**LABORATORY REPORTS
FUEL DISPENSER AND FUEL PIPELINE REMOVAL
CONFIRMATORY SOIL SAMPLE ANALYSIS**

CHEMICAL & ENVIRONMENTAL LABORATORIES, INC.

March 4, 2005

ELAP Certificate No: 2268

Mr. David Lesperance
Signal Geoscience
3125 S. Maddock Street
Santa Ana, CA 92704

Project: 500 S. Alameda
C&E ID: 50225I

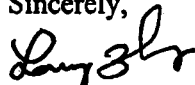

Dear Mr. Lesperance:

Enclosed please find an analytical report for the sample(s) received by Chemical & Environmental Laboratories, Inc. on February 25, 2005, and analyzed as indicated in the attached chain-of-custody.

Unless otherwise noted, no problems were encountered during the reception, preparation, or analysis of these samples.

Please contact me at (562) 921-8123 if you have any questions regarding this report.

Sincerely,

Larry Zhang, Ph.D.
Laboratory Director

CHEMICAL & ENVIRONMENTAL LABORATORIES, INC.

ANALYTICAL REPORT

--- M8015(Diesel) ---

Client Name: Signal Geoscience
 Project Manager: David Lesperance
 Project Name: 500 S. Alameda
 Sample Matrix: Soil

Date Sampled: 02/25/05
 Date Analyzed: 02/25/05

Dear Ms. Fierro:

On behalf of Los Angeles County Metropolitan Transportation Authority (LACMTA), Arcadis U.S., Inc. (Arcadis) is submitting this completion report to document underground storage tank (UST) removals, excavation of impacted soil areas, and confirmation sampling activities that were conducted at the LOC 61S (Butterfield Property) located at 590 South Santa Fe Avenue in Los Angeles, California (Site; Figure 1). The scope of work was conducted in accordance with the Department of Toxic Substances Control- (DTSC-) approved *Removal Action Work Plan* (RAW), dated August 28, 2015, and Los Angeles Fire Department (LAFD) UST closure regulations. The purpose of this completion report is to present the UST removal, soil excavation, and sampling data and request concurrence from DTSC that UST removal, soil remediation, and confirmation sampling activities were completed satisfactorily to allow the property to be redeveloped for future commercial and industrial land use.

Shallow soil cleanup goals were developed based on a human health risk assessment performed for the site and to ensure protection of groundwater. The chemicals of concern identified in shallow soil include metals (cadmium and lead), polynuclear aromatic hydrocarbons ([PAHs] naphthalene, benzo(a)anthracene, benzo(a)pyrene, benzo(a)fluoranthene, and chrysene), and total petroleum hydrocarbons (TPH). Cleanup goals for all chemicals of concern, with the exception of TPH, were based on their Commercial USEPA Region 9

Regional Screening Levels and the California alternate screening levels, where applicable (e.g., for benzo(a)pyrene, cadmium, and lead). Cleanup goals for TPH were based on a July 1, 2015 conference call between Arcadis, LACMTA, and the DTSC. The site-specific cleanup goals were presented in the RAW and are as follows:

Constituent	Cleanup Goal (mg/kg)
Lead	320
Cadmium	6.37
Naphthalene	17
Benzo(a)anthracene	2.9
Benzo(a)pyrene	0.13
Benzo(k)fluoranthene	29
Chrysene	290
TPH-g	2,200
TPH-d	440

Notes: mg/kg = milligrams per kilogram

A summary of the removal areas that are the subject of this report is presented below:

- Excavation A – The boundaries of the excavation are approximately 79 feet long by 56 feet across by 4 feet deep, with a total volume of approximately 653 cubic yards removed. The soil removed had PAHs, TPH-gasoline range (TPH-g), and TPH-diesel range (TPH-d) as the primary chemicals of concern (COCs).
- Excavation B – The boundaries of the excavation are approximately 112 feet long by 52 feet across and ranged from 2 to 6 feet deep, with a total volume of approximately 752 cubic yards removed. The soil removed had cadmium and lead as the primary COCs.
- Excavation C – The boundaries of the excavation were approximately 50 feet long by 35 feet across by 12.5 feet deep, with a total volume of approximately 810 cubic yards removed. The soil removed had TPH-g and TPH-d as the primary COCs.
- Northern USTs (USTs T1-T3) – The northern UST pit contained three 10,000-gallon USTs. The USTs previously contained petrochemical solvents.
- Central/Southern USTs (USTs T4-T10) – The central UST pit contained one 10,000-gallon UST. The southern UST pit contained four USTs ranging in sizes from a 500-gallon to 10,000-gallon USTs. The USTs previously contained petroleum hydrocarbon solvents.
- UST T5 Product Line – An approximately 175-foot-long product line trench was discovered near the central UST (T5) leading north to the former tank farm area. The product line trench contained six 2-inch steel product lines with a cumulative total of approximately 65 gallons of petrochemical product.

- **Hoist Removal Area** – A previously undiscovered, former hydraulic hoist was encountered in the central portion of the Site at approximately 3 feet below ground surface (bgs).

UST PREPARATION AND REMOVAL

The northern USTs T1 through T3 were found to be abandoned in place and contained a slurry backfill that needed to be removed prior to removal. The tanks were cut open and slurry was excavated and stockpiled on site for waste profiling and disposal. Slurry wastes were manifested and disposed of as non-hazardous waste at Simi Valley Landfill.

The USTs were excavated per the LAFD permit (Attachment A). On December 22, 2015, Able Environmental Services, Inc., used a pressure washer to triple rinse USTs T1 through T3 (Figure 2). Once the tanks had been decontaminated and water had been removed by a vacuum truck, the tanks were removed from the UST pit using a crane and placed on the ground surface. All of the tanks were certified clean by a Certified Industrial Hygienist. The USTs were in good condition and had no cracks or holes before the removal process. Soil underneath USTs T1 and T2 appeared to be non-impacted, with no stains or evidence of a release. Soil underneath UST T3 was dark and stained and had a noticeable odor. However, based on measurements taken with a photoionization detector (PID), no volatile organic compounds (VOCs) were detected around the excavation. The PID air monitoring logs are presented in Attachment B. The USTs were then loaded onto flat-bed trucks and hauled to U.S. Ecology for disposal. The tank rinsate was disposed of as non-RCRA hazardous waste at Crosby and Overton.

The central and southern USTs T4 through T10 were found to be abandoned in place and contained a slurry backfill that needed to be removed prior to removal with the exception of USTs T9 and T10. USTs T9 and T10 were found to be empty. The tanks were cut open and slurry was excavated and stockpiled on site for waste profiling and disposal. Slurry wastes were manifested and disposed of as non-hazardous waste at Simi Valley Landfill and/or South Yuma County Landfill.

The USTs were excavated per the LAFD permit (Attachment A). On December 15, 2015, Nieto & Sons used a pressure washer to triple rinse USTs T4 through T10 (Figure 2). Once the tanks had been decontaminated and water had been removed by a vacuum truck, the tanks were removed from the UST pit using a crane and placed on the ground surface. There was an exception to this process for USTs T9 and T10. For safety reasons, both of these tanks were first removed from the subsurface and then later decontaminated. UST T10 was removed during ongoing soil excavation activities at Excavation Area A. UST T9 was situated on top of UST T8 and was removed during the uncovering of USTs T6 through T8, which were all located in the same UST pit. All the tanks were certified clean by a Certified Industrial Hygienist. The USTs were in good condition and had no cracks or holes before the removal process. Soil underneath the USTs appeared to be non-impacted, with no stains or evidence of a release. The USTs were then loaded onto flat-bed trucks and hauled to U.S. Ecology for disposal. The tank rinsate was disposed of as non-RCRA hazardous waste at DeMenno Kerdoon.

Soils around the rest of the excavation were inspected, and no evidence of staining, odors, or other evidence of chemical impacts was observed. Based on measurements taken with a PID, no VOCs were detected around the excavation. The PID air monitoring log is presented in Attachment B.

Additionally, during site grading activities, an abandoned hydraulic hoist was discovered at approximately 3 feet bgs in the north-central portion of the property (Figure 2). The hoist was removed, triple rinsed, and disposed of off site as metal scrap. A sample of the native soil at approximately 7 feet bgs was collected and analyzed.

UST CONFIRMATION SOIL SAMPLING AND ANALYTICAL RESULTS

USTs T1- T3

Confirmation bottom soil samples were collected on December 22, 2015. Under the direction of LAFD inspector Mr. Bernard Sanchez, two bottom samples per UST were collected at depths ranging from 11 to 14 feet bgs and analyzed by United States Environmental Protection Agency (USEPA) Method 8260B/5035 for VOCs and Method 8015B/5035 for TPH-g and TPH-d. Laboratory results are presented in Attachment C.

Soil concentrations were compared to the site-specific cleanup goals established in the RAW. Tables 1a and 1b present a summary of the analytical data and compare concentrations to the cleanup goals. Soil removed from the UST pits was stockpiled in preparation for disposal. Stockpile samples were collected for waste profiling purposes. Waste characterization laboratory results are presented in Attachment D. Table 1c presents the soil stockpile results and compares concentrations to Site reuse criteria. The confirmation soil sampling data are summarized below.

VOC Concentrations in Soil

Benzene was detected in one of the six confirmation soil samples at a concentration of 1.3 micrograms per kilogram ($\mu\text{g}/\text{kg}$). All six confirmation samples reported benzene concentrations below the cleanup goal for groundwater protection of 18 $\mu\text{g}/\text{kg}$ and the cleanup goal for human health protection (industrial land use scenario) of 5,100 $\mu\text{g}/\text{kg}$.

Ethylbenzene was detected in two of the six confirmation soil samples at 1.1 and 1.4 $\mu\text{g}/\text{kg}$, respectively. All six confirmation samples reported ethylbenzene concentrations below the cleanup goal for groundwater protection of 27,000 $\mu\text{g}/\text{kg}$ and the cleanup goal for human health protection (industrial land use scenario) of 14,000 $\mu\text{g}/\text{kg}$.

Toluene was detected in two of the six confirmation soil samples at concentrations ranging from 0.94 to 1.5 $\mu\text{g}/\text{kg}$. All six confirmation samples reported toluene concentrations below the cleanup goal for groundwater protection of 5,000 $\mu\text{g}/\text{kg}$ and the cleanup goal for human health protection (industrial land use scenario) of 45,000,000 $\mu\text{g}/\text{kg}$.

Samples had trace concentrations of n-propylbenzene, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, and xylenes detected, all below their respective cleanup goal for groundwater protection and the cleanup goal for human health protection (industrial land use scenario).

TPH Concentrations in Soil

TPH-g was detected in one of the six confirmation soil samples at a concentration of 0.726 milligram per kilogram (mg/kg). All six confirmation samples reported TPH-g concentrations below the DTSC cleanup goal of 2,200 mg/kg.

TPH-d was detected in one of the six confirmation soil samples at a concentration of 6.78 mg/kg. All six confirmation samples reported TPH-d concentrations below the DTSC cleanup goal of 440 mg/kg.

Stockpile Soil Data

Native soil overburden was excavated from UST Pit 1 and segregated into clean and impacted stockpiles. Two stockpile soil samples (PIT1-NS and PIT1b-NS) were collected and analyzed for TPH-g, TPH-d, VOCs, and metals for waste characterization purposes. As presented in Table 1c, the stockpile sample for Pit-1 reported concentrations below their individual soil cleanup goal and hazardous waste criteria. Arcadis intends to reuse this soil as clean backfill on site. The stockpile sample for PIT-1b reported concentrations of TPH-d that exceeded the site cleanup goal of 440 mg/kg and was disposed of off site at Simi Valley Landfill. Waste characterization laboratory reports are presented in Attachment D.

USTs T4- T10

Confirmation bottom soil samples were collected on December 15, 2015. Under the direction of LAFD inspector Mr. Sanchez, up to two bottom samples per UST were collected and analyzed by USEPA Method 8260B/5035 for VOCs and Method 8015B/5035 for TPH-g and TPH-d. As discussed above, a soil sample was also collected from beneath the former hoist location, at approximately 7 feet bgs. In addition to VOCs, TPH-g, and TPH-d, the sample from the hoist location was also analyzed for California Assessment Manual (CAM) metals using USEPA Methods 6010B and 7471. In total, nine confirmation soil samples from the central and southern USTs and hoist location were collected for analysis.

Sample results from UST T6, collected at a depth of approximately 6 feet bgs, reported a concentration of TPH-d that slightly exceeded the site cleanup goal of 440 mg/kg. The UST T6 pit was further excavated to approximately 11 feet bgs on December 22, 2015, and a second confirmation bottom sample was collected, which reported a TPH-d concentration below the cleanup goal (see discussion below).

Soil concentrations were compared to the site-specific cleanup goals established in the RAW. Tables 2a and 2b present a summary of the analytical data and compare concentrations to the cleanup goals. Table 2c presents additional metals data for the sample collected beneath the former hoist. Soil removed from the UST pits was stockpiled in preparation for disposal. Stockpile samples were collected for waste profiling purposes. Table 2d presents the soil stockpile results and compares concentrations to site reuse criteria. Laboratory reports are presented in Attachment C. The confirmation soil sampling data are summarized below.

VOC Concentrations in Soil

Benzene was detected in six of the nine confirmation soil samples at concentrations ranging from 1.0 to 2.5 µg/kg. All nine confirmation samples reported benzene concentrations below the cleanup goal for groundwater protection of 18 µg/kg and the cleanup goal for human health protection (industrial land use scenario) of 5,100 µg/kg.

Ethylbenzene was detected in two of the nine confirmation soil samples at 1.8 and 10 µg/kg, respectively. All nine confirmation samples reported ethylbenzene concentrations below the cleanup goal for groundwater protection of 27,000 µg/kg and the cleanup goal for human health protection (industrial land use scenario) of 14,000 µg/kg.

Toluene was detected in six of the nine confirmation soil samples at concentrations ranging from 1.6 to 14 µg/kg. All nine confirmation samples reported toluene concentrations below the cleanup goal for groundwater protection of 5,000 µg/kg and the cleanup goal for human health protection (industrial land use scenario) of 45,000,000 µg/kg.

Trace concentrations of isopropylbenzene, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, and xylenes were detected in the samples, all below their respective cleanup goal for groundwater protection and the cleanup goal for human health protection (industrial land use scenario).

TPH Concentrations in Soil

TPH-g was detected in one of the nine confirmation soil samples at a concentration of 3.17 mg/kg. All nine confirmation samples reported TPH-g concentrations below the DTSC cleanup goal of 2,200 mg/kg.

