such as airports, universities, shopping centers, hospitals, etc. A computerized model was developed and applied to an urban university, located in a hypothetical city. Results indicate that efficient, frequent, low cost service will encourage increased patronage by the model university community. To alleviate the expense of providing costly service additions to the entire regional transit system, specialized transit services such as express shuttle bus service might be instituted.

42 054540 FOSTERING URBAN TRANSPORTATION ACTIVITIES IN UNIVERSITIES: RECOMMENDATIONS TO THE URBAN MASS TRANSPORTATION ADMINISTRATION. The study is the outcome of the exploration an UMTA commissioned study team at George Washington University (GWU) to undertake an investigation of the possibilities of university-based centers for urban transportation. After discussion of scope and method of approach, findings and recommendations are put forth. Among findings is that UMTA grants to universities have significantly increased the amount of research produced and students trained in the field of urban transportation. Also found was that whether a university is public or private has little relevance to its ability to serve as a resource for a region larger than a single state, although other institutional characteristics may affect this ability.

42 054654 DOT SECRETARY BRINEGAR: "I CAN SEE A HARDER THRUST TOWARD RAIL." In an interview, DOT Secretary Claude S. Brinegar discussed the energy crisis and its

impact on railways. He predicts a continued growth in rail freight and a strong revival of inter-city and urban rail passenger traffic. The fuel shortage is creating problems in obtaining diesel fuel but it is not yet critical. Brinegar is strongly opposed to nationalizing the railways and believes that the problems can be solved by private ownership. He is also very critical of the present government attitude to urban rail transit. He believes that cities should be required to finance a larger proportion of the cost of urban transit and there should be an incentive program attached to federal funds that would encourage the cities to operate efficient transit systems.

Lewis, RG Miller, LS *Railway Age* Vol. 175 No. 2, Jan. 1974, 4 pp; ACKNOWLEDGMENT: Canadian National Railways, Headquarters Library; ORDER FROM: XUM, Repr PC

42 054738 SYSTEMS APPROACH TO COST-BENEFIT ANALYSIS OF URBAN TRANSPORTATION. The government and public are currently considering how increases in traffic congestion, land committed to freeways, and air pollution might be simultaneously ameliorated by suitable new rapid transit systems. What is not clear is the extent to which people would actually use new rapid transit systems, and what some of the indirect socioeconomic effects might be if they did. The overall objective of urban transportation analysis is to study the effects of a new transportation system such as the rapid transit, on the environment and on the socioeconomic conditions of a city.

42 054763 REAPPRAISING METROPOLITAN TRANSPORTATION NEEDS. The purpose of this paper is to describe: (1) The process used to reappraise the transportation needs in Boston, Mass., and the results of that endeavor; (2) the new and revitalized comprehensive, cooperative, and continuing transportation planning process that has been established throughout Massachusetts as a means of bringing the transportation decision-making process closer to the citizens of the Commonwealth; and (3) the relationship of the new transportation planning process to the development of the Action Plan, a

recent requirement of the Federal Highway Administration. The experience of the BTPR was utilized in establishing similar open and participatory planning processes throughout the state. This has resulted in a shift in emphasis, from a centralized planning effort in Boston, to a locally based planning effort focusing on the 12 regional planning agencies that encompass nearly all the 351 communities in Massachusetts.

42 054918 WHICH U.S. CITIES NEED RAIL TRANSIT? BRINEGAR HEDGES. Two opposing programs on the future of urban transportation are being debated in Washington. On one side is the Nixon Administration represented by DOT's Secretary Brinegar that is arguing for the Unified Transportation Assistance Program (UTAP) that will promote buses and discourage rail systems and offer transit subsidies on a population basis. On the other hand are the transit planners and operators that argue that UTAP will provide less money for major projects than is currently available, that population formula subsidies would help the cities that least need it and that other systems than buses must be considered in some cases.

42 056784 ANALYSIS OF SATELLITE AIR TERMINAL SYSTEM. A systems approach is used to analyze the concept for large metropolitan areas. A mathematical model formulates the

problem as a fixed charge selection-allocation problem, and computes optimum locations for the satellites in the megalopolis. The analysis enables comparison among the transportation modes used to transfer passengers between the satellite collection ports and the main airport. A heuristic algorithm is used in conjunction with the model to compute locations for collection ports when a rapid transit network is used.

Sud, IK (International Bank for Reconstruction and Develop) Gray, P *ASCE Journal of Transportation Engineering Paper* Vol. 99 No. TE4, Nov. 1973, pp 935-953, 22 Ref; ACKNOWLEDGMENT: EI (EIX740203441); ORDER FROM: ESL, Repr PC, Microfilm

42 056826 STRESS MODEL FOR MASS TRANSIT SYSTEMS. The variables which describe a mass transit system are combined in a statistical model to produce a new set of mutually independent variables called principal components which also describe the system. The principal components are combined in a generalized n-dimensional model which in three dimensions is identical to the shear and normal stress on the octahedral plane, a well-known concept from engineering mechanics. The normal stress is a measure of the system's tendency to grow without structural change; the shear stress is a measure of the tendency to change structurally without growth. These stresses are compared with the energy and employment requirements and dollar of various bus systems.

Hannon, B (Illinois University, Urbana) Puleo, F American Society of Mechanical Engineers Paper N73-WA/Ener-5, Nov. 1973, 10 Ref; ACKNOWLEDGMENT: EI (EIX740303056); ORDER FROM: ESL, Repr PC, Microfilm

42 056882 MASS TRANSIT: WHAT ARE THE LIMITS? The reconfiguration of urban design, the reduction of pollution, and the democratization of the transportation system can be achieved by mass transit. However, there are other urban problems that would remain largely unaffected. These include economic ills, the nature of urban politics, fiscal problems, urban crime, and urban education. The means of transportation--autos, buses, trains--have no value in themselves. Their value is merely functional. The same can be said of the city. The city and the transportation network in combination can be considered as a communications system.

Cornehls, JV Taebel, DA ; Consulting Engineer Vol. 42 No. 3, Feb. 1974, pp 128-135; ORDER FROM: Consulting Engineer, 217 Wayne Street, St Joseph, Michigan, 49085 Repr PC

42 056889 RELATIONSHIPS BETWEEN THE TRANSIT OPERATOR AND THE REGIONAL PLANNING AGENCY IN A LARGE METROPOLITAN AREA. Previous arrangements have resulted in a mismatch between the kinds of transportation facilities that are locally desired and the kind that can be delivered by existing federal and state transportation agencies. If this is to be overcome, such relationships will have to change. Many of the freeways in the area have been mandated by state and federal plans. The newly created nine county Metropolitan Transportation Commission will fail in its charge without fundamental changes in existing financing and institutional arrangements in the San Francisco region.

It states the goals and discusses the steps taken to realize the goals. It concludes with some recommendations to the federal government to facilitate urban mass transit programs and transportation system planning.

Kinstlinger, J (Pennsylvania Department of Transportation) *Highway Research Record* #475, 1973, pp 26-29, 1 Ref; This article is one of seven reports prepared for the 52nd Annual Meeting of the Highway Research Record entitled "Federal, State, and Local Roles in Transit Planning" which sells for \$1.80.; ORDER FROM: TRB

42 056946 JOURNEY TO WORK PATTERNS OF TRANSPORTATION CONSUMERS AMONG THE URBAN DISADVANTAGED.

The primary objective of this study of journey-to-work patterns of transportation consumers among the urban disadvantaged was to determine the problems these workers have in getting to their jobs. Cost, time and mode of transportation of low-income workers in selected cities were analyzed by race, earnings, occupation and industry. The impact on employment opportunities of the suburbanization of industry in the metropolitan areas of these cities has also been assessed. The 12 cities selected for study were: Atlanta, GA; Buffalo, NY; Dayton, OH; Denver, CO; Houston, TX; Louisville, KY; Miami, FL; Milwaukee, WI; Portland, OR; San Francisco, CA; Washington, DC; and Wichita, KS. Ethnic data are also included.

42 056947 JOURNEY TO WORK PATTERNS OF TRANSPORTATION CONSUMERS AMONG THE URBAN DISADVANTAGED.

The transportation problems of the disadvantaged residents of poverty areas are particularly acute, since they do not either live or work in the CBD's. The central business district is often encompassed by census tracts defined as poverty or low-income areas. Moreover, because disadvantaged poverty area residents constitute a relatively small segment of the total metropolitan area population, their transportation needs are often overlooked. In order to place the transportation needs of the urban disadvantaged in proper perspective, the report examines the extent of suburbanization of industries in metropolitan areas in order to assess their impact on future employment opportunities of disadvantaged workers in the central cities. It then seeks answers to some critical questions.

Piovia, ES Hill, RB Leigh, W ; National Urban League, Incorporated Final Rpt Dec. 1973, 184p; See also PB-230 703; Contract DOT-OS-10191; ACKNOWLEDGMENT: NTIS (PB-230704/9); ORDER FROM: NTIS, Repr PC, Microfiche; PB-230704/9, DOTL NTIS

42 056951 TEST AND EVALUATION OF DATA FROM THE STANDARD PACKAGE OF CENSUS DATA FOR URBAN TRANSPORTATION STUDIES. The census data consist of 1970 census of population and housing data which were specifically selected and assembled for use in the urban transportation planning process. It is based on the 15 and 20% census count data which were assigned to locally used small areal identifiers such as traffic zones. The socioeconomic data is assembled into zone of residence and zone of work tables. In addition, there is a home-to-work trip table by mode of transportation. Phase I of this project tests the validity of the zone of residence data by comparing it to local data and other census sources. Phase II of this project determined the usability of the Standard Package in the transportation planning process. The analysis of the Standard Package led to a number of recommendations and conclusions about its contents. These include comments on the usability of the current package, recommendations to the user, and suggestions for improving it.

42 057165 TUNNELING FOR TRANSPORTATION. This paper discusses the role of the transportation tunnel. The state-of-the-art is discussed for tunneling technology, and general areas needing research and development are identified. The problems to be solved are difficult ones; they will require a high degree of technical competence and innovation on the part of those who solve them. With a projected demand greater than \$14 billion for the decades of the 70's and 80's, achievable technological improvements leading to 30 percent cost savings and 100-200

percent increases in construction rates will produce savings of over \$2 billion for the Nation. Additional fringe benefits related to an improved environment and better energy utilization cause the transportation tunnel to be called an important tool for achieving national goals.

42 057344 TRANSPORTATION AND EQUITY: TOWARDS A FRAMEWORK FOR DISTRIBUTIVE ANALYSIS. The report addresses the need to be beyond the consideration of social, economic and environmental impacts of transportation planning in the aggregate, and take into account the detailed distribution of positive and negative effects of transportation planning decisions on various subgroups with specific needs and disadvantages. Distributive analysis can help to open up the politics of transportation planning by making complex information more accessible, raising hidden issues and sparking debate. If accompanied by explicit attention to distributive effects at new points in the planning process, an expanded range of possible interventions to consider strategies outside transportation itself, and bringing new participants into the planning and decision making process, along with a new set of roles and expectations, distributive analysis can make possible more equitable policy outcomes.

McKoy, JH Harris, J ; Association of Bay Area Governments, (HUD-CPA-CA-1028) ABAG-HUD-1028-2.01-A, Sept. 1973, 56 pp; Conference on Transportation Horizons: Rebuilding Urban Environments held at Berkeley, Calif. on 20-25 Sep 73; ACKNOWLEDGMENT: NTIS (PB-232188/3); ORDER FROM: NTIS, Repr. 42 057350 PLANNING MODE SELECTION AND ECONOMIC FEASIBILITY REPORT CHARLOTTE-HENRIETTA TRANSIT CORRIDOR, VOLUME I. PLANNING AND PRELIMINARY MODE SELECTION. The purpose of the report is to provide the necessary documentation by which an evaluation may be made of the economic and technical feasibility of the proposed Charlotte-Henrietta Rapid Transit System in Rochester, New York. Presented are an analysis of present conditions, the determination of future transit requirements and an initial analysis of alternative transportation systems. Requirements for rapid transit are based on population projections, employment projections, existing land use, proposed land use plans, patronage projections and resultant service characteristics. The three alternative rapid transit modes which best satisfy all of the criteria established for Rochester were the grade separated conventional rail, light rail and busway system.

Rochester-Genesee Regional Transportation Auth, (UMTA-NY-09-0006) Tech Study Feb. 1974, 322 pp; Prepared by Corddry, Carpenter, Dietz, and Zack Engineers, Rochester, N.Y.; ACKNOWLEDGMENT: NTIS (PB-232347/5); ORDER FROM: NTIS, Repr. PC, Microfiche; PB-232347/5, DOTL NTIS

42 057353 URBAN TRANSPORTATION POLICY: AN ANNOTATED BIBLIOGRAPHY. The purpose of the bibliography is to provide a collection of material dealing exclusively with urban transportation policy. It is designed to enable policy analysts, planners and government officials to understand how urban transportation policy is formed and how current arrangements may be altered to influence future outcomes. The bibliography is organized to emphasize the demands that shape policy, the institutional framework that constrains policy alternatives and how these factors shape supply strategies. Sections present overviews of urban transportation problems and prospects, literature on the demand or input side of transportation, transportation decision-making and management, policy-making arrangements in the U.S., transportation facilities and foreign transportation policies.

42 057369 A SHORT-RANGE TRANSIT DEVELOPMENT STUDY. These memoranda provide background and supporting information pertaining, to the existing transit system in the Tuscaloosa, Alabama urban area. The procedures and assumptions used in the development of

performance indices and other data contained in the final report are identified. Peak-period directional passenger counts showing present patronage trends are discussed and a table presented showing transfer volume on the existing system. Also presented is the analysis and evaluation procedure used to develop the proposed transit system as described in the final report.

42 057507 MODAL SPLIT AS AN ESSENTIAL LINK BETWEEN LAND USE PLANNING AND TRANSPORT PLANNING. Modal split, the choice between different modes or means of transport, has nowadays become a slogan, at present especially related to the promotion of public transport. To take an influence on modal split, however, is not as simple as is often assumed. That is because the modal split depends on several, different influence factors such as the urban structure, the social importance of the transport system, the standard of living, etc. Moreover, each traffic category has its own intrinsic laws so that, even in this respect, a corresponding classification appears to be called for. In the present paper, the attempt is made, first of all, to survey the essential features under the headings of urban development, society, and space planning, and secondly, to illustrate by practical examples modal split models for different traffic categories.

42 057524 HANDBOOK ON URBAN PLANNING. Urban planning is one of the most pressing subjects of the times with the majority of the people living in urban areas in North America and Europe and those areas continuously growing. The motivation of the authors also includes their desire to place in the hands of planners (professional and lay) a positive and useful book (a) to offset the dire predictions of the future, so in vogue, with principles, methods, and standards of planning that will ensure a hopeful instead of a hopeless future, (b) to recognize the order and abundance that exists and to capitalize on them for the benefit of all, and (c) to instill a faith in man's ability to solve any problem he makes. Several uses are intended for the handbook in the fields of education, professional planning, and political science in Canada, the United States, and other American nations.

42 071622 REPORT ON JOINT CONFERENCE ENO FOUNDATION BOARD OF DIRECTORS AND BOARD OF CONSULTANTS NOVEMBER 7 AND 8, 1973. This two-part report, summaries of panel discussions, deals with Trends in Transportation Policy and then with Issues in Transportation Development. Transportation accounts for 20% of the Gross National Product of the U.S. and about 55% of the transportation portion involves passenger movement (by all modes, including the private automobile). The changing involvement of government is covered in its various facets with particular attention given to railroad and transit problems.

42 071766 PROGRAMMING APPROACH TO URBAN TRANSIT PLANNING. A mathematical programming model based on the objective of maximizing net social benefits is developed to evaluate the effect of introducing a personal rapid transit system into the Minneapolis transit environment. The initial solution modeled on the Minneapolis Cordon Count considers the model characteristics of a system consisting of auto, bus, and PRT. The assumption that the demand for transit is a given function of transit characteristics underlies the derivation. The two characteristics of fare and time per trip are considered. Two sets of simulations are conducted. The first consists of the analysis of changes in transit demand. The second consists of changing the modal service characteristics which involves changing the average trip time. The major conclusions are: (1) The introduction of PRT is likely to result in a greater relative reduction of automobile than in bus use; (2) changes in PRT demand and efficiency have small effects on auto and bus use; and (3) reduction in the relative time of a bus trip to be the key to increasing bus utilization.

42 071768 TRENDS IN URBAN TRANSPORTATION. This paper develops a comparative basis for examining trends in urban transportation. The important variables included in the study are indicative of vehicle capacity, demand density, and size of the transportation system in vehicles per square mile. Related variables such as privacy, residential density, travel cost, and convenience in terms of waiting time are also considered. Trends in transit usage since the turn of the century are reviewed to gain insight into the relative importance of the variables and to estimate possible trends in transit service developments during the remainder of the century. It is shown that new door-to-door demand activated transit systems can fill an important gap in urban transportation services.

42 071972 URBAN PUBLIC TRANSPORT IN THE UNITED STATES. The fuel shortage, plus emission control requirements on cars that decrease fuel efficiency, should contribute to alternatives for buses and automobiles for transportation. Systems described include rapid transit line haul, rubber-tire rapid transit, modified bus service, door-to-door service (dial-a-bus) and major activity center distribution techniques. Romualdi, JP (Canadian Transport Commission) *Transportation Planning and Technology* Vol. 2 No. 3, 1974, pp 195-204, 2 Fig., 1 Tab., 4 Ref.; ACKNOWLEDGMENT: EI (EIX740904868); ORDER FROM: ESL, Repr PC, Microfilm

42 072037 PUBLIC TRANSPORT IN THE ADELAIDE METROPOLITAN REGION. The metropolitan Adelaide area is relatively uncongested for a city of its size. Current and predicted future expansion is on a north-south axis. In planning transportation for the area, objectives include maintaining the environmental quality of the area, using existing facilities fully, and keeping costs at a level justifiable on an economic basis. At present, public transport is most used during peak periods. This pattern is expected to continue. It is to be encouraged in order to avoid traffic congestion at these hours. Fare and parking policies will be used to accomplish this. The five-year transport plan will bring the existing network to a standard necessary to serve the existing city. This includes electrification of some routes, vehicle purchases, and rail extensions. Further expansion will be made in the long-term (thirty year) program.

42 072078 MAN SHALL HAVE PRIORITY. A GUIDE TO TRANSPORTATION POLICY [Der Mensch hat Vorfahrt. Kurshuch fuer die Verkehrspolitik]. The transportation policy of the Federal Republic of Germany is to be determined by social needs, rather than by technical and economic considerations. This paper explains the detailed effects of this attitude on specific modes and issues. Projections based on current population, land use, production and transportation patterns indicate an increase in private automobile transportation, and hence an increase in public transit deficits, traffic accidents, pollution, and highway building in crowded areas. Road transport is expensive, and because most of the costs are borne by the general public in taxes, the expense is hidden. In addition, the time lost to traffic congestion lowers production. Therefore, public transportation is a major priority, for both passengers and goods. Specific measures are noted in traffic safety, infrastructure policy, legislative policy, and international policy. Lauritzen, L ; Ministry of Transport, West Germany 31 pp; ACKNOWLEDGMENT: TSC

42 072105 URBAN TRANSPORTATION IN METROPOLITAN ADELAIDE. This working paper contains four separate reports selected to demonstrate four alternative responses to the transport land use interrelationship in metropolitan Adelaide. The first paper, entitled, "Land Use and Transportation Planning discusses road hierarchies, the need for bus routes, and the potential for rail access in the "North-West Development

area". The second paper looks at existing transport facilities and services and how better use can be made of them. The third paper discusses "Staggered or Flexible Working Hours". It reviews the experience of staggered working hours and flexible work time around the world. The fourth paper, "Some Environmental Aspect of a Transportation Problem and/or Solutions", looks at the environmental implications of transport in six subdivisions in metropolitan Adelaide. The author emphasizes the domination of the automobile in subdivision planning, and the fact that if we must worship the car, perhaps we can do it more cheaply both in terms of finance and human lives. He suggests increased use of "T" junctions in subdivisions rather than cross-roads.

42 072137 ILLUSTRATION OF TRANSPORT ECONOMY 1974. As indicated by the title "Illustration of Transport Economy '74", this book presents Japanese transportation economic trends and developments up to 1973 by graphs. The first chapter "Social Economic Activities" includes general topics such as public transportation services, Gross National Products, and etc. The second and third chapters deal with the trends of national cargo and passenger transport. Chapter 4.: International Transport; chapter 5.: Transportation and Energy; chapter 6.: Big City Traffic versus Light Traffic; chapter 7.: Organization of Traffic Facilities; chapter 8.: Transportation Labor and Management; chapter 9.: Modernization of Transportation; chapter 10.: Traffic Accidents and Hazards; and chapter 11.: Comparing Japan to Other Countries. 42 072139 NEW TOWN TRANSPORT TASK STUDY. The prime objective of this study has been to examine transport/land use system parameters for a new town in order to provide standards and performance criteria within planning of a transport system, without cars, can be undertaken. Secondly, a framework and guideline to enable the evaluation of alternative transport plans which might be considered appropriate to a new town of the order of 200,000 population. The two main phases included historical data studies which were analyzed to establish broad standards of performance for transport systems in Australian cities. The second phase of the study has been aimed at testing the sensitivity of transport system operations to changes in urban structure, in particular the location and density of residential and employment centers, and to changes in actual transport system operating characteristics. It was concluded that city planning should be closely integrated with the planning of public transport services.

