NOTE TO READER

On November 17, 1993 the Los Angeles County Metropolitan Transportation Authority certified as final this EIR and adopted the 1993 Los Angeles County Congestion Management Program. The Final EIR incorporates as Chapter VIII the Response To Comments on the DEIR and includes, as part of the Appendices, letters received on the Response To Comments, the November 17, 1993 staff report to the LACMTA Board, the adopted Statements and Facts in Support of Overriding Considerations, and the adopted Mitigation Monitoring Program.

The Final EIR also incorporates revisions made as a result of the Response to Comments on the Draft EIR. These revisions are indicated by redlining and strikeouts.

SUMMARY

PROJECT DESCRIPTION

The following Environmental Impact Report (EIR) analyzes the potential of the 1993 Congestion Management Program (CMP) Update for Los Angeles County to create significant environmental impacts.¹ The 1993 CMP Update is the first update of the CMP for Los Angeles County.² A key component of the 1993 Update is the addition of a deficiency plan approach. Deficiency plan requirements were not specifically addressed in the 1992 CMP, pending the completion of planning and feasibility studies regarding the development of a countywide approach to deficiency planning. Since the deficiency plan component represents a substantial addition to the program, and because of the concerns of local jurisdictions, expressed during the development of the 1992 CMP, over the potential impacts of deficiency planning, this subsequent EIR has been prepared to assess the potential of the 1993 Update to create significant environmental impacts. The Los Angeles County Metropolitan Transportation Authority (MTA) is the Lead Agency for the EIR. The MTA Board will use this EIR in its review prior to adopting the 1993 CMP Update..

The 1993 CMP Update includes the following proposed modifications to the 1992 CMP, and informational updates:³

1993 Highway and Transit Monitoring Data - The 1992 CMP produced the first consistent, multi-jurisdictional analysis of traffic congestion throughout the County. The 1993 CMP provides comparable data and identifies changes in congestion levels over the past year. Transit frequency and routing data are also being compiled through information provided by transit operators as part of the Short Range Transit Plan (SRTP).

Additions to the CMP Highway and Roadway System - The 1992 CMP established a mechanism for adding routes through the biennial CMP update. In January 1993, local jurisdictions were asked to nominate routes that they would like considered for addition to the CMP system. The CMP Policy Advisory

¹Appendix A contains a listing of all acronyms contained in this EIR and their meaning.

²Statute requires preparation of biennial updates to the CMP.

³The 1993 CMP is herein incorporated by reference. Portions of the 1993 CMP are summarized in relevant sections of this EIR. The full text of the 1993 CMP is available for review at the offices of the MTA located at: 818 West Seventh Street, Los Angeles, California 90017.

Committee (PAC) discussed nominated routes in great detail in March and April 1992. As a result of this discussion, the PAC recommended that La Cienega Boulevard between the Santa Monica Freeway (I-10) and the San Diego Freeway (I-405) be added to the system.

Refinement of the Land Use Analysis Program - The 1992 CMP established guidelines for analyzing the impacts of new development on the regional transportation system, through existing CEQA requirements. These guidelines included technical procedures for analyzing the impacts of individual development projects at CMP intersections and freeway segments.

Through implementation, CMP staff has found that a brief supplement to these guidelines would allow for the analysis of longer range and more generalized development programs such as local general plans and community plans. By allowing the analysis of these plans to focus on CMP street segment analysis rather than intersections, comparable evaluation of regional impacts and mitigation measures can be provided. This supplement is intended: to improve the effectiveness of the land use analysis program at capturing cumulative development impacts, while permitting more generalized technical evaluation in keeping with the programmatic nature of general plans; and to minimize administrative costs.

Update of the Capital Improvement Program - State programming statutes require that projects competing for State Flexible Congestion Relief (FCR) funds be included in the CMP, and that projects competing for Traffic System Management (TSM) funds be consistent with the CMP. 1992 CMP monitoring data and analysis have been integrated into the MTA's Multi-Year Call for Projects, and were used in evaluating the regional significance of project applications. Those projects that were recommended for State funding are incorporated into the 1993 CMP Capital Improvement Program.

Deficiency Plan Procedures - Statute requires preparation of deficiency plans when highway conditions worsen below LOS standards. The purpose of the deficiency plan is to implement strategies that either fully mitigate congestion or provide measurable improvement to congestion and air quality. The contents of a deficiency plan are specified in statute, as are guidelines for the determination of deficiencies and the agencies that must be consulted.

In March 1992, a workshop was held to discuss CMP deficiency plan requirements. In response to previous Commission direction, staff reported on various CMP deficiency plan alternatives. Based on extensive testimony, Commission directed staff to develop a coordinated, countywide approach to meet

deficiency plan responsibilities. As described more fully in Chapter II of this EIR, the deficiency plan approach includes: a program for assigning deficiency points to jurisdictions based on local land use decisions and their contribution of trips to the CMP network; a Tool Box of mitigation strategies, and associated mitigation point values, which local jurisdictions can use to mitigate the impacts of local land use decisions on the CMP network; and the specification of deficiency plan reporting procedures. The proposed deficiency plan Tool Box includes land use strategies, capital improvements, transportation systems management, and demand management methods of mitigation.

ENVIRONMENTAL ANALYSIS

The major environmental impacts and suggested mitigation measures are summarized in **Table S-1**. Appendix A contains a list of acronyms used in the summary and throughout this document.

ALTERNATIVES TO THE PROJECT

This EIR looks at alternatives to the proposed 1993 CMP Update. Specifically this analysis focuses on alternatives to the proposed deficiency plan strategy. The five alternatives analyzed are as follows:

- Alternative 1 - The No-Project Alternative (No Deficiency Plan Addition)
- Alternative 2 - The No-Countywide Deficiency Plan Alternative
- Alternative 3 - The Countywide Fee Alternative
- Alternative 4 - The Monitoring-Based Approach Alternative
- Alternative 5 - The Modified Tool Box - Hot Spot Reducing Approach Alternative

Alternative 1 is the California Environmental Quality Act (CEQA) mandated No-Project Alternative.⁴ Alternatives 2, 3, and 4 are alternatives which were seriously considered by the Los Angeles County Metropolitan Transportation Authority (MTA), but rejected because they did not meet the MTA's goals and objectives in adopting a deficiency plan component of the CMP. Alternative 5 has been developed with the intent of reducing one of the few significant impacts identified for the 1993 CMP Update, hot spot air quality impacts.

⁴See CEQA Guidelines, Section 15126, subd. (d)(2).