TPH-d was detected in five of the nine confirmation soil samples at concentrations ranging from 7.14 to 498 mg/kg. The one sample that exceeded the cleanup goal (UST6-BS1-6) was removed when the UST pit was further excavated to approximately 11 feet bgs. Another bottom sample (UST6-BS2-11) was collected from the new excavation bottom and used to evaluate soil data to cleanup criteria. This sample was non-detect for TPH-d, which is below the cleanup goal of 440 mg/kg. The remaining seven soil confirmation samples collected beneath the other former USTs also reported TPH-d concentrations below the DTSC cleanup goal of 440 mg/kg.

Metals Concentrations in Soil

Low concentrations of arsenic, barium, cadmium, chromium, cobalt, copper, lead, nickel, vanadium, and zinc were detected in the sample collected beneath the former hoist (HOIST1-BS-7). All detected concentrations were below their respective screening criteria as presented in Table 2c.

SOIL EXCAVATION AND MONITORING

Soil remediation at Excavation Area A was conducted by removing soil with COCs exceeding the site-specific cleanup goals. The excavation boundaries were pre-marked in the field and cleared of utilities prior to intrusive activities. On November 5 through 7, 2015, Arcadis excavated Excavation Area A to a

total depth of 4 feet bgs (Figure 3). The boundaries of the excavation are approximately 79 feet long by 56 feet across with a total volume of approximately 653 cubic yards removed.

During excavation activities, an approximately 100-gallon steel UST (T4) was encountered at approximately 4 feet bgs. The tank measured approximately 26 inches wide by 48 inches long. The UST was removed from the excavation and placed on visquene. The UST was in good condition and had no noticeable cracks or holes. Soil underneath the UST appeared to be non-impacted, with no stains or evidence of a release. The UST was subsequently removed and the underlying soil was sampled, as described above.

Soils around the rest of the excavation were inspected, and no evidence of staining, odors, or other evidence of chemical impacts was observed. Based on measurements taken with a PID, VOCs were detected around the excavation. The PID air monitoring log is presented in Attachment B.

Soil remediation at Excavation Area B was conducted by removing soil with COCs (cadmium and lead) exceeding the site-specific cleanup goals. The excavation boundaries were pre-marked in the field and cleared of utilities prior to intrusive activities. On November 4 through 6, 2015, Arcadis excavated the northern portion of Excavation Area B to a total depth of 2 feet bgs and the southern portion to a depth of 6 feet bgs (Figure 3). The boundaries of the excavation are approximately 112 feet long by 52 feet across with a total volume of approximately 752 cubic yards removed. Soils were inspected during excavation, and no evidence of staining, odors, or other evidence of chemical impacts was observed.

Soil remediation at Excavation Area C was conducted by removing soil with COCs TPH-g and TPH-d exceeding site-specific cleanup goals. The excavation boundaries were pre-marked in the field and cleared of utilities prior to intrusive activities. On December 15 through 17, 2015, Arcadis excavated down to approximately 12.5 feet bgs (Figure 3). The boundaries of the excavation were approximately 50 feet long by 35 feet across with a total volume of approximately 810 cubic yards removed. Soils were inspected during excavation and intermittent dark petroleum staining was observed in the northern half of the excavation bottom. The petroleum staining in this area appeared to be discontinuous, highly degraded and hardened, implying it may have been related to fill materials reworked to greater depths at the Site by former operations.

Soils around the rest of the excavation were inspected, and no evidence of staining, odors, or other evidence of chemical impacts was observed. Based on measurements taken with a PID, no VOCs were detected around the excavation. The PID air monitoring log is presented in Attachment B.

EXCAVATIONS A, B, AND C CONFIRMATION SOIL SAMPLING AND ANALYTICAL RESULTS

Excavation A

Confirmation sidewall and bottom soil samples were collected on November 7, 2015. Per the RAW, four sidewall samples were collected at approximately 2 and 3 feet bgs and two bottom samples were collected at approximately 4 feet bgs. Soil samples were analyzed by USEPA Method 6010B for lead,

Method 8260B for VOCs, Method 8310 for PAHs, and Method 8015B for TPH-g and TPH-d. In addition, a soil sample was collected from beneath the UST location for laboratory analysis to determine if the UST had potentially leaked. The UST sample was analyzed for metals, VOCs, PAHs, and TPH. Laboratory results are presented in Attachment C.

Soil concentrations were compared to the site-specific cleanup goals established in the RAW. Tables 3a through 3d present a summary of the analytical data from Excavation Area A and compare concentrations to the cleanup goals. Tables 4a through 4d present a summary of UST sample analytical data and compare concentrations to the cleanup goals. The confirmation soil sampling data are summarized below.

Lead Concentrations in Soil

Lead was detected in all six confirmation soil samples at concentrations ranging from 2.3 to 34 mg/kg. All six confirmation samples reported lead concentrations below the cleanup goal of 320 mg/kg.

VOC Concentrations in Soil

Benzene was detected in five of the six confirmation soil samples at concentrations ranging from 1.0 to 3.0 µg/kg. All six confirmation samples reported benzene concentrations below the cleanup goal for groundwater protection of 18 µg/kg and the cleanup goal for human health protection (industrial land use scenario) of 5,100 µg/kg.

Toluene was detected in three of the six confirmation soil samples at concentrations ranging from 0.96 to 1.4 µg/kg. All six confirmation samples reported toluene concentrations below the cleanup goal for groundwater protection of 5,000 µg/kg and the cleanup goal for human health protection (industrial land use scenario) of 45,000,000 µg/kg.

PAH Concentrations in Soil

Sample EA-BS2-4 had the following detections:

- Anthracene at 0.0083 µg/kg
- Benzo(a)Anthracene at 0.0020 µg/kg
- Benzo(a)Pyrene at 0.022 µg/kg
- Benzo(k)Fluoranthene at 0.013 µg/kg
- Chrysene at 0.024 µg/kg
- Fluoranthene at 0.035 µg/kg
- Phenanthrene at 0.027 µg/kg

A benzo(a)pyrene concentration of 0.022 µg/kg was reported below the cleanup goal of 0.13 µg/kg.

Pyrene concentrations were detected in two of the six confirmation soil samples at concentrations of 0.0026 and 0.037 µg/kg, respectively.

TPH Concentrations in Soil

TPH-g and TPH-d were not detected in any of the six confirmation soil samples analyzed.

UST Sample Results

Trace concentrations of metals and PAHs were detected in the soil sample collected beneath the UST, all at concentrations below their respective cleanup goals for the Site. In addition, there were no detectable concentrations of VOCs and TPH.

Excavation B

Confirmation sidewall and bottom soil samples were collected on November 6, 2015. Six sidewall samples and three bottom samples were collected and analyzed by USEPA Method 6010B. Laboratory results are presented in Attachment C.

Soil concentrations were compared to the site-specific cleanup goals established in the RAW. Table 5 presents the analytical data and compares concentrations to the cleanup goals. The confirmation soil sampling data are summarized below.

Cadmium Concentrations in Soil

Cadmium was detected in all nine confirmation soil samples at concentrations ranging from 0.25 to 1.5 mg/kg. All confirmation soil samples reported cadmium concentrations below the cleanup goal of 6.37 mg/kg.

Lead Concentrations in Soil

Lead was detected in all nine confirmation soil samples at concentrations ranging from 1.8 to 340 mg/kg. Confirmation soil sample EB-ESW2-1 reported lead at a concentration of 340 mg/kg, which slightly exceeded the lead cleanup goal of 320 mg/kg. The other eight confirmation samples reported lead concentrations below the cleanup goal of 320 mg/kg.

Excavation C

Confirmation bottom soil samples were collected on December 19, 2015. Three sidewall samples and two bottom samples were collected and analyzed by USEPA Method 8015B/5035 for TPH-g and TPH-d, respectively. In total, five confirmation soil samples from Excavation C were collected for analysis. Laboratory results are presented in Attachment C.

Sample results from EC-BS1-12.5, collected at a depth of approximately 12.5 feet bgs, reported a concentration of TPH-d at 1,690 mg/kg, which exceeded the site cleanup criteria of 440 mg/kg. Excavation C was potholed further to approximately 18 feet bgs on January 4 and 5, 2016, and two additional confirmation bottom samples were collected, which reported a TPH-d concentration above the cleanup goal (see discussion below). Figure 4 presents a cross-section view of Excavation C.

Soil concentrations were compared to the site-specific cleanup goals established in the RAW. Tables 6a and 6b present a summary of the analytical data and compare concentrations to the cleanup goals. Soil removed from Excavation C was stockpiled in preparation for disposal. Stockpile samples were collected for waste profiling purposes. Table 7 presents the soil stockpile results and compares concentrations to site reuse criteria. Waste characterization laboratory reports are presented in Attachment D. The confirmation soil sampling data are summarized below.

TPH Concentrations in Soil

TPH-g was not detected in any of the five confirmation soil samples. All five confirmation samples reported TPH-g concentrations below the DTSC cleanup goal of 2,200 mg/kg.

TPH-d was detected in two of the five confirmation soil samples at concentrations ranging from 4.84 to 1,690 mg/kg. One sample (EC-BS1-12.5) exceeded the cleanup goal of 440 mg/kg. Potholing at this location was conducted and two additional samples were collected. Samples EC-BS1-15 and EC-BS1-18 reported TPH-d concentrations at 2,030 mg/kg and 1,770 mg/kg, respectively (Table 6b). In both samples, TPH concentrations were in the diesel to motor oil carbon-chain range (C17 and above), and the lab reported that the chromatograms do not match the diesel standard. The contamination appeared to be discontinuous, highly degraded and hardened, implying it was related to fill materials reworked at the site by former operations. Additionally, the TPH signatures indicate the contamination does not appear to be related to the deeper groundwater and free product plumes, which consist of light-end hydrocarbons. Due to the proximity of the excavation to the property boundary and South Santa Fe Avenue, additional excavation was not feasible. Therefore, the excavation was completed to the maximum feasible depth, and shallow soil remediation has been completed to the maximum practicable amount.

UST T5 PIPING REMOVAL, CONFIRMATION SOIL SAMPLING AND LIMITED SOIL EXCAVATION

During additional site grading activities, underground piping was discovered near former UST T5 (Figure 5). Six 2-inch product lines were discovered running from former UST T5 north toward the former aboveground storage tank area. Approximately 65 gallons of petrochemical product were drained from the product lines and placed into new 55-gallon drums. Then product lines were removed from the subsurface and transported off site for recycling. On January 29, 2016, Arcadis collected 11 bottom samples from the former piping trench at approximately 2 feet bgs. Soil samples were analyzed by USEPA Method 8260B/5035 for VOCs and Method 8015B for TPH-g and TPH-d. Laboratory results are presented in Attachment C.

Sample results from UST5-PP11-2, collected at a depth of approximately 2 feet bgs, reported a concentration of toluene at 120,000 µg/kg, which exceeded the cleanup criteria of 5,000 µg/kg. On February 4 and 5, 2016, the soil around this sample was excavated further to approximately 10 feet bgs (overall excavation dimensions of 6 ft. x 6ft. x 10ft.). Three additional confirmation samples were

collected, a bottom sample at 10 feet, and two sidewall samples at 5 feet bgs. All three samples reported toluene concentrations below the cleanup goal (see discussion below).

Soil concentrations were compared to the site-specific cleanup goals established in the RAW. Tables 8a and 8b present a summary of the analytical data from the former piping trench and compare concentrations to the cleanup goals. The confirmation soil sampling data are summarized below.

VOC Concentrations in Soil

Benzene was detected in 11 of the 14 confirmation soil samples at concentrations ranging from 0.89 to 5.9 µg/kg. All 14 confirmation samples reported benzene concentrations below the cleanup goal for groundwater protection of 18 µg/kg and the cleanup goal for human health protection (industrial land use scenario) of 5,100 µg/kg.

Ethylbenzene was detected in eight of the 14 confirmation soil samples at concentrations ranging from 1.3 to 15 µg/kg. All 14 confirmation samples reported ethylbenzene concentrations below the cleanup goal for groundwater protection of 14,000 µg/kg and the cleanup goal for human health protection (industrial land use scenario) of 27,000 µg/kg.

Toluene was detected in all 14 confirmation soil samples at concentrations ranging from 7.1 to 120,000 µg/kg. One sample (UST5-PP11-2) exceeded the cleanup goal of 5,000 µg/kg. Further excavation at this location was conducted and three additional samples were collected. One bottom sample (UST5-PP11-10) and two sidewall samples (UST5-PP11-NSW1-5 and UST5-PP11-SSW2-5) were collected at 10 feet bgs and 5 feet bgs, respectively. The maximum toluene concentration detected in the three confirmation samples was in sample UST5-PP11-NSW1-5 with a toluene concentration reported at 1,700 µg/kg (Table 8a). The remaining soil confirmation samples collected in the former piping trench reported toluene concentrations below the cleanup goal for groundwater protection of 5,000 µg/kg and the cleanup goal for human health protection (industrial land use scenario) of 45,000,000 µg/kg.

TPH Concentrations in Soil

TPH-g was detected in eight of the 14 confirmation soil samples at concentrations ranging from 0.187 to 448 mg/kg. All 14 confirmation samples collected in the former piping trench reported TPH-g concentrations below the DTSC cleanup goal of 2,200 mg/kg.

TPH-d was detected in 11 of the 14 confirmation soil samples at concentrations ranging from 2.87 to 242 mg/kg. All 14 soil confirmation samples collected in the former piping trench reported TPH-d concentrations below the DTSC cleanup goal of 440 mg/kg.

STOCKPILE SOIL DATA

Native soil overburden that was excavated from Pits 1 through 4 and product piping from UST 5 was sampled for TPH-g, TPH-d, VOCs, and metals for waste characterization purposes. As presented in Table 7, soil stockpile samples reported concentrations below their individual soil cleanup goal and hazardous waste criteria, with the exception of Pit 1b. Soil from stockpile Pit 1b exceeded cleanup goal

for TPH-d and was disposed of off site. Waste characterization laboratory results are presented in Attachment D. Arcadis intends to reuse this soil as clean backfill on site. Excavation Areas A, B, and C were all disposed of off site.

SUMMARY AND CONCLUSIONS

The UST removal, soil excavation, and confirmation soil sampling activities at the Site were conducted in accordance with the approved RAW and the LAFD permit. TPH concentrations reported in the high end carbon chain exceeding the cleanup goal were left in place in the northern portion of the Excavation C bottom. The sampling depths in this excavation ranged from 12.5 to 18 feet bgs. Due to the fact that the excavation is directly adjacent to South Santa Fe Avenue, further excavation would require additional shoring and major street disturbances. The additional costs and risks to perform further excavation in this area outweighs the benefits. Arcadis concludes that soil remediation activities are complete for the Site and, per the DTSC's e-mail approval on January 21, 2016, is in the process of backfilling former UST pits and shallow soil excavations with clean imported fill material and/or Site stockpile soil from former UST Pits 1 through 4 that was deemed clean for reuse. On behalf of LACMTA, Arcadis respectfully requests a letter from DTSC that states that all the shallow soil cleanup requirements have been met and the property may be developed for commercial and industrial land use.