42 072145 PUBLIC TRANSPORTATION. VOLUME 29, NUMBER 5-6. This issue of *Trasporti Pubblici*, May-June 1972, contains articles on: (1) disk brakes; a comparison is made between disk and drum brakes, with particular regard to mechanical and technical characteris-

tics. Particular attention is given to dealing with the problem of vibrations; (2) the transporting of dangerous goods, which is increasing all the time. The experiences abroad are discussed, together with some proposals to restrict itineraries and loads; (3) harbor policy in the European community; (4) an article on the problems of vehicle braking; (5) vehicle safety through the study of impact, e.g. decelerations affecting the passenger compartment in case of front-end collisions, both against another vehicle and against a standing obstacle; (6) the International Conference on Vehicle and Traffic Safety, and (7) the effects of impact between two vehicles. Calculation is made of the values which may be assumed for safety headway intended as minimum between two vehicles. [Italian]

42 072164 MODERN TRANSPORT: THREE CANTOR LECTURES. This issue contains three articles on the subject of transportation. The first entitled, *An Integrated Transport System*, attempts to see where the line should be drawn and what scope there is for integrating the components which together make up Britain's transport system. The author suggests that the scope for integration lies primarily in those areas where there is severely wasted competition between the available systems leading to either a surplus, of transport capacity or to deprivation of means of transport. The prime examples may be listed as follows: (1) urban areas where the car competes with public transport services, which leads to an excess of car traffic; (2) direct competition between road and rail for long-distance passenger transport; (3) direct competition between road and rail for both long and short-haul freight transport. This is an extremely difficult field. No one doubts the value of rail haulage for the long distance transport of bulk commodities such as coal, iron ore, cement and petroleum products; (4) direct competition between cars and buses in rural areas. The author concludes that it is futile to talk of integration unless all the authorities concerned can develop a common outlook and agree on the objectives, including the professional staffs behaving in the same manner.

42 072173 ILLUSTRATED TRANSPORT ECONOMY OF JAPAN 1974. This is a fully illustrated version of the 1974 transport economy of Japan. It includes chapters on economic and social activities; aspects of domestic goods transport; domestic passenger transport; international transport; transport energy; large city traffic, including bus lanes, subsidies for local buses and coaches; improvement of transport facilities with a chart reflecting underground railways; management and labor aspect of transport enterprises; modernization of transport showing charts on expansion of the freightliner network and modernization of aircraft. Chapter 10, which discusses traffic accidents and environmental pollution by transport, contains charts on causes of death; railway accidents; road traffic accidents; marine accidents; air accidents; composition of exhaust gas from motor vehicles; airport noise; and deaths caused by traffic accidents in the world's major countries.

42 072346 TRANSPORTATION ECONOMICS: GUIDE TO PUBLICATIONS. Each chapter of this report is followed by an extensive list of publications pertaining to the respective subject. The first chapter, transportation problems in economic and social development covers such topics as social overhead capital, recession and investment, industrial location, development planning, motorization, and transport policies. It notes that a new type of community must be constructed which will fit the coming new high-welfare society. The second chapter deals with the problems of air and noise pollution, environmental standards, and energy. The third chapter advocates that technological developments should be determined by their suitability to the society they are intended to serve. The chapter on public subsidy and financial burdens for public transportation heavily emphasizes the fact that the old regulations for public transport fares must be changed so that the revenue from fares can sustain the operational costs of all public transport agencies. The next chapter, the function of intra-city transportation modes identifies the transportation problem in inner-and intra-cities over congestion. The intra-city transportation problem is rising due to the increase of commuters and transportations inability to meet their new needs. The final chapter deals with the movement of passengers and freight and points out that future transportation planning must take into account leisure travel, as well as freight terminals which facilitate the transportation of freight from their terminal to the consumer.

42 072456 SPATIAL EQUILIBRIUM AND JOURNEY TO WORK. The length of the journey to work may depend on choice of residence from a fixed job site or on choice of job from a fixed residence. The authors consider the factors that influence both in southeast England, and the effects on males and females separately. The authors suggest that rising car ownership increases the variance of journey-to-work lengths, and that the changing demands for skills may also be influential.

42 072470 TRAVEL DEMAND, MODE CHOICE, AND SYSTEM ANALYSIS. The seven papers examine various aspects of travel demand, modal choice and system analysis. The first examines the effects of a fare reduction in Atlanta. The second paper investigates the potential for gradually restructuring urban areas to reduce the built-in requirements for transportation. The third studies the socioeconomic characteristics of commuters and the transport service characteristics they value in their choice of mode

for work trips. Two papers consider the problems of airport access. A methodology called Special Area Analysis is described in the sixth paper. The final paper describes the problem of integrating system and project planning to include all community and environmental concerns.

42 072495 PARAMETRIC ANALYSIS OF TRANSIT SYSTEM CAPACITY. In designing a passenger transportation system, two problems are the total passenger carrying capacity and the sensitivity of this capacity to variations in performance characteristics of the operating and control equipment. This paper presents a faster, more direct method than has been available to answer these questions. The equations, examples and graphs presented show that a typical urban transit route employing on-line passenger stations, trains about 450 ft long and approximately 20 second dwells can be expected to carry an average 600 ppm while operating at scheduled headway of 90 seconds and approaching stations at up to 70 mph. The calculations are a guide to early estimating of carrying capacity in a wide scope of transportation systems.

42 072558 METROPOLITAN TRANSPORTATION PLANNING. While emphasizing the transportation planning process, the contributors to this volume offer an insight into an interdisciplinary approach to solving metropolitan transportation problems. Consisting of engineers and planners as well as an architect, urban designer, and landscape architect, these contributors provide a modular "problem solving" framework into which further information on various aspects of metropolitan transportation planning can be integrated. Information on different types of transportation service and impact problems is included as well as discussion on goal identification techniques. Relevant legislation and land use control mechanisms and mathematical programming techniques in solution generation and specification are offered.

42 072659 PRINCIPLES OF URBAN TRANSPORT SYSTEMS PLANNING. The processes involved in urban transport strategic planning are described in depth and within a systems type framework by the author of this precedent-setting text. Recent advances as well as the commonly used analytical methods are described thoroughly. The first part of the book covers the techniques used to estimate the travel demands that are likely to be created by a given land use arrangement including trip generation analysis,

modal split analysis, trip distribution analysis and traffic assignment analysis. A family of Lowry type land use models is presented and current applications of these models to regional spatial planning are discussed. Other topics covered by this book include transport technology, concepts of urban structure, economic evaluation, urban information sources and urban goods movements.

Hutchinson, BG (Waterloo University, Canada) ; Scripta Book Company 1974, 444 pp; ACKNOWLEDGMENT: Scripta Book Company; ORDER FROM: McGraw-Hill, Incorporated, 1221 Avenue of the Americas, New York, New York, 10020 Orig. PC

42 072697 PROBLEMS OF TRAFFIC CONGESTION AND OF COMMUTERS IN THE PLANNING OF METROPOLITAN AND RAILROAD SERVICES [I problemi della congestione del traffico e dei pendolari nella pianificazione dei servizi metropolitani e ferroviari]. Individual automobile transport as the main cause of traffic congestion in urban areas and the remedies to solve the commuter problem are considered. The system adopted in London by the British Transport Commission, to keep quite separate urban transport from suburban and regional is explained and recommended. A comparison is made between short distance and inter-city commuter services, which involves change of trains and the accompanying difficulties. It is suggested that metropolitan lines be gradually extended to the points where there is sufficient traffic intensity, with a traffic distribution as uniform as possible, attempting to balance it on two radial sections of a transversal line of the city. 42 072860 CITIZEN PARTICIPATION IN TRANSPORTATION PLANNING: THE BOSTON EXPERIENCE. This book examines "citizen participation" and the way it influences changes in basic public policy. It focuses on the recent experience of metropolitan Boston with its transportation plan and program—a program which was dramatically altered by recent decisions of the governor of Massachusetts to scrap

plans for completing expressway projects that had been in the process of construction for some years. Behind the governor's decisions is the story of a new method of doing business in transportation planning, a method that among other features called for "public participation" in the process of drawing up plans and recommending programs.

42 080212 SOUTH SHORE RAIL RAPID TRANSIT EXTENSION. PRELIMINARY IMPACT STUDY. The major goal of the report is to increase the understanding of impacts of this transit extension with the view toward the planning of future extensions. The major data source for the study was a ridership survey. The questionnaire was developed to determine a variety of ridership characteristics and transit extension impacts; i.e., time of use, mode of transportation to the station, previous mode of travel, origin, destination, reasons for use, propensity to transfer, time saved or lost, and a variety of socio-economic characteristics. A sample questionnaire is included in this report. Chapters include the introduction-methodology, historical review, planning considerations, engineering design aspects, ridership characteristics, impacts on traffic volume and patterns, economic impacts, and land use impacts. Conclusions are presented. A bibliography is furnished.

42 080471 URBAN TRANSPORTATION FACTBOOK. PART 2. The FACTBOOK is organized into Parts I and II to aid handling convenience. Part I contains Section I, a summary highlighting the most important transportation related phenomena occurring in major metropolitan areas today and Section II, a comparison primarily among the 33 largest SMSAs of selected city transportation and growth characteristics. Part II contains one section consisting of additional detailed transportation and growth statistics for the 33 largest SMSAs. Part II consists of detailed tables for each of the 33 SMSAs included in this edition of the FACTBOOK. The basic organization presents the statistics for each city in finer geographic detail, including statistics on a county-by-county basis and distinguishing between central city and outside-central-city residents. Finally, source notes for the tables in each volume are given at the end of that volume. It should be noted that most of the statistics presented in the FACTBOOK were previously available in other published sources, but generally in publications prepared for different purposes. As a result, the key transportation-related variables were not previously presented in a convenient form for either inter-metropolitan comparisons or intra-metropolitan trend analyses. A major contribution of the FACTBOOK consists of assembling and displaying in one place the data collected by a variety of agencies for a variety of purposes.

42 080472 URBAN TRANSPORTATION FACTBOOK. PART 1. The FACTBOOK is organized into Parts I and II to aid handling convenience. Part I contains Section I, a summary highlighting the most important transportation related phenomena occurring in major metropolitan areas today and Section II, a comparison primarily among the 33 largest SMSAs of selected city transportation and growth characteristics. Part II contains one section consisting of additional detailed transportation and growth statistics for the 33 largest SMSAs. The Summary gives a national overview of transportation and growth trends, focusing primarily on the 33 largest Standard Metropolitan Statistical areas—all those whose 1970 populations exceeded one million. Comparative figures are provided for each of the 33, along with regional and national summaries. Section II was planned to permit detailed comparisons among cities. The material in this section is organized into four basic categories: 1) characteristics of the city, including population and demographic variables, residence and workplace location, and land-use patterns; 2) demand for urban transportation, concentrating on worktrip statistics for all SMSA residents and for residents of selected low-income areas; 3) supply of urban

transportation costs, including statistics on auto availability, highway and transit facilities; and 4) transport costs, including statistics on highway and transit investments and expenditures. A glossary of terms follows the City Comparisons section. The glossary precisely defines the variables which appear in the tables. For statistics derived from the Census, the definitions come from the Census Users Guide; for computed data the basis of calculation is explained. The glossary serves as a bridge between Part I and Part II, which may be viewed as a "technical appendix".

42 080655 1972 NATIONAL TRANSPORTATION STUDY. POPULATION PROJECTIONS BY STATES, URBANIZED AREAS AND OTHER GEOGRAPHIC AREAS. The report, tabulated from demographic data in support of 1972 National Transportation Report, provides the user with population projections by state, urbanized areas and small urban, and rural under 1990 Boundaries. Because 1990 Boundaries are the basis for National Transportation Requirements, the 1960 and 1970 population detail is adjusted for those areas less than 50,000 persons, but which would contain such population by 1990, and are therefore treated as urbanized areas. Totals for urbanized areas may not be consistent to Census totals for these reasons but agree with state control totals and national aggregates.

42 080760 SPATIAL PATTERNS OF THE JOURNEY-TO-WORK AND MASS RAPID TRANSIT IN LOS ANGELES. The proposed mass rapid transit system for the Los Angeles metropolitan region is examined and evaluated. Data describing the journey-to-work function in the region is analyzed in order to delineate the major patterns that exist, along with the major centers of attraction. The techniques used are those of factor analysis, modal analysis and cluster analysis. All three techniques delineate lightly similar patterns and define identical centers of attraction within the system. The emergent structure is compared with the proposed rapid transit network and comments are made regarding the possible success of the future system.

42 080775 PLANNING MASSIVE ACCESSIBILITY FOR CENTRAL ATLANTA: A STUDY OF MISLEADING PROJECTIONS. Urban transportation planning in Atlanta has evolved in the 1950's and 1960's on the premise the massive new accessibility is needed for the Central Area of the city to accommodate vast increases in downtown trips. Projections have been made with little concession to reality, stemming from an unwillingness to collect and study existing data and trends. Peak hour trips to the Central Area have stabilized, but more radial capacity is being proposed. The Atlanta fixed rail rapid transit program has been justified by the doctrine of massive new accessibility for the downtown area. Little consideration was given to busways, and benefit/cost studies did not compare alternate systems. Also, instead of casting mass transit as a substitute for additional freeway construction, the local transit agency, MARTA, has agreed to support a new expressway network also focusing on the Central Area.

42 080816 URBAN CORRIDOR DEMONSTRATION PROGRAM. The plans are summarized of eleven urban agencies participating in the Urban Corridor Demonstration Program the purpose of which is to test and demonstrate the concerted use of available highway traffic engineering and transit operations technology for relieving traffic congestion in radial corridors serving major urban centers. The program which is directed to metropolitan areas of over 200,000 population, emphasizes low-capital intensive improvements rather than new major construction to demonstrate whether rapidly implementable, relatively inexpensive projects can effectively relieve urban traffic congestion. This report which is presented with the purpose of apprising public officials and citizens of ideas that will help relieve peak-hour traffic, discusses highlights of proposed projects, provides relevant information for prospective applicants and lists of participating agencies and proposed projects.

42 080922 APPRAISING URBAN TRANSPORT POLICY-THE NEW REGIME. The nature of the defects which existed in urban transport policy planning are examined, as well as the ways in which new administrative arrangements will revolutionize the process. The new policy will reform the planning enquiry and participation process, reform local government structure, and reform the financial arrangements for urban transportation. Corollary developments

necessary to structure planning are discussed, and the structure planning process itself is detailed. Local planning, it is noted, shall incorporate procedures both of public participation and of independent assessment. Two separate planning processes that require improvement are identified as (a) planning delay, and (b) planning misdirection. Four fundamental philosophies about the purpose of the enquiry process are identified as: conflict resolution; technical checking; examination of the relationship between the political objectives and the technical plans; and judgement of the values implicit in the plan. Skills required by an enquiry of this kind are both technical and political, and the procedures adopted need to be formal. The role of the central government is discussed as well as local government structure particularly as related to the transport planning field. The creation of intermediate institutions of planning are outlined. It would be useful to develop a planning advice service which might have a central staff of planning experts for technical services and a number of small regional bureaus. The government should produce policy guidelines which indicate the framework within which local political discretion should operate. With regard to the appraisal procedure, it should be clearly required that the statements make clear and explicit reference to the fundamental objectives and judgement on which the plan is based.

42 081002 TRANSPORTATION ATTITUDE SURVEY FOR MODAL-SPLIT FORECASTING AS PART OF LONG-RANGE TRANSIT PLANNING. The Orlando Urban Area Transit Study included a community attitude survey in its long-range transit planning process. The primary purpose of the attitude survey was to provide input to a modal-split model designed to determine patronage on a future transit system. Criteria for long-range planning of the regional transit system where obtained from potential users' attitudes. The basic information obtained from the survey is (a) attributes that the public considers important in satisfying what it perceives as acceptable transportation service; (b) minimum levels of service necessary to generate significant patronage of the future system; (c) factors that may cause choice riders to use transit rather than automobiles; (d) trip purposes for which the future public transit system would be used; (e) whether individual respondents would use a future transit system that met their specifications, as a rough indication of modal split; (f) socioeco-

nomic groups with a greater tendency to use a future transit system; (g) determination of automobile-captive, transit-captive, and free-choice ridership for different system alternates, trip purposes, and income levels. A pilot attitude survey of community leaders, coupled with a slide show presentation on regional public transit system concepts, preceded the telephone survey of the tricity Orange-Seminole-Osceola region. An additional consideration in this study was that traditional calibration of a modal-split model would not be possible. Current bus service does not reflect the type of well-designed regional transit system for which we want to forecast patronage. This suggested use of a model that had been calibrated in a different urban region and that could be justified as "universally applicable" in theory. The community attitude survey served to confirm the basic assumptions of the disutility model that was adopted and provided the captive rider endpoints, thus making the model more realistic for application to the Orlando urban area.

42 081133 INTEGRATED ANALYSIS OF SMALL CITIES INTERCITY TRANSPORTATION TO FACILITATE THE ACHIEVEMENT OF REGIONAL URBAN GOALS. The research focuses upon intercity transportation and its relationship to socioeconomic characteristics in essentially rural regions. The study area consists of the nine administrative planning regions in Iowa that do not include a community of 50,000 population or more. The research objective was to relate the intercity transportation system of small urban communities to their ability to attract and absorb growth. This relationship, as established, suggested a structured set of conditions regarding transportation planning, regulation, policies, and programs that would be supportive of growth in the study regions and in similar rural regions in other states.

42 081297 IMMEDIATE IMPROVEMENTS IN PUBLIC TRANSPORTATION. PORTLAND VANCOUVER METROPOLITAN AREA. This report describes the analyses, conclusions and recommendations concerning immediate improvements in regional public transportation to be implemented in the next few years. The report describes present transit service in the area, outlines surveys and analyses performed, articulates objectives and standards, recommends a plan for transit improvements, presents estimates of financial results of operation and outlines an implementation program. A summary of the conclusions and recommendations is included at the beginning of the report. Part II, which is not yet finished, will be the 1990 PUBLIC TRANSPORTATION MASTER PLAN. The implementation of the plans presented in both parts will result in a regionwide bus rapid transit system operating on exclusive busways, reserved busways on existing streets or in mixed traffic, with the capability to be converted to a new technology of public transportation systems as that technology unfolds. The performing organization worked closely with the staffs of the Columbia Regional Association of Governments (CRAG), the Tri-County Metropolitan Transportation District (TRI-MET), the City of Portland, the Oregon State Highway Division, and staff members of the various cities and public agencies throughout the metropolitan area. Meetings with civic, professional and community groups were held to inform the public and to receive comments on the plan. Two large maps, one on existing transit service as of 1971 and one on the recommended transit plan, are included.

42 081310 HOMOGENEITY OF MODELS OF TRANSPORT MODE CHOICE: THE DIMENSIONS OF TRIP LENGTH AND JOURNEY PURPOSE. This paper reports the development of disaggregate, behavioral models of transport mode choice along two new dimensions. The scope of disaggregate modeling is extended to an intercity context and the range of journey purposes is broadened to include social/recreational and business travel, as well as the journey to/from work. The intercity models developed should be viewed in the context of recent trends in demand modeling. Instead of arbitrarily selecting a mode as a base on the grounds that in term of speed, or cost, or comfort, the approach advocated in this paper examines the choice actually made by the traveler. The results reported lead to the conclusion that doubts as to the homogeneity of the transport mode choice decision are fully justified. This paper has investigated mode choice behavior stratified along two dimensions, journey purpose and trip length, and the analysis clearly demonstrates that the same mode choice process is not reflected in each case.

Watson, PL *Journal of Regional Science* Vol. 14 No. 2, Aug. 1974, pp 247-257

42 081536 HIDDEN CITY. In studying the problems of modern cities, students and professors at the Harvard Graduate School of Design are exploring some of the possible uses of artificial hills and trying to see how these might relate to the more familiar kinds of buildings. A city in which all of the major windowless services are clustered in hills may also contain service mounds accommodated the main roads and facilities for parking, one could conceive of plans which would permit the development of adjacent pedestrian areas, possibly serviced by monorails, subways, electric minibuses and moving sidewalks.

42 081592 CHALLENGES IN URBAN TRAVEL FORECASTING. This paper discusses the need for travel forecasting models which take into account the current needs in urban planning. These models should reflect the socioeconomic changes that have occurred in recent years. They should be concerned with distribution systems, peripheral parking concepts, traffic-free zones, bicycle and taxi modes, movement of goods, noise and air pollution, mobility for the disadvantaged, and many other recent developments. Current models have many disadvantages, which make them unsuitable for use in urban planning. Not only are they costly and time-consuming, but they do not easily respond to the increasing number of legislative requirements for such matters as air quality and energy conservation. It is concluded that the past efforts in travel demand forecasting were largely successful for the purposes for which they were intended, but the current transportation-related issues are far more complex and require a concerted effort on the part of the profession to meet the challenge. Another topic addressed in this paper is the value of travel time. It is concluded that it should be used as a policy variable in public investment analysis, rather than as a basis for evaluating alternative courses of action.

Gendell, DS (Federal Highway Administration) *Transportation Research Board Special Reports* No. 149, 1974, pp 7-9, 1 Ref.; Presented at a conference in South Berwick, Maine, July 8-13, 1973, sponsored by TRB, DOT and the Engineering Foundation.; ORDER FROM: TRB Publications Off, Repr. PC

42 081628 MASS TRANSIT AND THE POLITICS OF TECHNOLOGY: A STUDY OF BART AND THE SAN FRANCISCO BAY AREA. This is a book about the political consequences of technological choice. The substantive portion of the book deals with two public transit agencies in the San Francisco Bay Area. The author is more concerned, however, with the issues of politics and technology than with those of transportation. This is, therefore, a book about how two different technologies coping with transportation problems can produce significantly different consequences. The intention is to demonstrate how proposals for large-scale technological systems, such as BART, have social and political consequences that were neither intended nor anticipated.