TABLE S-1 SUMMARY OF IMPACTS AND MITIGATION MEASURES

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
TRANSPORTATION		
The 1993 CMP Update is designed to be consistent with the Regional Mobility Plan (RMP)	None Required	Significant Beneficial Impact
The proposed program would result in between 202 million and 205 million vehicle miles of travel (VMT), 7.1 million and 7.3 million vehicle hours of travel (VHT) and 2.45 million and 2.46 million hours of delay on the regional transportation system compared to 202 million VMT, 7.3 million VHT and 2.52 million hours of delay under year 2010 baseline conditions. Actual program effects are anticipated to be in the middle portion of the range indicated due to selection of a mix of demand reducing and capacity increasing strategies on a countywide basis.	None Required	Significant Beneficial Impact
AIR QUALITY		
There may be localized adverse affects including the affects of facility construction, realignment of facilities near sensitive and uses, and the creation of "hot spots" near transit centers/stations and/or park and ride lots. These are highly localized adverse impacts of otherwise beneficial improvements.	3.3.1 - The MTA will develop its Tool Box in consultation with SCAG and the SCAQMD to ensure air quality goals are addressed.	Significant Localized Adverse Impact

TABLE S-1 SUMMARY OF IMPACTS AND MITIGATION MEASURES

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
<p>Air quality emissions (in tons per day) would be between 584 and 597 for Carbon Monoxide (CO), 38 for Reactive Organic Gas (ROG), 86 and 88 for Nitrogen Dioxide (NOX), 36 for particulates (PM10), and 20 for Sulfur Dioxide (SOX), compared to 590 tons per day of CO, 38 of ROG, 87 of NOX, 36 of PM10, and 20 of SOX under year 2010 baseline conditions. Actual program effects are anticipated to be in the middle portion of the range indicated due to selection of a mix of demand reducing and capacity increasing strategies on a countywide basis.</p>	None Required	Significant Beneficial Impact
ENERGY		
<p>Fuel consumption (in millions of gallons) would be between 7.6 million and 7.8 million gallons compared to 7.7 million gallons without the proposed program. Actual program effects are anticipated to be in the middle portion of the range indicated due to selection of a mix of demand reducing and capacity increasing strategies on a countywide basis.</p>	None Required	Beneficial Impact
<p>In addition the proposed program would result in a shift toward high occupancy modes.</p>	None Required	Beneficial Impact

TABLE S-1 SUMMARY OF IMPACTS AND MITIGATION MEASURES

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
The project may result in an increase in fuel consumption in and around transit stations or park and ride lots due to increased localized traffic delays and reduced speeds at these centers.	None Required	Not Significant
Construction of capital projects would result in a short-term consumption of energy.	None Required	Not Significant
LAND USE		
The proposed program will not systematically result in a land use pattern which is substantially different than the adopted regional forecast or which is systematically different than market patterns.	3.5.1 -In order to ensure that the CMP is contributing to achieving the objectives of the GMP, the MTA shall evaluate the growth patterns and determine whether CMP Tool Box choices have a significant correlation to the changes in land use patterns in the County, if any, after the Deficiency Plan Program has been in place for 5 years.	Not Significant
The proposed program may result in a localized redistribution of development in the form of greater densification of transit corridors and/or station areas.	None Required	Beneficial Impact
PUBLIC SERVICES		
The proposed program will help to maintain or improve emergency vehicle response times.	None Required	Beneficial Impact

TABLE S-1 SUMMARY OF IMPACTS AND MITIGATION MEASURES

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
<p>Although the proposed program will impose additional administrative requirements on local jurisdictions, these administrative "costs" are more than offset by the return in administrative time invested, that the jurisdiction will receive in the form of revenue eligibility and service production efficiencies.</p>	<p>None Required</p>	<p>Not Significant</p>
<p>There appear to be sufficient funding mechanisms and mitigation options available for local jurisdictions to meet their deficiency mitigation obligations while avoiding the use of general funds, or diversion of funds from the provision of other public services.</p>	<p>3.6.1 -The MTA shall continue to work on both a state and regional level to integrate CMP deficiency plan reporting requirements with the reporting requirements associated with the AQMP in order to reduce the administrative effort required by local jurisdictions.</p> <p>3.6.2 - The MTA shall allow local jurisdictions to carry-over from year to year any surplus credit points accumulated.</p> <p>3.6.3 - The MTA, as part of the biennial updates to the CMP, shall investigate adding additional measures to the Tool Box.</p>	<p>Not Significant</p>

1 The No-Project Alternative (No Deficiency Plan Addition)

Under this alternative, no deficiency plan component would be added to the CMP and the MTA would not review and approve any deficiency plans generated by local jurisdictions. The existing adopted CMP would remain in place. The lack of a deficiency plan mechanism would result in local jurisdictions losing their Section 2105 monies, losing their ability to compete for state funding through the State Transportation Improvement Program (STIP), and the loss of federal funds linked to compliance with the CMP. The net result would be no change in the existing transportation system. None of the programmed improvements would be built. This alternative would have the same impacts as the No-Project (Existing System) Alternative discussed in the 1992 CMP EIR.

This alternative would not comply with the requirements of the CMP statute since there would be no deficiency plan component incorporated in the CMP by the time deficiencies are identified on the CMP network. This alternative would fail to fulfill the aims of the CMP legislation and would be inconsistent with the RMP. It is, therefore, not considered feasible.

2 The No-Countywide Deficiency Plan Alternative

Under this alternative no uniform Countywide approach to deficiency planning would be adopted. Instead, the CMP Update would specify the general content of deficiency plans, and local jurisdictions would be left to develop their plans individually. Local jurisdictions would also be responsible for determining the degree to which mitigations result in an improvement in deficiency conditions. Plans would then be submitted to the MTA for review and approval.

Under this alternative, local jurisdictions would be held responsible for mitigating any deficiencies identified on portions of the network within their jurisdiction, regardless of the degree to which they contributed to the creation of the deficiency, since no method for sharing responsibility for deficiency creation would be in place. Jurisdictions on portions of the network serving as key connectors between portions of the County would be unfairly burdened with the responsibility for mitigating deficiencies on these segments. Imposition of additional TDM requirements within the impacted jurisdiction may have little impact on curing a deficiency, since the deficiency may be largely the result of trips originating and terminating in other jurisdictions. This would mean that deficiency mitigation would primarily take the form of capacity enhancements, which have less environmental

benefit than trip reduction approaches, as a general rule.⁵ Local jurisdictions on heavily traveled portions of the network would thus have the burden of major capital improvements. Jurisdictions faced with mitigation costs which exceeded the funds available to the jurisdiction from public or private sources could potentially choose to not participate in the CMP and thus lose their Section 2105 funding, their ability to compete for state funding through the STIP, and all federal funds that are linked to compliance with the CMP.

This alternative does not meet the MTA's deficiency plan goals and objectives regarding provision of a Countywide approach, minimization of administrative costs, consistency among jurisdictions, sensitivity to the economy or jobs, or promotion of inter-jurisdictional mitigation. It is unclear the degree to which the alternative meets the MTA's remaining goals of effectiveness and flexibility of actions or transit enhancing land use. Therefore, this alternative was rejected by the MTA.

3 The Countywide Fee Alternative

The Countywide Fee Alternative received extensive investigation, prior to rejection by the MTA Board, as part of the development of the adopted CMP. Under this alternative, a Countywide traffic impact fee would be imposed on new development. It would be established based on a nexus study which would establish the casual connection between the creation of deficiencies on the network and development activity. The fee would be used to fund capacity enhancements on the regional network.

This alternative was rejected by the MTA because it met fewer of the MTA's deficiency plan goals and objectives than the proposed program. Specifically, it did not provide the deficiency mitigation and funding flexibility of the proposed program, the sensitivity to the economy or jobs, or the transit-enhancing land use effects. It does meet the MTA's goals regarding a Countywide approach, minimization of administrative costs, consistency among jurisdictions, and the promotion of inter-jurisdictional mitigation.