If you have any questions regarding site activities, please contact Phil Skorge by phone at 714.508.2676 or by e-mail at Phil.Skorge@arcadis.com.

Sincerely,

Arcadis U.S., Inc.

Notes:
 UST = underground storage tank
 Units for soil are in micrograms per kilogram.
Bold type indicates reported at detectable concentration.
 Highlighted cell indicates concentration exceeds applicable cleanup goal.
 bgs = below ground surface
 < Denotes not detected at the reporting limit indicated.
 GW SSL = groundwater soil screening level
 NA = not applicable
 RSL = Regional Screening Level
 VLEACH = Vadose Zone Leaching
 VOC = volatile organic compound

Notes:

UST = underground storage tank

*TPH cleanup goals were developed as part of the Removal Action Work Plan dated August 28, 2015

TPH-g = total petroleum hydrocarbons - gasoline range

TPH-d = total petroleum hydrocarbons - diesel range

-- = not applicable

Units for soil are in milligrams per kilogram.

Bold type indicates reported at detectable concentration.

< Denotes not detected at the reporting limit indicated.

bgs = below ground surface

DTSC = Department of Toxic Substances Control

Re: LA Metro S61 - LA 8.2015
Project No. : LA Metro S61 - LA 8.2015
Work Order: P511007

Dear Zack Mason

Enclosed are the results of analyses for samples received by our laboratory on 11/9/2015. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
R2	[Undefined]
M1	Matrix spike recovery was high, the associated blank spike recovery was acceptable.
M2	Matrix spike recovery was low, the associated blank spike recovery was acceptable.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The associated blank spike recovery was acceptable.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
R2	RPD/RSD exceeded the laboratory acceptance limit.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: LA Metro S61 - LA 8.2015
Project No. : LA Metro S61 - LA 8.2015
Work Order: P512009

Dear Phil Skorge

Enclosed are the results of analyses for samples received by our laboratory on 12/22/2015. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Work Order: P512003

Dear Zack Mason

Enclosed are the results of analyses for samples received by our laboratory on 12/16/2015. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Case Narrative

The result in this report for sample UST5-BS2-8 was reported without the 5035 bisulfate vial for gasoline. The 5035 Bisulfate vial was analyzed but the CCV for that run failed high and the sample needed to be reanalyzed. The kits did not have an extra bisulfate for re-analysis. A 5 gram sample was weighed using the 8 oz. jar that was provided for the DRO analysis.

Notes and Definitions

Item	Definition
S-03	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: LA Metro S61 - LA 8.2015
Project No. : LA Metro S61 - LA 8.2015
Work Order: P512008

Dear Phil Skorge

Enclosed are the results of analyses for samples received by our laboratory on 12/22/2015. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

- Escono 5035 sample smart Kit Instructions**
- 1) Remove the caps from all vials
 - 2) Immediately, with the plunger seated in the handle, push the corer into the soil to be collected until chamber is full. This is approximately 5 grams of soil.
 - 3) Using the corer, dispense full chamber (5 g of soil) into each vial.
 - 4) Wipe dirt from threads of vials.
 - 5) Tightly cap all vials.
 - 6) Complete the collection information on the label provided.
 - 7) Place the kit **UPRIGHT** in a cooler @ 4° C or less for shipment to lab.

Re: LA Metro S61 - LA 8.2015
Project No. : LA Metro S61 - LA 8.2015
Work Order: P511006

Dear Zack Mason

Enclosed are the results of analyses for samples received by our laboratory on 11/7/2015. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
R2	[Undefined]
M1	Matrix spike recovery was high, the associated blank spike recovery was acceptable.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The associated blank spike recovery was acceptable.
QM-01	The spike recovery for this QC sample is outside of established control limits due to sample matrix interference.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
R2	RPD/RSD exceeded the laboratory acceptance limit.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: LA Metro S61 - LA 8.2015
Project No. : LA Metro S61 - LA 8.2015
Work Order: P512002

Dear Zack Mason

Enclosed are the results of analyses for samples received by our laboratory on 12/10/2015. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
M2	Matrix spike recovery was low, the associated blank spike recovery was acceptable.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The associated blank spike recovery was acceptable.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Dear Lawrence Browne

Enclosed are the results of analyses for samples received by our laboratory on 11/6/2015. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Work Order: P512006

Dear Phil Skorge

Enclosed are the results of analyses for samples received by our laboratory on 12/20/2015. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
M2	Matrix spike recovery was low, the associated blank spike recovery was acceptable.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The associated blank spike recovery was acceptable.
QM-01	The spike recovery for this QC sample is outside of established control limits due to sample matrix interference.
S-03	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
X	Sample required a dilution due to a high concentration of heavy hydrocarbons present in the sample
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: LA Metro S61 - LA 8.2015
Project No. : LA Metro S61 - LA 8.2015
Work Order: P601001

Dear Phil Skorge

Enclosed are the results of analyses for samples received by our laboratory on 1/4/2016. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Case Narrative

This sample has organic matter that was reportable in the diesel range but is not diesel because it does not match the standard pattern. The loss of surrogate standard for both the gasoline and diesel also support that the sample is made up of organic matter. The chromatogram has been added to this report for your review.

Notes and Definitions

Item	Definition
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
S-01	The surrogate recovery for this sample is not available due to sample dilution required from high analyte concentration and/or matrix interference's.
S-03	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
S-04	Re-analysis confirmed surrogate failure due to matrix effects.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: LA Metro S61 - LA 8.2015
Project No. : LA Metro S61 - LA 8.2015
Work Order: P601002

Dear Phil Skorge

Enclosed are the results of analyses for samples received by our laboratory on 1/5/2016. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
D-02	Hydrocarbon pattern present in the requested fuel quantitation range but does not resemble the pattern of the requested fuel.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
QR-03	The RPD value for the sample duplicate or MS/MSD was outside of QC acceptance limits due to matrix interference. QC batch accepted based on LCS and/or LCSD recovery and/or RPD values.
S-01	The surrogate recovery for this sample is not available due to sample dilution required from high analyte concentration and/or matrix interference's.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: LA Metro S61 - LA 8.2015
Project No. : LA Metro S61 - LA 8.2015
Work Order: P601008

Dear Phil Skorge

Enclosed are the results of analyses for samples received by our laboratory on 1/29/2016. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
D-02	Hydrocarbon pattern present in the requested fuel quantitation range but does not resemble the pattern of the requested fuel.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: LA Metro S61 - LA 8.2015
Project No. : LA Metro S61 - LA 8.2015
Work Order: P602007

Dear Phil Skorge

Enclosed are the results of analyses for samples received by our laboratory on 2/5/2016. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
QR-03	The RPD value for the sample duplicate or MS/MSD was outside of QC acceptance limits due to matrix interference. QC batch accepted based on LCS and/or LCSD recovery and/or RPD values.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: LA Metro S61 - LA 8.2015
Project No. : LA Metro S61 - LA 8.2015
Work Order: P602005

Dear Phil Skorge

Enclosed are the results of analyses for samples received by our laboratory on 2/4/2016. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Re: LA Metro Soil Testing LA 8.2015
Project No. : LO493901.0001
Work Order: P509008

Dear Lawrence Browne

Enclosed are the results of analyses for samples received by our laboratory on 9/24/2015. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
M2	Matrix spike recovery was low, the associated blank spike recovery was acceptable.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The associated blank spike recovery was acceptable.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
QR-03	The RPD value for the sample duplicate or MS/MSD was outside of QC acceptance limits due to matrix interference. QC batch accepted based on LCS and/or LCSD recovery and/or RPD values.
S-03	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: LA Metro S61 - LA 8.2015
Project No. : LA Metro S61 - LA 8.2015
Work Order: P512007

Dear Phil Skorge

Enclosed are the results of analyses for samples received by our laboratory on 12/22/2015. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Project Manager: Phil Skorge

Notes and Definitions

Item	Definition
M1	Matrix spike recovery was high, the associated blank spike recovery was acceptable.
M2	Matrix spike recovery was low, the associated blank spike recovery was acceptable.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The associated blank spike recovery was acceptable.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
QR-03	The RPD value for the sample duplicate or MS/MSD was outside of QC acceptance limits due to matrix interference. QC batch accepted based on LCS and/or LCSD recovery and/or RPD values.
R2	RPD/RSD exceeded the laboratory acceptance limit.
S-03	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: LA Metro S61 - LA 8.2015
Project No. : LA Metro S61 - LA 8.2015
Work Order: P512007

Dear Phil Skorge

Enclosed are the results of analyses for samples received by our laboratory on 12/22/2015. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
M2	Matrix spike recovery was low, the associated blank spike recovery was acceptable.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The associated blank spike recovery was acceptable.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: LA Metro S61 - LA 8.2015
Project No. : LA Metro S61 - LA 8.2015
Work Order: P511012

Dear Zack Mason

Enclosed are the results of analyses for samples received by our laboratory on 11/30/2015. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
M1	Matrix spike recovery was high, the associated blank spike recovery was acceptable.
M2	Matrix spike recovery was low, the associated blank spike recovery was acceptable.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The associated blank spike recovery was acceptable.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
S-02	The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: LA Metro S61 - LA 8.2015
Project No. : LA Metro S61 - LA 8.2015
Work Order: P511012

Dear Zack Mason

Enclosed are the results of analyses for samples received by our laboratory on 11/30/2015. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

Re: LA Metro S61 - LA 8.2015
Project No. : LA Metro S61 - LA 8.2015
Work Order: P602006

Dear Phil Skorge

Enclosed are the results of analyses for samples received by our laboratory on 2/4/2016. The contents of this report apply to the sample(s) analyzed in accordance with the chain-of-custody document supplied with the sample(s).

No duplication of this report is allowed, except in its entirety. Please do not hesitate to call if you have any questions and thank you very much for using Performance Analytical Laboratories for your analytical needs.

Regards,

Marycarol Valenzuela
Project Manager

Notes and Definitions

Item	Definition
B7	Target analyte detected in method blank at or above method reporting limit. Concentration found in the sample was 10 times above the concentration found in the method blank.
M1	Matrix spike recovery was high, the associated blank spike recovery was acceptable.
QM-06	Due to noted non-homogeneity of the QC sample matrix, the MS/MSD did not provide reliable results for accuracy and precision. Sample results for the QC batch were accepted based on LCS/LCSD percent recoveries and RPD values.
QR-03	The RPD value for the sample duplicate or MS/MSD was outside of QC acceptance limits due to matrix interference. QC batch accepted based on LCS and/or LCSD recovery and/or RPD values.
Dry	Sample results reported on a dry weight basis.
ND	Analyte NOT DETECTED at or above the reporting limit.
RPD	Relative Percent Difference
%REC	Percent Recovery
Source	Sample that was matrix spiked or duplicated.
(R)	Re-run for dilution or confirmation.

1 INTRODUCTION

On behalf of EDGE Architectural Planning (EDGE), Kleinfelder has prepared this *Removal Action Completion Report* (RACR) to document soil removal activities performed at the At Mateo project site (Site) located at 555 Mateo Street in Los Angeles, California (Figure 1). The removal action (RA) was performed on November 12 and 13 and December 9, 15, and 18, 2015 under the oversight of the California Environmental Protection agency (Cal/EPA) Department of Toxic Substances Control (DTSC) in accordance with a Draft Remedial Action Work Plan (RAW) prepared by Kleinfelder (2016). A draft of the RAW was submitted to the DTSC on August 21, 2015. DTSC reviewed the Draft RAW pursuant to a California Land Reuse and Revitalization Act Agreement (Docket No. HSA-FY 14/15-035). DTSC approved the Draft RAW with no modifications in a letter dated January 8, 2016, after which the Final RAW was submitted to DTSC on January 12, 2016.

1.1 PURPOSE

The purpose of this RACR is to document that the actions proposed in the DTSC-approved Final RAW have been completed and the RA objectives (RAOs) were met.

1.2 REMOVAL ACTION OBJECTIVES

The soil RA at the Site focused on the removal and disposal of defined areas primarily containing lead concentrations above the current lead Screening Level (SL) for Residential Soil used by the California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control (DTSC), and/or total petroleum hydrocarbon (TPH) constituents at concentrations above the Maximum Soil Screening Levels (MSSLs) issued by the Los Angeles Regional Water Quality Control Board (LARWQCB).

RAOs were established to be protective of human health and the environment. The RAOs were based upon the current environmental conditions and current and anticipated future uses of the Site. The RAOs, as presented in the approved Final RAW, were to:

- Remediate soil containing concentrations of constituents of concern (COCs), specifically lead and TPH, to reduce the potential health risk associated with direct contact and ingestion pathways to acceptable thresholds suitable for residential Site use.
- Obtain an unrestricted Site use determination from the DTSC.

- Eliminate the need for long term operation and monitoring.

1.3 SCOPE

The completed RA combined excavation of primarily lead- and TPH-impacted soil with off-Site disposal of the impacted soils. The activities performed to implement the RA are summarized below and described in greater detail in subsequent sections of this report.

- Initiated pre-excavation activities by marking out an exclusion zone.
- Marked proposed excavation boundaries using stakes and caution tape.
- Excavated lead- and TPH-impacted soil from Excavation Areas EA-1 through EA-4 pursuant to the DTSC-approved Final RAW.
- Performed post-excavation soil sampling for Excavation Areas EA-1 through EA-4.
- Added Excavation Area EA-5 to the soil excavation plan based on analytical results of soil samples collected by Tetra Tech, Inc. (Tetra Tech) from five test pits excavated in the area of the Site's proposed subterranean parking level, and excavated TPH-impacted soil there, pursuant to Section 6.5.5 (Contingency Plan) of the DTSC-approved Final RAW and the DTSC's authorization provided in an electronic mail from Mr. Jose Diaz of DTSC (Diaz, 8 Dec. 2015 E-mail).
- Performed post-excavation confirmation soil sampling of Excavation Area EA-5.
- Performed air and meteorological monitoring during excavation activities.
- Pre-characterized soil for off-Site disposal using soil analytical data.
- Loaded and transported excavated soil off-Site to a licensed disposal facility.

RA activities were performed in accordance with a Site-specific Health and Safety Plan prepared by Kleinfelder (see Appendix D of the Final RAW) and a Transportation Plan (see Section 6.6 of the Final RAW).

2 SITE BACKGROUND AND PHYSICAL SETTING

This section provides a description of the topographic, hydrologic, geologic, and hydrogeologic settings of the Site. Additionally, this section provides information concerning the Site's operational history, environmental assessments and results, and current status. These descriptions were developed from a review of the published literature cited in the text and data gathered during previous investigations of the Site.

2.1 SITE LOCATION AND SETTING

The Site presently has the address of 555 Mateo Street, Los Angeles, California, and is undergoing commercial redevelopment. Until recently, the Site had addresses of 561 to 585 Mateo Street and 1248 to 1264 Palmetto Street; and it was previously developed with various warehouse buildings and paved loading/parking areas. The Site location is shown on Figure 1.