42 081636 SUMMARY DESCRIPTION 1995 TRANSPORTATION SYSTEM PLAN. The 1995 Transportation replaces the Regional Transportation Interim Plan and Program of 1971. The Chicago Area Transportation Study and Northwestern Indiana Regional Planning Commission, aided by the City of Chicago and Northeastern Illinois Planning Commission prepared this plan to provide a better transportation system for more than 3 million citizens of an eight-county area. The Plan is a coordinated multimodal approach involving transit (composed of commuter railroads, rapid transit and bus), the highway system, airport system for commercial and general aviation, and the freight system involving rail, water, truck and energy corridors. The plan strives to meet 11 regional objectives which are listed.

Chicago Area Transportation Study, Northwestern Indiana Regional Planning Commission Nov. 1974, 34 pp, 13 Fig., 4 Tab., Refs.; This study has been funded in part by the Urban Mass Transportation Administration.; ORDER FROM: Chicago Area Transportation Study, 300 West Adams Street, Chicago, Illinois, 60606 Repr. 42 081830 MACROPLANNING APPROACH TO THE ASSESSMENT OF REGIONAL BUS RAPID TRANSIT SYSTEMS. Bus systems provide the major public transportation services in the Seattle area. System viability has become a matter of increasing concern in recent years, in many urban areas, as ridership has fallen and operating deficits have increased. There is considerable sentiment, however, that public transit should not be allowed to collapse, because this would leave many people with no economical means of transportation and place even greater reliance than at present on the private automobile and freeways. An approach to the problem is bus rapid transit, which would provide a different route structure and operating philosophy than present bus systems. A bus-based system has merit because it offers the possibility for relatively high-speed movement of people on existing arterials, highways, and freeways without the very high capital investment required for a rail system.

Meier, RC Vederoff, GE Porter, D (Washington University, Seattle) *Transportation Research Record* No. 513, 1974, pp 15-22, 4 Fig., 3 Tab., 10 Ref.; ORDER FROM: TRB Publications Off, Repr. PC

42 081845 A PRELIMINARY PROPOSAL FOR HIGH AND INTERMEDIATE LEVEL TRANSIT IN THE DETROIT METROPOLITAN AREA. This proposal results from a refinement of previous regional transit planning efforts by the Southeast Michigan Council of Governments (SEMCOG), and SEMTA. While this booklet focuses on public transit, the proposal stems from a coordinated transportation planning review incorporating both highways and transit. Input to the process has been provided by a joint effort of SEMTA, SEMCOG, and other appropriate city and county agencies. This input, in the form of goal formulation, regional land use planning, total travel projections, and transit

travel projections, forms the basis for all recommendations. Recent projections indicate that between 1970 and 1990 the population of the seven county SEMCOG region will increase by 28% to a total of 5,950,000. The number of households will increase by 38%, thus indicating a decrease in family size and an increase in both the number of wage earners and the demand for rush hour work trips. Even more significant, the number of private automobiles in the region is expected to more than double by 1990. These and other factors, including pollution abatement, socio-economic disparities, and land use considerations, lead to the conclusion that development of a viable public transit system is of paramount alternative to the automobile for must provide a competitive alternative to the automobile for certain types of trips. To meet this need, a potential 1990 transit network was developed by SEMTA and SEMCOG in early 1972. This test network builds upon the existing bus and limited commuter railroad system. It incorporates the best features of previous studies together with the performance characteristics of the most modern transit systems. The test network has been subjected to refined analysis, the results of which are presented herein. /HSRI/

42 081855 EVALUATION: 1995 HIGHWAY-PUBLIC TRANSPORTATION NETWORKS. This evaluatory report of six alternative transportation networks (public transportation and highways are combined in these networks) for the 8-county Chicago-Gary Region, assesses the social, economic and environmental consequences including the compatibility of the alternatives with adopted comprehensive plans for the Region. This evaluation is a part of the reappraisal component of the planning work program which is a systematic recycling of the planning activities which leads to periodic changes in plans and programs, and consists of three cycles: annual review, major review, and complete plan re-evaluation. Details are given of the methodology, as well as of the results of the overall assessment and the analysis of variable runs. Conclusions based on the study are presented.

Northwestern Indiana Regional Planning Commission 1974, 77 pp, Figs., Tabs., 27 Ref., 5 App.

42 081901 AN ANALYSIS OF TWO FEDERALLY-ASSISTED DEMONSTRATION PROJECTS. This report is an analysis of two demonstration projects. Demonstration projects resulted from the passage of the Housing Act of 1961 which marked the beginning of the Federal government's role in providing funds to aid urban areas in solving their transportation problems. One of the demonstration projects examined was undertaken by the Southeastern Pennsylvania Transportation Compact (SEFACT) from October 1962 to October 1965; and the other by the Mass Transportation Commission of the Commonwealth of Massachusetts (MTC) from December 1962 to March 1964. Both projects provided data for the purpose of predicting the effects on ridership levels of various changes in fares and frequencies. Both projects were analyzed from regional and national viewpoints. It

was determined what could be learned from these projects and what could have been done to obtain more information that might have increased their worth to both the Federal government and the local area. It should be recognized that while other modes were included in the demonstrations, only commuter rail experiments (which comprised the largest group) were considered for the purpose of analysis in order to limit the size of the study. Appendices contain the letter to B&M's passengers and an excerpt from the Housing Act of 1961. A selected bibliography is furnished and there is a list of those contacted for the structured interviews and telephone conversations.

42 081947 AN AGGREGATE URBAN TRANSPORTATION MODEL: ECONOMETRIC SPECIFICATION. Many transportation researchers have concerned themselves with a single problem. They have devoted a great deal of effort to estimating the user and socio-economic impacts of routes. Their work presumes a description of the location and physical capacities of a set of existing and proposed routes. This route-specific approach requires much engineering design work before estimates of user and socio-economic impacts can be made. When specific routes are not important, estimating the total travel volumes of various modes within a region can be approached more simply. The purpose of this paper is to derive a model of aggregate transportation relationships within an urban region.

42 083082 ATTITUDINAL AND SITUATIONAL VARIABLES INFLUENCING URBAN MODE CHOICE: SOME EMPIRICAL FINDINGS. A mode choice decision structure incorporating travel attitudes toward modes and situational constraints is investigated. The major hypothesis tested is that mode choice is determined primarily by situational constraints, such as auto ownership and income, secondly by the quality of alternative modes. The structure of the mode choice process is analyzed with respect to (1) applicability of certain criterion forms; (2) psychological weighting of modal attributes in the choice criterion; (3) strength of logit, probit, and discriminant functional forms; (4) the relative strength of socio-economic and attitudinal variables in predicting mode choice. An evaluation is made of 50 binary choice models fitted to a sample of 471 randomly drawn urban travelers. Results indicate that (1) the four choice criterion forms tested are all about equal in predictive strength; (2) psychological weighting has no effect on model strength, but does influence which modal attributes appear to determine choice; (3) the three functional forms tested are all about equal in strength; (4) situational factors account for 80-90% of variation explained by the models, attitudes toward modes 10-20% thus confirming the primary hypothesis. Implications of these results for mode choice modeling and transit planning are discussed.

Hartgen, DT (New York State Department of Transportation) *Transportation* Vol. 3 No. 4, Dec. 1974, pp 377-392, 2 Fig., 4 Tab., Refs.; ACKNOWLEDGMENT: Transportation; ORDER FROM: Elsevier Scientific Publishing Company, P.O. Box 211, Amsterdam, Netherlands Repr. PC

42 083083 TRANSPORT PLANNING AND THE POLICY-MODELLING INTERFACE. Evidence of the inability of transport models to elucidate policy is cited and reasons for this weakness are then suggested. Attention is drawn to the fundamental changes in both opinion and policy currently taking place. There is less concern with accessibility per se and rather more concern with the provision of adequate or minimum accessibility for certain social groups. More emphasis is placed also on the environmental aspects of transportation. The implications of these changes are outlined. It is not at all clear that the need to adapt and up-date models is appreciated widely enough. Finally, it is considered whether fundamental changes in methodology may help to make transport models more responsive to policy needs.

42 083288 MODAL CHOICE MODELS: INTRODUCTION AND SELECTED BIBLIOGRAPHY. The introduction to this bibliography discusses briefly the concept of modal split models, including the characteristics of both pre-distribution and post-distribution models. It is indicated that the data base used for predicting modal split allocation among the competing modes is obtained from origin-destination surveys, the U.S. census, and attitudinal and behavioral data. A literature review disclosed that, with respect to modal split models, most of the literature has addressed the question of preferences indirectly, by focussing on the decision to use one mode of transportation rather than another. The studies have primarily been concerned with the journey to work and research has fallen into three general areas. First, there is the type of study which relates mass transportation usage to physical and social characteristics of the city, such as size, density and age, population, income, race and automobile ownership. Secondly, models of modal choice have been developed to explain and predict public transport and private car usage for the work trip between specified geographic zones in urban areas. Thirdly, some researchers have developed models to explain and predict individual modal choice behavior, taking account of individual travel and household characteristics. The bibliography contains references to articles, books, and reports.

42 083585 A TRANSIT DEVELOPMENT PROGRAM FOR HUNTINGTON, LONG ISLAND. This report documents the work performed and the conclusions reached in the Huntington (NY) Mass Transportation Study.

Two broad objectives were established: (1) to identify problems associated with transit services and the local access elements of commuter railroad service in the Town, and to identify alternative opportunities for service improvement; and (2) to develop policy and program directions that would help the town better cope with the weakness of near total reliance on the auto. In the first phase of the study, existing transit services, population, employment, and economic data were collected. About 20 interviews with representatives of potential transit user groups were conducted. Three surveys related to existing and potential transit use were conducted. In the second phase, existing transit services were analyzed, needs for additional transit services were defined, alternative improvements were identified and preliminarily screened, and findings were presented. In the final phase, alternative transit improvements were analyzed in detail and a Transit Development Program was developed and detailed. The program includes 4 categories of services: (1) fixed route services; (2) commuter services; (3) specialized services; and (4) a cooperative taxi program for special user groups. Appendices contain the transit rider, commuter access and potential needs surveys, potential user interviews and preliminary program proposal. /UMTA/

42 083587 LOUISVILLE METROPOLITAN TRANSIT IMPROVEMENT PROGRAM. Louisville is Kentucky's largest city and the 40th largest in the U.S. Located on the Ohio River, its population was 361,472 in 1970. The study area for the Louisville Metropolitan Transit Improvement Program constitutes the original SMSA boundaries-Jefferson Co., Kentucky, and Clark and Floyd Counties, Indiana. This area also includes 26 incorporated communities. The purpose of this report is to provide a short-range (five-year) transit improvement program. This program is designed to offer the Louisville community a specific course of implementation and several alternate funding sources whereby transit can be shaped to accommodate the community's needs. This report has included an on board origin-destination survey, public hearing, goals-based alternate systems analyses, and financial/legislative research to define practical avenues to implement the recommended plan. Chapters address the background of the area, community involvements, transit goals and objectives, adequacy of service, valuation of physical assets, characteristics of transit users, alternate ownership/management framework, alternate transit systems, program for implementation, and continuing transit planning and improvement program. Figures and tables are numerous.

42 083816 COST-BENEFIT ANALYSIS FOR EVALUATING TRANSPORTATION PROPOSALS: LOS ANGELES CASE STUDY. Although most economists and public officials understand the theory of cost-benefit analysis, there seems to be great difficulty when it comes to applying this technique to "real world" problems. This paper critically examines a cost-benefit study undertaken for a proposed rapid transit system in the Los Angeles metropolitan area in order to illustrate the problems and to suggest alternative methods for treating them. For the proposed Los Angeles rapid transit system, the benefit cost ratio is favorable (exceeds unity) only because: (1) many benefits are incorrectly calculated due to such factors as inflation, anticipated unemployment reductions and expenditure decreases, along with double counting and the inclusion of non-quantifiable benefits; (2) many costs are understated or omitted entirely; and (3) the passenger estimates are overly optimistic. This last point is particularly important since passenger estimates are crucial to a cost-benefit study of any rapid transit system. /Author/

42 083973 TRANSPORTATION POLICY AND THE DELIVERY OF SOCIAL SERVICES IN A SMALL CITY. The study examined the ways in which social service agencies in a small city cope with the transportation problems of immobile clients. The study documents unmet needs as well as underused capacity. Inefficiency stems from the tendency for many agencies to operate 1 or 2 vehicles only a brief time during the day. Low-vehicle utilization combines with high driver cost to produce per client trip costs as high as \$7.60. Demand for services appears to be poorly coordinated with the available supply of vehicles. Consolidation of transportation services would eliminate this inefficiency, but economic, institutional, and legal barriers stand in the way of effective merger of transportation programs. Interim solutions include exchanges among agencies of data on volunteers and vehicle availability and increased reliance on public transit modes. Longer range solutions involve application for federal funds through local governmental channels for service development and capital improvement programs.

42 083975 INCOME DISTRIBUTION EFFECTS OF THE ATLANTA TRANSIT SYSTEM. This paper reports on a pilot study to evaluate the income-distribution effects of the proposed Atlanta transit system. The incidence of benefits and costs to each of 8 traffic zones is estimated. The zones have annual incomes per family varying between \$5,000 and \$18,000. Benefits accruing to each zone as a result of savings in time, vehicle ownership and operating costs, transit fares, parking, and accidents are estimated and compared to transit fares and additional sales taxes that must be paid by the residents of that zone. The net benefits accruing to each zone seem to be more, both per family and per trip, in zones where family incomes are lower. This pattern, however, is strongly influenced by both the location of the zone relative to the closest

transit station and the level of interaction between the zone and the central business district. Other factors affecting the distribution of income in the Atlanta metropolitan area are also discussed.

42 083977 URBAN TRIP DISTRIBUTION FRICTION FACTORS. Trip distribution study reports are summarized and graphs are presented which show friction factors that were developed by various cities (taken from final reports and various technical reports). The curves are grouped by purpose and city size and are plotted directly from the given information. The graphs or composites could be utilized for synthesis, or borrowed to run a gravity model for a city. They may also be useful as an initial set of factors to any city calibrating a gravity model using origin destination data.

Federal Highway Administration 1974, 90 pp, 22 Fig., 4 App.

42 084380 TRANSIT DEVELOPMENT PROGRAM: FY 1975 TO FY 1976. TECHNICAL BACKGROUND FOR SELECTING PUBLIC TRANSPORTATION IMPROVEMENTS. In an effort to place the needs of the public and private transit carriers into a single document (to better ascertain the appropriateness of the needs and to call for the implementation of the long-range transportation planning effort on a continuing basis), the basis is documented for developing a fundable program for transit development in the Chicago-Northwest Indiana Region. In an evaluatory report of the existing conditions, all the various transit aspects are summarized. The anticipated 5-year capital needs (FY 1975- FY 1979) are presented, and documentation is provided of the 5-year capital needs of the region as input for determining regional priorities. Estimates of costs by funding sources, implementation responsibility, the maintenance of the transit development program, coordination of transit systems, past and current assistance efforts, results of research, development and demonstration, noncapital intensive solutions and congestion relief are other aspects discussed.

Chicago Area Transportation Study CATS 352-02, Sept. 1974, 500 pp, 13 Fig., 23 Tab., 1 App.; Prepared in cooperation with the Federal Highway Administration and financed in part by a grant from the Urban Mass Transportation Administration.

42 084776 PUBLIC TRANSPORT. The papers are published here that were presented at the Seminar on Public Transport held during the PTRC Summer Annual Meeting. The 14 papers grouped in two categories, namely, communication and control, and experimental services, include the following: Benefits of Radio-Assisted Centralized Control of Bus Services; Control of Bus Operations in Dublin; Communication and the Passenger; Changing Occupational Structure in the Road Passenger Transport Industry and its Implications for the Future; Manpower Planning in the Public Sector of the Transport Industry; Problems of Recruitment and Retention of Bus Drivers in London; Factors Affecting Recruitment and Wastage among Bus Drivers in Lon-

don; Park and Ride at Suburban Railway Stations on Merseyside-Some Demonstration Project Results; Stevenage "Superbus" Public Transport Demonstration; Some Results from the Second Stevenage Superbus Experiment; Chaffeur Coach-An Experiment by the West Yorkshire Road Car Company in Personalized Transport at Harrogate; Experience with a Personalized Bus Service for Heathrow Airport Staff; Local Transport in City Centres: Problems and Possibilities for Travelators; and Research Requirements for Dial-A-Ride in Britain.

42 084915 TECHNICAL EVALUATION OF THE RECOMMENDED 1995 TRANSPORTATION SYSTEM IN THE CHICAGO-GARY REGION. This report is confined to the functional evaluation of public transportation and highway modes. The procedure involves a standard methodology developed for the urban transportation planning process: A methodology consisting of a sequence of technical studies designed to simulate 1995 future travel over the proposed public transportation and highway networks. In the latter stages of this process, performance measures are defined and the functional characteristics of the proposed networks are described at the simulated levels of transportation demand.

Chicago Area Transportation Study June 1974, 125 pp, 32 Fig., 52 Tab.; ACKNOWLEDGMENT: Chicago Area Transportation Study; ORDER FROM: Chicago Area Transportation Study, 300 West Adams Street, Chicago, Illinois, 60606 Repr. PC

42 084992 IRT ANNUAL CONFERENCE DIGEST. Proceedings of the annual meeting here presented, cover various aspects of transportation policy planning, construction, legislation, environmental and economic issues. The Southern California rapid transit district development plan was reviewed, and the problems encountered by BART are discussed. Governmental and public pressures for public transport, the consideration of all funding options, the need for analysis of mass transportation alternatives, suggestions for a national transportation policy, and the economic issues of construction are examined. Panels discussed changes taking place in the Federal-Aid Highway Act, as well as new legislative objectives, and the expanding role of light rail cars. Environmental issues were covered, in addition to research and development programs, and the importance of marketing programs. Subjects such as graffiti, vandalism, and citizen participation were also covered.

Institute for Rapid Transit 1974, 72 pp, Photos.

42 084994 METHOD FOR DESCRIPTION OF THE STANDARD OF A PUBLIC TRANSPORT SYSTEM. A method is described of comparing the ability of different public transport systems to satisfy different types of travel requirements, and which may also be used to study the influence of the location of the different activities. The method is designed to describe the public transport standard in a region from the point of

view of the user, and to show how this varies for different groups and different travel purposes in conjunction with journeys to all areas in the region. This report summarizes and discusses the literature review on the subject, and outlines the standard descriptive model.

42 090125 URBAN TRANSPORTATION ALTERNATIVES. A MACRO ANALYSIS. The objective of the study was to evaluate the relative performance and effectiveness of seven transportation systems deployed on a regional basis: Highway (with limited bus), Comprehensive Bus, Exclusive Bus, Rapid Rail, Dial-A-Ride, Dual Mode, and PRT. The systems were analyzed in a hypothetical scenario reflecting the projected 1990 characteristics of the 30 largest U.S. urban areas (excluding the three biggest) as regards transit ridership, application for which it appears to be most suited, and urban transportation needs.

42 090342 THE DETERMINATION AND EVALUATION OF OBJECTIVE ACCESS TIMES TO PUBLIC TRANSIT FOR DISAGGREGATE TRAVELER BEHAVIOR MODELING. The paper investigates methods of overcoming the deficiency of zonal aggregate transit network data for representing local walk access variations. Alternative methods of determining transit access in a real setting are reduced to five, based on modifications of transit network coding procedures. These are evaluated by comparison with values from travelers' reports, bus

time tables, and zonal networks. A method of manually coding alternative access links from known individual trip-ends to standard network nodes is found to give a four-to-one improvement in the resulting walk access variance of a trip sample compared to an interzonal representation access for the trips. Numerous other sources of differences between calculation methods and reports for all components of a transit trip were investigated.

42 090450 NEBRASKA STATEWIDE ACCESSIBILITY STUDY. The accessibility analysis has been structured to measure the transportation service to necessary community facilities (hospitals, schools, recreational facilities, etc.) available to different groups of residents (young, old, wealthy, poor, white, non-white, etc.) via alternate modes of travel (auto, public transit). Information generated as a result of this analysis enables the transportation planner to more completely evaluate the benefits and disbenefits of both existing and proposed facilities.

42 090466 THE CHARACTERISTICS OF NEW TOWN TRAVEL: A CASE STUDY OF RESTON, VIRGINIA. New towns often have been proposed as a significant factor in alleviating transportation problems in urban areas. To test this hypothesis, a comparative study was made between Reston and Vienna, Virginia. Both towns are located on the outskirts of Washington, D.C., with the former being a new town and the

latter a typical suburb. The results of this study refer to the automobile ownership and average total mileage driven, the average distance for journey to work, the average number of person trips, the number of walking trips, and the roadspace required and noise levels.

42 090549 CONCEPTUAL DESIGN FOR AN URBAN TRANSPORTATION PLANNING INFORMATION SYSTEM. The system is designed to help state and local planning agencies maintain a current data base to support the 'surveillance' component of the continuing urban transportation planning process. Particular emphasis is placed on the needs of urban areas of 50,000-500,000 population and on the use of existing, local government data sources. Separate sections deal with: (1) The continuing transportation planning process; (2) system design and data sources; (3) computer requirements and software support; (4) system implementation and management; and (5) estimated staff and resource requirements.

42 090559 GUIDEBOOK FOR PLANNING TO ALLEVIATE URBAN RAILROAD PROBLEMS. This report is the third of four volumes reporting the results of a project to analyze the nationwide magnitude of the urban railroad relocation and to prepare methodology for future relocation studies. Volume 1 is an executive summary; Volume 2 is a community guide for preliminary assessment of the potential for planning to alleviate urban railroad conflicts; and Volume 4 presents a nationwide estimate of the nature and magnitude of urban railroad relocation. The purposes of Volume 3 are to suggest an appropriate approach to planning for community policy makers, to outline analytical processes to be used by technical specialists, and to provide supporting data.