4 The Monitoring Based Approach Alternative

Under this alternative, the MTA would not provide a mitigation Tool Box. Instead, each local jurisdiction would select their own mitigation measures, monitor their

⁵Please see the discussion of the capacity enhancement and trip reduction scenarios used to bracket the range of impacts of the proposed program. This discussion is contained in Sections 3.2, 3.3, and 3.4 of this EIR.

effectiveness, and get credit based on the demonstrated effectiveness of their mitigation measures.

Local jurisdictions would still be responsible for calculating and mitigating the effects of development within their boundaries. The impacts of new development activity would still be calculated according to formulas prepared by the MTA staff and used countywide. However, rather than using the standardized list of options for mitigation credits, where the benefits have been prequantified by the MTA staff, each local jurisdiction would implement its own measures and, through monitoring, determine their effectiveness in reducing the impacts of new development. The monitoring results would be submitted to the MTA for their evaluation. This alternative would add a strong element of uncertainty to the process of compliance with the CMP.

This alternative was rejected by the MTA because of the administrative cost to local jurisdictions and the MTA, and because it did not meet the MTA's goals and objectives regarding transit enhancing land use, effectiveness and flexibility of actions, sensitivity to the economy and jobs, and consistency and fairness among communities and developments.

5 The Modified Tool Box - Hot Spot Reducing Approach Alternative

Under this alternative, those Tool Box measures which are likely to result in air quality hot spots would be eliminated from the Tool Box. Strategies targeted for removal would include: land use strategies which result in an intensification of land use; rideshare support facilities such as passenger loading areas for carpools; capital improvements such as park and ride lots, transit and goods movement facilities, High Occupancy Vehicle (HOV) lanes and general use highway lanes; and some transportation systems management improvements, such as, potentially some intersection modifications.

This alternative would provide less flexibility of action than under the proposed program. It may be difficult to achieve the MTA's goals and objectives regarding the promotion of transit enhancing land uses, and this alternative may not be fully found inconsistent with the RMP. Given the number of strategies which could product hot spots, this alternative is unlikely to meet the CMP statute's requirement to measurably improve congestion and air quality.

6 The Environmentally Superior Alternative

Alternative 5, the Hot Spot Reducing Approach will have less air quality hot spot creating impacts than the proposed program. However, regional air quality

impacts may be greater if the Alternative is found inconsistent with the RMP. By providing for fewer Tool Box measures, the alternative will make it more difficult for local jurisdictions to meet their deficiency mitigation obligations. This may result in greater public service impacts than the proposed program. This alternative is, therefore, not clearly environmentally superior to the proposed program. It would be clearly inferior to the proposed program if found inconsistent with the RMP.

In addition, this alternative would be less able to meet the MTA's deficiency plan approach goals and objectives. It would provide less flexibility of action than under the proposed program and it may be difficult to achieve the MTA's goals and objectives regarding the promotion of transit enhancing land uses.

The other alternatives are clearly inferior to the proposed 1993 CMP Update deficiency plan approach. Alternative 1, the No-Project Alternative, would have negative transportation, air quality, energy, land use, and public service impacts. Alternative 2, the No-Countywide Deficiency Plan Approach Alternative, would have less air quality and energy benefits than the proposed program and it could have negative transportation, land use, and public service impacts. Alternative 3, the Countywide Fee Alternative, would have less transportation, air quality, and energy benefits than the proposed program, and could have land use impacts. Public service effects may be less than under the proposed program, however, Alternative 4, the Monitoring Based Approach Alternative, would have less transportation, air quality, and energy benefits than the proposed program. It would encourage less densification around transit stations and it would result in significant public service impacts.

Therefore, the proposed project is environmentally superior to the project alternatives.

I. INTRODUCTION

The following Environmental Impact Report (EIR) analyzes the potential of the 1993 Congestion Management Program (CMP) Update for Los Angeles County to create significant environmental impacts.¹ The 1993 CMP Update is the first update of the CMP for Los Angeles County.² A key component of the 1993 Update is the addition of a deficiency plan approach. Deficiency plan requirements were not specifically addressed in the 1992 CMP, pending the completion of planning and feasibility studies regarding the development of a countywide approach to deficiency planning. Since the deficiency plan component represents a substantial addition to the program, and because of the concerns of local jurisdictions, expressed during the development of the 1992 CMP, over the potential impacts of deficiency planning, this subsequent EIR has been prepared to assess the potential of the 1993 Update to create significant environmental impacts.

This assessment fulfills the requirements of the California Environmental Quality Act (CEQA) and is designed to inform decision-makers, responsible agencies, and the general public of the proposed action and the range of potential environmental impacts of that action. The EIR also analyzes alternatives to the CMP program changes contained in the 1993 CMP Update, and recommends a set of measures to mitigate any potentially significant adverse impacts identified in the EIR.

The Los Angeles County Metropolitan Transportation Authority (MTA), the Lead Agency for the EIR, will use this EIR in their review and consideration of the adoption of the 1993 CMP Update.³ As explained more fully in section 1.3 below, this Subsequent Program EIR is tiered from the EIR for the 1992 CMP and the EIR

¹Appendix A contains a listing of all acronyms contained in this EIR and their meaning.

²Statute requires preparation of biennial updates to the CMP.

³Assembly Bill 152, signed by Governor Pete Wilson on May 19, 1992, merged the Los Angeles County Transportation Commission (LACTC) and the Southern California Rapid Transit District (SCRTD) into the new Los Angeles County Metropolitan Transportation Authority (MTA). Effective February 1, 1993, the new MTA assumed responsibility for all programs and services previously provided by LACTC and SCRTD. Among these will be the responsibilities of the Congestion Management Agency and the implementation and administration of the CMP. Therefore, the new MTA is the Lead Agency for preparation of this EIR.

for the Regional Mobility Plan (RMP). These two EIRs are incorporated herein by reference.⁴

1.1 THE 1992 CMP

In November 1992, the MTA adopted the first CMP for Los Angeles County and certified the accompanying Final Environmental Impact Report for the program. Because the CMP was a new program, the MTA adopted a first year CMP that was designed to meet the basic legislative requirements for a CMP and to establish a countywide planning framework for addressing congestion on the regional transportation network. Government Code Section 65089 (b) requires that each CMP contain the following elements:

1. An element designating the CMP transportation system and establishing Level of Services (LOS) standards for the highways and roadways included in that system.
2. A transit standards element for service frequency, routing, and coordination among multiple transit agencies operating within the CMP's jurisdiction.
3. A transportation demand and trip reduction element that includes alternatives to single-occupant auto use and promotes strategies to manage overall travel demand.
4. A land use program to analyze the impacts of land use decisions by local jurisdictions on the regional transportation system.
5. A 7-year Capital Improvement Program (CIP) to maintain or improve the traffic and transit standards or to mitigate the impact of new development.

⁴*Los Angeles County Congestion Management Program Final Environmental Impact Report*, November 1992 (SCH NO. 91121062; SCAG Clearing House #LA55791-MT); *Draft Environmental Impact Report Regarding the SCAG Regional Mobility Plan*, October 1988 and the *Final Environmental Impact Report Regarding the 1988 SCAG Regional Mobility Plan*, (SCH# 87-121613), December 1988. Portions of the CMP and RMP EIRs are summarized in relevant sections of this EIR. All three of these documents are available for review at the offices of the MTA, located at: 818 West Seventh Street, Los Angeles, California 90017.