2.2 OPERATIONAL HISTORY AND CURRENT STATUS

The Site's industrial use dates back to the early 1900s. Phase I and Limited Phase II Environmental Site Assessment (ESA) reports concerning the Site indicate it was historically as a tool and foundry works, bulk oil plant, and die cutting facility (ENVIRON, 2012a and 2012b; and Environmental Management Group [EMG], 2014). Businesses historically operating at the Site reportedly include American Engineering and Foundry (1906), Union Oil Tool Company (1906), Union Well Supply (1906), Union Oil (1920s through 1950s), and Acme Spring Company (1960s). Additionally, a rail spur was formerly located on the northern part of the Site. Furthermore, the uppermost approximately 2 feet to 5 feet of subsurface soil at the Site was identified to consist of fill and disturbed soil from previous Site development (Kleinfelder, 2014).

Warehouse buildings formerly present on the northern portion of the Site have been demolished in preparation for redevelopment, and this northern Site area is presently vacant of structures. The proposed Site commercial redevelopment will consist of a multi-level retail facility and parking structure with three levels above grade and one subterranean level. The redevelopment will include construction of the subterranean parking level and new buildings on new concrete pads, along with the remodeling of the existing warehouse building (with former addresses of 561 to 585 Mateo Street) that remains on the southern portion of the Site.

2.3 SITE AND REGIONAL TOPOGRAPHY

Site surface elevations are above Mean Sea Level, ranging from approximately 255 feet near the southern Site boundary to approximately 258 feet near the northern Site boundary. The topographic gradient at the Site is relatively flat, having a gentle downward slope to the south. The surrounding regional topography slopes gently downward to the southeast, toward Los Angeles River (ENVIRON International Corporation [ENVIRON], 2012a).

2.4 GEOLOGY AND HYDROGEOLOGY

The Site is located on the Central Plain of the greater Los Angeles Basin (Yerkes et al, 1965). The Los Angeles Basin, which lies within the Peninsular Ranges geomorphic province, represents the transition between the Peninsular Ranges province and the Transverse Ranges geomorphic provinces (California Geological Survey [CGS], 2002). The Transverse Ranges province is characterized by roughly east-west trending, convergent structural features in contrast to the predominant northwest-southeast structural trend of the Peninsular Ranges and other geomorphic provinces in California.

The Los Angeles Basin is further divided into structural blocks separated by physiographic features. The Site is situated on the Central Block of the Los Angeles Basin (Yerkes et al, 1965). Structurally, the Central Block is bounded on the north by the Santa Monica-Hollywood-Raymond faults and the adjacent Santa Monica Mountains, on the east by the Whittier Fault and Elysian Park Fault Zone, and on the west by the Newport-Inglewood Fault Zone. The Central Block extends southward to the San Joaquin Hills of Orange County. The Site is located approximately 5.5 miles south of the Raymond Fault and approximately 7 miles east of the Newport-Inglewood Fault Zone. Both of these faults are considered active by the State of California (Cao, et al., 2003).

The Site is in an area mapped as having Quaternary alluvium at the ground surface. These alluvial soils were deposited by the Los Angeles River and consist generally of silt, sand, and gravel (Kleinfelder, 2014). Available information indicates historical high groundwater levels in the general Site area are deeper than 100 feet below surface (CGS, 1998). Fluctuations of the groundwater level, localized zones of perched water, and increased soil moisture content should be anticipated during and following the rainy season. Irrigation of landscaped areas on or adjacent to the Site may also cause fluctuation of local groundwater levels (Kleinfelder, 2014).

2.4.1 Regional Geology

Regional soils in the Site vicinity are classified as urban land, which contains disturbed soils without classification (ENVIRON, 2012a).

2.4.2 Site Soil Types and Hydrogeology

Subsurface soils at the Site consist of approximately 2 feet to 5 feet of fill and disturbed earth from previous development. The fill is undocumented and not considered suitable for structural support (Kleinfelder, 2014). Underlying the fill are alluvial soils consisting primarily of sand and gravel. Within the sand and gravel deposits are relatively thin, discontinuous layers of clay and silt. These soils are consistent with the types of sedimentary deposits mapped for the Site area (Kleinfelder, 2014).

2.5 CURRENT USE OF SURROUNDING PROPERTIES

The current uses of properties adjacent to the Site are generally as follows:

- North of Site – Palmetto Street, beyond which are warehouse buildings and residential buildings consisting of multi-tenant condominium and apartment buildings. Railroad tracks were observed on Palmetto Street.
- East of Site – Mateo Street, beyond which are commercial buildings occupied by Interstate Seafood (a seafood packaging company), Handsome Coffee Roasters (a coffee producer/roaster), and other unspecified businesses. No apparent exterior manufacturing or chemical storage operations were observed.
- South of Site – A commercial building with unspecified occupant and the Pear Garden restaurant. No apparent exterior manufacturing or chemical storage operations were observed.
- West of Site – Commercial and warehouse buildings with unspecified occupants. No apparent exterior manufacturing or chemical storage operations were observed.

2.6 SUMMARY OF ENVIRONMENTAL CONDITIONS AND PREVIOUS ACTIVITIES

Phase I and Limited Phase II Environmental Site Assessment (ESA) reports for the Site indicate that since the early 1900s, it was used by various businesses for industrial purposes, including a tool and foundry works, bulk oil plant, and die cutting facility (ENVIRON, 2012a and 2012b; and Environmental Management Group [EMG], 2014). Businesses historically operating at the Site

reportedly included Acme Spring Company, American Engineering and Foundry, Union Oil, Union Oil Tool Company, and Union Well Supply. Additionally, a rail spur was formerly located on the northern part of the Site. Furthermore, the uppermost approximately 2 feet to 5 feet of subsurface soil at the Site has been identified to consist of fill and disturbed soil from previous Site development (Kleinfelder, 2014).

In October 2012, to assess potential environmental concerns identified by its Phase I ESA, ENVIRON advanced and sampled 18 soil bores, installed 24 soil vapor probes, and collected soil vapor samples at the Site. Soil samples were collected to a maximum depth of approximately 10 feet below ground surface (bgs) and soil vapor samples were collected from an approximate depth of 5 feet bgs. The soil vapor samples were analyzed for volatile organic compounds (VOCs), and the soil samples were analyzed for VOCs, semi-volatile organic compounds (SVOCs), TPH, metals, and/or pesticides and polychlorinated biphenyls (PCBs), depending on the area from which a given soil sample was collected (ENVIRON, 2012b). Figure 2 shows the previous sampling locations. Analytical results of the soil vapor samples indicated only benzene and tetrachloroethylene (PCE) were detected at concentrations at or above the reporting limits. Analytical results of the soil sample indicated TPH in the diesel carbon range (TPH-d) and oil carbon range (TPH-o) were detected in several samples, and the pesticide 4,4'-dichlorodiphenyltrichloroethane (4,4'-DDT) was detected in one soil sample. Additionally, several metals were detected in the analyzed samples, but most of the detected metals concentrations did not exceed respective screening levels. ENVIRON concluded that the VOC concentrations detected in the soil vapor samples were below their respective screening levels, and except for arsenic in the samples in which it was analyzed and TPH-d and TPH-o in one soil sample, no other detected analyzed compounds in the soil samples were present at concentrations exceeding their screening values. It was determined that the arsenic concentrations were similar to background levels.

Kleinfelder performed methane survey field activities at the Site in December 2014, during which 13 shallow soil gas probes (SV-1 through SV-13), screened at approximately 5 feet bgs, were installed in an approximately even-spaced grid-like pattern across the Site. The shallow probes were monitored for pressure and methane with hand-held instruments. Methane was not detected by the survey (Kleinfelder, 2015a).

In February 2015, at which time the At Mateo Project-related demolition of warehouse buildings at the Site had commenced in preparation for redevelopment, Kleinfelder was requested by EDGE to collect and analyze surface soil samples from an area of the Site where a slight petroleum odor in soil was noted by the demolition contractor. On February 25, 2015, Kleinfelder collected three near-surface soil samples, designated KLF-01 through KLF-03, from the Site area of concern (Kleinfelder, 2015b). The samples consisted of soil collected between the ground surface and approximately 2 feet bgs from potholes excavated by the demolition contractor. The samples were submitted for laboratory analysis of TPH by carbon range (quantified as gasoline-range TPH [TPH-g] with the carbon range C4 to C10, diesel-range TPH [TPH-d] with the carbon range C11 to C22, and oil-range TPH [TPH-o] with the carbon range C23 to C35), VOCs, and CCR Title 22 Metals, including soluble metals as warranted. The analytical results for TPH, VOCs, and metals are discussed below:

- The analytical results indicated TPH-d and TPH-o were detected in Sample KLF-02 at respective concentrations of 4,390 milligrams per kilogram (mg/kg) and 37,100 mg/kg. This TPH-d concentration exceeds both the Aliphatic Medium and Aromatic Medium RSLs, and the TPH-o concentration exceeds the Aromatic High RSL. Additionally, the TPH-d and TPH-o concentrations in Sample KLF-02 exceed their respective MSSLs of 1,000 mg/kg and 10,000 mg/kg. Samples KLF-01 and KLF-03 contained reported TPH-d and TPH-o concentrations below their respective MSSLs, but the detected TPH-d concentration of Sample KLF-03 exceeds the residential Aliphatic Medium RSL. The laboratory flagged the TPH-d results with a qualifier that indicated that the pattern of the diesel-range hydrocarbons in the samples' chromatograms did not match the pattern of the chromatogram of the diesel standard.
- The VOC analytical results of the three samples indicated acetone and 1,3,5-trimethylbenzene were detected in Sample KLF-02 at respective concentrations of 0.158 mg/kg and 0.010 mg/kg, which are substantially lower than the VOCs' respective United States Environmental Protection Agency (US EPA) Regional Screening Level (RSL) values for Residential Soil of 61,000 mg/kg and 780 mg/kg (US EPA, 2015a). Other VOCs were not detected at concentrations equal to or above their respective practical quantitation limits (PQLs).
- The metals arsenic, barium, cadmium, chromium, cobalt, copper, lead, mercury, nickel, vanadium, and zinc were detected in one or more of the three samples, but the detected concentrations of most of these metals were below their respective Residential Soil SLs

or RSLs (as applicable to the given metal), with only concentrations of arsenic (in each sample), cadmium (in one sample), lead (in two samples), and nickel (in two samples) exceeding their respective SLs. The maximum detected arsenic concentration (10.9 mg/kg) was below the upper range of the Los Angeles County average soil background level for arsenic (with overall range of 8 mg/kg to 12 mg/kg) developed by the DTSC's school unit (Chernoff, et al., 2008). The nickel concentrations also appear to represent background values, based on Kleinfelder's experience with other properties in the Central Block of the Los Angeles Basin, but concentrations of barium, chromium, lead, and zinc appeared in Kleinfelder's opinion to potentially be above regional background levels (although of these, only lead concentrations exceeded its screening level [SL]).

In summary, the February 25, 2015 sampling analytical results revealed Site environmental impact by primarily TPH and lead. The specific source of the impact is unclear, but based on review of the two reports prepared by ENVIRON (2012a and 2012b), it is suspected to be a consequence of the Site's past industrial use dating back to the early 1900s. In response to these results, Kleinfelder developed and implemented a scope of work to assess the lateral and vertical extent of the TPH and metals impact to near-surface soils at the Site. Soil sampling was performed by Kleinfelder at the Site on March 30 and April 23, 2015, as further discussed below:

- On March 30, 2015, 112 soil samples were collected from 28 locations (KLF-04 through KLF-31) placed using an approximate 50-foot grid. This sampling was performed to address data gaps and facilitate assessment of the lateral and vertical extent of TPH and metals impact. It was planned to collect soil samples from bores at approximate depths of 0.5 foot (i.e., near-surface), 2 feet, 4 feet, and 5 feet bgs, but a prevalence of cobbles and debris in the uppermost 3 feet resulted in hand auger refusal. Instead, the At Mateo Project demolition contractor excavated potholes to an approximate depth of 5 feet bgs, and Kleinfelder collected relatively undisturbed samples from the pothole sidewalls at these approximate depths.
- Based on the interpretation of the analytical results of the March 30, 2015 soil samples, 117 soil samples were collected on April 23, 2015 from 39 step-out locations (KLF-02A through KLF-24H) placed at approximate distances of 10 feet and 25 feet outward in the northern, eastern, southern, and western directions from selected previously-sampled locations. The demolition contractor potholed each new sampling location to an approximate depth of 3 feet bgs, and soil samples were collected from the pothole

sidewalls at approximate depths of 0.5 foot (near-surface), 2 feet, and 3 feet bgs by pushing laboratory-provided glass containers into the undisturbed soil in the sidewalls of the excavations.

Based on the results of the February 25, 2015 sample analyses, the March 30, 2015 samples were analyzed for TPH-g, TPH-d, TPH-o, and the metals barium, chromium, lead, and zinc. Based on the results of these analyses, most of the April 23, 2015 step-out samples were analyzed for lead only, although six of these samples were subsequently analyzed for TPH at the request of the DTSC.

Of the March 30 and April 23, 2015 samples, one (KLF-09-2') contained a TPH-g concentration that exceeds the residential TPH Aliphatic and Aromatic Low RSLs, and several contain TPH-d and TPH-o concentrations that exceed the Aliphatic and/or Aromatic Medium and High RSLs, respectively. However, only the TPH-g concentration of 1,850 mg/kg and the TPH-d concentration of 1,130 mg/kg in the 2-foot bgs sample collected from Location KLF-09 exceed their MSSSLs of 500 mg/kg and 1,000 mg/kg, respectively. The laboratory flagged these and the other sample's TPH-g and TPH-d results with qualifiers indicating the pattern of hydrocarbons in the sample's chromatogram did not match the patterns in the chromatograms of the gasoline or diesel standards. The detected TPH-o concentrations in the March 30 and April 23, 2015 samples were below the TPH-o MSSSL. Figure 2 shows the previous sampling locations.