42 090879 TRANSPORTATION CONTROLS TO REDUCE AUTOMOBILE USE AND IMPROVE AIR QUALITY IN CITIES. THE NEED, THE OPTIONS, AND EFFECTS ON URBAN ACTIVITY. The report discusses the problem of implementing the national air quality standards in certain metropolitan areas. This will require reductions in automobile emissions greater than those achievable by new car emissions controls, inspection/maintenance, and retrofit. Accordingly, transportation controls to reduce automobile emissions by reducing automobile use have been developed and are being implemented in the affected areas. The approaches to reducing automobile use most frequently used are transit improvements, carpooling programs, and parking restrictions. Programs that combine all three approaches could reduce automobile emissions by as much as 30 percent through diversion of automobile drivers to transit and carpools. However, because of the cost disadvantages created by the underpricing of automobile use, programs not incorporating parking restrictions or other disincentives to low-occupancy automobile travel are unlikely to achieve emissions reductions greater than 5 to 10 percent.

42 091306 INTEGRATION OF TRANSIT SYSTEMS. VOLUME 1. CONCEPTS STATUS, AND CRITERIA. The institutional, operational and physical forms of transit integration and the intermodal and interagency approaches are defined and discussed. Current transit integration efforts are described. Standards for evaluating existing transit systems are developed from a concept of an ideal system and typical deficiencies of U.S. systems and their causes are described. These standards are then used to evaluate and compare transit systems of London, Hamburg, and Paris with those of three U.S. urban areas. Criteria are presented for selecting demonstration projects. Also considered are benefits and costs involved in improving public transit through integration and related measures.

42 091615 RIDERSHIP AND REVENUE STUDY BRANCH AVENUE ROUTE ALTERNATIVES. The objective of the study is to estimate the patronage, revenue and operating costs of five alternative transit systems in the Branch Avenue Corridor. These five alternatives include a base alternative, the Adopted Regional System (ARS) Metro alignment to the Branch Avenue and the South Capital Street busway, and four alternatives which include shuttle rail lines or a change in the ARS Alignment to Branch Avenue. The study was designed as a comparative analysis of these five alternatives. The study uses an analytical approach which combined the information from the extensive 'Traffic Revenue and Operating Cost' report with the travel demand models recently developed by the Metropolitan Washington Council of Governments. The report contains a glossary of terms and a brief appendix.

42 092153 PROCEEDINGS OF THE SYMPOSIUM ON REGIONAL PUBLIC TRANSPORTATION. The contents include discussion of: Integrating highway and transit plans for the region; Dallas area transit plan; Fort Worth transit plan; Research results on metro area public attitudes; Evaluation of rail rapid transit and express bus service in the urban commuter market; Financing alternatives for urban public transit.

Fox, JN ; Texas University, Arlington, Urban Mass Transportation Administration, (UMTA-TX-11-0001) UMTA-TX-11-0001-74-1, July 1974, 89 pp; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-243654/1ST, DOTL NTIS

42 092214 TODAY'S R AND D BUILDING A BASE FOR BETTER TRANSPORTATION. The report presents a concept of a strategic R and D plan for the Department of Transportation. It also presents the concept of a core program of R and D and sets forth the DOT core program in its present stage of development. The plan shows the relationship within the DOT between socio-economic R and D and R and D in the areas of engineering and in the physical, technical, and life sciences, and presents scenarios for the time frame

circa 2000 A.D. for transportation systems for urban passenger, intercity passenger, and freight. Against this background, ongoing R and D programs are described as practical examples of the foregoing conceptual structure. The strategic R and D plan is presented as one with the flexibility to be changed with changing socio-economic patterns, political situations, and break-throughs in the fields of science and engineering.

42 092315 INVOLVEMENT IN TRANSPORTATION THROUGH CAREER AND CURRICULUM PLANNING. SEMINAR PROCEEDINGS, JACKSONVILLE, FLORIDA, 18-22 JUNE 1973. Papers included in the proceedings are categorized as follows: The economic, social and political significance of transportation; transportation services; government and transportation; transportation issues and answers; transportation career opportunities; transportation and the curriculum. The Seminar brought together career counselors, curriculum planners, students, industry representatives from both the private and public sectors, and faculty of the University of North Florida. A workshop format was utilized in developing an understanding of transportation career opportunities and manpower requirements. By-products of this conference were an insight into the current and future regional manpower requirements for the private and public sectors, as well as a more complete knowledge of how the educational counseling process operates. Perhaps the most important understanding reached by those attending the conference was that the ability to analyze, measure, and project manpower resources into the future is essential to constructive solution of a wide range of questions and decisions related to transportation.

42 092488 REGIONAL TRANSPORTATION PLAN. FINANCIAL PLAN. VOLUME II. This report documents the financial analysis undertaken in the Regional Transportation Plan. Following a brief description of the plan elements, the report describes the basic assumptions used for cost and revenue escalation and source of funds. A cost/revenue comparison for the transit and highway elements is presented and the additional transportation funding needs are identified. The final chapter discusses three financial policies adopted to support plan implementation. A five-part appendix documents the history of transportation revenues and expenditures in the San Diego region, describes the cost constrained financial plan, and contains the detailed project listings and revenue and expenditure forms required by the California Department of Transportation.

42 092489 REGIONAL TRANSPORTATION PLAN. DEVELOPMENT OF THE PLAN. VOLUME III. The report describes the methodology used to develop the Regional Transportation Plan and documents the major elements of that methodology, including the regional goals and objectives program, the citizen participation program, the plan development alternative studies, the evaluation criteria utilized to select a development strategy, the policy selection process, and the plan refinement and staging process.

San Diego County Comprehensive Planning Organization, Urban Mass Transportation Administration, (UMTA-CA-09-0037) CPO-TRANS-RTP3-75, July 1975, 191 pp; See also PB-244 893. Supplemental Report.; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-244895/9ST, DOTL NTIS

42 092491 GUIDELINES FOR TRIP GENERATION ANALYSIS. The report documents the uses and techniques of trip generation analysis, a key variable in the urban transportation planning process. Three approaches to the subject are discussed: regression analysis; land area trip rate analysis; and cross-classification analysis. The report presents new techniques and statistical procedures brought to light in recent research and reevaluates data obtained from the analysis. The bibliography provides the most complete list of publications on the topic.

42 092497 TRAFFIC ASSIGNMENT, AUGUST 1973. METHODS, APPLICATIONS AND PRODUCTS. The guide has four major purposes: first to present the techniques currently available for estimating loads on a transportation

network; second, to discuss operational decisions involved in applying traffic assignment techniques; third, to describe the uses for the traffic assignment procedure; and finally, to present an evaluation of the products of the assignment. The report will prove useful to transportation planning personnel and to administrators in Federal, State, and local government. In addition, the publication includes a significant bibliography of traffic assignment procedures and techniques.

42 093012 GUIDEBOOK FOR PRELIMINARY ASSESSMENT OF URBAN RAILROAD PROBLEMS. The report is the second of four volumes and prepares a methodology for performing future railroad relocation studies. The purposes of Volume 2 are to acquaint community leaders with the problems and opportunities that are presented by planning for railroad relocation, and to enable local government personnel, with assistance from railroad company and highway department sources, to prepare a preliminary estimate of the feasibility for improving a local railroad system—including rough costs, economic consequences, and other community impacts, using minimum resource outlay. Charts, tables, and worksheets aid in estimating costs and impacts of alternative approaches to improving the local railroad system. Volume 1 is an executive summary; Volume 3 is a guidebook for community policymakers and technical specialists for conducting detailed relocation planning projects; and Volume 4 presents a nationwide estimate of the nature and magnitude of urban railroad problems.

42 093348 A COMPARISON OF METHODS FOR EVALUATING URBAN TRANSPORTATION ALTERNATIVES. The objective of the report was to compare five alternative methods for evaluating urban transportation improvement options: unaided judgmental evaluation cost-benefit analysis, cost-effectiveness analysis based on a single measure of effectiveness, cost-effectiveness analysis based on multiple measures of effectiveness, and scoring function methods. Each method was assessed within the framework of eight methodological criteria relating to the three major concerns of feasibility, reviewability, and relevancy. The following conclusions are drawn: (1) the judgmental method is satisfactory in several respects, but its subjectivity, lack of specificity might create difficulties in a federal review of the local decision process; (2) of the systematic evaluation methods, cost-effectiveness analysis based on multiple measures of effectiveness poses the fewest difficulties in simultaneously serving the local and federal purposes.

42 093375 CHARACTERISTICS OF URBAN TRANSPORTATION SYSTEMS. A HANDBOOK FOR TRANSPORTATION PLANNERS. The objective of the handbook specifically for use by transportation planners in the evaluation of alternative systems, is to provide a single simplified reference source which characterizes the most important (from the standpoint of evaluation) performance characteristics of the following contemporary urban transportation systems: (1) Rail (commuter, rapid, and light); (2) local bus and bus rapid transit; (3) automobile-highway system (automobiles and other vehicles); (4) pedestrian assistance systems; and (5) activity center systems--people mover systems that have been installed at airports, zoos, amuse-

ment parks, etc. The handbook assesses the supply or performance aspect of urban transportation dealing with passenger demand implicitly. Seven supply parameters studied are: speed, capacity (service volume), operating cost (vehicle), energy consumption (vehicle or source), pollution, capital cost, and accident frequency.

42 093441 UMTA TRANSPORTATION PLANNING SYSTEM REFERENCE MANUAL. Developed by the Urban Mass Transportation Administration, the UMTA Transportation Planning System (UTPS) is a collection of IBM System/360-370 computer programs for use in planning multimodal urban transportation systems. The objective of UTPS is to provide transportation planners with readily available, tested, and easy to use planning tools. This document summarizes information on the function and use of the UTPS program. It discusses general program operation and contains each individual program's operating instructions. This manual also describes all UTPS datasets, and explains how UTPS is installed at a user's computing facility. Sections of the manual include system control statements, subject program control statements, program writeup organization, software system description, data file formats, cataloged procedures, and program writeups.

Urban Mass Transportation Administration, (UMTA-IT-06-0050) UTP.40.74.1.5, UMTA-IT-06-0050-75-1, June 1975, 512 pp; Supersedes PB-231 865; ACKNOWLEDGMENT: NTIS, UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB-246187/9ST, DOTL NTIS

42 093471 A HISTORY OF THE KEY DECISIONS IN THE DEVELOPMENT OF BAY AREA RAPID TRANSIT. The report describes the key decisions in the planning and implementation of Bay Area Rapid Transit (BART) during the period 1947 through 1974. The decisions are evaluated in terms of the influences brought to bear upon the decision-making process to determine decision outcomes.

Grefe, R Smart, R ; Metropolitan Transportation Commission, Department of Housing and Urban Development, McDonald and Smart Incorporated Final Rpt. FR-3-14-75, Aug. 1975, 229 pp Prepared in cooperation with Dept. of Housing and Urban Development, Washington, D.C., and McDonald and Smart, San Francisco, Calif.; Contract DOT-OS-30176; ACKNOWLEDGMENT: NTIS; ORDER FROM: NTIS, Repr. 42 093483 IMMEDIATE TRAVEL IMPACTS OF TRANSBAY BART. The Bay Area Rapid Transit (BART) System started service beneath San Francisco Bay in September 1974. The report analyzes travel patterns in the transbay corridor in the period before and immediately after the start of transbay BART service. Aggregate transbay travel by automobile and transit are analyzed in terms of historical trends and seasonal and short-term variations as the basis for assessing the

impacts of BART. Impacts on traffic congestion are analyzed using highway travel time survey data. The results of on-route questionnaire surveys of transbay travelers using automobile, BART, and bus in October 1974 provide descriptions of the origin-destination pattern of transbay trips, their purposes, and the profiles of travelers. Traveler choices between BART and the alternative modes are analyzed in terms of reported travel times and costs and ratings of perceived importance and satisfaction for a set of 14 travel factors (impedances) included in the survey questionnaire. Portions of this document are not fully legible.

42 093634 A COMPREHENSIVE POLICY TO AMELIORATE ADVERSE IMPACTS OF TRANSPORTATION FACILITIES. Transportation facilities impose numerous adverse economic, social and environmental impacts on surrounding communities. These adverse impacts significantly detract from the overall positive effects of such facilities. A number of initiatives have been developed which help ameliorate adverse transportation impacts at the source, and through facility location and design. There are, however, additional outside the right-of-way measures which might be taken to reduce adverse impacts. In this report, the available alternatives for outside the right-of-way action are reviewed, and a package of viable program techniques including noise regulation, grants in aid, and untied compensation is proposed. Draft legislation is outlined which makes provision for: (1) Acquisition of land or development rights in land outside the right-of-way, (2) construction of berms and sound-absorbing barriers, (3) sound-proofing of private and public structures, (4) short-term loans to municipalities and small businesses financially impacted, and (5) cash compensation to homeowners suffering property value losses.

42 094242 RANN UTILIZATION EXPERIENCE. CASE STUDY NO. 21. TECHNOLOGY IN CITY OPERATIONS. This project, referred to as 'Totem 1,' is demonstrating the extent to which science and technology can help city officials improve the delivery of municipal services. The focus is on identification of technology that can be transferred successfully into city operations and on the subsequent transfer and beneficial application of that technology. Efforts have been varied: for example, hardware innovations in the fire department; computer software applications directed at public transit, courts, and

police problems; and training and organization changes in several departments. At present the most impressive applications are the computer software products, but the hardware technologies promise significant returns in the future. The anticipated benefits suggest that additional technology transfer projects should be attempted.

42 094663 INTEGRATED MASS TRANSPORTATION SYSTEM STUDY/DEFINITION/IMPLEMENTATION PROGRAM DEFINITION. Specific actions needed to plan and effect transportation system improvements are identified within the constraints of limited financial, energy and land use resources, and diverse community requirements. A specific program is described which would develop the necessary generalized methodology for devising improved transportation systems and evaluate them against specific criteria for intermodal and intramodal optimization. A consistent, generalized method is provided for study and evaluation of transportation system improvements. (Author)

42 095295 TRANSPORTATION PLANNING FOR A NEW CITY IN A DEVELOPING COUNTRY. With rapid urbanization, planning and constructing new cities is, perhaps, equally common in the developing and the developed countries. The methods evolved for transportation planning (an important component of the urban planning process) for the developed countries would not, however, be directly applicable to the situation in the developing countries. A developing country has severe constraints; mainly relating to limited resources, the need to depend on and conserve indigenous resources, the paying capacity of the average citizen and the effect of the cost of transportation on the overall economy. An urban transportation plan for a new city near Bombay in India was evolved under such constraints. The article describes the criteria evolved for the transportation plan and describes the methodology of evolving a land use-transportation system for the new city. The factors which controlled the evolution of this plan have also been discussed.

42 095523 SUBURBANIZATION AND ITS IMPLICATIONS FOR URBAN TRANSPORTATION SYSTEMS. The basic premise of this report is that with the growing trend toward suburbanization, more effective transportation systems must be developed to meet the needs of

the low-density, suburban population. Up until this time, urban transportation systems have focused on the CBD of the large city. It is evident now, however, that more flexible forms of transportation must be developed in conjunction with fixed-route systems. The paper is divided into two sections, the first of which summarizes the current trends of suburbanization and their effects on transportation. It also outlines the implications of Federal RD&D, which include technology sharing, state-of-the-art advancement, and demonstration support. Section II details urban demographic and transportation trends, utilizing graphs to show the growth of suburban population in recent years. Transportation system options are described, including the automobile, bus, rapid rail transit, and demand-responsive systems. Discussion of future systems includes personal rapid transit and dual mode. Each system discussed is then classified according to its role in the total transportation system: i.e. high density vs. low-density transportation. In the final analysis, it is accepted that development of urban transportation systems has not kept pace with the changing nature of cities in recent years. A system which offers a modal selection to its residents is what is needed. The complexities of integrating such a total transportation system with urban planning techniques is what transportation planners must consider in designing the most effective system for an area's residents.

Ward, JD Paulhus, NG, Jr ; Department of Transportation, (TST-10) Final Rpt. DOT-TST-74-8, Apr. 1974, 52 pp, 18 Fig., 33 Ref.; ORDER FROM: NTIS, Repr. PC, Microfiche

42 095585 LET'S ATTACK THE REAL URBAN TRANSPORTATION PROBLEM. This paper examines different interpretations of the transportation problem and its solution and argues for an interpretation that takes as its point of departure the near term and the present supply of urban transportation resources and that gives greater weight to the economic forces influencing the behavior and performance of the urban transportation market. It suggests a range of noncapital and low-capital alternatives that reduce the demand for vehicle trips, increase the effective capacity of existing systems, or do both. Policy considerations and the advantages and obstacles of the low-cost approach are discussed, and policy implications are developed.

Hedges, CA (Department of Transportation) *Transportation Research Record* No. 519, 1974, pp 10-25, 2 Fig., 5 Tab., 43 Ref.; ORDER FROM: TRB Publications Off, Orig. PC

42 095587 SUBURBAN TRANSIT PLANNING AND FORECASTING. Problems and policy issues of particular concern to suburban transportation planners are identified, including dispersed trip-making, high income and automobile ownership, low densities, significant transit-dependent population, increasing peak-hour freeway congestion, growth policy issues, and short-term availability of less expensive or non-union labor. Experience in Orange County, 4 areas of Los Angeles County, and Chicago suburbs is discussed. Unique suburban approaches in the planning process are identified, and forecasting problems are discussed. For forecasting implications, 3 high-quality suburban-to-CBD transit services are compared with

the range of calibration values for the LARTS model in southern California. Variables compared include the system characteristics in the marginal utility mode-choice model, socioeconomic characteristics of trip-makers, attitudes of trip-makers, and resultant trip-making behavior. The last category focuses on transit's market share, which appears to be a more appropriate planning statistic than the percentage of all trips using transit, as called for in mode-choice models. Some uniquely suburban transit organizational and planning process issues are discussed.

42 095685 RAIL TRANSIT CAR COSTS. A REVIEW ANALYSIS AND PROJECTIONS.

The purpose of the report is to provide the elected officials and technical staffs involved in transportation planning in Southern California with some essential background data to the planning efforts for rail transit. Considering the lead time between planning and implementation and the current rate of inflation and technological advances being engineered into rail transit vehicles, this paper attempts to forecast car costs for rapid transit, commuter rail and light rail vehicles. The operational characteristics of each of the rail systems is discussed under System Characteristics. This includes headways, speeds, power etc., as well as, a tabulation of the equipment used by each operator and a summarization of system characteristics. The Analysis chapter looks at the division of the rail car market by the manufacturers. It also compares the expenditures made for each of commuter rail, rapid transit and light rail transit by City, by Transit Property and by Type of Equipment including a further breakdown for locomotive-hauled cars versus electrically-propelled cars. The Prognosis chapter attempts to forecast what cars will cost between 1975 and 1980 based on a complete documentation of all car orders between 1962 and the present. A major finding of the study has been the possible cost projection for the various rail car types in use throughout the U.S. and Canada and what the cost of equipment suitable for the Los Angeles area might be.

42 096053 EVALUATION OF LONG-RANGE TRANSIT ALTERNATIVES. An evaluation methodology was developed to measure the relative and absolute performance of alternative transit plans in a major Minneapolis travel corridor. A major element of the transit analysis was to identify the extent and location of exclusive transit facilities. One unusual feature of the analysis was that the transit mode was not specified since such a question is to be resolved at

the regional level. Each of the transit facilities was evaluated in terms of factors influencing travel population, employment, and trip ends. The alternative transit plans were evaluated not only in terms of aggregate measures of socioeconomic and travel characteristics, but they were also considered in terms of efficiency measures—per mile and per station. An ordinal ranking procedure was developed as a final step in the evaluation procedure to select the best combination of transit facilities for the corridor.

Cherwony, W Polin, L. *ASCE Journal of Transportation Engineering Proc Paper* Vol. 101 No. TE2, ASCE 11282, May 1975, pp 199-210

42 096062 ATTACK BY CHARLATANS. Rail transit has found its enemies in the zealous advocates of buses and automobiles. The proponents of these two modes of transportation claim that the construction of rail transit is too costly and time consuming. They set out to prove the efficiency of buses over rail transit but since the fuel consumed by buses and cars is in short supply, it seems likely that a transit system dependent upon central station generation of power is more likely to win out. Bus transportation is labor intensive, and rail transit is capital intensive, a fact which has been used to promote bus transit. However, where a great volume of riders exists, capital intensive systems are more of an economic advantage. Other factors besides cost must also be considered in choosing the most suitable transit system. Supporters of bus and auto transportation insist that rail transit will be unable to attract riders, but facts have shown otherwise: BART has attracted thousands of riders and has reduced automobile use. It is not too soon to start building transit systems that will alleviate the problems of the 1980's. Costs will continue to rise, so long-term planning will prove to be the better solution in the long run. The ultimate solution is a carefully planned, community responsive mix of buses, cars, and rail transit systems.

Myers, ET *Modern Railroads* Vol. 29 No. 11, Nov. 1974, pp 68-70, 3 Fig., 3 Phot.

42 096063 A NEW GEORGIA PEACH. Construction on Atlanta's new rapid rail transit system (MARTA) will begin this year. The task of acquiring right-of-way will receive much attention, since provision must be made for relocation of the people who will be displaced by the construction. Most of the planned route, though, will follow existing rights-of-way. A critical path system is being used for all construction and planning, with emphasis on critical areas so that revenue trains may begin running in 1978. Full completion is expected by 1980. The choice of car design was considered so important it has taken a year to design the one that will be used. Rather than lend itself to experimentation, MARTA has decided to go with proven designs. It has learned from BART's mistakes, and has allowed more time for testing before becoming an operating reality. It intends to operate initially on a 15 cent fare, which will be increased until 1982, when fares will have to defray 50 percent of its costs.