The adopted 1992 CMP for Los Angeles County approached each of the elements required by CMP Statute as follows:

Highway System - The 1992 CMP designated 1,000 miles of freeways, state highways, and roads as the CMP system in Los Angeles County. It established procedures for measuring over time the effectiveness of the CMP in terms of LOS on the CMP system. LOS are rated from "A" (free-flow) to "F" (heaviest congestion). One of the objectives of the adopted CMP is to maintain this system at LOS "E", or to prevent further degradation on portions already at "F".

During the spring of 1992, traffic volumes were measured to establish the base year LOS. This base year monitoring provided the first uniform countywide picture of how the transportation system in the County is operating. The adopted CMP provides for local jurisdictions and Caltrans to take these measurements annually to help track changes in travel patterns, determine the impact of growth on countywide mobility, and determine the effect of transportation improvements.

Transit Standards - The 1992 CMP designated a transit monitoring network comprised of transit routes running on, or parallel to, the CMP highway system. Under the CMP, information is gathered annually about passenger volumes, seat capacity, and travel speed in broad transit corridors to provide a picture of how transit assists in relieving congestion and where transit will be needed in the future.

Transportation Demand Management (TDM) - The 1992 CMP required local jurisdictions to adopt their own TDM ordinance by April 1, 1993, to encourage transit ridership, carpooling, vanpooling, bicycling, or otherwise reduce the number of vehicles on the road. To help cities meet this requirement, a model ordinance was developed and included in the 1992 CMP to complement existing efforts by the South Coast Air Quality Management District. The ordinance required "TDM-friendly" design standards for new non-residential construction. Local jurisdictions are also required to provide transit operators the opportunity to comment on the impacts of new development through the CEQA process.

Land Use - The 1992 CMP required local jurisdictions to adopt a land use analysis program that considers the impact of new development on the regional transportation system when making land use decisions. The adopted CMP included Transportation Impact Analysis (TIA) guidelines to provide a common measure countywide for assessing these regional impacts. The 1992 CMP only requires TIA for projects preparing an EIR. This approach was designed to coordinate CMP requirements with CEQA, with the intent of minimizing additional analysis requirements. The ultimate decision on addressing congestion concerns identified in an EIR remains the responsibility of the local jurisdiction under the

adopted CMP. Local jurisdictions were required to adopt this CMP land use analysis program by April 1, 1993.

Capital Improvement Program - In order to qualify for funds through the State Transportation Improvement Program (STIP), projects must first demonstrate a benefit to the CMP highway system. The Capital Improvement Program for the 1992 CMP identified those State funded projects that are already included in the 1992 STIP. Statute requires that these projects be included in the CMP in order to remain eligible for State funding.

1.2 THE 1993 CMP UPDATE

The 1993 CMP Update includes the following proposed modifications to the 1992 CMP, and informational updates:⁵

1993 Highway and Transit Monitoring Data - The 1992 CMP produced the first consistent, multi-jurisdictional analysis of traffic congestion throughout the County. The 1993 CMP provides comparable data and identifies changes in congestion levels over the past year. Transit frequency and routing data are also being compiled through information provided by transit operators as part of the Short Range Transit Plan (S RTP).

Additions to the CMP Highway and Roadway System - The 1992 CMP established a mechanism for adding routes through the biennial CMP update. In January 1993, local jurisdictions were asked to nominate routes that they would like considered for addition to the CMP system. The CMP Policy Advisory Committee (PAC) discussed nominated routes in great detail in March and April 1992. As a result of this discussion, the PAC recommended that La Cienega Boulevard between the Santa Monica Freeway (I-10) and the San Diego Freeway (I-405) be added to the system.

Refinement of the Land Use Analysis Program - The 1992 CMP established guidelines for analyzing the impacts of new development on the regional transportation system, through existing CEQA requirements. These guidelines included technical procedures for analyzing the impacts of individual development projects at CMP intersections and freeway segments.

⁵The 1993 CMP is herein incorporated by reference. Portions of the 1993 CMP are summarized in relevant sections of this EIR. The full text of the 1993 CMP is available for review at the offices of the MTA located at: 818 West Seventh Street, Los Angeles, California 90017.

Through implementation, CMP staff has found that a brief supplement to these guidelines would allow for the analysis of longer range and more generalized development programs such as local general plans and community plans. By allowing the analysis of these plans to focus on CMP street segment analysis rather than intersections, comparable evaluation of regional impacts and mitigation measures can be provided. This supplement is intended: to improve the effectiveness of the land use analysis program at capturing cumulative development impacts, while permitting more generalized technical evaluation in keeping with the programmatic nature of general plans; and to minimize administrative costs.

Update of the Capital Improvement Program - State programming statutes require that projects competing for State Flexible Congestion Relief (FCR) funds be included in the CMP, and that projects competing for Traffic System Management (TSM) funds be consistent with the CMP. 1992 CMP monitoring data and analysis have been integrated into the MTA's Multi-Year Call for Projects, and were used in evaluating the regional significance of project applications. Those projects that were recommended for State funding are incorporated into the 1993 CMP Capital Improvement Program.

Deficiency Plan Procedures - Statute requires preparation of deficiency plans when highway conditions worsen below LOS standards. The purpose of the deficiency plan is to implement strategies that either fully mitigate congestion or provide measurable improvement to congestion and air quality. The contents of a deficiency plan are specified in statute, as are guidelines for the determination of deficiencies and the agencies that must be consulted.

In March 1992, a workshop was held to discuss CMP deficiency plan requirements. In response to previous Commission direction, staff reported on various CMP deficiency plan alternatives. Based on extensive testimony, Commission directed staff to develop a coordinated, countywide approach to meet deficiency plan responsibilities. As described more fully in Chapter II of this EIR, the deficiency plan approach includes: a program for assigning deficiency points to jurisdictions based on local land use decisions and their contribution of trips to the CMP network; a Tool Box of mitigation strategies, and associated mitigation point values, which local jurisdictions can use to mitigate the impacts of local land use decisions on the CMP network; and the specification of deficiency plan reporting procedures. The proposed deficiency plan Tool Box includes land use strategies, capital improvements, transportation systems management, and demand management methods of mitigation.

1.3 ENVIRONMENTAL REVIEW OF THE CMP

The EIR for the 1993 CMP Update is a subsequent tiered program EIR. Each of these concepts, and the relationship of this EIR to past and future environmental review of the CMP, is explained below.

Program EIR

The EIR for the CMP is a "program EIR," which under CEQA guidelines may be prepared for projects characterized as a series of actions that are parts in the chain of contemplated actions, in connection with the issuance of rules, regulations, plans or other general criteria to govern the conduct of a continuing program.⁶ Under CEQA an EIR on a project, such as the adoption of a plan, should focus on the secondary effects that can be expected to follow from its adoption, but need not be as detailed as an EIR on the specific construction projects that might follow.⁷ This program EIR, therefore, identifies general countywide effects of the proposed 1993 CMP Update and identifies general areas of environmental sensitivity which, where necessary, can be evaluated in greater detail in project-specific EIRs.