Based on the analytical results of soil samples collected by ENVIRON and Kleinfelder, it appears that TPH-o impact is limited to the uppermost 4 feet of soil beneath the Site, and that TPH-g and TPH-d impact is limited to the uppermost 2 feet bgs in the vicinity of Locations KLF-02 and KLF-09. The TPH-g, TPH-d, and TPH-o concentrations appear to attenuate with depth. The assessment results indicate cadmium and lead impact in excess of the Residential Soil SLs is limited to the uppermost approximate 2 feet of soil. Except for arsenic and nickel, the maximum concentrations of the other metals detected in the soil samples are below their respective Residential Soil SL or RSL (as applicable for the given metal), and the detected arsenic and nickel concentrations appear to represent background values. With the exception of lead concentrations in two soil samples (1,000 mg/kg in the sample from Location KLF-02 and 2,300 mg/kg in the near-surface sample from Location KLF-24B), the maximum concentration of each detected metal is below its CCR Total Threshold Limit Concentration (TTLC) value. Waste Extraction Test (WET) Soluble Threshold Limit Concentration (STLC) lead results for 18 of the 40 sample analyzed for

soluble lead exceed the lead STLC value of 5 mg/L, but soluble chromium WET STLC results are below the hexavalent chromium STLC value of 5 mg/L. Toxicity Characteristic Leaching Procedure (TCLP) results of the samples analyzed for barium, chromium, and/or lead using this test are below these metals' respective TCLP values of 100 mg/L, 5 mg/L, and 5 mg/L. Thus, the analyzed soil samples with lead concentrations exceeding the lead TTLC and soluble lead concentrations exceeding the lead STLC are representative of California-hazardous waste but not representative of a Resource Conservation and Recovery Act (RCRA)-hazardous waste. To further assess the nature of the soluble lead, Kleinfelder requested laboratory analysis of 16 soil samples containing STLC lead concentrations exceeding 5 mg/L using the De-Ionized Water WET (DI-WET). The DI-WET soluble lead concentration in only one of the 16 samples tested exceeded 5 mg/L (Sample KLF-23-Surface, which had a STLC-WET result of 19.5 mg/L but a DI-WET result of only 6.94 mg/L). The DTSC was provided these results for review, and indicated in a subsequent August 6, 2015 electronic mail that based on the testing results it would be acceptable to re-use soil represented by the 16 samples on-Site and that such re-use would not be a basis for restricting Site land use.

2.7 IMPACT ON HUMAN HEALTH AND/OR THE ENVIRONMENT

As stated in the previous section, the soil sampling performed recently by Kleinfelder at the Site identified the presence, in surface and near-surface soils, of TPH at concentrations exceeding US EPA RSLs and LARWQCB MSSLs and the metals arsenic, cadmium, lead, and nickel at concentrations exceeding their respective SLs, although the detected arsenic and nickel concentrations appear to represent background values. Based on the analytical results of the soil samples collected by ENVIRON and Kleinfelder, it appeared that TPH-d and TPH-o impact was limited to the uppermost 4 feet of soil beneath certain portions of the Site and that TPH-g impact was limited to the uppermost 2 feet bgs in the vicinity of one sample location (KLF-09) only. The TPH-g, TPH-d, and TPH-o concentrations appeared to attenuate with depth. Additionally, cadmium and lead concentrations above the Residential Soil SLs were limited to the uppermost approximately 2 feet of soil.

2.8 NATURE AND EXTENT OF CONTAMINATION

This section summarizes the nature and extent of the contamination identified at the Site. Contaminant concentrations in the samples discussed were compared to screening values including the DTSC's SLs for residential land use presented in Human Health Risk Assessment

(HHRA) Note No. 3 issued in October 2015 by the DTSC's Office of Human and Ecological Risk (HERO), if such values were available, and to the US EPA's current (November 2015) RSLs for residential land use (for Hazard Quotient of 1.0) for those compounds without published HERO screening values. TPH concentrations in soil were also compared to the LARWQCB's TPH MSSLs for a depth to groundwater beneath the sample ranging from 20 feet to 150 feet.

Site potential areas of concern contained soil concentrations of lead that exceeded the DTSC's lead SL for residential soil of 80 mg/kg (DTSC, 2015) and/or soil concentrations of TPH that exceeded the US EPA's residential TPH Aliphatic and Aromatic RSLs (US EPA, 2015a). Additionally, TPH concentrations in two soil samples (KLF-02 and KLF-09-2') exceeded the LARWQCB MSSLs for TPH-g, TPH-d, and TPH-o of 500 mg/kg, 1,000 mg/kg, and 10,000 mg/kg, respectively (LARWQCB, 2004).

2.8.1 Lead-Affected Shallow Soil

Soil sampling was performed as necessary to assess the extent of areas with concentrations exceeding the lead SL, with step-out samples collected as warranted. The extent of lead-impacted soil with concentrations exceeding the lead SL for residential soil was thus assessed. Lead concentrations in 20 soil samples collected during Site assessment exceeded the SL for residential soil of 80 mg/kg. The soil samples exceeding the lead residential soil SL were collected at depths ranging from the surface to approximately 2 feet bgs, and lead concentrations exceeding the SL ranged from 80.1 mg/kg (Sample KLF-24C-Surface) to 2,300 mg/kg (Sample KLF-24B-Surface).

A statistical evaluation of the full lead data set for the Site was performed by estimating a 95-percent upper confidence level (UCL) soil concentration using the US EPA's ProUCL™ software, Version 5.0. The results indicated a Site-wide, 95-percent UCL lead concentration of 148.8 mg/kg, which is above the lead SL of 80 mg/kg. DTSC has noted that the 80-mg/kg lead screening level is not intended to be used as a "bright-line," not to exceed value. With the two samples containing the highest lead concentrations (specifically KLF-02, with a lead concentration of 1,000 mg/kg, and KLF-24B-Surface, with a lead concentration of 2,300 mg/kg) removed from the data set, the Site-wide 95-percent UCL soil concentration of lead became 59.59 mg/kg, which is well below the 80 mg/kg SL for unrestricted land use. Based upon this evaluation, it was concluded that only soil at the locations of Samples KLF-02 and KLF-24B-Surface contained lead concentrations warranting remedial action.

2.8.2 Cadmium-Affected Shallow Soil

A cadmium concentration in one Site assessment soil sample (KLF-02, which contained a cadmium concentration of 7.01 mg/kg) exceeded the SL for residential soil of 4.5 mg/kg.

2.8.3 TPH-Affected Shallow Soil

Concentrations of TPH constituents (gas, diesel, and motor oil) in several of the soil samples collected at the Site by ENVIRON and Kleinfelder exceeded the US EPA's lowest RSLs for residential land use and/or LARWQCB MSSLS. As with lead, statistical evaluations of the full TPH-g, TPH-d, and TPH-o data sets for the Site were performed by estimating 95-percent UCL soil concentrations using the US EPA's ProUCL software. The Site-wide 95-percent UCL concentrations of TPH-d and TPH-o were 664.3 mg/kg and 2,738 mg/kg, respectively. Removing the three samples containing the highest TPH-d and TPH-o concentrations (specifically, Samples SB-16-2, KLF-02, and KLF-09-2'), the Site-wide 95-percent UCL soil concentrations of TPH-d and TPH-o became 74.7 mg/kg and 713.7 mg/kg, respectively. The ProUCL output sheets are provided in Appendix B of the Final RAW. Based upon this evaluation, soil at the locations of Samples SB-16-2, KLF-02, and KLF-09-2' contained hydrocarbon concentrations warranting remedial action.

2.8.4 Estimated Volume of Lead- and TPH-Impacted Shallow Soil

Four Site areas (designated EA-1 through EA-4) contained reported lead concentrations (and cadmium concentrations for Area EA-1) exceeding the residential SL, and/or reported TPH concentrations exceeding the lowest residential RSL and/or LARWQCB MSSLS. The approximate areas and estimated volumes of contaminated soil were as follows:

Area Name	Soil Sample Location Driving Remediation (Contaminant)	Area Affected (square feet)	Depth of Area (feet)	Estimated Volume of Affected Soil (cubic feet)	Estimated Volume of Affected Soil (cubic yards)
EA-1	KLF-02 (TPH/lead/cadmium)	305	2	610	22.6
EA-2	SB-16 (TPH)	100	2	200	7.4
EA-3	KLF-24B (lead)	207	2	414	15.3
EA-4	KLF-09 (TPH/lead)	267	4	1,068	39.6
TOTAL		879	--	2,292	84.9

2.9 SCREENING HUMAN HEALTH RISK ASSESSMENT AND REMEDIAL ACTION OBJECTIVES

A Tier I human health screening evaluation (HHSE) was performed using the Site assessment data collected by ENVIRON (2012b) and Kleinfelder (2015). To evaluate detected concentrations of TPH, VOCs, SVOCs, organochlorine pesticides (OCPs), PCBs, and metals, they were compared to the DTSC's SLs for residential land use presented in HERO's HHRA Note No. 3, issued in May 2015, if such values were available, and to the US EPA's current (revised June 2015) RSLs for residential land use (for Hazard Quotient of 1.0) for those compounds without published HERO SLs. TPH concentrations in soil were also compared to the LARWQCB's TPH MSSSLs for a depth to groundwater beneath the sample ranging from 20 feet to 150 feet.

2.9.1 HUMAN HEALTH AND RISK EVALUATION

Soil Vapor

ENVIRON installed and sampled 5-foot deep temporary soil vapor probes at 24 Site locations, including six soil vapor probes placed using a Site-wide grid in order to evaluate non-specific historical use areas and provide better spatial coverage. Analytical results of ENVIRON's soil vapor sampling indicated only the VOCs benzene and PCE were detected, in seven samples and four samples, respectively. The maximum detected benzene and PCE concentration were 0.0369 microgram per liter ($\mu\text{g/L}$) and 0.154 $\mu\text{g/L}$, respectively. The maximum detected concentration of benzene (0.0369 $\mu\text{g/L}$) and PCE (0.154 $\mu\text{g/L}$) was below its corresponding residential scenario soil vapor screening level (0.097 $\mu\text{g/L}$ for benzene and 0.480 $\mu\text{g/L}$ for PCE), calculated as described in HERO's HHRA Note No. 3, issued May 2015, using the DTSC-modified

residential air screening level for the compound in concert with the 0.001 attenuation factor for a future residential building as discussed in the DTSC's October 2011 guidance document (DTSC, 2011). Based on these results, VOCs in soil vapor were not identified as Site constituents of concern (COCs).

Soil

VOCs – Ten soil samples collected at depths of 2 and 5 feet bgs were analyzed for VOCs, although three of the samples were analyzed only for benzene, toluene, ethylbenzene, and total xylenes (BTEX). VOCs were not detected above the laboratory reporting limit in the analyzed soil samples, with the exception of acetone and 1,3,5-trimethylbenzene, which were detected in Sample KLF-02 at respective concentrations of 0.158 mg/kg and 0.010 mg/kg. These detected concentrations were below the US EPA's acetone RSL for residential soil of 61,000 mg/kg and 1,3,5-trimethylbenzene RSL for residential soil of 780 mg/kg. Based on these results and in conjunction with the soil vapor sampling results described previously in Section 4.1.1, VOCs in soil were not identified as Site COCs.

SVOCs – Four soil samples collected by ENVIRON were analyzed for SVOCs. The analytical results indicate that SVOCs were not detected above the laboratory reporting limit. Based on these results, SVOCs are not identified as Site COCs.

OCPs – Four soil samples collected by ENVIRON were analyzed for OCPs. The pesticide 4,4'-DDT was detected in one sample (SB-8), which contained a reported concentration of 8.27 µg/kg. The detected concentration of 4,4-DDT is below the 4,4-DDT residential RSL of 1,900 µg/kg. Based on these results, OCPs were not identified as Site COCs.

PCBs – Four soil samples collected by ENVIRON were analyzed for PCBs. The analytical results indicate that PCBs were not detected above the laboratory reporting limit. Based on these results, PCBs were not identified as Site COCs.

TPH – In 2012, ENVIRON drilled and sampled 18 soil bores for TPH at targeted sampling locations, to depths of 5 feet to 10 feet bgs, depending on the nature of the targeted feature. In 2015, Kleinfelder sampled 32 locations for TPH, to depths of 2 to 4 feet bgs. As previously discussed, based on a statistical evaluation of the Site assessment TPH-d and TPH-o data sets

and use of the US EPA RSLs for TPH Aliphatic and Aromatic Low, Medium, and High, soil at the locations of Samples SB-16-2, KLF-02, and KLF-09-2' contained hydrocarbon concentrations warranting remedial action. Additionally, the TPH-g concentration of one of these soil samples (KLF-09-2') exceeded the TPH-g MSSL of 500 mg/kg, the TPH-d concentrations of three soil samples (SB-16-2, KLF-02, and KLF-09-2') exceeded the LARWQCB TPH-d MSSL of 1,000 mg/kg, and the TPH-o concentrations of two samples (SB-16-2 and KLF-02) exceeded the TPH-o MSSL of 10,000 mg/kg. Based on these results, TPH was identified as a COC.

Metals – Other than arsenic, cadmium, lead, and nickel, the maximum concentrations of metals detected in the soil samples were below their respective DTSC HERO residential soil SLs and US EPA residential and soil screening values, as applicable. Note that the detected arsenic and nickel concentrations appear to represent background values. Cadmium and lead were detected at respective concentrations of 7.01 mg/kg and 1,000 mg/kg in the sample from Location KLF-02, exceeding these metals' respective DTSC HERO SLs for residential soil of 4.58 mg/kg and 80 mg/kg. Additionally, lead was detected at a concentration of 2,300 mg/kg in the surface sample collected at Location KLF-24B. Lead concentrations in 17 additional samples also exceed the lead residential soil SL. As previously discussed, based on a statistical evaluation of the Site lead data set and use of the lead residential SL, soil at the locations of Samples KLF-02 and KLF-24B contained lead concentrations warranting remedial action. Based on these results, cadmium and lead were identified as Site COCs.

2.9.2 ECOLOGICAL RISK EVALUATION

The Site is located in a highly urbanized and completely developed area within the City of Los Angeles (Kleinfelder, 2015b). Streets, sidewalks, and commercial/industrial structures consistent with urban commercial land uses occupy the area adjoining to the Site, and there is no habitat suitable for ecological receptors within or near the Site. Redevelopment activities at the Site and the surrounding area are consistent with continued commercial/industrial land use. Therefore, an ecological risk assessment was not proposed.

3 APPLICABLE OR RELEVANT AND APPROPRIATE REQUIREMENTS

Previous investigations on Site indicated the presence of lead and TPH in soil exceeding its residential SLs. The most effective remedial action was determined to be soil excavation and off-Site disposal of soil containing COC concentrations exceeding remedial goals. This section discusses the applicable or relevant and appropriate requirements for the soil excavation and off-Site disposal activities performed.

3.1 PUBLIC PARTICIPATION

The public participation requirements and activities during the RA process included:

- The development of a community profile.
- Performing community interviews.
- Publishing a notice of the availability of the Draft RAW for public review and comments (upon which the public comment period occurred from November 13 to December 18, 2015).
- Making the Draft RAW and other supporting documents available at DTSC's office and in a local information repository.
- Responding to public comments received on the Draft RAW and California Environmental Quality Act (CEQA) documents.
- Sending a community update to the Site mailing list describing the Site, the proposed RA, and the RAW implementation schedule.
- Preparing final documents in electronic format and uploading them to DTSC's publicly-accessible EnviroStor database.

3.2 CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA) DOCUMENTATION

As the lead oversight agency, DTSC is responsible for making discretionary decisions in approving the RAW. DTSC evaluated and prepared the appropriate CEQA documentation for the RA, which coincided with the RAW public comment period.