Myers, ET *Modern Railroads* Vol. 30 No. 2, Feb. 1975, pp 60-62, 1 Fig., 3 Phot.; ORDER FROM: Cahners Publishing Company, Incorporated, Watson Publications, 5 South Wabash Avenue, Chicago, Illinois, 60603 Repr PC

42 096145 ATTRIBUTES OF TRANSIT DEMAND. The sample of observations for this study was acquired from a cross-sectional data base consisting of 20 medium-sized cities. Data for each city were collected at the census-tract level, and two basic types of data were collected for each census tract: socioeconomic characteristics of the rider, and level-of-service characteristics provided by the transit firm. Regression analyses of the data revealed that transit may not be routed in such a manner as to provide an optimum level of service to the public. The finding that the number of workers employed in the CBD is not an important attribute for explaining the demand for work trips on public transit tends to support this conclusion and suggests that there may be potential transit user markets to which transit firms could justify new service. Examination further reveals that there are regional variations for the demand for work trips on public transit; this finding should discourage attempts to develop an aggregate travel-demand model which would be applied indiscriminately to various areas.

Costantino, DP *Traffic Quarterly* Vol. 29 No. 2, Apr. 1975, pp 243-257

42 096309 TRANSPORTATION PLANNING PRACTICE. Ten papers were presented on five major topics at the seminar on transportation planning practice. One paper was presented on the topic of management of medium term transportation studies. Three papers on the topic of preparation of alternative medium term plans, covered the following areas: the formulation of such plans; the development of transport alternatives; and alternative strategies for the specific case of Nottingham, Gt. Britain. The papers which reviewed medium term plan evaluation process include: Option Design and Evaluation in Transportation Studies; Equity and Incidence in Transport Evaluation, and Urban Transportation Planning Decision Making. In the area of programming and implementation factors, a paper described the modernization of the Glasgow underground. Papers which made an assessment of the future role and nature of transportation planning include the following: Appraising Urban Transportation Policy; and Practical Transport Planning.

Planning and Transport Res and Computation Co Ltd PTRC/P/102, July 1974, 163 pp, Figs., Refs.; Presented at Seminar P of the PTRC Summer Annual Meeting, Warwick University, England, 8-12 July 1974.; ORDER FROM: Planning and Transport Res and Computation Co Ltd, 167 Oxford Street, London W1, England Orig. 42 096442 DETERMINATION OF FUNCTIONAL SUBREGIONS WITHIN AN URBAN AREA FOR TRANSPORTATION PLANNING. It is axiomatic that large urban areas are not spatially homogeneous with respect to transportation demand, supply, and impact phenomena. This paper addresses this heterogeneity in terms of the transportation planning process. A technique for using areawide travel, land use, and population data to divide an urban area into a set of functional subregions is presented. Each subregion represents a planning area, and interregion planning is proposed on a different scale of analysis. The technique is based on the statistical decomposition of origin-destination

flow matrices. The decomposition method can be considered a generalized type of factor analysis in which raw data observations are used as opposed to variable correlations. The units can be any spatial aggregation of people and activities, such as census tracts or minor civil divisions, and the travel can be trips for any specific purpose or a composite of all trips. Selection in both cases depends on the objectives of the planning process. Multiple discriminant and regression analyses are then used to define the subregions in terms of differences in population and land use characteristics. Results from an application of the technique in the Detroit area are presented as a case study. Six subregions, composed of groups of minor civil divisions and central city subcommunities, were found and successfully described for home-based work travel in this urban area. The results support urban economic theories of a central city core area, suburban industrial centers, and satellite cities.

Golob, TF Hepper, SJ (General Motors Research Laboratories) Pershing, JJ, Jr (Fairfax County Planning Commission, Virginia) *Transportation Research Record* No. 526, 1974, pp 16-25, 2 Fig., 12 Tab., 5 Ref.; ORDER FROM: TRB Publications Off, Orig. PC

42 096443 STRUCTURE OF PASSENGER TRAVEL DEMAND MODELS. This study is concerned with the structure of travel demand models. Two alternative structures are defined, simultaneous and recursive, that are based on different hypotheses about the underlying travel decision-making process. The simultaneous structure is very general and does not require any specific assumptions. The recursive structure represents a specific conditional decision structure, i.e., the traveler is assumed to decompose his trip decision into several stages. Thus, simultaneous and recursive structures represent simultaneous and sequential decision-making processes. Theoretical reasoning indicates that the simultaneous structure is more sensible. Moreover, if a sequence assumption is accepted, there are several conceivable sequences, and generally there are no a priori reasons to justify a selection among them. A simultaneous model, however, is very complex because of the large number of alternatives selection among them. A simultaneous model, however, is empirical study is conducted to investigate the feasibility of a simultaneous model and to appraise the sensitivity of predictions made by a travel demand model to the structure of the model. The data set for the study was drawn from conventional urban transportation study data. Included in a trip decision are destination and mode choices. With the same data set, three disaggregate probabilistic models are estimated for the shopping trip purpose: a simultaneous model and two recursive models with two possible sequences. The simultaneous model proved to be feasible in terms of the computational costs and the estimation results. The results of the recursive models showed that estimated model coefficients vary considerably with different model structures. The simultaneous model structure is recommended.

42 096446 STRUCTURAL MODEL FOR EVALUATING URBAN TRAVEL RELATIONSHIPS. Urban travel forecasting equations are typically developed by analyzing only the relationships between several possible explanatory variables and the ultimate variable of interest, trip production. Seldom is the full degree of interaction among explanatory variables such as automobile ownership, household size and income, and accessibility understood. In this paper, a structural model is used to examine the relationships among an entire system of variables rather than just the simple isolated effects. The basic concepts and limitations of the modeling approach are discussed, and models of urban household trip production are evaluated. Several conclusions about the causal structure of urban travel relationships are drawn. The structural model is felt to be an important methodological tool for developing urban transportation theory.

Kannel, EJ (Illinois University, Urbana) Heathington, KW (Tennessee University, Knoxville) *Transportation Research Record* No. 526, 1974, pp 73-82, 3 Fig., 3 Tab., 13 Ref.; ORDER FROM: TRB Publications Off, Orig PC

42 096583 INTERACTION BETWEEN PUBLIC TRANSPORT AND URBAN TRANSPORT. This report, prepared for the UITP 1975 International Congress, examines metropolitan transportation after first pointing out that the central city cannot be considered as a separate element. Public transport has to be a vital element in the implementation of planning. Conceding that there is a role for the automobile, it is concluded that further demands for urban mobility that accompany economic growth will have to be met primarily by public transport. Among the recommendations: Public surface transport must be given absolute priority; public underground transport must be provided or extended; land development must be planned to locate secondary centers of expansion close to the more developed and congested central zones. Finally separate fare systems and administrations must be abandoned.

42 096756 TPPS-ROUND TWO COMING UP. The author discusses problems associated with the introduction of the new transport policies and programmes (TPP) system, the need for authorities to take a critical look at their own TPPs and the way in which they can do this. The main part of the article is concerned with the sort of approaches that authorities should be adopting, the question of evaluation and the involvement of other agencies. Details are given of a check list of items requiring consideration namely; an integrated approach to the problems facing the area as a whole; the preparation of a position statement for existing policies and programmes, the development of a base for the understanding of the transport problem; the production of a clear statement of the objectives in operational terms derived from an analysis of needs and the position statement; the need for flexibility of plan and for keeping options open particularly in the earlier years; a study of the part to be played by public

transport including methods of overcoming constraints and making an analysis of the operation of services; and the encouragement of new approaches. Mention is made of the problems of evaluation particularly in relation to policy decisions, the effectiveness of policies and the need for a policy impact statement in all TPPs. After stating the need for the involvement of other agencies including British Rail, NCB and district councils, the author concludes with a brief reference to the future. /TRRL/

42 096984 CHANGING DIRECTIONS. A REPORT FROM THE INDEPENDENT COMMISSION ON TRANSPORT. This book presents a detailed discussion of all aspects of transport. The need for such a study is briefly discussed and some basic statistics on transport in Great Britain are given. Resource needs are considered together with a projection of resource supply, with particular attention to energy. Details of costs such as accidents, pollution, and the over-use of the natural environment are provided. The need for mobility is discussed and the effects of relative changes in it are analysed in terms of both locational effects and the effects on different user groups. Techniques used for formulating transport policy and for decision-making are described, with particular attention to cost benefit analysis and car ownership forecasting. Policy for urban situations is suggested, using physical restriction and subsidy; in rural areas subsidy is particularly important and for the inter-urban travel re-appraisal of the roads programme, rail plans and freight movement is necessary. The summary and conclusions suggest a wide range of measures and appendices include additional information such as the position of the three major political parties on transport, urban mobility problems of the elderly, impact on rural life of declining public transport services, transport in Scotland etc., mention is made of the TRRL's methods of forecasting future transport. /TRRL/

42 097114 MEASUREMENT OF USER'S PREFERENCES FOR PUBLIC TRANSPORTATION THROUGH COMPUTER ASSISTED INTERVIEWS. Citizens' preferences concerning bus transportation in Boulder, Colorado, were ascertained by two different but related techniques. The primary method was through a computerized game ('CARTFED,' or Computer-Aided-Real-Time Feedback Decision) in which subjects are asked to design a desirable bus system by choosing values for system characteristics. Subjects enter these in a portable computer-terminal and the computer calculates and reports the associated deficit, whereupon subjects reiterate making trade-offs to reduce the deficit to an acceptable level. A prerequisite to the CARTFED program was the estimation of citizens' preferences by a different technique, which

took the form of a questionnaire survey in which respondents were presented with randomly-generated profiles of possible bus systems and asked how often they would use such a system. Multiple regression analysis of the responses yielded the demand function necessary for the CARTFED program. This paper describes both techniques and their results.

42 097234 MEASUREMENT OF URBAN TRAVEL DEMAND. This paper suggests approaches to advancing the behavioral theory of travel demand and discusses some currently unresolved empirical questions on the determinants of travel behavior. Urban travel demand is the result of aggregation over the urban population, each member of which is making individual travel decisions based on his personal needs and environment. Travel is not normally an end objective of the consumer but rather a concomitant of other activities such as work, shopping, and recreation. Thus, it is natural to analyze travel demand within the framework of the consumption activity--i.e., household production models. Selected results are presented from a pilot study of rapid transit demand forecasting in the San Francisco Bay Area.

42 097286 PUBLIC TRANSPORTATION PLANNING ISSUES. This compilation of eight reports covers a number of issues of interest to planners, administrators and professionals in the field of public transportation. Topics include funding sources, determination of market sectors, operations and levels of service. Hedges advocates low-capital and non-capital alternatives. Anderson and Hoel present an analysis of latent demand at various service levels. Benson discusses suburban transport planning. Wilson et al discuss marketing aspects of transit. Mix and Dickey report on rural transport problems. Vuchic et al discuss Pennsylvania DOT's guidelines for local transit operations. Botzow describes a system of patron service variables, applicable to any mode.

42 097289 TOWARD THE DEVELOPMENT OF MEASURES OF CONVENIENCE FOR TRAVEL MODES. This paper describes a research project aimed at investigating the effect on disaggregate, behavioral, modal-choice models of the inclusion of 2 alternative measures of convenience. The 2 measures investigated compare a proxy variable for convenience, which could be included in many existing models without further data collection, a scale index that was developed from the use of psychological scaling techniques, which will require longer term development and additional data collection. Both measures correlated highly with travel mode choices, although data limitations prevented any actual model building with the scale index. The proxy variable for convenience was found to add significantly to the explanatory power of a modal-choice model

and to improve substantially the specification of the model. This paper describes the data sets used to generate these results and discusses the analytical processes used to derive scale information from preference and attitude data. A survey of previous work in the topic area, which is also included, shows that this paper reports on one of the first successful attempts to incorporate a measure of convenience in an urban modal-choice model.

42 097607 TRANSPORT IN TOKYO. A detailed account is given of Tokyo's various transport problems and their causes. The supply of transport in the city is reported to be unable to handle the high level of demand. Increased road congestion in the city centre and the spread of congestion to the suburbs are ascribed to the poor layout of existing roads, to the low road ratio and to the lack of parking facilities. Congestion is considered to be a major cause of the decline in bus patronage. Rush hour trains are reported to be crowded to 2.5 times their normal capacity, despite improvements to the rail network. The rapid population growth, particularly in the suburbs of Tokyo, and the concentration of economic, academic and cultural functions in the city centre, together with the dislocation between production and distribution facilities, are cited as the major causes of the tremendous increases in demand. Environmental problems are discussed in terms of accident rates, lack of pedestrian facilities, air pollution and noise levels. Transport policies in Tokyo are examined, and it is suggested that in the short-term the problem of curtailing or adjusting demand, possibly by shift-

ing transport volumes from one system to another should be investigated. Ultimately it is suggested that a complete change in the structure of the city will be necessary to cope with the growing transport problems. /TRRL/

42 097667 DISAGGREGATE SIMULTANEOUS URBAN TRAVEL DEMAND MODELS: A BRIEF INTRODUCTION. This paper is intended to provide a general background to the two following papers, "a simultaneous destination and mode choice model for shopping trips" and "some estimation results of a simultaneous model of auto ownership and mode choice to work." Some of the deficiencies of the conventional urban transport modeling system are reviewed and a case is made for the use of simultaneous models estimated with disaggregate data. /Author/TRRL/

42 097669 TRANSPORTATION PLANNING IN NAIROBI. Although a high proportion of trips in developing countries are invariably made on foot or by bicycle, insufficient importance has been placed on them in the past. This article describes the methods adopted in a study of Nairobi in which such trips were fully considered, being included in all stages of the modelling procedure in which a novel modal split model was developed to deal with three modes. In the survey, 4000 households were interviewed and a comprehensive traffic survey was undertaken. Particular attention was given to ensuring that the data for walk, cycle and public transport trips were adequate. Some results of this survey are presented and discussed. An outline of the modelling procedures adopted together with an indication of the results is given. The calibration of the transport model is described in detail. Two alternative public transport systems were examined in long-term tests, one entailing the use of rail rapid transit where demand was sufficient, the other embodying the use of exclusive busways. The transportation network for 1985 is shown and the recommendations for the 1985 transportation plan are given. /TRRL/

42 097721 A FEASIBILITY STUDY OF MORGANTOWN PRT SYSTEM FOR THE CENTER CITY OF RICHMOND, VIRGINIA. The feasibility of implementing a PRT movement, similar to the one presently under construction in Morgantown, West Virginia, is studied for the center city of Richmond, Virginia. A travel demand model is first developed for forecasting travel patterns on the basis on trip characteristics within the study area. A benefit-cost analysis is then performed with the benefits derived from the relief of travel congestion and the PRT system costs obtained from currently available data sources. Results of the study indicate that it

would be economically feasible to install the Morgantown system in the Richmond CBD under a set of assumed conditions.

42 097825 GWENT TRANSPORT POLICIES AND PROGRAMME 1974 APPLICATION FOR: TRANSPORT SUPPLEMENTARY GRANT & SUBMISSION FOR 1975/76. This document gives details of the Transport Policies and Programme (TPP) for the New County of Gwent, which is aimed at securing the integration of approaches to overall transport needs. It provides a foundation for the evaluation and development of policies for future years. The existing facilities and policies, against which future developments can be considered, are discussed. All aspects of transportation in the county are reviewed and an indication is given of how the county council propose to develop overall transport policies. Alternative ways of implementing these policies are evaluated. This document is to be submitted as an application for a transport supplementary grant. The new system of grants is designed to cover current and capital expenditure on roads and public transport. /TRRL/

42 097883 STATE TRANSPORTATION IN TRANSITION. The institutions upon which state government places the responsibility of providing citizens with transportation services are changing to meet changing needs in an orderly fashion, without disrupting existing state transportation programs that continue to provide needed services to the people. Public transit is viewed as an alternate to the open-ended approach of building more highways, especially in urban areas where the financial, environmental, and social costs of new highways are becoming exceptionally high to individual communities and the states.

42 097949 AN END TO URBAN MOTORWAYS? A COMPARISON OF TRANSPORT PLANNING IN PARIS AND LONDON. The article compares the problems facing the transportation planners of London and Paris where some 13M trips are made daily, of which half are made by private car, 40% by public transport and the remainder by two-wheeled vehicles. Over a period an increase in private car usage in Paris of about 8% per annum has been accompanied by a reduction in the use of public transport attributable to declining bus patronage. Parisian planning authorities are required to work within the broad framework of the SCHEMA DIRECTEUR plan adopted in 1965 for the development of new towns on the perimeter of Paris with a network of urban motorways, high-speed metros and modernised commuter services. Details are tabulated of the public transport systems of Paris compared with that of London. Increases in fuel costs are lately seen to have resulted in a growing demand for public transport and a reduction in the use of

private transport. With more public transport funds and subsidies now available the Parisian transport authority, RATP, is presently proceeding with measures to improve and to increase the usage of public transport. /TRRL/

42 098516 NORWALK BUS TRANSPORTATION STUDY. This report seeks to review the existing bus system of Norwalk, Connecticut and how it evolved, and then to offer a series of four alternative courses of action that will provide adequate levels of transit service to Norwalk citizens. Structured so that they can be phased in sequence, these alternatives can be presented separately in such a way that combinations of features can be made to form new alternatives which may be more responsive to local inputs. The four alternatives proposed are: (1) preserve existing bus service; (2) Traditional transit improvements; (3) Norwalk local system (This would eliminate intercity service by local bus transit to enable concentration of resources in

Norwalk and in other neighboring cities with local bus systems. The intercity traveler would use the railroad or anticipate new service by an intercity bus carrier.); (4) New concept approach for comprehensive transit improvement. (Two types of service would be structured to complement one another; the bus subsystem is point to point; major traffic generators would be connected along a corridor. The taxi element of the system is continuous point to point service for trips originating and terminating in neighborhoods beyond the scope of the spine bus route. Chapters include the 5 year transit development program, existing transit system, bus passenger survey, recommendations, findings and implementation.

Tri-State Regional Planning Commission, (TS H-120(7610)) Tech. Rpt. UMTA-IT-09-0014-73-1, Jan. 1973, 110 pp; This report was sponsored by the Urban Mass Transportation Administration, Department of Transportation.; ACKNOWLEDGMENT: UMTA; ORDER FROM: NTIS, Repr. PC, Microfiche; PB 241-423/AS

42 098822 MASS TRANSPORTATION AND MINORITY TRANSPORTATION. The American Mass Transportation System consists of three principal elements: part of the land area of the nation is dedicated as rights-of-way for the system; there are one hundred million individually operated vehicles; approximately 125 million Americans have varying degrees of competence in negotiating these vehicles on thoroughfares. This entire auto-highway system is financed from a mixture of sources. Every other method of moving people in or between cities is trivial by comparison; every other mode is a minority system. These systems are contemporaries of the automobile, having been invented at approximately the same time, and have been defeated by the auto in direct competition.

Bruce-Briggs, B *Public Interest* No. 40, Apr. 1975, pp 43-74

42 098978 MOBILITY INDEX BASED ON THE SOCIOECONOMIC CHARACTERISTICS OF HOUSEHOLDS. Data for this examination of the relationship between certain socioeconomic characteristics and household trip making were from two trip origin and destination studies involving random sampling of over 10,500 households in Lansing and Kalamazoo, Michigan. Present findings suggest that three factors can be used for mobility analyses to summarize differences between households rather than using a dozen or more other socioeconomic characteristics. These are mobility opportunity, social class and life cycle. A mobility index was computed which measures the change in the variable in question while holding all other variables constant. Transportation research and planning can be improved by combining households into districts; determining needs of each district keeping in mind that the lower the mobility opportunity the greater the need, the lower the social class the greater the need, and the more advanced the stage of the life cycle the greater the need; the allocating transportation facilities in relation to the need of each district.

42 099136 PUPIL TRANSPORTATION: A COST ANALYSIS AND PREDICTIVE MODEL. This paper analyzes the system characteristics and operating costs of pupil transportation systems in Texas, and describes the model for predicting operating costs in comparison to other models developed to predict the costs of urban transit. Because pupil transportation differs considerably from public transit in its system characteristics, absolute cost figures for pupil transportation in rural areas are an unreliable indicant of likely public transit costs. However, cost comparisons for pupil transportation between rural and urban areas provide some indication of the likely costs involved in rural as against urban public transit. The conclusion to be drawn from the data in this study is that the cost differential may not be as large as might be expected. For instance, operational costs in rural areas are only 23% higher than in central cities.

Briggs, R Venhuizen, D ; Texas University, Austin Res. Memo. No. 20, Apr. 1975, 31 pp; Contract DOT-OS-30093

42 099157 URBAN TRANSPORT IN DEVELOPING COUNTRIES. It has been predicted that between 1950 and 2000 in developing nations, the population living in towns will rise from 500M to 2200M. Tables are presented which show the forecast population growth rate in various cities between 1970 and 1985 and also the changes in urban populations in various developing countries from 1968-1972. Along with the growth in population, increases in car ownership are to be expected. In many developing countries a high proportion of all cars in the country is concentrated into one major city, making the traffic situation there very difficult. The congestion in third-world cities is mainly due to three factors: the layout of the road network; poor utilisation of roads; ineffective traffic management schemes. All these factors result in a decline in the standard of public transport. In the short term, the situation may be improved by using traffic management schemes to increase the efficiency of the present system. Careful planning in the long term should aim at reducing the volume of travel and improve employment, social amenities and the environment. Examples of successful long term schemes are discussed. /TRRL/

Jacobs, GD Fouracre, PR (Transport and Road Research Laboratory) *Traffic Engineering and Control* Vol. 15 No. 20, Dec. 1974, 4 pp, 1 Fig., 5 Tab., 2 Phot., 9 Ref.; ACKNOWLEDGMENT: TRRL (IRRD 212123)

42 099183 TRANSIT POLICY AND OPERATIONS IN EUROPE AND CANADA. This article describes and compares city planning policies as related to transit planning and transit operations in Europe and Canada. While transit is the traditional travel mode in Europe, authorities there are now experiencing the general decline in ridership that accompanies increased car ownership, the case in North America. One reason for larger transit usage in Europe is the difference in attitudes of authorities responsible for mass transportation. In Europe there is willingness to experiment and innovate, even if it means attacking the privileges of the automobile driver, and whether or not the new measure will benefit the transit authority in monetary terms. Canadian and British systems have low costs because they pare down unprofitable services so as not to incur a deficit.