Subsequent EIR

Under CEQA, where a previous EIR or Negative Declaration has been prepared, no additional EIR need be prepared unless one of three things happens: subsequent changes are proposed in the project which require revisions or additions to the previous EIR as a result of the creation of the potential for significant new environmental effects not considered in the previous EIR; substantial changes occur with respect to the circumstances under which the project is undertaken; or, new information of substantial importance to the project becomes available which was not previously known and which affects the analysis.⁸ This subsequent EIR is being prepared to analyze the 1993 CMP Update.

⁶CEQA Guidelines (Cal. Code of Regulations, Title 14), Section 15168.

⁷CEQA Guidelines (Cal. Code of Regulations, Title 14), Section 15146.

⁸CEQA Guidelines (Cal. Code of Regulations, Title 14), Section 15162.

Tiered EIR

As explained in Section 15384 of the CEQA Guidelines, tiering is a procedure where broad EIRs (such as those for general plans or policy statements such as the RMP or CMP) are followed by the preparation of either narrower EIRs or ultimately site-specific EIRs incorporating by reference the general discussions of the prior EIRs and concentrating solely on the issues specific to the EIR subsequently prepared. Tiering is intended to increase efficiency in the CEQA process by allowing agencies to deal with broad environmental issues in EIRs at planning stages and then to provide more detailed examination of specific effects in EIRs on later development projects that are consistent with, or implement, the plans. Use of tiering to focus on only those issues identified as requiring further consideration allows an individual EIR to fit into the process of long-term comprehensive planning, and encourages consistency between regional planning choices and specific project development.

The EIR for the 1993 CMP Update is tiered from the EIR for the 1992 CMP and from the EIR for the 1989 RMP. The CMP is required by law to be consistent with the RMP prepared by Southern California Association of Governments (SCAG). These prior EIRs provide the context for CMP development.

The EIR prepared for the SCAG 1989 RMP and the EIR prepared for the 1992 CMP, shall be considered the "first tier" and "second tier," respectively, of the CEQA process for the 1993 CMP Update. The 1993 CMP EIR constitutes the third tier of CMP environmental review and is, therefore, limited to examining impacts and mitigation measures which were not evaluated in the 1992 CMP EIR or the 1989 RMP EIR. Environmental review of individual improvement projects included in, or made necessary by, the CMP will constitute the fourth tier of CMP environmental review. Mitigations were included in the 1992 CMP EIR to ensure that adequate environmental review of individual improvement projects occurs. The Mitigation Monitoring Program for the 1992 CMP is included in Appendix B of this EIR.

The 1989 RMP EIR and the 1992 CMP EIR

The RMP serves as the Regional Transportation Plan required under State and Federal statute. The RMP identifies the short and long range transportation needs of the region, and identifies policies, actions, and funding sources to meet these needs. In developing its RMP, SCAG must assess the impact that transportation improvements have on attaining air quality goals, and must find that the RMP is in conformance with the Air Quality Management Plan (AQMP). The goal of the RMP is to maintain 1984 mobility levels.

The RMP EIR looked at the potential impacts of the RMP on: mobility and access; air quality; energy and conservation; geology and seismicity; biological resources; water resources; visual resources; noise; cultural resources; social; urban form and growth; and the regional economy. It evaluated five alternatives to the adopted RMP: the No-Project Alternative; two facilities-intensive alternatives; and two demand management intensive alternatives.

The 1992 CMP EIR, which was tiered from the EIR for the RMP, looked at the following potential impacts of the CMP: land use and planning, transportation, air quality, noise, geology, water resources, biological resources, cultural resources, and public services. It examined the following alternatives to the CMP: the No-Project (Existing Transportation System) Alternative; the No-Project (No CMP, No Future State Funding) Alternative; and two alternatives designed to be consistent with the balance between TDM and capital intensive approaches to maintaining mobility selected in the RMP. These two alternatives were a capital intensive Alternative which accelerated much of the capital component of the RMP into the 7 years of the CMP's CIP, and a TDM Intensive Alternative, which emphasized implementation of additional TDM measures, while delaying capital improvements until late in the RMP's implementation. The adopted CMP represents a balance between implementation of the capital intensive and TDM strategies contained in the adopted RMP. The proposed deficiency plan Tool Box has been designed to strike the same balance between capital intensive and TDM approaches to maintaining mobility.

Environmental Review of the 1993 CMP Update

On May 21, 1993, a Notice of Preparation (NOP) and Initial Study for the 1993 CMP Update were issued by the MTA. A copy of the NOP, the Initial Study, and comment letters received in response to the NOP are contained in Appendix C. In addition, a scoping session for this EIR was held on June 22, 1993, at the MTA offices to obtain comments on the Initial Study and the proposed contents of this EIR.

The Initial Study examines the potential of the changes in the CMP contained in the 1993 Update to create significant environmental impacts. As explained in the Initial Study, according to Section 21094 of CEQA, where a prior EIR has been prepared and certified for a program, plan, policy, or ordinance, the Lead Agency for a later project shall examine significant effects of the later project upon the environment by using a tiered environmental impact report, except that the report on the later project need not examine those effects which the lead agency determines were either: (1) mitigated or avoided pursuant to subdivision (a) of Section 21081 of CEQA as a result of the prior environmental impact report; or (2) examined at a

sufficient level of detail in the prior environmental impact report to enable those effects to be mitigated or avoided by site specific revisions, the imposition of conditions, or by other means in connection with the approval of the later project.

The Initial Study for the 1993 CMP Update, therefore, analyzed whether the 1993 CMP Update has the potential to create significant effects on the environment, which were not examined in the EIR for the 1992 CMP or in the EIR for the RMP, from which the EIR for the 1992 CMP was tiered. It was the conclusion of the Initial Study that: (1) the 1993 deficiency plan addition to the CMP does have the potential to create significant effects on the environment, not previously analyzed; and (2) that the other proposed changes in the program either do not pose the potential for significant effects on the environment, or have the potential to create effects, but that mitigations included in the 1992 CMP EIR are sufficient to address these potential effects.

Based on the Initial Study for the 1993 CMP Update, this EIR evaluates the 1993 CMP's potential to create significant environmental effects on:

- Transportation
- Air Quality
- Energy
- Land Use
- Public Services

Since the deficiency plan component is the addition to the CMP contained in the 1993 Update with the potential to create significant impacts, and since the 1992 CMP EIR evaluated alternatives to the CMP as a whole, this EIR examines the potential impacts associated with the following alternatives to the proposed deficiency plan approach:

- The No-Project Alternative (No-Deficiency Plan Addition)
- The No-Countywide Deficiency Plan Alternative
- A Countywide Fee Alternative
- A Monitoring Based Mitigation Approach Alternative
- A Modified Tool Box - Hot Spot Reducing Approach Alternative

II. PROJECT DESCRIPTION

The proposed project consists of the adoption and implementation of the 1993 Congestion Management Program (CMP) Update for the County of Los Angeles. The 1993 CMP will be administered by the Los Angeles County Metropolitan Transportation Authority (MTA), which is the designated Congestion Management Agency (CMA) for Los Angeles County. The MTA is the lead agency for the preparation of this Subsequent Tiered Program Level Environmental Impact Report (EIR). However, local jurisdictions, transit operators, the South Coast Air Quality Management District (SCAQMD), the Southern California Association of Governments (SCAG), and Caltrans all have roles and responsibilities regarding implementation of the program and the 1993 Update.