3.3 HAZARDOUS WASTE MANAGEMENT

Based on then-existing soil data before soil removal activities commenced, lead was detected at a maximum concentration of 2,300 mg/kg, in a soil sample collected in the area of proposed

Excavation Area EA-3. In addition, the California Soluble Threshold Limit Concentration for hazardous waste classification is 5 mg/L for soluble lead. As a result, lead- and TPH-impacted soils excavated from Excavation Areas EA-1 through EA-4 were handled as non-RCRA hazardous waste.

Analytical results of soil samples collected by Tetra Tech on December 2, 2015 from five test pits excavated within the footprint of the proposed subterranean parking level were used to evaluate appropriate off-Site disposal options for soil excavated for its construction. Based on the analytical results, the TPH-impacted soil from Excavation Area EA-5 was disposed as non-hazardous waste.

3.4 STORM WATER POLLUTION PREVENTION PLAN

R.A. Smith National, Inc. prepared a project SWPPP (included in Appendix C of the Final RAW) that described construction stormwater pollution management and best management practices (BMP) that were implemented during the remedial activities. BMPs included those published by the California Department of Transportation (Caltrans, 2003). The SWPPP specified measures to be undertaken to limit stormwater impact to the Site, including reducing the sediment load in stormwater runoff during Site cleanup activities and preventing accidental spills caused or exacerbated by stormwater. The contractor filed a Notice of Intent (NOI) with the SWRCB prior to initiation of Site cleanup activities.

The Contractor prepared an addendum to the SWPPP, which was prepared by a Qualified SWPPP Developer in accordance with the General Permit requirements for the project Risk Level determined for the Site. The addendum included the following:

- A copy of the NOI and receipt letter.
- Determination of the Risk Level for the Site.
- Material Safety Data Sheets for chemicals used or stored on the Site during construction.
- An example BMP inspection form.
- Emergency contact information.
- Proposed deviations from the procedures specified in the SWPPP.

The Contractor was responsible for implementing the SWPPP, as approved by the DTSC.

3.5 SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

The South Coast Air Quality Management District (SCAQMD) has two rules addressing excavation, Rules 1150 and 1166, along with Rule 403, which addresses Fugitive Dust. Rule 1150 applies to excavation of sanitary landfills and is not relevant to this project. Rule 1166 applies to the excavation of soil containing VOCs. Although VOCs have not been identified as Site COCs, as a precaution soil generated by remedial excavation activities was screened for the presence of total volatile organic vapors at the Site, using a photoionization detector (PID) equipped with a 10.6-electron volt and calibrated to a 100-part per million by volume (ppmv) hexane standard with a detection limit of 0.1 ppmv.

Several elements of Rule 403, such as protocols to mitigate potential fugitive dust emissions (SCAQMD, 2005), were incorporated into the RAW. Excavation, loading, and transport of impacted soils were performed in compliance with Rule 403's prevention, reduction, and mitigation measures for fugitive dust emissions. However, notification of SCAQMD is required only for large operations. For this project, no notification or filing of a Fugitive Dust Emission Control Plan was required, due to the project's size.

3.6 HEALTH AND SAFETY PLAN

All contractors were responsible for operating in accordance with the most current requirements of Title 8, California Code of Regulations (CCR), Section 5192 (8 CCR 5192) and Title 29, Code of Federal Regulations (CFR), Section 1910.120 (29 CFR 1910.120), Standards for Hazardous Waste Operations and Emergency Response. On-Site personnel were responsible for performing work in accordance with all applicable regulations of the Occupational Safety and Health Administration (OSHA) outlined in 8 CCR (General Industry Standards), as well as other applicable federal, state and local laws and regulations.

A Site-Specific Health and Safety Plan (SSHSP) was prepared for the Site and was used during the execution of the RAW. The SSHSP is included in Appendix D of the Final RAW.

The provisions of the SSHSP were mandatory for Kleinfelder personnel. Non-Kleinfelder personnel, including the contractor selected to perform the remedial activities, were required to implement their own SSHSP reflecting their organizations' respective development/construction activities during the remedial activities. Such programs were required to meet or exceed the

DRAFT

requirements set forth in Kleinfelder's SSHSP. On-Site personnel read the SSHSP and signed a log provided by Kleinfelder's Site Health and Safety Officer before initiating activities at the Site.

4 REMOVAL ACTION WORK ACTIVITIES

Impacted soil removal activities for Excavation Areas EA-1 through EA-4 were performed on November 12 and 13, 2015, whereas impacted soil removal activities for Excavation Area EA-5 were performed on December 9, 15, and 18, 2015. Soils were excavated using a Link-Belt™ excavator (Model 135).

Removal, transportation, and disposal were performed in accordance with applicable Federal, State, and local laws, regulations, and ordinances. Soil handling and disposal practices were described in the project Transportation Plan (presented in Section 6.6 of the DTSC-approved Final RAW and summarized in Section 4.7 herein).

Figure 3 depicts Excavation Areas EA-1 through EA-5. Figure 4A depicts the extents of Excavation Areas EA-1 through EA-4 along with their post-excavation sample locations. Figure 4B depicts locations of five test pits sampled by Tetra Tech within the area of the Site's proposed subterranean parking level, along with the extent of Excavation Area EA-5. Figure 4C depicts the Excavation Area EA-5 post-excavation sample locations. Figure 5 shows the air and weather monitoring locations. Figure 6 depicts the truck routes used to transport excavated non-hazardous and non-RCRA hazardous soils off-Site. A photographic log documenting each day of RA activities is included in Appendix A.

4.1 SITE PREPARATION

Prior to equipment mobilization for the proposed excavation activities, Site preparation activities were performed, including surveying, utility clearance, and provision of Site control and security measures. These activities are discussed further below.

4.1.1 Surveying

Hennon Surveying and Mapping, Inc. performed a topographic survey of the Site and prepared a map, dated March 30, 2014, of the then-existing Site conditions (Hennon Surveying and Mapping, Inc., 2014). Four proposed Excavation Areas, designated EA-1 through EA-4, were subsequently marked in the field by Kleinfelder using stakes and caution tape.

Prior to the initiation of field work, coordinates of the historic soil sample locations were entered into a hand-held global positioning system (GPS) unit. The GPS unit was then used to mark out

the boundaries of Excavation Areas EA-1 through EA-4. Exclusion zones were established around each proposed excavation area to accommodate staging of transport vehicles and movement of contractor equipment.

4.1.2 Utility Clearance

Prior to commencement of excavation, Kleinfelder notified Underground Service Alert of Southern California (USASC) of its intent to perform excavation, in accordance with California State law (Assembly Bill AB 73).

4.1.3 Site Control and Security Measures

At the time of the RA the Site was not open to unauthorized vehicular traffic, and the property was securely fenced and locked. Persons requesting Site access were required to have pre-access authorization and demonstrate a valid purpose for access. If access to work was planned, visitors were briefed regarding the SSHASP (see Appendix D of the Final RAW).

4.2 SOIL EXCAVATION ACTIVITIES

This section discusses the field tasks performed during soil excavation work and identifies the excavation areas and approximate quantity of impacted soil excavated and removed from each area.

Soil excavation activities at four Site locations (EA-1 through EA-4) were performed on November 12 and 13, 2015, as proposed in the DTSC-approved Final RAW (Kleinfelder, 2016). Excavation Areas EA-1 through EA-3 were each excavated to an approximate depth of 2 feet bgs, whereas Excavation Area EA-4 was excavated to an approximate depth of 4 feet bgs. The approximate lateral extents of Excavations EA-1 through EA-4 are depicted on Figure 3. Approximately 22.6 cubic yards (yd³) of soil was removed from Excavation Area EA-1, approximately 7.3 yd³ of soil was removed from Excavation Area EA-2, approximately 22 yd³ of soil was removed from Excavation Area EA-3, and approximately 39.6 yd³ of soil was removed from Excavation Area EA-4. The excavated impacted soils from Excavation Areas EA-1 through EA-4 were transferred directly from the excavator's bucket into dump trucks for off-Site disposal.

On December 2, 2015, Tetra Tech collected soil samples for laboratory analysis from five test pits (designated Test Pits S-1 through S-5), to accommodate export profiling of soils to be excavated

from the area of the Site's proposed subterranean parking level. Two soil samples were collected from each test pit at approximate depths of 5 feet and 10 feet bgs. On December 7, 2015, Kleinfelder was informed that two apparent old oil conveyance pipes were encountered during grading work in the proposed subterranean parking area. The pipes were removed, and one pipe was found to contain oil residue whereas the other pipe was dry. Also on December 7, 2015, Kleinfelder was provided the laboratory report of results of the soil samples collected by Tetra Tech on December 2, 2015. The results indicated the two samples from Test Pit S-3 contained reported TPH concentrations exceeding the TPH residential SLs (Tables 3 and 4). Consequently, an additional excavation area (EA-5) was added to the soil excavation, sampling, and analysis plan in order to remove this TPH-impacted soil from at and around Test Pit S-3 (Figure 4B). Excavation Area EA-5 was added pursuant to Section 6.5.5 (Contingency Plan) of the DTSC-approved Final RAW, and this modification to the RAW was approved by Mr. Jose Diaz of the DTSC via a December 23, 2015 electronic mail (DTSC, 2015b). Excavation Area EA-5 was subsequently excavated on December 9, 15, and 18, 2015, with soil removed to a maximum approximate depth of 20 feet bgs over much of the area and to as deep as 37 feet bgs at the location of a pothole excavated deeper to assess TPH vertical extent (Tables 5 and 6). The approximate extent of Excavation Area EA-5 is depicted on Figure 4C. Approximately 1,110 cy³ of soil was removed from Excavation Area EA-5. The excavated soil was temporarily stockpiled on Site on 10-mil plastic sheeting and securely covered with plastic sheeting.

4.3 AIR AND METEOROLOGICAL MONITORING

Air and meteorological monitoring were performed to achieve the following goals:

- Identify and measure particulate matter generated during the soil removal and decontamination activities, to assign the appropriate personal protective equipment (PPE) and safety systems specified for those activities.
- Provide feedback to Site operations personnel regarding potential hazards from exposure to hazardous air contaminants generated through excavation activities.
- Identify and measure particulate matter at points outside of the soil removal and exclusion zones.

Four air monitoring stations and one weather station were placed around the perimeters of the exclusion zone at the approximate locations depicted on Figure 5. The air monitoring and weather

stations were calibrated and checked prior to commencement of the excavation activities to minimize disruptions and down time.

4.3.1 Air Monitoring

Air monitoring was performed during excavation activities involving disturbance and/or handling of impacted or potentially-impacted soils, and included the following:

- Monitoring dust levels around the perimeter of the Exclusion Zone (fenced area) at the approximate locations depicted on Figure 5. The monitoring results indicated dust levels did not exceed the Site dust action level of 22 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$).
- Monitoring for the presence of total organic vapors in the excavation area and exclusion zone, with a PID, to assess the appropriate level of PPE. If total organic vapor readings equaled or exceeded 5 ppmv above background levels sustained over 1 minute, the work area was evacuated temporarily to allow for the air to stabilize for resampling (see the SSHSP provided in Appendix D of the Final RAW). If total organic vapor readings equaled or exceeded 25 ppmv above background levels sustained over 1 minute, work was stopped and the SSO was notified. Additionally, dust and PM_{10} were monitored as described in Section 4.4. The level of respiratory protection did not need to be upgraded during excavation activities.
- Routine perimeter monitoring to assess the levels of airborne contaminants at the perimeter of the exclusion zone and demonstrate that the community was not being exposed to organic vapors.

4.3.2 Meteorological Monitoring

On-Site ambient weather conditions (wind speed and direction, and relative humidity) were monitored using the following: an on-Site meteorological station, real-time weather websites, and the National Weather Service website. On-Site meteorological monitoring was performed by Kleinfelder on November 12 and 13, 2015 during the excavation activities at Excavation Areas EA-1 through EA-4. Weather conditions did not adversely impact the excavation activities.

4.4 DUST CONTROL

Dust control measures were implemented during soil excavation activities to prevent potential air transport of excavated soil and dust to adjacent areas. Applicable BMPs were implemented to

control airborne dusts generated by the soil RA. Dust and particulate matter (PM₁₀) were periodically monitored during metals-impacted soil excavation work at Excavation Areas EA-1 through EA-4 using a miniRAM™ dust monitor (or functional equivalent). Dust levels were not measured greater than the 22 µg/m³ PM₁₀ dust limit.

4.5 POST-EXCAVATION SOIL SAMPLING

Post-excavation soil samples were collected, as specified in the DTSC-approved Final RAW, from Excavation Areas EA-1 through EA-4, and a post-excavation soil sampling plan was added for Excavation Areas EA-5. The post-excavation soil samples were collected as follows:

- From the sidewalls of each excavation, at a frequency of approximately each 25 linear feet (with a minimum of one sample per sidewall).
 - At a discrete depth of approximately 1 foot bgs per side wall location for 2-foot deep Excavation Areas (EA-1 through EA-3) (Figure 4A and Tables 1 and 2).
 - At discrete depths of approximately 1 foot and 3 feet bgs per side wall location for 4-foot deep Excavation Areas (EA-4) (Figure 4A and Tables 1 and 2).
 - At discrete depths of approximately 5 feet, 10 feet, and 16 feet per side wall location for Excavation Area EA-5 (Figure 4C and Tables 5 and 6).
- At a frequency of one sample per each 225 square feet (or less) of excavation floor (for Excavation Areas EA-1 through EA-5, plus at selected deeper depths beneath the floor of Excavation Area EA-5 to assess the vertical extent of TPH).

Where practicable, Excavation Area EA-5 locations with initial post-excavation sampling TPH results exceeding US EPA residential SLs for TPH were further excavated, and new post-excavation soil samples were then collected. The excavation work continued to the vertical and lateral extents practicable. Note that the areas further excavated include several samples listed in Tables 3 through 5 that were removed by the subsequent overexcavation work. Samples that were subsequently overexcavated/removed are Tetra Tech's Samples S3 @ 5' and S3 @ 10' (see Tables 3 and 4) and Kleinfelder's Samples EA-5-N1-27-5, EA-5-N1-28-10, EA-5-N1-29-16, EA-5-N2-30-5, EA-5-N2-31-10, EA-5-S1-33-5, EA-5-S1-34-10, EA-5-S1-35-16, EA-5-S2-36-5, and EA-5-S-37-10 (see Table 5). The excavation work had to eventually be terminated laterally to the south and west due to a potential for undermining the existing structures that adjoin to the south of the Site work area and west of the Site, and vertically due to slope stability concerns and limitations of the excavator.