Morrall, J Finn, N *Traffic Quarterly* Vol. 29 No. 3, July 1975, pp 385-402, 6 Fig., 4 Tab.; ORDER FROM: Eno Foundation for Transportation, Incorporated, P.O. Box 55, Saugatuck Station, Westport, Connecticut, 06880 Repr. PC

42 099205 THE BIAS IN TRANSIT PLANNING. It is difficult to compare the advantages and disadvantages of highway transit versus rail transit, quantitatively. Road and rail transit both have unique characteristics that make them best suited for certain purposes. Transportation is now recognized as a public service that reflects a wide range of needs. It is not valid to measure the cost of service against the direct benefit of the user. Historically, there has been a strong bias against rail transit.

42 099235 RESEARCH NEEDS FOR EVALUATING URBAN PUBLIC TRANSPORTATION. This Special Report contains the results of a 3-day conference organized by the Committee on Public Transportation Planning and Development of the Transportation Research Board to devote attention to the research needed for evaluating urban public transportation. There is an introductory survey of the need for evaluation of urban public transportation, followed by the five formal papers presented to the conference as a setting for workshop discussions. Part III of the Special Report contains the workshop reports describing the general discussions and any consensus reached. Part IV contains the 57 research project statements which were the important products of the workshop groups. The research statements were developed independently by the individual workshops, and thus there are certain overlaps in various tasks of the research called for. An index is provided as a cross-reference to the subject topics of the research project statements. The conferees were not reticent in designation of costs, priorities, and establishment of research urgency. The total suggested costs to undertaken all the identified research in the 57 projects amount to nearly \$8,000,000.

42 099236 THE NEED FOR EVALUATION. The basic steps involved in the urban transportation planning process are reviewed, along with past efforts which to date have proved unsuccessful in establishing a viable public transportation system. From this review, the necessity for a meaningful evaluation of public transportation at all levels of government is apparent. For this purpose a conference was organized. Its objectives, as stated in this introduction to the proceedings, were as follows: (1) to provide all attendees with a better understanding of the perspectives and needs of the users, transit authority boards, planners, operators, and grantors; (2) to identify current approaches being used by each of these groups to evaluate performance; (3) to identify steps that need to be taken to provide information

necessary to plan, design, operate, finance, and effectively evaluate public transportation; and (4) to identify research projects, complete with work statements, that are needed to increase the effectiveness of each of the groups as they interact to fulfill their respective roles.

42 099238 A PLANNING PERSPECTIVE ON EVALUATING URBAN PUBLIC TRANSPORTATION. The first part of this paper outlines some of the basic differences between highway and transit planning which should be recognized and accounted for if successful public transportation operations are to be achieved. In the second part of the paper, several steps to be followed for achieving a meaningful evaluation of public transportation systems are discussed. These steps are as follows: (1) establish specific and quantifiable goals and objectives for public transportation; (2) select alternative means of accomplishing the objectives; (3) define the criteria that will be used to evaluate an alternative in terms of meeting the objectives; (4) firmly establish the constraints under which the objectives are to be accomplished; and (5) develop the methodologies to be used in evaluation of each alternative. It is pointed out that these steps are applicable at all levels of government.

Heathington, KW (Tennessee University, Knoxville) *Transportation Research Board Special Reports* No. 155, 1975, pp 14-23, 1 Ref.; ORDER FROM: TRB Publications Off, Orig. PC

42 099239 TRANSIT ANALYSIS. Using the transportation problems faced by California as examples of the problems which various transportation planning agencies might be faced with, this paper points out some of the areas where there is a need for evaluation criteria. It is found that such criteria are needed for defining roles, for judging the adequacy of existing and proposed programs, for resolving the debates between facility and service strategies and between the commuter and the transit-dependent, and for help in analyzing the impact of labor costs and the role of the private sector. Also, evaluation criteria are needed that will allow people at the neighborhood level to control the institutions providing transit service.

McCausland, S (California State Assembly) *Transportation Research Board Special Reports* No. 155, 1975, pp 24-28; ORDER FROM: TRB Publications Off, Orig. PC

42 099244 WORKSHOP 3: THE PLANNER'S ROLE. The purpose of Workshop 3, which viewed the evaluation of urban public transportation from the planner's perspective, was to identify the steps in the planning process and to evaluate current ability to perform each of these steps in terms of available procedures and knowledge. This report of the proceedings of Workshop 3 identified the following research projects as being necessary for an adequate evaluation of urban public transportation: (1) development of a participatory multimode transportation planning process; (2) evaluation of alternative institutional structures and agency responsibilities for transportation planning; (3) deriving goals and objectives for transportation in urban areas; (4)

matching transportation system criteria to transportation goals; (5) methodology to match transportation modes to different markets; (6) techniques for segmenting the public transit market; (7) manual of performance and operating characteristics of transit modes; (8) identification and measurement of transportation system costs and benefits; (9) transit and paratransit forecasting techniques; (10) sketch planning techniques for low-capital alternatives; (11) methodology for measuring transportation impacts on land use; and (12) determination of the length of time required for transportation impacts to occur.

Weiner, E (Department of Transportation) *Transportation Research Board Special Reports* No. 155, 1975, pp 40-44; ORDER FROM: TRB Publications Off, Orig. PC

42 099247 WORKSHOP 6: THE COLLECTIVE PERSPECTIVE. Workshop 6 was the "collective group" and viewed the problem of evaluating urban public transportation from many different perspectives. Due to the breadth of the subject area, the problem could not be dealt with as comprehensively as desired. Nevertheless, the following research projects were identified as being necessary for an adequate evaluation of urban public transportation: (1) effects of the absence or decline of scheduled public transportation services on those who are expected to be dependent on transit; (2) benefits of transforming institutional constraints to incentives for innovative transit service; (3) economic impact of labor practices on transit efficiency and the implications of current trends; (4) improved techniques for identifying and serving transit market requirements; (5) benefits of the transit system stratified by city size (not limited to dollar measures); (6) advantages of scheduling activities in which transit users engage to be more compatible with efficient transit operations; (7) transit alternatives for non-CBD travel; (8) development of measures and standards to assist definitions of travel service levels; (9) development of aggregate measures providing comparison between cities of levels of services; (10) identification and development of standard definitions and techniques for collecting data required for evaluation and performance measures; (11) development of standardized benefit measures for transit evaluation; (12) public transportation versus other community services and facilities; (13) classification of alternative service concepts and identification of major similarities and differences in layman's terms; (14) analysis of the relationship between transit system evaluation measures and the variables being controlled that affect the evaluation measures; and (15) development of guidelines for methodology and research design for the evaluation of transit service demonstrations and trials of innovations.

42 099268 URBAN TRANSPORT-SELECT POLICY PAPER. This book reviews the current situation and prospects of urban transport in developing countries, suggests possibilities for improvement, and discusses the activities of the World Bank in the urban transport field. Urban transport in the developing world is found to be

inadequate both in levels of service and in the areas served. Commercial transport is suffering heavy expense from severe congestion, poor road surfaces and inadequate terminal facilities. Underlying urban transport problems is an acute shortage of resources, along with increasing costs for such resources. The result foreseen, if such trends are allowed to continue, is a rapid deterioration in urban transport conditions. There are, however, possibilities for combating this deterioration. First, more rational use of transport facilities, particularly of road space in congested areas, must be ensured. Second, large improvements are needed in the efficiency of transport undertakings and their coordination. Third, transport requirements should be considerably reduced by closely relating transport facilities to improvements in urban physical patterns. The World Bank's activity in the urban transport sector of developing countries is a highly concentrated program that averages around two or three projects a year. This limitation stems less from the financial resources available—though the Bank's contribution will inevitably remain very small in comparison with total investments in this sector—than from the limitations of staff and consultants. Fundamental to the Bank's approach is the need to place the physical elements of urban transport projects in the context policy measures, institutional development and management solutions. Urban transport projects presented to the Bank are considered in the context of their contribution, direct and indirect, to the wider problems of improving the basic urban transport system and the form of urban growth.

World Bank May 1975, 103 pp, Figs., Tabs.

42 099512 CHANGES IN POPULATION DISTRIBUTION AND AUTOMOBILE OWNERSHIP AND IMPLICATIONS FOR URBAN TRANSPORTATION. Emergent long-term trends in population and automobile ownership are examined, and some implications for urban transportation are drawn. Population trends include (a) a strong national trend toward zero population growth, at a pace well above demographers' expectations; (b) an inverse relation between growth and urban size, where the largest metropolitan areas exhibit little or even negative growth; and (c) a general shift in population from higher to lower density areas, with associated lower congestion, and some reversal of migration flows from nonmetropolitan to metropolitan places. Statistical analysis of growth rates shows two key relations: high rates of growth in three subregions (Pacific Southwest, Florida, and middle-sized Texas areas) and an inverse relation between size and growth for both the high-growth and low-growth areas of the country. Despite the continuing shift of population from central cities to suburbs, available evidence suggests some current diminution of suburban sprawl and a likely buildup of population densities in urban areas, a development that can be related to a corresponding movement toward saturation of automobile ownership. Data on intraurban density relations and rates of automobile ownership are presented in support of these predictions. The discerned trends in population and automobile ownership are likely to reduce traffic congestion and hence the needed highway investment and improve the viability of public transit in the large urban areas investing in such systems.

42 099672 ROLE OF WAITING TIME, COMFORT, AND CONVENIENCE IN MODAL CHOICE FOR WORK TRIP. This paper is concerned with the development and use of a policy-oriented, disaggregated behavioral choice model for transportation planning problems and emphasizes the impacts of changes in travel comfort, convenience, and waiting times. The econometric method chosen was logit analysis, and, in that the logit model can be derived from demand or choice, we can interpret logit coefficients as trade-off values. The model is based on survey data for commuters' work trips in the Stockholm metropolitan area in 1968 and 1971. It contains choice variables, socioeconomic variables, and transportation policy variables. The most important choice variable is "the use of car for work," which supposedly restricts the possibility for public transit use. The socioeconomic variable is income. The Transportation policy variables are travel time, travel cost, and the chance of getting a seat. A dummy variable technique is applied to the binary-choice approach so that stratification of the choice situation for different types of transit modes within the same model is possible. This allows for differences among the various transit modes in relation to comfort. The survey data are subdivided into two income groups to test the hypothesis that the value of time and comfort depends on the level of income. Results from our research are of particular interest when suggested changes in public transportation are compared with each other or with the do-nothing alternative.

42 099673 APPLICATION OF DISAGGREGATE MODAL-CHOICE MODELS TO TRAVEL DEMAND FORECASTING FOR URBAN TRANSIT SYSTEMS. This paper describes the development and application of disaggregate models to travel demand forecasting for transit systems in the Niagra Frontier region in western New York State. In this study, the disaggregate modal-choice models are developed from trip information from standard home-interview surveys. The data set used is a 12 percent subsample of the home interview conducted in 1962. Binary logit models are calibrated for four types of trips, classified by trip purpose and automobile availability. For each model, the individual's probability of using transit is related to two system variables: the ratio of transit-to-automobile travel time and trip length. Aggregated transit-use proportions for the entire system are then obtained by combining the disaggregate probabilities with an approximation term, which reflects the within-zone variance of system characteristics. The prediction performance of the disaggregate modeling approach is compared to

that of the conventional modal-split model. Results suggest that, by using the same type of information but only 12 percent of the sample, the disaggregate modal-choice method can produce at least as accurate modal-split predictions as the conventional method. The paper also describes the procedures necessary to integrate the disaggregate modal-choice method into typical urban transportation planning modeling systems.

Liou, PS Cohen, GS Hartgen, DT (New York State Department of Transportation) *Transportation Research Record* No. 534, 1975, pp 52-62, 4 Fig., 4 Tab., 10 Ref.; ORDER FROM: TRB Publications Off, Orig. PC

42 099701 FEDERAL TRANSIT POLICY: SPECULATIONS ON THE FUTURE. For the near future at least, it appears that no major new legislation in the mass transportation area is needed or foreseeable. Modest amendments to the law would be a big help. Some increase in funds may be in the cards, and some fleshing out of programs, such as extending the operating aid provisions to embrace urban places of less than 50,000 population, are justifiable for the sake of equity. The important thing to observe now is how well the new formula grant programs work and how effective some of the requirements are in making transit more efficient to operate and more attractive to the urban public.

Smerk, GM *Transit Journal* Vol. 1 No. 3, Aug. 1975, pp 5-20

42 099746 METHODS AND THEORETICAL BASES FOR THE TRAFFIC PLANNING OF RAPID TRANSIT LINES. This investigation which is confined to the sphere of general planning and is mainly concerned with traffic and traffic economic matters, indicates and compares the planning data and the methods applied to transit planning. The degree to which the different branches of the technical and economic sciences are able to supply decision aids in examined, and recommendations are derived for the further development of rapid transit planning methodology. This report, which is based on a European questionnaire survey and information supplied by Germany and the U.S., presents data on traffic structure, planning periods and planning authorities, and discusses transport policy objectives which are components of rapid transit planning. The methods of planning are based on traffic analyses, traffic forecasts, and network planning. Economic and socio-economic investigations are reviewed, and empiric traffic criteria related to rapid transit planning are outlined. Financing and the volume of investment for rapid transit construction are considered.

42 099759 TRANSPORTATION AND URBAN AND REGIONAL DEVELOPMENT IMFACTS. In this paper, TOPAZ (Technique for the Optimum Placement of Activities in Zones) a mathematical programming technique is used to study long term effects of transportation systems on macro development patterns in urban and regional systems: for a Melbourne-Sydney re-

gional corridor; and for the small town of Blacksburg in the United States. The first case is an objective function representing total costs and benefits for several alternative decentralized layouts of land uses and public service facilities. A gravity model is used to predict daily travel between town zones, and an iterative procedure produces the cheapest solution within certain constraints. In the second application, sub-models representing fuel consumption and pollution levels are added to the objective function, to ensure that they are reduced to a minimum. From these two studies, it can be concluded that the transportation, land use development, energy and air pollution components of urban and regional systems are highly interconnected.

42 099776 SYNTHESIS OF A STUDY ON THE ANALYSIS, EVALUATION AND SELECTION OF URBAN PUBLIC TRANSPORT SYSTEMS. A summary of a study carried out in 1971 by the Battelle Research Center at the request of Fiat. This study is made up of 8 volumes: (1) Definition of transport demand; (2) Definition of Transport supply; (3) Analysis of linear transport (transport serving several stations along one line); (4) Physiological problems; (5) Proposals by the Battelle Research Center for 4 original linear systems; (6) System selection process based on the functional and operational qualities of the systems; (7) Economic and technical evaluation of the systems; and (8) Project development methods. This document contains 8 chapters, summarizing the contents of the original report.

42 125536 A METHOD FOR EVALUATING URBAN TRANSPORTATION PLANNING IN TERMS OF USER BENEFIT. The optimum distribution of origins and destinations which minimizes the sum of the costs of travel between origins and destinations and the cost of location of those origins and destinations is derived for a linear city. It is assumed that the cost of travel is directly proportional to, or proportional to the square of, the distance between origin and destination. It is also assumed that the rent per unit area is proportional to a power of the total number of origins and destinations per unit area. The model is calibrated to data for London and Sydney and Comparisons made to the actual population distributions for these cities. /A/

42 125569 PUBLIC TRANSPORT POLICY AND ITS EFFECT ON METROPOLITAN AREAS [Politica dei trasporti pubblici ed effetti sull'assetto territoriale]. An analysis of the regional, social, economic and administrative conditions which determine traffic flows, begins with a study of the four basic community sectors which generate and require transport: residence,

commerce, industry and services. The importance of accessibility is emphasised and various fare and pricing policies favouring public transport are discussed. Planning policies which restrict the car from town centres, and some bus priority measures are outlined, and a discussion of financing policies covers state, private, and public investment. Finally, it is stressed that transport planning must be an integral part of the medium and long term urban planning program. /TRRL/ [Italian]

42 125588 URBAN TRAFFIC MODELS: POSSIBILITIES FOR SIMPLIFICATION. Urban traffic is one of the crucial problems of governmental transport policies. In order to make urban transport investments and policies more effective, it is necessary to analyse and evaluate a wide range of alternative transport solutions before selecting those most adequate for detailed study. The aim of this report is therefore to appraise and improve existing decision making tools available in the form of "strategic" transport computer models and to study the degree of simplification which is compatible with meaningful results. The report reviews the current state of the art in urban traffic models, i.e. The four-step models (generation, distribution, modal split, assignment) conventionally used in urban transportation and the new single-step "explicit" demand/supply equilibrium models; the concept of the general share model is introduced and the various modelling approaches are discussed. The implications for simplified traffic models and current research in this field are described. The report also contains an evaluation of the main issues involved in modern urban transport planning and of the major model components such as changes in land use, public transport, new modes, traffic restraint, parking and pedestrians. A short chapter on accuracy considerations is included and presents some practical results of past transportation studies. Finally data requirements, availability and simplification are examined. The report concludes with a series of recommendations for transport planners and proposals for further research in this area. /TRRL/

42 125595 TRANSPORT AS AN INDUCER OF URBAN CHANGE. Four factors are discussed as having led to an increase of traffic in cities. They are: 1) the increased number of people in cities, 2) the changing distribution of population within cities, itself influenced by developments in transport, 3) the growth in car ownership, 4) cars are used in the peak period rather than public transport. Town size is shown to be related to mode of travel to the central areas of cities during the morning peak. It is concluded that there is a strong interaction between urban development and transport. The last part of the paper briefly discusses intercity and leisure travel. The number of the covering abstract of the textbook is IRRD Abstract No. 212297. /TRRL/

42 125600 URBAN PUBLIC TRANSPORT POLICY IN A FULLY MOTORISED SOCIETY. Two essentials are stressed at the beginning of this paper: the increasing importance of the motor car and the need for transport policy. The creation of passenger transport authorities and executives has attacked the latter problem. Urban transport policy must be based on trade-offs: decisions on the balance of facilities for cars and public transport, in the light of land use policies and traffic congestion. Social welfare issues must be the financial responsibility of the community as a whole, especially as the executives must pay their way. Policy on fares and services is even more important to financial success than efficient management and relates also to the balance between public transport and the car. It is concluded that the arguments for a total transport budget apply equally well to a total urban budget. The number of the covering abstract of the textbook is IRRD Abstract No. 212297. /TRRL/

42 125607 SPATIAL DISTRIBUTIONS OF HOMES FOR JOURNEYS TO WORK BY DIFFERENT MODES OF TRANSPORT. Home density data from London and Bristol are examined for different transport modes to work. The data can be fitted to functions that generalize those proposed by Clark (1951) and Sherratt (1960) for the same purpose. Our generalized model assumes circular symmetry, but takes into account the smaller density of homes in the central area. Comparison between the different modes of transport in London show that the homes of car commuters are the most spread out, followed by train and then bus. The homes of tube commuters are the least spread out across the city. Further studies of the data on journeys to work show that the positions of the homes and workplaces are correlated. The correlation is especially apparent for car journeys and bus journeys in London. Direct distances between home and workplace are examined and comparisons made between the different modes of transport. /Author/TRRL/

42 125610 TECHNIQUES FOR TRIP MODELING. This paper describes the methods used by the London Borough of Islington in trip modelling during their transportation study. Since matrices for the base year 1971, were not available from the greater London transportation study until late 1974, base data were synthesized from the 1962 London traffic survey data. In order to determine how trips are generated, each household is allocated to one of 180 categories which depend on household structure, income group and car ownership. For each zone a small survey

was performed and probability functions used to find the distribution of categories. To find the distribution of trips between zones a gravity-type model was assumed. The flows on the road network were simulated using standard transportation modelling techniques. The models may then be used to estimate future trip generation and patterns of journeys. It is hoped to develop the distribution model to include trips made by public transport. /TRRL/

42 125631 THE IMPROVEMENT OF PUBLIC TRANSPORT. The author reviews the roles of public and private transport: it is noted that few people now believe the car is the solution to all transport problems. This is due to American experience and the warnings of documents such as the Buchanan report. A description of the general decline in public transport is followed by an analysis of the relative investment in the two types of transport, indicating a far greater emphasis on private transport. The financing system is discussed and it is concluded that the separate financing of individual projects favours road transport and considerably distorts real costs and benefits. It is argued that effective control of all parking is needed to limit car usage. The construction of trans-shipment centres and the provision of good rail access are examined as means of alleviating freight transport problems. The author presents a number of policy conclusions which include the need for overall planning of the transport system, an integrated financing system, parking controls and more encouragement for rail freight. /TRRL/

42 125771 AGGREGATE TIME-SERIES ANALYSIS OF URBAN TRANSIT DEMAND: THE MONTREAL CASE. This paper shows how readily available monthly time-series data may be used to explain the aggregate demand for public transit in particular urban areas in terms of the prices of public and private transportation, the price of non-transportation goods, service characteristics of the competing modes, comfort levels, income and socioeconomic variables, etc. Parameter values pertain to the adult market of the Montreal Urban Community Transit Commission over the period December 1956 to December 1971. Estimates are obtained by using linear regression techniques in conjunction with the Box-Jenkins procedures for the specification of the Rth-order autoregressive process of the error terms. /Author/

42 125796 COMMUNITY ROLE IN MODAL CHOICE FOR TRANSIT SYSTEM PLANNING. The Buffalo, N.Y., SMSA is currently anticipating the construction of a rail rapid transit system. This rail rapid transit system is to be contained in a central corridor going from the existing CBD in Buffalo to the rapidly developing new State University campus and planned new community in the suburban areas. Current travel patterns and their changes in the past decade have been examined together with changes in population, employment, and shopping characteristics. As the proposed rapid transit is the culmination of a long transportation planning process begun in the early 1960's, the history of this process is reviewed. Issues that have arisen by community groups in the impact area are traced. It is noted that the diversity of the issues and current concerns regarding planning have arisen from previous transportation actions, job availability, and dependence upon the car. The paper concludes with an assessment of current actions in the corridor area.