2.1 PROJECT LOCATION

The planning area for the CMP includes all of Los Angeles County which is 4,083 square miles in size. The County is located in Southern California and is bordered by Ventura County to the west; Kern County to the north; San Bernardino and Orange Counties to the east; and the Pacific Ocean to the south (see **Figure 2.1**).

The County contains 88 incorporated cities. These cities contain 8,196,300 of the County's 9,158,400 residents and cover 1,386 square miles of the County's total area.¹ The County of Los Angeles and the 88 incorporated cities represent the 89 local jurisdictions participating in the CMP for Los Angeles County. **Table 2.1** lists the cities in the County. **Figure 2.2** shows their locations.

Los Angeles County, along with the Counties of Imperial, Orange, Riverside, San Bernardino and Ventura, make up the Southern California planning region. SCAG is the designated metropolitan planning organization for the Southern California region. SCAG has divided the County into ten sub-regional areas for forecasting purposes. SCAG groups these sub-regional areas into three categories: urban, urbanizing, and mountain and desert (see **Figure 2.3**). **Table 2.2** shows the growth projections for the sub-regional areas within the County.

¹Data is from the California Department of Finance. Population figures are for January of 1993. The figures were provided by Andy Malakates, Los Angeles County Research and Community Relations Department, telephone conversation, July 8, 1993.

SOURCE: SCAG 1989 Regional Growth Management Plan Tables VI-1, 2, and 3

As shown in **Table 2.2**, most of the County's population lives in the urban portion of the County: 7,594,100 in 1984 projected to increase to 9,350,400 by the year 2010. Although the population of the urban portion of the County is projected to increase substantially, the share of the County's population living in the urban sub-regional areas is projected to decline slightly from 96.58 percent in 1984 to 91.39 percent by the year 2010 as a result of increased growth in the urbanizing, and mountain and desert portions of the County. According to SCAG, the fastest growing sub-regional areas within the County are projected to be the Santa Clarita Valley and North Los Angeles County. Population in Santa Clarita Valley is expected to increase by 172 percent to 242,400, employment by 337 percent to 102,200, and housing by 208 percent to 89,800. North Los Angeles County is anticipated to experience a 345 percent increase in population to 529,600, a 392 percent increase in employment to 160,800, and a 383 percent increase in housing to 222,600. Even with these substantial increases, the share of the population living in the urbanizing portion of the County represented by the Santa Clarita Valley and the Santa Monica Mountains is only projected to increase from 1.87 percent to 3.41 percent of the Los Angeles County total. Similarly, the share of the population living in the mountain and desert portion of the County represented by North Los Angeles County and the Angeles National Forest is projected to increase from 1.54 percent to 5.2 percent of the population.²

2.2 CONGESTION MANAGEMENT PROGRAM REQUIREMENTS

The CMP is a program enacted by the State to address traffic congestion in California's urbanized counties.³ In establishing the CMP requirement, the State Legislature emphasized the importance of California's transportation system to maintaining the economic vitality of the State. The Legislature also noted that the existing transportation system relies on a street and highway system that is currently over-crowded. The resulting congestion results in significant hours of delay, increased pollutants released into the air, and increased costs to the motoring public.

Regulatory Framework

The CMP requirement originated in the State Legislature with the passage of Assembly Bill 471 (1989) and Assembly Bill 1791 (1990). The program requirement

²Data is from Tables VI-1,2 and 3 of SCAG's 1989 Regional Growth Management Plan and represents the adopted policy forecast, which incorporates SCAG's jobs/housing balance policy.

³See Section 65089 of the California Government Code.

became effective when Proposition 111 was enacted by the voters in June of 1990. The California voters approved Propositions 108 and 111 in June of 1990, and put into place a nine-cent-per-gallon gas tax. These taxes are expected to generate approximately \$18.5 billion in gas tax revenues to fund transportation investment statewide over a 10-year period. A portion of these funds are returned to local governments for transportation related purposes. In order to receive these funds, local jurisdictions must comply with local CMP requirements. These requirements are as established in Section 65088 through 65089.2 of the California Government Code and include monitoring of the CMP highway system, adopting and implementing Transportation Demand Management (TDM) ordinances, adopting and implementing programs to assess the impact of land use decisions on the CMP system, and preparing and adopting deficiency plans when Levels of Service (LOS) standards are not attained.

The intent of the program is to: link land use, transportation, and air quality decisions; to develop a partnership among transportation decision makers in developing multi-modal transportation solutions; and that the CMP be the first step in identifying congestion relief projects for state gas tax funding.

Each urban county in the state is required to designate a CMA to develop and biennially update a CMP. Preparation of a CMP is a condition for eligibility to receive the State gas tax subventions. Section 65089(b) requires each CMP to contain the following five elements:

1. An element designating the CMP transportation system and establishing LOS standards for the highways and roadways included in that system.
2. A transit standards element for service frequency, routing, and coordination among multiple transit agencies operating within the CMP's jurisdiction.
3. A transportation demand and trip reduction element that includes alternatives to single-occupant auto use and promotes strategies to manage overall travel demand.
4. A land use program to analyze the impacts of land use decisions by local jurisdictions on the regional transportation system.
5. A 7-year Capital Improvement Program (CIP) to maintain or improve the traffic and transit standards or to mitigate the impact of new development.

In addition to these components, the CMA must develop a uniform data base for use in a computer model of the countywide transportation system.⁴ The MTA has developed such a model for Los Angeles County. The CMA also has the responsibility to review and approve local community models used for CMP purposes and assess their consistency with the countywide transportation model.

After approving the CMP, the CMA must forward it to the regional transportation agency for review.⁵ SCAG is the regional transportation agency for Los Angeles County. SCAG must then evaluate whether the proposed CMP is consistent with the Regional Mobility Plan (RMP). SCAG must also evaluate the compatibility of Los Angeles County's CMP with the CMPs of the four other urbanized counties in the SCAG planning region. SCAG has developed criteria for determining CMP consistency and these are included in Appendix D. If SCAG finds that the CMP is inconsistent with the RMP, it may remove inconsistent projects from the Regional Transportation Improvement Program (RTIP).⁶ Consistent CMPs are incorporated into the RMP and serve as a county level building block, working towards regional mobility goals. This program is a list of highway, and transit, TDM and operational improvement projects that SCAG recommends to the State for inclusion in the State Transportation Improvement Program (STIP). The STIP contains transportation projects from throughout California. Inclusion in the STIP is essential to receive certain State and federal funding.

Goals and Objectives

The CMP legislation was created by the State Legislature in recognition of the following conditions and with the following objectives:⁷

- (a) Although California's economy is critically dependent upon transportation, its current transportation system relies primarily upon a street and highway system designed to accommodate far fewer vehicles than are currently using the system.
- (b) California's transportation system is characterized by fragmented planning, both among jurisdictions involved and among means of available transport.

⁴See Section 65089(b)(5) of the Government Code.

⁵See Section 65089.2 of the Government Code.

⁶See Section 65089.2 of the Government Code.

⁷Section 65088 of the Government Code.