Each post-excavation soil sample was collected with a new, disposable plastic scoop. Immediately following collection, each sample was placed in a laboratory-provided, wide mouth glass container that was promptly sealed with its lid. Although VOCs have not been identified as Site COCs, as a precaution excavated soil was screened in the field for the presences of total volatile organic vapors using a PID equipped with a 10.6-electron volt detector lamp. The PID was calibrated to a 100-ppmv hexane standard and had a detection limit of 0.1 ppmv. To perform the screening, soil from a given location was placed in a clean, unused, re-sealable plastic bag that was then sealed for approximately 10 minutes to allow volatile organic vapors, if present, to volatize into the bag's headspace. Then, the seal of the bag was opened slightly, the tip of the PID was placed into the bag, and the observed PID reading was recorded on a field log. Sample handling and chain-of-custody procedures for soil sampling were performed consistent with US EPA SW-846 protocols (US EPA, 2015b).

Kleinfelder's post-excavation soil samples were transported in an ice-chilled cooler under proper chain-of-custody to Enviro-Chem, Inc. of Pomona, California, a California Environmental Laboratory Accreditation Program (ELAP)-accredited laboratory. Soil samples collected from Excavation Areas EA-1 through EA-4 were analyzed for lead using US EPA Method 6010B and for TPH with carbon range analysis using US EPA Method 8015B. The TPH carbon range analysis quantifies TPH-g (C4 to C10), TPH-d (C11 to C22), and TPH-o (C23 to C35). Soil samples collected from Excavation Area EA-5 were analyzed for TPH with carbon range analysis using US EPA Method 8015B. Additionally, two soil samples collected from the bottom of Excavation Area EA-5 were analyzed for VOCs using US EPA Method 8260B, and two soil samples collected from the west wall of Excavation Area EA-5 were analyzed for polynuclear aromatic hydrocarbons (PAHs) using US EPA Method 8310. The two soil samples analyzed for VOCs were preserved in the field pursuant to US EPA Method 5035.

Two field duplicate soil samples (i.e., co-located samples) were collected from Excavation Areas EA-1 and EA-2 and analyzed for lead, using US EPA Method 6010B, and TPH with carbon range analysis, using US EPA Method 8015B. Two field duplicate soil samples were collected from Excavation Area EA-5 and analyzed for TPH with carbon range analysis using US EPA Method 8015B.

A unique sample identification number was typically assigned to each soil sample that was tied to the sample's location and depth. This number was typically an alphanumeric sequence that

served as an acronym to identify the sample. The alphanumeric sequence reflected the given excavation area, and is as follows:

EA-X-Y-ZZ-AA: EA = Excavation Area; X = EA area number (1 through 7); Y = (use one of the following, as appropriate) N = north wall, S = south wall, E = east wall, W = west wall, or B = bottom of excavation); ZZ = sample number; and AA = depth (in feet bgs).

When a duplicate (i.e., co-located) sample was collected, a “D” was affixed to the end of the sample number, preceded by a hyphen (e.g., EA-X-Y-ZZ-AA-D).

Including field duplicates, 67 post-excavation soil samples were collected. The laboratory analytical reports for the post-excavation soil samples are provided in Appendix B.

4.6 EQUIPMENT CLEANING

Entry to the excavation area was fenced off, and access was limited to avoid unnecessary exposure and limit the potential for cross contamination. Each post-excavation soil sample was collected with a new, disposable plastic scoop, and disposable equipment was packaged after use for appropriate off-Site disposal. Trucks were visually inspected before leaving the Exclusion Zone, and dirt (if any) adhering to the exterior surfaces was brushed off and collected on Visqueen.

4.7 LOADING, TRANSPORTATION, AND DISPOSAL OF EXCAVATED SOIL

Excavated soil was either temporarily stockpiled or directly loaded onto trucks for transport off Site. The excavator was primarily used to load soil into the trucks. At the end of each day, stockpiled soil (if present) was covered with plastic sheeting, and straw wattles and/or gravel bags were placed around the perimeter of the stockpile until the soil was transported off Site for proper disposal.

Based on pre-profiling using analytical results (see Section 3.3), excavated soils from within Excavation Areas EA-1 through EA-4 were classified as non-RCRA hazardous waste, whereas excavated soil from within Excavation Area EA-5 was classified as non-hazardous waste. Based on soil disposal manifests and landfill receipt tickets, approximately 143.9 tons of excavated soil

was properly transported to and disposed under hazardous waste manifest at South Yuma County Landfill located in Yuma, Arizona. Based on soil disposal manifests and landfill receipt tickets, approximately 1,441.36 tons of excavated soil was properly transported to and disposed under non-hazardous waste manifest at Chiquita Canyon Landfill, in Castaic, California. The removed old oil conveyance piping was disposed of at Chiquita Canyon Landfill, in Castaic, California. Copies of the transportation and disposal manifests are included in Appendix C. Truck routes to the respective landfills are depicted on Figure 6.

4.8 BACKFILL AND SITE RESTORATION

Backfilling of the Excavation Areas is being completed as part of the on-going Site redevelopment work, which will include construction of three buildings, including two constructed at grade and one that will have a subterranean parking level. The redevelopment work is to result in a net export of soil, and no import of soil is thus expected to be required.

5 EVALUATION OF ANALYTICAL RESULTS

In total, 67 post-excavation soil samples were collected by Kleinfelder from the walls and floors of the remedial excavations within Excavation Areas EA-1 through EA-5, although soil represented by 10 of the Excavation Area EA-5 post-excavation soil samples was removed via subsequent overexcavation activities, as was discussed in Section 4.5. The sample numbers for these 10 subsequently-removed soil samples are highlighted in yellow in Table 5 in order to distinguish them from the other post-excavation soil samples, which represent soil remaining on Site.

Qualitative data validation of the laboratory data reported by Enviro-Chem, Inc. was performed by Kleinfelder. Based on the review, the overall data quality is considered acceptable and the data are concluded to meet the data quality objectives for this project. Based on the review results, the data are usable for the intended purposes. The laboratory's data quality assurance and quality control (QA/QC) summary reports for the analytical methods performed on the soil samples collected during the RA activities are presented in Appendix B.

5.1 RESULTS FOR EXCAVATION AREAS EA-1 THROUGH EA-4

For Excavation Areas EA-1 through EA-4, the analytical results indicate one soil sample (EA-4-N-17-1, collected at an approximate depth of 1 foot bgs from the north wall of the Excavation Area EA-4 excavation) contains reported TPH-d and TPH-o concentrations of 393 mg/kg and 3,690 mg/kg, which exceed their respective residential soil lowest RSLs of 96 mg/kg and 2,500 mg/kg (see Table 1). Additionally, one soil sample (EA-3-S-13-1, collected at an approximate depth of 1 foot bgs from the south wall of the Excavation Area EA-3 excavation) contains a reported lead concentration of 250 mg/kg, which exceeds the lead residential soil SL of 80 mg/kg (see Table 2). TPH and lead concentrations reported in each of the post-excavation samples collected from Excavation Areas EA-1 and EA-2 and in each remaining post-excavation sample collected from Excavation Areas EA-3 and EA-4 are below their screening values. Kleinfelder performed statistical evaluations of the TPH-d, TPH-o, and lead results using the full post-excavation sample data set for Excavation Areas EA-1 through EA-4 (i.e., the results for the 29 post-excavation samples listed in Tables 1 and 2), conservatively assigning the PQL as a detected concentration for non-detect TPH-d and TPH-o results (note that the lead results were all detects). Kleinfelder used the US EPA's ProUCL™ software, Version 5.0, which evaluate the various UCLs that it calculates and provides a "Suggested UCL to Use." The ProUCL output

sheets are provided in Appendix D. The “Suggested UCL to Use” for the 95 percent UCL of the mean for each of the three Site COCs remaining in Excavation Areas EA-1 through EA-4 is as follows:

- TPH-d – 95 percent Chebyshev UCL – 97.29 mg/kg (versus lowest residential soil RSL of 96 mg/kg).
- TPH-o – 95 percent Chebyshev UCL – 1,010 mg/kg (versus lowest residential soil RSL of 2,500 mg/kg).
- Lead – 95 percent H-UCL – 42.14 mg/kg (versus residential soil SL of 80 mg/kg).

Although the TPH-d 95 percent Chebyshev UCL of 97.29 mg/kg very slightly exceeds the US EPA’s June 2015 aliphatic medium TPH residential RSL of 96 mg/kg, it is below the US EPA’s aromatic medium TPH residential RSL of 110 mg/kg. Furthermore, the analytical laboratory flagged each of the C11-C22 TPH-d detects with a qualifier indicating that the diesel-range peaks on the samples’ chromatograms are atypical of the diesel-range standard. Mr. Curtis Desilets of Enviro-Chem informed Kleinfelder that the detected diesel-range hydrocarbons in the samples represent the lower-carbon fraction of a much heavier hydrocarbon, pointing out that over 90 percent of the hydrocarbon mass appears to be in the heavier oil carbon range.

The results of Kleinfelder’s evaluation for Excavation Areas EA-1 through EA-4 were transmitted to the DTSC via electronic mail on November 17, 2015. Based on the results, the DTSC’s approval to proceed with planned rough grading of the Site was requested. Upon completion of the DTSC’s review, Mr. Jose Diaz of the DTSC responded with the DTSC’s concurrence in a November 23, 2015 electronic mail (DTSC, 2015a).

5.2 RESULTS FOR EXCAVATION AREA EA-5

As previously described herein, soil sampling to accommodate export profiling of soils to be excavated from the Site’s proposed subterranean parking level was subsequently performed by Tetra Tech, and the analytical results indicated TPH-impacted soil was present in the southwest portion of the proposed subterranean parking area. Consequently, additional Excavation Area EA-5 was added to the soil excavation, sampling, and analysis plan in order to remove that TPH-impacted soil. Excavation Area EA-5 was subsequently excavated on December 9, 15, and 18, 2015, with soil removed to a maximum approximate depth of 20 feet bgs over much of the area. The excavation work continued to the vertical and lateral extents practicable. Ultimately

the excavation work had to be terminated laterally to the south and west, due to a potential for undermining the existing structures that adjoin to the south of the Site work area and west of the Site, and vertically due to slope stability concerns and limitations of the excavator.

During and after completion of the excavation of Excavation Area EA-5, post-excavation soil samples were collected from the sidewalls and floor of the excavation. Soil samples were collected from as deep as 37 feet bgs (at the location of a pothole further excavated within the excavation floor to assess the vertical extent of TPH). Based on the analytical results for the 28 post-excavation samples not subsequently removed by further overexcavation, 10 soil samples contain reported TPH-d concentrations exceeding the lowest TPH-d residential soil RSL (96 mg/kg) and eight soil samples contain reported TPH-o concentrations exceeding the lowest TPH-o residential soil RSL (2,500 mg/kg), as shown in Table 5. The maximum respective TPH-d and TPH-o concentrations measured in these samples were 4,410 mg/kg (in Sample EA-5-B-45-19, which was collected from an approximate depth of 19 feet bgs) and 26,100 mg/kg (in Sample EA-5-S2-38-16, which was collected from an approximate depth of 16 feet bgs). The TPH concentrations measured in the remaining post-excavation samples collected from Excavation Area EA-5 are below their screening values. Using the US EPA's ProUCL™ software, Version 5.0, Kleinfelder performed statistical evaluations of the post-excavation TPH-d and TPH-o data set (i.e., using the results for the 28 post-excavation samples that are not highlighted in yellow in Table 5), conservatively assigning the PQL as a detected concentration for non-detect TPH-d and TPH-o results. These ProUCL output sheets are also provided in Appendix D. The "Suggested UCL to Use" for both TPH-d and TPH-o is again a Chebyshev UCL. The 95 percent Chebyshev UCLs of the means for TPH-d and TPH-o remaining in Excavation Area EA-5 are as follows:

- TPH-d – 1,492 mg/kg (versus lowest residential soil RSL of 96 mg/kg).
- TPH-o – 9,798 mg/kg (versus lowest residential soil RSL of 2,500 mg/kg).

Note that these exceedances of the RSLs by the calculated 95 percent UCLs are driven mostly by the results of four post-excavation soil samples collected from approximate depths of 16 feet bgs to 19 feet bgs beneath the southwestern portion of the proposed subterranean parking level (Samples EA-5-N2-32-16, EA-5-S2-38-16, EA-5-B-45-19, and EA-5-B-46-17) and three post-excavation soil samples collected from depths of 5 feet bgs to 10 feet bgs to the west of the southwestern portion of the proposed subterranean parking level (Samples EA-5-W-42-5,

EA-5-W-43-10, and EA-5-W-43-10D). With the results of these seven samples excluded from the data set, the calculated 95 percent Chebyshev UCLs of the means for TPH-d and TPH-o remaining in Excavation Area EA-5 are as follows:

- TPH-d – 118.9 mg/kg (versus lowest residential soil RSL of 96 mg/kg).
- TPH-o – 1,195 mg/kg (versus lowest residential soil RSL of 2,500 mg/kg).

This calculated 95 percent Chebyshev UCL of the mean for TPH-d minimally exceeds the lowest TPH-d residential soil RSL and is below the lowest TPH-d industrial soil RSL, whereas the calculated 95 percent Chebyshev UCL of the mean for TPH-o is below the lowest TPH-o residential soil RSL. These ProUCL output sheets are also provided in Appendix D.

These results indicate a small quantity of hydrocarbon-impacted soil remains on Site beneath and adjoining to the west of the southwestern portion of the Site's proposed subterranean parking level. Hydrocarbon-impacted soil within the proposed subterranean parking level footprint has been removed to beneath the deepest depth of excavation expected to be necessary for the construction work, however. As previously noted, the analytical laboratory flagged each C11-C22 TPH-d detect with a qualifier indicating that the diesel-range peaks on the samples' chromatograms are atypical of the diesel-range standard. Mr. Curtis Desilets of Enviro-Chem further informed Kleinfelder that the detected diesel-range hydrocarbons in the samples represent the lower-carbon fraction of a much heavier hydrocarbon, pointing out that over 90 percent of the hydrocarbon mass appears to be in the heavier oil carbon range. As indicated in Table 5, VOCs were not detected in the two Excavation Area EA-5 post-excavation soil samples that were analyzed for VOCs (i.e., Samples EA-5-B-45-19, which was the sample containing the highest TPH-d concentration, and Sample EA-5-B-46-17). Additionally, the 5-foot and 10-foot bgs samples containing the highest TPH-d and TPH-o concentrations of the samples collected at those respective depths (Samples EA-5-W-42-5 and EA-5-W-43-10) were analyzed for PAHs, and (as indicated in Table 6) the results indicate the measured concentrations of most detected PAHs are below their residential soil RSLs, whereas those measured concentrations of the three detected PAHs that exceed their residential RSLs – benzo(b)fluoranthene, benzo(a)pyrene, and dibenz(a,h)anthracene – are considerably below their respective industrial RSLs. Furthermore, as indicated in Table 5, the analytical results of the deepest Excavation Area EA-5 post-excavation confirmation samples are below their lowest residential soil RSLs for TPH-d and TPH-o and the LARWQCB's MSSSLs. Note also that the Site will be completely covered by

DRAFT

buildings once it has been redeveloped, and the City of Los Angeles is requiring the installation of a methane vapor barrier with underlying passive ventilation system beneath the new buildings. These measures will eliminate potential human exposure pathways.