Paaswell, RE (State University of New York, Buffalo) Pafka-Gerbig, J *ASCE Journal of the Urban Plan and Develop Div* Vol. 101 No. 1, May 1975, pp 35-47, 16 Ref.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL, Repr. PC, Microfilm

42 125797 RAIL TRANSIT OPERATING COST GUIDELINES. Operating costs may be estimated at several levels of detail, ranging from the simple application of unit costs per car-mile or car-hour, to the preparation of a complete manning table and other refinements, depending on the level of accuracy required for the individual application. The need for this type of estimate prompted the development of the set of guidelines that forms the subject of this paper. The so-called "yardstick concept" that evolves utilizes unit measures of work and cost derived from actual operating systems to estimate generalized man-

power requirements and operating costs for planned urban rail systems. Following an analysis of present transit accounting practices, factors affecting operating costs, and the development of the yardstick concept, an estimate prepared for Atlanta with the aid of the guidelines is presented.

42 125833 MASS TRANSPORTATION: A NATIONAL COMMITMENT. This paper emphasized the need for a national commitment to public transportation and the need for legislative action to provide stable long-term funding. It is estimated that a \$77 billion commitment could provide the systems and rolling stock for public transit to attract upwards of 38 billion trips by 1990. The three basic modes of ground transportation--rail transit, bus, and automated personal rapid transit--are discussed and their relative role and funding needs advanced.

Lancaster, TA (Rohr Industries, Incorporated) Hearn, DL ; Society of Automotive Engineers Preprint 750443, Feb. 1975, 6 pp; Prepared for meeting 24-28 February 1975.; ACKNOWLEDGMENT: EI; ORDER FROM: ESL, Repr. PC, Microfilm

42 126077 NATIONAL ECONOMIC ANALYSIS OF TRAFFIC SYSTEMS-A CAB TRACK SYSTEM IN VAESTERAAS [Sambhaell-sekonomisk Analys av Trafiksystem-Spaartaxi I Vaesteraas]. A method for the analysis of traffic systems from a national economic viewpoint is described; it involves taking whole traffic system into consideration and investigating alternative traffic solutions with different public transport systems. In the evaluation all factors that are affected should be accounted for. The proposed methodology is applied to a case study for a Swedish town, Vaesteraas, involving a new means of public transport, a cab track system, which the authors find technically possible and fully realizable in this town in 1990. Three alternatives, reflecting different courses of development have been analyzed in the report, for the year 1990; the first is an extension of the present trend, that is car traffic dominating, the second includes the introduction of a cab track system as a public means of transport, the third furthermore includes a forced limitation of private car traffic. Economic and other consequences are discussed. /TRRL/ [Swedish]

42 126122 POLITICS, REGULATION AND URBAN TRANSPORTATION PRIORITIES: THE TRIUMPH OF THE AUTO SOCIETY. In the United States, urban transportation is in serious difficulty. The emphasis is on the automobile highway transportation system not mass transit. A network of auto related industries keep policy orientation on highways. They wield economic and political power that burdens urban

areas. Cities are not only choked with auto pollution and congestion but about one half of the center cities land is devoted to accommodating the auto. People have no viable alternative to the auto. The Highway Trust Fund indirectly regulates the automobile industry by creating the demand for automotive transportation. The revenue generated by the fund leads government to heavily subsidize highways. This makes mass transit look even less attractive. The auto-highway aggregation is deeply entrenched in our society from government officials to auto dealers, and parking lot and gasoline service station owners. The automobile problem is an economic and political problem. It will have to be solved by political means.

42 126203 MAN AND CAR SOCIETY [Maenniskan och bilsamhaellet]. This book deals with the priorities of various modes of transport in Sweden. It is shown how car-oriented traffic planning has developed up to today. The changes in traffic environment during the latest 5 decades are analyzed and the effects on different road user categories are discussed. A main idea is that if a more reasonable payment responsibility is laid on car traffic a substantial increase in public transport will be the effect. Many concrete suggestions are made in order to favor public transport and pedestrians. /TRRL/ [Swedish]

42 126265 EFFECTS OF CHANGES IN PARKING PRICES AND PARKING RESTRICTIONS ON URBAN TRANSPORT DEMANDS AND CONGESTION LEVELS. The research reported investigates the influence of parking prices, fees, and time costs, on urban modal choice and parking location decisions. A disaggregate approach is used to test a behavioral two-stage model in which the use of the car is followed by a selection among alternative parking locations. Parking was shown to be treated as a separate variable in the modal choice decision, and not simply aggregated with running costs as previous modal split studies suggested. Work trip data, based upon the Toronto and region transportation study of 1964, was used for testing modal choice and parking location equations, and the effects of changes in parking prices, fee structures and time costs are evaluated. The main conclusions are: (1) The estimated elasticity of choice of mode with respect to changes in parking fee is -0.44. This is lower than previously believed. Also, the impact of any changes in parking prices are dependent on the current auto/transit split. (2) The parking location models indicate that a rise in parking prices over the central business district (CBD) will result in both a relocation and modal switching effect. (3) Congestion in aggregate is influenced very little, if at all. There is, however, a redistribution of parkers towards the periphery of the CBD. The redistributive impact depends on the current distribution of parkers within the CBD, their socio-economic characteristics, such as income level, and the particular parking policy chosen. /TRRL/

Gillen, GW ; Toronto-York University Joint Program in Transp R&D Rept. No. 25, Feb. 1975, 51 pp, 2 Fig., 9 Tab., 21 Ref.; ACKNOWLEDGMENT: TRRL (IRRD-213719)

42 126311 PRELIMINARY TRANSIT PATRONAGE ESTIMATION FOR SMALL URBAN AREAS VIA TRANSIT SERVICE FACTOR. Transit service-factor (annual revenue miles of bus service per capita) offers a conveniently applied parameter for preliminary estimation of system-wide patronage for the small urban area contemplating establishment or substantial expansion of public transit service. Its use is particularly suited to preliminary transit feasibility studies using sketch-planning techniques for rapidly generating and appraising alternative system concepts and general levels of service. Careful judgment should be exercised in application of the service factor/ridership relationships presented here to any particular urban area, however. Adjustments for local conditions--community factors and transit system parameters--and consistency checks with other patronage estimation criteria are essential in applications beyond gross preliminary patronage estimation.

42 126408 PLANNING, IMPLEMENTATION AND OPERATION OF THE PHILADELPHIA-LINDENWOLD LINE. The one to six car trains are operated by a one man train crew who is, in fact, part of the automated or computerized process. He notifies the computer as to the length of the train; opens and closes doors; determines the length in time of each stop; initiates acceleration; and can eliminate station stops. The computer prevailing determines train speed for each track section and right of way conditions; causes the train to decelerate at the optimum rate; and stops at the station with the center of the train at the center of the platform. The Lindenwold Line has demonstrated that motorists will leave their cars if superior transportation is provided; quality transit service can reduce air and noise pollution and conserve energy; traffic congestion can be reduced; technology is now available to create desirable rapid transit service, and that rail rapid transit can be planned, constructed, and efficiently managed to meet operating and maintenance costs out of the fare box.

42 126412 QUESTIONNAIRE SURVEYS OF PASSENGER COMFORT. Some of the techniques involved in the quantitative treatment of data obtained in the 'field' situation are discussed. The examples provided concern attempts to quantify passenger reaction to the noise and vibration experienced in public transport, since it is the assessment of these two factors, and their effects on passenger comfort, which is being investigated at Swansea. After discussing the validity of information derived in this way, general methods of assessment are described. The paper continues with a detailed examination of questionnaire methods of the subjective assessment of environmental stimuli, and concludes with examples of the pitfalls which may be inherent in such assessment.

42 126428 ANALYSIS OF URBAN TRANSPORTATION CRITERIA. The criteria should accurately account for the quality of the transportation service, accessibility to various land-use opportunities, economic efficiency, system and traffic characteristics, community disruption, pollution of the environmental, adaptability to changes in technology and travel behavior, and esthetic quality of transportation facilities. The results of an attitudinal survey conducted by the Delaware Valley Regional Planning Commission (DVRPC) indicate that individuals can adequately rank well-defined criteria. The examination of the criteria ranks by population groups of different socioeconomic characteristics shows no larger variations from the ranking by the total population in the sample. The DVRPC survey indicates that safety and security is the most important criterion in transportation, followed by reliability, air pollution, travel time, preservation of neighborhood, comfort, noise pollution, esthetics, job opportunities, transfers, duration of service, construction cost, and shopping opportunities.

42 126858 NATIONAL TRANSPORTATION POLICY-A PROPOSAL. This six-part paper reviews the central transportation issues, and drafts (for public comment) a statement of goals, aspirations and programs for public transport in America. The first part which discusses the national problem, is designed to furnish an historical reference point and perspective on area of principal concern to those of 1,000 private and public agencies which are engaged in the task of daily moving persons within urban and rural areas. Part II, which considers the place for public transport in a national transportation policy, establishes relationships primarily among urban and rural ground transportation forms. This section is an attempt to crystallize those elements of an overall policy which would advance the role and possible contributions of public transport in restoring balance to the efforts which must be expended in assuring future mobility for citizens. Part III focuses on specific objectives and requirements of the public transport industry within the framework of general goals. The two immediate public transport markets are brought into play in Part IV and several approaches to potential markets are examined. Part V analyses the National Mass Transportation Act of 1974 insofar as it meets the specified requirements of the transit industry. In the final section (Part VI), the future of the provisions of the '74 act are considered and a number of major concerns that have arisen are addressed.

42 127010 PREPARATION OF STRATEGIC CHOICES IN INTER-REGIONAL URBAN OR SUBURBAN PUBLIC TRANSPORT SERVICES [Preparation des choix strategiques en matiere de transports interregionaux de personnes (TR.I.P.)]. The French Minister of Transport and the Minister for Urban and Regional Development have set up an interministerial Steering Committee to study possible strategies for inter-regional passenger transport. The author, who is chairman of the working party known as TR.I.P., which is the committee's executive body, explains the progress made by his group in its work. He describes the organization and scope of the study, the supply-demand simulation model, the envisaged financing plan, and the strategic formulations they make possible. It is planned to apply them in the preparation of the VIIth economic plan. [French]

42 127487 PROGRAMMING IN PERSPECTIVE. The role of programming is defined and the historical aspects, current features and future trends of the concept are examined. The programming role is that of marshalling all the options, weighing them against one another, deciding the order of effectiveness among means, and the order of relative efficiencies for each level of effectiveness of means. The programming role is an intermediate role which must continually interact with the initiatives that arise at the planning level and with the consequences reported at the budgetary level. The transportation picture in the 19th century is described; the needs at this time were met by a mixture of public and private programming. Before the advent of the automobile, the only programming required of public authorities had to do with the level and structure of franchise payments they could exact. Programming soon came to assume the intermediary function if not holds. At this time the special programming problem became the establishment that the use of vehicles confers net benefits at least equivalent to the costs. The need for intermodal programming (most needed in connection with terminals and terminal areas) now arose. The main needs in this area are likely to relate to the hearts of metropolitan areas. Comments are made on the traditional impact study and the programming based on the benefits it indicates. The implications held by the private passenger vehicle and public transportation is examined. Complex problems for programming are also presented by the Highway Trust Fund and Transportation Trust Fund. The programming road ahead for freight is seen in the railroad; in intercity transport, programming must demonstrate sensitivity to more parameters and different points of view; within cities, the development of "discontinuous or disjunctive" programming is suggested. There will be a need in the future for more extensive and imaginative programming and a better grasp of far-out options.

23-26, 1975 at Orlando, Florida. See individual sections, HRIS #127487-#127495.; ORDER FROM: TRB Publications Off, Orig. PC

42 127488 FEDERAL ROLE IN PROGRAMMING. Although federal programs, policy and regulations have distorted the competitive balance among modes, changes are foreseen. Regulatory reform will allow inherent competitive advantage to operate more fully and to allow intelligent trade-offs in the economic sphere. Another major federal policy change focuses on user-charge policy. Woven with the user-charge issue and an important part of programming are trust funds, earmarked financing, and long-term financing. The Department of Transportation has several basic premises that will serve to strengthen local transportation planning and programming. These include more flexibility in the use of funds, a broader range of modal choices with federal transportation assistance, and the use of multiyear contract authority. The need is expressed for the analysis of transportation investment in a way that openly recognizes the community development impact. Comment is made on the argument concerning the need to cross subsidize the unprofitable low-density lines with high-density lines. Without effective legislative cooperation, the new budget control act could restrict long-term programming to transit funds. To resolve this problem, either the act must be amended or an alternate system must be developed that allows for budget review and yet facilitates needed 2-or 3-year delivery systems. Transportation policy must not be dictated by a provision that hinders long-term programming authority unless there is a trust fund. With reference to the provisions of the 1973 highway act (especially the transfer of Interstate Highway funds), there must be some recognition of the special programming, timing and execution problems of the transfer provisions because conventional programming processes for the Interstate Highway System program does not accommodate the needs.

Lutz, TC (Department of Transportation) *Transportation Research Board Special Reports* No. 157, 1975, pp 25-27; Proceedings of a conference held March 23-26, 1975 at Orlando, Florida. See individual sections, HRIS #127487-#127495.; ORDER FROM: TRB Publications Off, Orig. PC

42 127495 EVALUATION. The failure of the transportation process or program is traced to lack of management. The basic cause of this failure is human, not technical. In evaluating the transportation programming process, reference is made to a linear alignment (from planning to programming to right-of-way acquisition to construction) and to factors of time, funds, and manpower generally for individual projects and possibly grouped. The evaluation of success must seriously consider the role of transportation in meeting the needs and the desires of society, the role of each level and unit of government, the role of private enterprise in establishing and accomplishing reasonable objectives, the balance of resources among all functions of publicly funded programs, and the performance of individual agencies and units in their assigned roles with available resources. In the discussion which follows, the Federal Highway Administration's viewpoint is put forward: programming is neces-

sary; and the Administration is committed to restoring it with a minimum requirement of federal presence in an evaluation process. The Urban Mass Transportation Administration has statutory objectives against which to measure progress, and certain national objectives of air quality and energy conservation. However, these are not operational objectives. Such objectives, it is suggested could be the improvement of the quality of service for the "transit independents"; improvement of mobility of the transit dependents; and the reduction of automobile usage because such usage serves as a surrogate for certain more basic goals such as improved environmental quality and energy conservation.

42 127574 EVALUATING TRANSIT SERVICE TO MINORITIES. This report describes a computerized evaluation methodology for analyzing the fair distribution of transit services. The report is of specific interest to the Office of Civil Rights, Urban Mass Transportation Administration, which is charged with evaluating compliance with Civil Rights standards during a review prior to the awarding of a capital grant in Urban Mass Transportation. It may be used to analyze the fairness of transit services provided to the elderly, to females, or to any desired interest group. The report is also of interest to transit planning agencies, and is useful in analyzing the geographic and socio-economic distributing of transit services in a metropolitan area. A model is formulated upon the concept of accessibility to opportunities, and produces accessibility indices of transit service for small geographic zones. The indices measure the percentage of opportunities available to residents of each zone via the transit system. A computer model is produced that is compatible with current U.T.P.S. programs and it uses these programs to develop input data. Capabilities of the model to analyze accessibility conditions and produce output reports are illustrated by data from the City of Richmond, Virginia. The computer program is included in the appendix and it is thoroughly described in the User's Manual. /Author/

42 127667 MAJOR SHIFT IN TRANSPORTATION MODES FORESEEN OVER NEXT 25 YEARS. The trend toward more energy-efficient forms of transportation is discussed in this summary of the market research study "Transportation Markets" published by Frost & Sullivan, Inc. Statistics are given for future car populations, engine modifications, auto usage, freight transportation and mass transit by both rail and bus.

Some specific features of each of these areas are mentioned.

American Highways and Transportation Vol. 54 No. 2, July 1975, p 29

42 127684 TELECOMMUNICATIONS: THE STATE OF THE ART AND PLANNING IMPLICATIONS. This overview of the science of telecommunications and some of its possible implications, focuses on the possibility of using telecommunication as a substitute for travel. Various combinations of four sub-systems (2-way audio, 2-way audio visual facsimile transmission, and remote computer services) are currently used in diverse fields through the country. Although many operational systems are limited geographically, they are already substituting for travel. The development of telecommunication science has been directed toward the improvement of communications and the bringing of social services within reach of the disadvantaged. Studies indicate that about 24 percent of all work trips and about 50 percent of all shopping trips could be replaced by telecom methods. There is a real possibility that substitution of telecommunications for travel will lead to changes in urban form and to decentralization. A possible consequence of such decentralization is the decline of CBD office growth, and the concomitant impacts on mass-transit-especially rapid rail. The social and psychological implications are also considered. The acceptability of a mechanical form of communication and a possible "information overkill" are discussed.

42 127773 GREATER LONDON TRANSPORTATION SURVEY. 1. ORGANISATION AND MANAGEMENT OF THE SURVEYS. The greater London transportation survey undertaken during 1971-72 was, in technical content, a conventional transportation survey, but differed from other surveys in that it was the first major update in the U.S. Of a transportation data base: 1962 was the year of the London traffic survey. The main differences were in terms of planning, implementation, processing and procedure. During the planning stage a number of pilot surveys were commissioned to find ways of avoiding mass data collection, hitherto an inherent part of the process. The study also provided the opportunity to introduce subjective data into a field previously guarded by opinion and precedent. The underlying approach was to establish a total data system in which fieldwork methods were not regarded in isolation, but rather as an integral part of the overall process. (A). /TRRL/

42 127860 THE MATTER OF BALANCED TRANSPORTATION. Balanced transportation has been used to describe a mixture of transport services involving desirable or optimum combination of two or more modes. This article concludes that a balanced transport system has not yet been achieved in any urban area. The author urges that there be better understanding of the nature of problems such as relation between land use and transportation. Decision making processes must

be clarified and there should be continued advancement in the processes of planning. More adequate concepts of organization are needed to perform transport-related functions. Broader bases are needed for public financing of urban transport. A greater range of alternatives are available for meeting special requirements of a complex regional transport system.

42 127879 TRANSPORTATION IN FOCUS. These proceedings, composed of papers presented at the Transportation Research Forum, reflect the broad spectrum of transportation problems that now exist and the wide range of approaches that have been taken to solve them. The following topics are covered: national transportation policy; determining the optimal railroad route structure; air service to small communities; financing urban transit systems; port planning and operation; the Canadian deregulation experience; issues in trucking and urban goods movement; urban transportation systems; transportation of solids by pipeline: economic issues; safety and security in public transportation; should railroad accounting be revised; the national transportation study; air transportation systems analysis; developments in travel demand analysis; transportation of solids by pipeline: technological issues; urban transportation system evaluation; transportation cost measurement for decision making; marketing public transport services; and interactive graphic tools for transportation planning. Papers from the Canadian Transportation Research Forum which was held prior to the U.S. Forum are also included. Reports of the discussions and debates appear in a companion volume.

42 127970 BALANCED TRANSPORTATION. An investigation of practices and problems of urban areas in Canada, Australia and eight European countries covered 5 specific areas: the coordination of the technical aspects of land use and transportation planning; the coordination in timing and financing of improvements; the sources of funds for planning and development; the legal requirements and administrative practices that require or encourage coordination in development; and the extent and form of citizen participation in the planning process. The most significant of these, and one common to all countries was that covering legal requirements and administrative practices. Forming and financing of improvements was also found to be of vital importance. Growing public participation was noted, and common features in the preparation and approval of the first-level plan are set forth. The question is considered why planning is more effective in other countries than in the U.S. The concept of "quality of transportation" is discussed, and the role of the transportation official is examined.

Holmes, EH (International Road Federation) *American Assn of State Hwy & Transp Office Proc* Vol. 16 1974, pp 64-75; Proceedings of the 1974 Sixtieth Annual Meeting, Detroit, Michigan, November 18-20, 1974.

42 128895 DEMAND FUNCTIONS, BEHAVIORAL ANALYSIS, AND COST EFFECTIVENESS IN URBAN TRANSPORTATION. The sensitivity of cost-benefit assessments to variations in demand for public transportation systems, indicates some major changes in costs and benefits for different demand conditions. However, the relative standing of new systems of urban transportation were not significantly affected. Also discussed are requirements for improved modeling of demand. Diagram and table illustrate analysis.

42 129478 INVESTMENT EVALUATION MODEL FOR MULTIMODAL TRANSPORT CORRIDORS. A method of economic evaluation of centrally focused multimodal urban transport corridors is presented that is based on certain production theory principles. Production functions are developed in terms of average door-to-door travel velocity in a corridor as a function of commuter-rail and expressway-facility inputs. Cost data are used to establish the optimum combinations of transport mode inputs for various travel speeds. The information used to develop the relationships was obtained in the Toronto region. The use of the techniques described in the paper allows the technical and economic characteristics of the modes to be examined in a quasi-continuous way, which allows a broad range of potential modal combinations to be evaluated. This is in contrast to the normal economic evaluation approach, which chooses from among a set of mutually exclusive, mode-specific alternatives that may not include the optimal alternative. The framework allows the examination of a range of policy variables such as parking charge changes in the central business district and the effect of dial-a-bus as a residential feeder mode.

42 129528 DESIGN CHARTS FOR ESTIMATING TRANSPORTATION PLANNING STATISTICS FROM AREA POPULATION. Utilizing data collected for urban transportation studies in Ontario, regression analysis has been used to establish relationships between the daily number of person trips in an urban area and the area population. In particular the number of trips by auto drivers, auto passengers and mass transit riders have been investigated. Further, auto driver trips have been stratified into the following destination trip purposes: return home, work and

related business, shopping, social-recreational and miscellaneous. The results of this analysis have been used to prepare a set of design charts. These charts are presented graphically and in the form of a nomogram. The accuracy of these charts has been investigated and found satisfactory for most planning purposes. (A) /TRRL/

42 129612 TRANSIT ASSISTANCE PROGRAM FOR IOWA. This inventory of transit services in Iowa covers urban transit, intercity passenger bus carriers and charter operators, taxicab operations, rural transit services and special services, and includes the results of questionnaire and interview surveys, and the resulting recommendations. The recommendations urge a centralized source of data and expertise, a public information program, the utilization of federal aid, the continuance of existing transit services with no diminution of service level, the establishment of new services in communities of over 20,000 population, the sponsorship of demonstrations in communities with populations of 10,000 to 20,000, and the development and improvement of rural transit service. Based on state and local community experience, recommendations are made concerning revenue sources to support transit in Iowa, and four alternative state transit assistance programs are presented.

42 129630 TOWARD MORE BALANCED TRANSPORTATION: NEW INTERGOVERNMENTAL PROPOSALS. This report focuses on the "regional" transportation systems (Metropolitan as well as non-metropolitan areas) encompassing all modes, operating characteristics and considers the challenge of finding a means of linking the planning for one mode with the planning for another. To meet this challenge, the Commission recommends a nine point program relating to the merging of the federal urban system and secondary highway system into a unified block grant program, the utilization of this block grant, the channeling of funds, the regional bodies designated for federal and roles, state and local financing policies, and the consolidation by Congress and State legislators of established regulatory bodies. Precedents upon which these recommendations are made are stated, and the importance of cooperative intergovernmental relations in the implementation of the recommendations is underscored.

Advisory Commission on Intergovernmental Relations 1975, 307 pp, 14 Fig., 115 Tab.; ORDER FROM: GPO, Repr. PC; 052-003-00106-3

42 129682 A MODAL SPLIT MODEL [Een Model Voor de Voertuigkeuze]. A modal split model developed by the national physical planning agency for a study of the relations between the physical structure of towns and the transport system is described. The model divides a given total origin-destination matrix into trips by mode:

car, public transport, motorcycle, bicycle. The basic idea of the model is that every traveller makes his choice from the various modes in a given choice situation. This situation is defined by the trip purpose and the modes available to the trip maker. The choice from these modes is determined by the travel times, costs and distances and in some cases by the parking situation at the place of destination. On the one hand, these variables constitute the choice determining factors, on the other hand they are policy related. The basic idea is worked out into an operational model concept. The calibration of the model is described. The appendices deal with the theoretical and operational model put into a scheme, the formulae of the modal split model, the parameter values used in the model and the results obtained. The covering abstract for the conference is IRRD no. 213390. /TRRL/ [Dutch]

42 129683 A FLEXIBLE TRAVEL DEMAND MODEL SYSTEM FOR REGIONAL APPLICATIONS [Een Provinciaal-Regionaal Rekenmedel: Toepasbaar en Aanpasbaar]. The regional model system presented here has the following characteristics: applicability to work days for the period 0-24 hour, three trip purposes and three modes. Furthermore, it is possible to apply it to particular periods of the day, e.g. the peak hour, and to make calculations for selected areas at a much higher level of detail. The following five submodels are dealt with: 1) trip production and attraction, and intrazonal trips 2) trip distribution 3) modal split 4) time split 5) road and public transport network assignment. Apart from the usual explanatory variables use is made of two zone typologies: a classification of zones according to service level and employment, and one with respect to urban and non-urban areas. 42 129976 THE BASIC-NETWORK: A FLEXIBLE SYSTEM FOR THE CALCULATION OF TRAVEL TIMES AND DISTANCES [Het Basis Netwerk: Een Flexibel Systeem voor het Berekenen van Reistijden en Reisafstanden].

The need for traffic and transport planners to have quickly available the values of explanatory factors influencing transport demand led, among other things, to the development of a so called basic network with corresponding software. The paper gives a systematic description of the infrastructure, analysed in all its essential components, for all modes of transport, such as walking, bicycle, moped, car, railway, bus etc. After dealing with the inventory of the infrastructure, the author focuses attention on the programs which produce a transport network model. Data checking is performed in order to guarantee an expeditious application. The output, such as travel time-matrices, distance-matrices and "round trips", is also discussed. Finally, brief attention is paid to the setting-up of a databank, to its use, and to the further development of the system and programs. For covering abstract for the conference see IRRD no. 215277. /TRRL/ [Dutch]

42 130767 SENSITIVITY ANALYSIS OF COMMUNITY SAVINGS DUE TO CHANGE-OF-MODE OPERATIONS.

This study is concerned with a sensitivity analysis of the community savings provided by successful change-of-mode (park-and-ride) facilities in medium to large U.S. cities. The research was an early attempt to generalize the locational aspects of change-of-mode facilities and their benefits to the community. The determination of the community savings due to the diversion of trips from highway to change-of-mode facilities is a prerequisite in assessing the feasibility (success of park-and-ride facilities). Community savings (the summation of both user and nonuser benefits) are computed as the difference in travel costs by highway alone and or by change-of-mode facilities. Travel costs are simulated in a deterministic fashion and by using average unit costs for cities of different sizes and for different locations within a given city. The simulated community savings data are then used to develop a linear multiple regression equation to predict the savings.

42 130768 INFLUENCE OF PARK-AND-RIDE FACTORS IN MODAL SHIFT PLANNING.

The purpose of this paper is to investigate the use of park-and-ride facilities and municipal parking policies as a means of controlling the modal split in urban areas. A discriminant model was used to examine the reasons why park-and-ride patrons shifted to that mode from a former automobile mode. An attitudinal survey was also used to substantiate the model results. The reduction in travel cost appears to be the main reason for the modal shift. The primary conclusion is that a park-and-ride facility can be used as a planning tool to adjust the modal split if the service is properly designed.

42 130770 COMPUTER-ANIMATED SIMULATION MODELS: A TOOL FOR TRANSPORTATION PLANNING.

The role of computer animation in visualizing the behavior of simulation models of complex processes and systems is described. The results of a demonstration project applying this technique to transportation planning are reported and analyzed. The study involved the modeling and display of passenger flow in a subway station. It was carried out by using SIMULOGO, a new discrete-event simulation language, and ZAPP, a new computer animation system, which are discussed in the paper. Planned extensions and elaborations of these facilities to provide a comprehensive and responsive environment for transportation systems modeling are outlined.

42 131011 COMPARATIVE TRAVEL PATTERNS FROM FOUR WORK TRIP DATA SOURCES.

This research investigated the feasibility of using work trip data as the primary source of information to obtain travel patterns for urban transportation planning in small urban areas. Data was collected from four sources in Lafayette-West Lafayette (Indiana) SMSA: (1) the Greater Lafayette Area Transportation and Development Study's home-interview origin-destination survey; (2) an employee survey; (3) the Lafayette city directory; and (4) Bureau of the Census 1970 Urban Transportation Planning Package. Chi-square test and simple analysis of variance techniques were used in comparing the resultant trip tables from the latter three sources against those from the home-interview. In addition to traffic zone to traffic zone trip tables, traffic zone to census tract tables were also compared. It was found that there were significant statistical differences in all comparisons. However, the differences did not appear to be of practical importance between the census and the home-interview patterns. It was also concluded that the directory pattern showed significant statistical and practical differences from the home-interview pattern. Although the employee survey pattern showed statistical differences, it was not clear that these differences would be truly practical differences in transportation planning for small cities. Further research is recommended in the form of another comparative survey with more comprehensive sampling and data collection techniques.

42 131316 RAPID TRANSIT PLANNING: A TALE OF THREE CITIES.

Three articles explore the complex nature of rapid transit planning and reflect the experiences of three municipalities in their efforts to plan rail transit systems,

providing insight into the mechanisms, concepts and difficulties inherent in such undertakings. Dyer analyzes the events that have taken place in the Miami area. Looking at rapid transit planning in the context of public policy, four major issues are related to the Dade County project and recommendations are offered to sooth the planning process and make it more responsive. Alegria focuses on the physical aspects of planning and specifically on technical barriers that the designers of Mexico City's Metro had to overcome. The system is now in operation and the municipal government is looking to its expansion. Simpson of Denver's Regional Transportation District asks at what point planning should stop and commitment be made. Denver's slow progress is discussed.

42 131357 MAN MOVEMENT AND TOMORROW'S CITIES: THE EFFECTS OF MOTORIZATION ON URBAN GROWTH.

The question of what the future holds for the automobile and for the city is considered, and the effect of motorization in limiting urban growth is examined. The situation in Japan is considered where bold plans for road construction were implemented in the 1960's. Rapid motorization soon met with opposition from elements which favor modes of transportation other than the automobile, and those who downgrade the importance of transportation altogether. It is recognized that the urge to move is deeply rooted, and it creates inevitable and never ending conflicts. The impact of these conflicts are described. The solution to automobile problems which has emerged, is that if a section of a city cannot handle automobiles, then the automobiles will go elsewhere. Restricting automobile use will stop urban population growth, but the reason for this will not be because the restriction will spur demand for mass transportation.

42 131596 TRANSPORTATION SYSTEM MANAGEMENT AS AN ELEMENT OF FEDERAL POLICY. Some of the commonly asked questions about the Transportation System Management (TSM), plan are clarified, and the rationale behind TSM is examined. TSM which is the short range element of the transportation plan (covering both highway and transit improvements) for each urban area, is designed to address needs through more efficient use of existing transportation resources. Development of the plan requires consideration of a wide range of actions of operational, pricing and regulatory nature. Typical examples of TSM are traffic operations improvements, provision of preferential treatment for transit, graduating parking fees and peak hour tolls, reducing transit fares, provision of incentives for ride sharing, provision of better local collection, distribution and circulation services, and the provision of coordination between feeder and line-haul services. Fiscal economy, better balance between transportation system elements, and the achievement of a better balance between intended future benefits and immediate benefits are the objectives of TSM. The question is asked, if TSM represents federal meddling in local affairs. The importance of action categories is stressed, and the question of assistance to localities, a single TSM/Transportation Control Plan (EPA requirement) and phased programming are considered.

Orski, CK (Urban Mass Transportation Administration) *Traffic Engineering* Vol. 46 No. 4, Apr. 1976, pp 36-39, 1 Phot.

42 131700 THE TRANSIT OPERATOR'S ROLE IN FEDERALLY FUNDED PLANNING AND PROGRAMMING. A plan for the allocation of resources by planning work area is presented which may be utilized by transit system operations and metropolitan planning organizations (MPO) to allocate responsibility and necessary funds to carry out planning and programming functions. Comments are made on the division of areas of planning responsibility, and the lack of guidance from the Urban Mass Transportation Administration is noted. The identification of the lead agency and manpower splits are seen to be the major problems. The long-range transportation plan;system plan covers six areas: identification of the long-range transportation needs of the urbanized area (MPO, 80-90 percent; operating agencies 10-20 percent); analysis of existing conditions (MPO, 80-90 percent; operating agencies 10-20 percent); projection of urban area economic, demographic and land use activities (MPO, 90-95 percent; operating agencies 5-10 percent); analysis of alternative transportation investments (MPO

40-50 percent; operating agencies 50-60 percent); monitoring and reporting urban development and transportation indicators (MPO, 60-80 percent; operating agencies, 20-40 percent), and identification of new transportation policies or facilities (MPO, 30-50 percent; operating agencies, 50-70 percent). Details are also outlined of long-range plan;plan refinement, short-range plan;transportation system management element, the transportation improvement program and implementation. Although the exact nature of the divisions will vary from one urbanized area to another, formalizing the allocation along the lines suggested here will make more explicit the relationship of transit operators and MPOs through the nation.

42 131742 1973-74 TRANSIT FACT BOOK. This is the fifth edition of a Transit Fact Book prepared by the Canadian Urban Transit Association giving statistical information for the year ending December 31, 1973. The information shown in this publication has been obtained mainly from statistical and other records of the Association and, in some cases, Statistics Canada. Such information pertains to member transit systems, both publicly and privately owned, operating in urban areas. It does not include interurban or school bus services. Membership represents approximately 90% of the urban transit systems in Canada. Statistical tables showing population groups are based on the 1971 Government of Canada census, and reports of member systems showing the size of areas served. Also included are the Officers and Board of Directors, Chairmen and Executive of Standing Committees, together with the lists of Operating, Associate Members and Associates of 1974. /RTAC/ Canadian Urban Transit Association No Date, 23 pp, 14 Tab.; ACKNOWLEDGMENT: Roads and Transportation Association of Canada; ORDER FROM: Roads and Transportation Association of Canada, 1765 St Laurent Boulevard, Ottawa, Ontario K1G 3V4, Canada

42 131797 ESTIMATING THE DEMAND FOR URBAN BUS TRAVEL. The disadvantages of conventional transportation study models, in particular their large data requirements and their weaknesses in dealing with changes in trip generation rates have led to a need for a simple model that can quickly and at low cost examine alternative public transport strategies. This paper investigates simple economic models of bus demand, examines alternative variables that can be used and discusses some alternative model forms. It demonstrates the results of a model using data from twelve urban bus operators in Britain and compares the results with those from other types of study. The model utilizes fare and service quality elasticities to explain the decline in passengers on urban bus services, and derives an average elasticity with respect to fare changes of -0.31 and with respect to service quality changes of 0.62. It is estimated that fare rises accounted for 13% of the 43% decline in passengers over the last fifteen years, vehicle mileage reductions for 14.3% and that only 15.7% was due to such factors as rising car ownership which are often given as the cause of declining bus patronage. The results, by showing that passengers are

far more sensitive to changes in service than they are to fare rises, are a useful guide to the broader public transport policy issues, and the paper concludes that the model does provide a useful method of forecasting public transport demand at a strategic level. Further work is needed, however, to establish more accurate forecasts for different types of passenger and studies are now being undertaken to establish these and to construct an operational forecasting model that can be applied with only limited data requirements. 42 131800 MODELING THE MODAL CHOICE DECISION PROCESS. Most models of modal choice are macroanalytic in nature-focusing on the behavior of large groups of travelers-and have limited explanatory power. Transportation managers need to know more about the decision processes of individual travelers in selecting a mode for a particular trip, if they are to be able to develop strategies for influencing these decisions. A microanalytic model of modal choice is therefore developed in flow-chart form, clarifying the stages in the modal choice decision process for any given trip. Individual consumers are seen as trying to satisfy a particular travel need by first specifying the characteristics of the trip itself and then specifying the "ideal" modal attributes required for this trip. Next, the perceived characteristics of a limited number of modes are evaluated against this "ideal" solution and the consumer is assumed to select that mode which provides the best match. The model explicitly recognizes the impact of psychological variables on modal choice as well as the consumer's need for information if he or she is to evaluate realistically all alternatives. 42 132276 TOWARDS THE ANALYSIS OF ATTITUDINAL AND BEHAVIORAL RESPONSES TO TRANSPORTATION SYSTEM CHARACTERISTICS. This report treats the requirements of planning methods for short-range and low-capital transportation options within the context of two primary objectives. The objectives are (1) the presentation of a fundamental set of behavioral principles which are relevant to the planning process and (2) the discussion of alternative methods for assessing the behavioral consequences of transportation changes. The presentation of fundamental behavioral principles relies substantially on classical behavioral reinforcement theory, but reference is also made to attitude theory, econometrics, marketing, and psychometrics. The discussion of data collection procedures presents information on sample specification, and it illustrates a variety of questionnaire formats for the collection of perceptions and preferences from respondents. Advantages and disadvantages of the formats are mentioned. Based on the discussion of behavioral principles and methods, general guidelines are offered for the modeling and data collection requirements of planning methods for short-range

and low-capital transportation options. (A) /TRRL/

Dobson, R (Department of Transportation) *Transportation (Netherlands)* Vol. 4 No. 3, Sept. 1975, pp 267-290, 7 Fig., 4 Tab., Refs.; ACKNOWLEDGMENT: TRRL (IRRD-216080)

42 132281 PLANNING OF TRANSPORT OPERATIONS. This report is prepared as the background to a lecture to be delivered to Scottish local authorities as part of the introduction of the transport policies and programmes system. The emphasis is on that part of the process which is concerned with making the best use of existing infrastructure and capital equipment. A general account is given of research results and recent relevant experience and an attempt is made to make a coherent picture of the present state of knowledge arising from operational studies of transport and transport policies. In a final section the plan-making process itself is discussed; it is suggested that the annually cyclic nature of the tpp process leads naturally to an annual cycle of plan revision in the light of measures which monitor the objectives. This has implications for the manner in which objectives are formulated. (A) /TRRL/

42 132891 THE COST STRUCTURE OF TUBE VEHICLE SYSTEM FOR HIGH SPEED GROUND TRANSPORTATION. This report examines the estimation of capital and operating costs for a range of general assumptions concerning the physical and cost features of tube vehicle systems. Costs are broken down as follows: costs of land acquisition (right of way, land prices, the cost of land), tunnels, at-grade construction, overhead construction, track and control (investment and maintenance), station, terminal and yard, vehicle and crew, vehicle power and evacuation systems, (electricity, aerodynamic drag, magnetic suspension drag, evacuation systems); total and unit costs are quoted together with vehicle capacity and headways. The costs of the above parameters are incorporated in the economic case study of a hypothetical tube vehicle system for which total annual and unit costs are compared /TRRL/

42 132894 A GLOBAL MODEL FOR THE EVALUATION OF EXTENSION PROJECTS FOR PUBLIC TRANSPORT IN THE PARIS REGIONAL NETWORK [Un modele global pour l'evaluation des projets d'extension des reseaux de transport public en region parisienne]. In order to dispose of tools which could cope with the evaluation of a specific project and with the comparison of several transport policies, the RATP has at its disposal a global model for traffic forecasts which is applicable to the whole Paris regional network and which operates in two stages: 1-the estimate of demand (generation and distribution) broken down into 302 independent zones for each socio-professional category comprising-the definition of basic planning data (active residents and employment by zone and by socio-professional category) using an original typological approach,-the generation of intra-zonal flows based upon average levels of service and accessibility, upon the type of zone and its area,-the distribution of inter-zonal flows using a normative model with probability justification. 2-the estimate of traffic (modal split and assignment) broken down by modal category into 600 zones and comprising:-assignment for each network of the "shortest" trips by reference to generalised cost,-modal split using assignment curves with variables based on the relative difference of generalised costs. The outputs of this model are exploited as the basis for comparative studies using the economics of multi-criteria analytical methods. These studies concern the development plan of the RATP, the preparation of the five year regional plan, and the interconnection of the RATP and SNCF rail networks. /TRRL/ [French]

42 132996 SERVICE AND METHODS DEMONSTRATION--ANNUAL REPORT. This report contains a description of the Service and Methods Demonstration Program. Transit demonstration projects undertaken in previous years are reviewed. Recently completed and current demonstration projects are described and project results from similar demonstrations are compared. The comparisons are made by grouping projects according to the program objectives addressed: (1) decrease transit travel time, (2) increase transit reliability, (3) increase transit coverage, (4) increase transit vehicle productivity, and (5) improve the mobility of transit dependents. Demonstrations are categorized as either experimental, i.e. those intended to develop and test concepts to the point where they merit widespread use, or exemplary, i.e. those conducted to achieve more widespread diffusion of proven concepts and techniques. Independent activities carried out in support of the demonstrations are described, such as the development of evaluation guidelines and improved methodologies for demonstration evaluation, analytical studies in support of the development of experimental demonstrations, and case studies of independent local innovations. Information dissemination mechanisms and activities intended to facilitate more widespread knowledge of effective approaches to improving transit are discussed. The Appendix contains a detailed description of each demonstration project including the objectives, history, status, results, evaluation and conclusions. /UMTA/

42 133112 A STRATEGY FOR THE EVALUATION OF ALTERNATIVE URBAN TRANSPORTATION SYSTEMS WITH MULTIDIMENSIONAL CONSEQUENCES. This report undertakes two interrelated efforts: (1) the examination of the validity of existing evaluation techniques potentially suitable for dealing with the problems involving multidimensional consequences of urban transportation systems; and (2) the development of an evaluation model in the context of additive utilities for unifying value judgements in search of the best alternative transportation plan. Four basic evaluation models are identified for comparative analysis. The focus of the analysis is on the theoretical soundness of the models and on the sensitivities of the models with respect to the number of alternatives encountered, to the distribution of outcome states, and to the addition or the reduction of the number of alternatives from the original set.

42 133321 OPERATING COSTS OF RAIL RAPID TRANSIT. The report examines the cost of operation of rail rapid transit systems, and the prediction of such costs for future systems, based on data obtained from the urban rail rapid transit operators in the United States and Canada. Existing cost-prediction models, based on the division of operating costs into maintenance of way and structures, maintenance of equipment, power, conducting transportation, administrative expenses, and miscellaneous expenses, are updated according to the most recent data available. In addition, those transit systems for which information is available are examined for division of costs into non-labor, direct labor and indirect labor categories; for the degree of utilization of personnel and facilities; for the relation of unit costs in the six categories to system characteristics; and for their relative scales of wages and benefits.