6 SUMMARY AND CONCLUSIONS

The purpose of the RA was to remove shallow soils from four previously-identified Site areas containing primarily lead and TPH concentrations above the DTSC's SLs for residential land use presented in HHRA Note No. 3 issued in October 2015 by the DTSC's Office of HERO, if such values were available, and to the US EPA's current (November 2015) RSLs for residential land use (for Hazard Quotient of 1.0) for those compounds without published HERO screening values. TPH concentrations in soil were also compared to the LARWQCB's TPH MSSLs for a depth to groundwater beneath the sample ranging from 20 feet to 150 feet.

Soil excavation activities at the Site within Excavation Areas EA-1 through EA-4 were performed on November 12 and 13, 2015, as proposed in the DTSC-approved Final RAW. However, analytical results of soil sampling subsequently performed by Tetra Tech, to accommodate export profiling of soils excavated from the Site's proposed subterranean parking level, indicated TPH-impacted soil was present in the southwest portion of the proposed subterranean parking area. Excavation Area EA-5 was then added to the scope of the RA, and the performance of remedial excavation within it was approved by the DTSC. Excavation Area EA-5 was subsequently excavated on December 9, 15, and 18, 2015, with soil removed to a maximum approximate depth of 20 feet bgs over much of the area.

Based on analytical results of post-excavation soil samples, the RA objective was achieved at the five Site excavation areas, except for the southernmost and westernmost portions of Excavation Area EA-5, where further excavation laterally had to be terminated due to the potential for undermining existing structures that adjoin to the south of the Site work area and west of the Site, and further excavation vertically had to be terminated due to slope stability concerns and excavator limitations. Although a small quantity of hydrocarbon-impacted soil remains on Site beneath and adjoining to the west of the southwestern portion of the Site's proposed subterranean parking level, hydrocarbon-impacted soil within the proposed subterranean parking level footprint has been removed to beneath the deepest depth of excavation expected to be necessary for the construction work. Removal of shallow soil containing TPH concentrations above the lowest RSLs and MSSLs for residential soil at the Site has thus been achieved to the extent practicable. Note also that the Site will be completely covered by buildings once it has been redeveloped, and the City of Los Angeles is requiring the installation of a methane vapor barrier with underlying passive ventilation system beneath the new Site buildings. These measures will eliminate potential human exposure pathways.

Approximately 144 tons of soil was excavated from Excavation Areas EA-1 through EA-4 and transported off Site, under hazardous waste manifest, for disposal at South Yuma County Landfill, Inc., located in Yuma, Arizona. Approximately 1,441 tons of soil was excavated from Excavation Area EA-5 and transported off Site, under non-hazardous manifest, for disposal at the Chiquita Landfill located in Castaic, California. Copies of the manifests are provided in Appendix C.

Based on these facts, it is Kleinfelder's opinion that the Site has been adequately remediated. It is Kleinfelder's further opinion that closure of the Site environmental case by the DTSC with an unrestricted Site use determination is warranted.

7 LIMITATIONS

This report was prepared in a manner consistent with that level of care and skill ordinarily exercised by other members of Kleinfelder's profession practicing in the same locality, under similar conditions and at the date the services were provided. Kleinfelder's conclusions, opinions, and recommendations are based on a limited number of observations and data. It is possible that conditions may vary between or beyond the data evaluated. Kleinfelder makes no other representation, guarantee, or warranty, express or implied, regarding the services, communication (oral or written), report, opinion, or instrument of service provided.

This report may be used only by EDGE and the registered design professional in responsible charge and only for the purposes stated for this specific engagement within a reasonable time from its issuance, but in no event later than 2 years from the date of the report. Provided however, Kleinfelder understands and consents that this report may be submitted to an appropriate regulatory agency for its review.

The scope of services described here is not intended to be all-inclusive, to identify all potential concerns, or to eliminate the possibility of other environmental problems. Within current technology, no level of assessment can show conclusively that a property or its structures are completely free of hazardous substances. Therefore, Kleinfelder cannot offer a certification that the property is free of environmental liability. Kleinfelder will assume no responsibility or liability whatsoever for any claim, loss of property value, damage, or injury which results from pre-existing hazardous materials being encountered or present on the Site, or from the discovery of such hazardous materials.

RSL - Residential (mg/kg)					82	96	2,500
RSL - Industrial (mg/kg)					420	440	33,000
LARWQCB MSSL (mg/kg)					500	1,000	10,000

Notes:

- TPH = Total petroleum hydrocarbons
- TPH-d = Diesel-range TPH
- TPH-g = Gasoline-range TPH
- TPH-o = Motor oil-range TPH
- C#-C# = TPH carbon range
- mg/kg = Milligrams per kilogram
- bgs = Below ground surface
- US EPA = United States Environmental Protection Agency
- 8015B = US EPA analytical method number
- ND = Not detected at or above the practical quantitation limit, which is shown in parentheses
- * = Laboratory reported that the chromatograph of the sample contains peaks in the gasoline or diesel range (as indicated), but the peaks do not match the peaks on the chromatograph of the gasoline or diesel standard
- RSL = US EPA November 2015 Regional Screening Level, in mg/kg; note that the RSL values used for TPH-g, TPH-d, and TPH-o are the lower of the Aliphatic or Aromatic values for TPH Low, Medium, and High, respectively
- LARWQCB MSSL = Los Angeles Regional Water Quality Control Board, Maximum Soil Screening Level (2004, revised 2006); MSSL used is for depth to groundwater beneath sample ranging from 20 feet to 150 feet bgs
- Result in bold font** indicates detected concentration is above Residential RSL

Table 2
Summary of Soil Analytical Results for Excavation Areas
EA-1 through EA-4 – TTLC Lead
 Mateo Palmetto
 555 Mateo Street
 Los Angeles, California 90013

Excavation Area	Sample	Date Collected	Location	Depth (feet bgs)	Lead (mg/kg)
					US EPA Method 6010B
EA-1	EA-1-B-01-2	11/12/2015	Excavation Floor	2	4.69
	EA-1-B-01-2D	11/12/2015		2	6.15

	EA-4-E-22-3	11/12/2015		3	37.5
	EA-4-W-23-1	11/12/2015	West Sidewall	1	7.60
EA-4-W-23-3	11/12/2015	3		1.38	
TTLC (mg/kg)					1,000
STLC (mg/L)					5
TCLP Value (mg/L)					5
RSL - Residential (mg/kg)					80*
RSL - Industrial (mg/kg)					320*
				10 x STLC	50
				20 x TCLP	100

Notes:

mg/kg = Milligrams per kilogram

bgs = Below ground surface

US EPA = United States Environmental Protection Agency

6010B = US EPA analytical method number

TTLC = California Code of Regulations Title 22 Total Threshold Limit Concentration

STLC = California Code of Regulations Title 22 Soluble Threshold Limit Concentration

mg/L = Milligrams per liter

TCLP = Toxicity Characteristic Leaching Procedure

RSL = US EPA November 2015 Regional Screening Level (in mg/kg); note that RSLs with an asterisk (*) are instead alternate soil screening levels provided in the California Office of Human and Ecological Risk's Human Health Risk Assessment Note No. 3, dated January 2016

Bolded result indicates concentration above residential RSL

Table 3
Summary of Soil Analytical Results for Parking Garage Test Pits – TPH and VOCs
 Mateo Palmetto
 555 Mateo Street
 Los Angeles, California 90013

Test Pit	Sample	Date Collected	Depth (feet bgs)	TPH-g C4-C12 (mg/kg)	TPH-d C13-C22 (mg/kg)	TPH-o C23-C32 (mg/kg)	TPH C33-C36 (mg/kg)	VOCs (mg/kg)

RSL - Residential (mg/kg)				82	96	2,500		Vary or NV
RSL - Industrial (mg/kg)				420	440	33,000		Vary or NV
LARWQCB MSSSL (mg/kg)				500	1,000	10,000		Vary or NV

Notes:

TPH = Total petroleum hydrocarbons

TPH-d = Diesel-range TPH

TPH-g = Gasoline-range TPH

TPH-o = Motor oil-range TPH

C#-C# = TPH carbon range

VOCs = Volatile organic compounds

mg/kg = Milligrams per kilogram

bgs = Below ground surface

US EPA = United States Environmental Protection Agency

8015B / 8260B = US EPA analytical method number

ND = Not detected at or above the practical quantitation limit, which is shown in parentheses

RSL = US EPA November 2015 Regional Screening Level, in mg/kg; note that the RSL values used for TPH-g, TPH-d, and TPH-o are the lower of the Aliphatic or Aromatic values for TPH Low, Medium, and High, respectively

NV = No published value

LARWQCB MSSSL = Los Angeles Regional Water Quality Control Board, Maximum Soil Screening Level (2004, revised 2006); MSSSL used is for depth to groundwater beneath sample ranging from 20 feet to 150 feet bgs

VOCs were not detected in the samples, so the range of practical quantitation limits for the various VOCs is indicated

Result in bold font indicates detected concentration is above Residential RSL**S-3 @ 5'** Highlighted cell indicates subject sample was removed by subsequent overexcavation

Notes:

mg/kg = Milligrams per kilogram

bgs = Below ground surface

US EPA = United States Environmental Protection Agency

6010B / 7471A = US EPA analytical method number

ND = Not detected at or above the practical quantitation limit, which is shown in parentheses

TTLC = California Code of Regulations Title 22 Total Threshold Limit Concentration

STLC = California Code of Regulations Title 22 Soluble Threshold Limit Concentration

mg/L = Milligrams per liter

TCLP = Toxicity Characteristic Leaching Procedure

NV = No published value

RSL = US EPA November 2015 Regional Screening Level (in mg/kg); note that RSLs with an asterisk (*) are instead alternate soil screening levels that are provided in the California Office of Human and Ecological Risk's Human Health Risk Assessment Note No. 3, dated January 2016

Result in bold font indicates detected concentration is above Residential RSL

S-3 @ 5' Highlighted cell indicates subject sample was removed by subsequent overexcavation

LARWQCB MSSL (mg/kg)						500	1,000	10,000	Vary or NV

Notes:

- TPH = Total petroleum hydrocarbons
- TPH-d = Diesel-range TPH
- TPH-g = Gasoline-range TPH
- TPH-o = Motor oil-range TPH
- C#-C# = TPH carbon range
- VOCs = Volatile organic compounds
- mg/kg = Milligrams per kilogram
- bgs = Below ground surface
- US EPA = United States Environmental Protection Agency
- 8015B / 8260B = US EPA analytical method number
- ND = Not detected at or above the practical quantitation limit, which is shown in parentheses
- NA = Sample not analyzed for this analyte
- NV = No published value
- * = Laboratory reported that the chromatograph of the sample contains peaks in the gasoline or diesel range (as indicated), but the peaks do not match the peaks on the chromatograph of the gasoline or diesel standard
- RSL = US EPA November 2015 Regional Screening Level, in mg/kg; note that the RSL values used for TPH-g, TPH-d, and TPH-o are the lower of the Aliphatic or Aromatic values for TPH Low, Medium, and High, respectively
- LARWQCB MSSL = Los Angeles Regional Water Quality Control Board, Maximum Soil Screening Level (2004, revised 2006); MSSL used is for depth to groundwater beneath sample ranging from 20 feet to 150 feet bgs
- VOCs were not detected in either analyzed sample, so the range of practical quantitation limits for the various VOCs is indicated
- Result in bold font** indicates detected concentration is above Residential RSL

EA-5-N1-28-10 Highlighted cell indicates subject sample was removed by subsequent overexcavation

Notes:

PAHs = Polynuclear aromatic hydrocarbons

mg/kg = Milligrams per kilogram

bgs = Below ground surface

US EPA = United States Environmental Protection Agency

8310 = US EPA analytical method number

ND = Not detected at or above the reporting limit, which is shown in parentheses

RSL = US EPA November 2015 Regional Screening Level, in mg/kg (note that the PAHs do not have alternate soil screening levels provided in the California Office of Human and Ecological Risk's Human Health Risk Assessment Note No. 3 dated January 2016)

NV = No published value

Result in bold font indicates detected concentration is above Residential RSL

Project: **AT Mateo - Raw**
Project No.: **20154388**
Lab I.D.: **151113-1 through -29**

Dear Mr. Johnson:

The **analytical results** for the soil samples, received by our lab on November 13, 2015, are attached. The samples were received chilled, intact and accompanying chain of custody.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

Sincerely,

Curtis Desilets
Vice President/Program Manager

Andy Wang
Laboratory Manager

Lab I.D.: **151113-1 through -29**

Dear Mr. Johnson:

The **analytical results** for the soil samples, received by our lab on November 13, 2015, are attached. The samples were received chilled, intact and accompanying chain of custody.

Enviro-Chem appreciates the opportunity to provide you and your company this and other services. Please do not hesitate to call us if you have any questions.

Sincerely,

Curtis Desilets
Vice President/Program Manager

Andy Wang

EA-4-B-16-4	151113-20	ND	86.4 *	818	10
METHOD BLANK		ND	ND	ND	1
	PQL	5	5	25	

COMMENTS

C4-C10 = GASOLINE RANGE
 C11-C22 = DIESEL RANGE
 C23-C35 = MOTOR OIL RANGE
 DF = DILUTION FACTOR
 PQL = PRACTICAL QUANTITATION LIMIT
 ACTUAL DETECTION LIMIT = DF X PQL
 ND = NON-DETECTED OR BELOW THE ACTUAL DETECTION LIMIT
 * = PEAKS IN DIESEL RANGE BUT CHROMATOGRAM DOES NOT MATCH THAT OF DIESEL STANDARD

Data Reviewed and Approved by:

LABORATORY REPORT

CUSTOMER: **Kleinfelder**
 3880 Lemon Street, Suite 300, Riverside, CA 92501
 Tel (951) 801-3681 Fax (951) 682-0192

PROJECT: **AT Mateo - RAW**
 PROJECT No.: **20154388**
 MATRIX: SOIL
 DATE SAMPLED: 11/12/15
 REPORT TO: Mr. GEORGE JOHNSON

DATE RECEIVED: 11/13/15
 DATE EXTRACTED: 11/13/15
 DATE ANALYZED: 11/13/15
 DATE REPORTED: 11/16/15

TOTAL PETROLEUM HYDROCARBONS (TPH) - CARBON CHAIN ANALYSIS
 METHOD: EPA 8015B; PAGE 2 OF 2
 UNIT: mg/Kg = MILLIGRAM PER KILOGRAM = PPM