- (c) The lack of an integrated system and the increase in the number of vehicles are causing traffic congestion that each day results in 400,000 hours lost in traffic, 200 tons of pollutants released into the air we breathe, and three million one hundred thousand dollars (\$3,100,000) added to costs to the motoring public.
- (d) To keep California moving, all methods and means of transport between major destinations must be coordinated to connect our vital economic and population centers.
- (e) In order to develop the California economy to its full potential, it is intended that federal, state, and local agencies join with transit districts, business, private, and environmental interests to develop and implement comprehensive strategies needed to develop appropriate responses to transportation needs.

2.3 THE 1992 ADOPTED CMP

In November 1992, the MTA adopted the first CMP for Los Angeles County and certified the accompanying Final EIR. Because the CMP was a new program, the MTA adopted a first year CMP that was designed to meet the basic legislative requirements for a CMP and to establish a countywide planning framework for addressing congestion on the regional transportation network.

Goals and Objectives

The adopted 1992 CMP was designed to meet the following goals and objectives, in addition to the goals and objectives specified by the State Legislature:

- The first year CMP focused on defining a basic, core program, consistent with statutory requirements. As this program must be biennially updated, MTA will build on this core program as implementation experience is gained.
- Local land use authority will remain the responsibility of local jurisdictions. MTA is not responsible for directing the land use decisions of local jurisdictions. Rather, the CMP process is a tool to assist local jurisdictions in making land use decisions that consider and enhance countywide mobility.
- The CMP will give local jurisdictions flexibility in meeting CMP responsibilities through existing local procedures rather than creating new CMP processes.

- MTA will work closely with local jurisdictions in implementing the CMP to ensure local conformance with CMP requirements and continued allocation of state gas tax funds.
- The CMP implementation process will be a tool for increasing coordination between: transportation providers responsible for implementing the best mix of transportation solutions; land use and transportation programs; and neighboring cities and counties.
- The CMP will be a focal point for ensuring consistency, compatibility, and integration of other MTA transportation studies.
- The CMP will serve as an important resource in the current update of the SCAG RMP. MTA will work closely with SCAG in the update of the RMP, providing input based on what MTA has learned through the CMP process. This will enable SCAG to incorporate relevant CMP information into the RMP and the regional planning process.
- Equity with respect to cost of service, quality of service, and access to service will be considered in programming decision made by MTA in the implementation of the CMP. In addition, equity considerations will be incorporated in ongoing area-specific needs assessment and service distribution studies.
- Economic development opportunities will be aggressively pursued in high-volume transit corridors. MTA will also develop programs for other areas to facilitate economic development in conjunction with transit improvements with the objective of maximizing the overall benefit of the community.
- The CMP will be developed to be sensitive of the general economy of Los Angeles County. While increased mobility and reduced congestion serve attainment of this goal, CMP policies and procedures should be developed to minimize cost and provide certainty and predictability to the public and private sector alike.

2.4 THE PROPOSED PROJECT - THE 1993 CMP UPDATE

The proposed project consists of the 1993 Update of the CMP. This is the first of the biennial updates to the CMP for Los Angeles County to be prepared. Biennial updates are required by statute. The 1993 CMP Update contains the following key changes to the program:

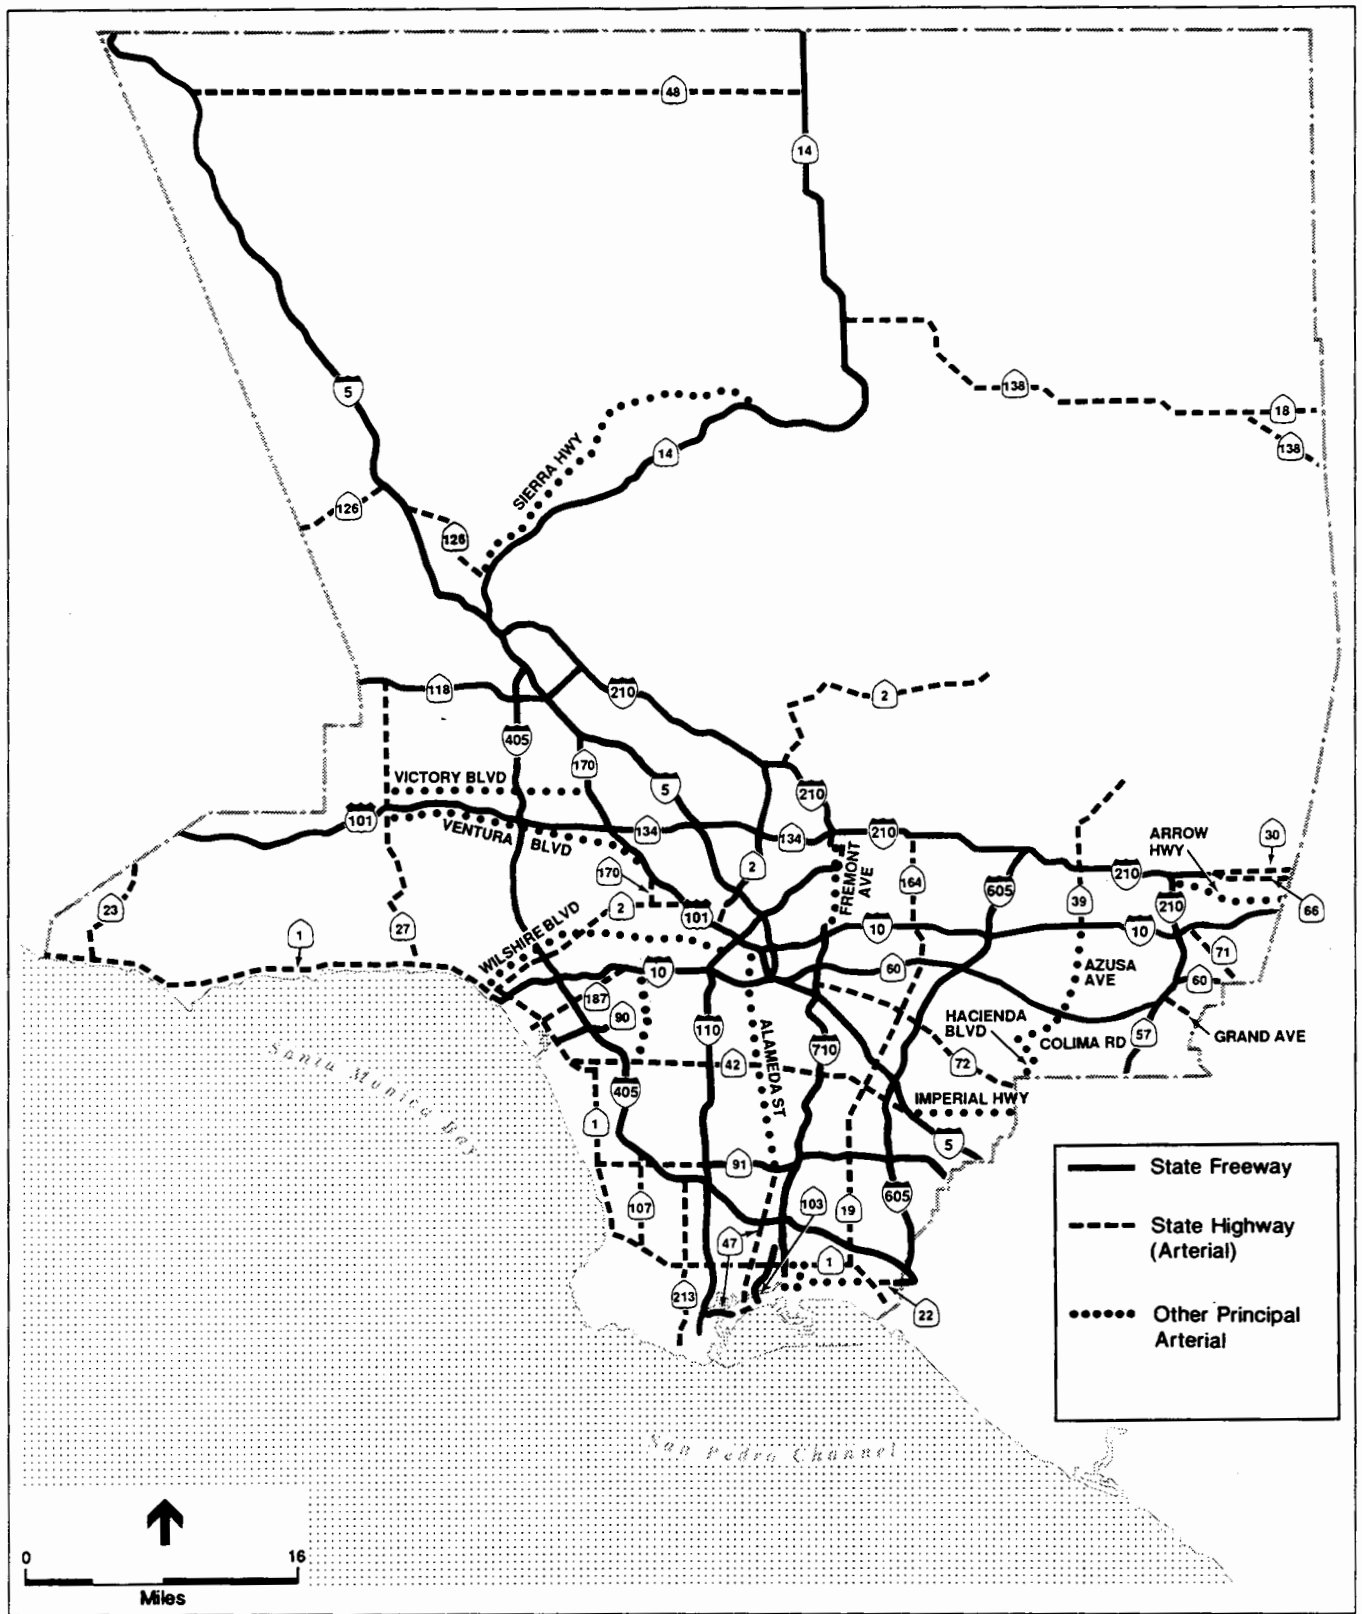

1993 Highway and Transit Monitoring Data - The 1992 CMP produced the first consistent, multi-jurisdictional analysis of traffic congestion throughout the County. The 1993 CMP Update provides comparable data, and identifies changes in congestion levels over the past year. Transit frequency and routing data are also being compiled through information provided by transit operators as part of the Short Range Transit Plan (SRTP).

Additions to the CMP Highway and Roadway System - The 1992 CMP established a mechanism for adding routes through the biennial CMP update. As part of the 1993 CMP Update, La Cienega Boulevard between the Santa Monica Freeway (I-10) and the San Diego Freeway (I-405) will be added to the system. **Figure 2.4** shows the CMP Highway and Roadway System with the addition of the La Cienega Boulevard segment.

Refinement of the Land Use Analysis Program - The 1992 CMP established guidelines for analyzing the impacts of new development on the regional transportation system through existing CEQA requirements. These guidelines included technical procedures for analyzing the impacts of individual development projects at CMP intersections and freeway segments.

Through implementation, CMP staff has found that a brief supplement to these guidelines would allow for the analysis of longer range and more generalized development programs such as local general plans and community plans. By allowing the analysis of these plans to focus on CMP street segment analysis rather than intersections, comparable evaluation of regional impacts and mitigation measures can be provided. This supplement is intended to improve the effectiveness of the land use analysis program at capturing cumulative development impacts, while permitting more generalized technical evaluation in keeping with the programmatic nature of general plans and to minimize administrative costs.

Update of the Capital Improvement Program - State programming statute requires that projects competing for State Flexible Congestion Relief (FCR) funds be included in the CMP, and that projects competing for Traffic System Management (TSM) funds be consistent with the CMP. 1992 CMP monitoring data and analysis have been integrated into the MTA's Multi-Year Call for Projects, and were used in evaluating the regional significance of project applications. Those projects that were recommended for State funding are incorporated into the 1993 CMP Capital Improvement Program.

As detailed in the Initial Study for the 1993 CMP Update contained in Appendix C, these changes either do not have the potential to create significant effects on the environment, not previously analyzed in the 1992 CMP EIR, or mitigations included in the 1992 CMP EIR and the Mitigation Monitoring Program for the 1992 CMP⁸ are sufficient to address potential impacts.

The other key change in the CMP included in the 1993 Update, and the one with the potential to create environmental impacts, is the addition of a deficiency plan component. It is the potential effects of this addition, which are the subject of this EIR.

THE PROPOSED DEFICIENCY PLAN ADDITION

The MTA's proposed deficiency plan procedures were developed through extensive consultation. Since their creation in 1991, both the CMP Policy Advisory Committee (PAC) and the CMP Technical Forum have met monthly to assist in CMP development. The 37-member Policy Advisory Committee consists of representatives reflecting a cross-section of local jurisdictions countywide, representatives of regional and state agencies (Caltrans, SCAG, Commuter Transportation Service, and the SCAQMD), transit operators, as well as representatives of the environmental and business communities.

In addition, there has been an intense effort to discuss specific aspects of the deficiency plan through numerous special working sessions, devoted to topics such as land use strategies, transportation demand management strategies, capital improvement strategies, transit issues, and new development activity reporting.

A variety of other mechanisms have also been used for public outreach and consultation. A monthly newsletter, *Up to Speed*, is mailed to approximately 2,000 people and provides a regular update of the status of CMP development, document review periods, and key meetings. A telephone hotline also provides up-to-date information on CMP issues and meetings. CMP staff have also been active in presenting the CMP in a wide range of forums and to a wide range of interests, including local jurisdictions, Chambers of Commerce, business and development groups, and environmental groups.

The proposed approach is designed to address deficiencies projected to occur on the regional network between 1990 and 2010. Projected deficiencies have come

⁸The Mitigation Monitoring Program for the 1992 CMP is contained in Appendix B.

to be referred to as the "congestion gap." The approach is the result of extensive study regarding the mitigation value of different land use, TDM, and capital improvement strategies.

Goals and Objectives

In developing its deficiency plan procedures, the MTA sought to develop a countywide approach to deficiency planning which met the following goals and objectives, as well as the State Legislature's CMP goals and objectives, and the goals and objectives outlined in the adopted CMP:

- **Countywide Deficiency Plan Approach** - Because of the complexity and interrelatedness of transportation impacts, local jurisdictions cannot bear the burden of addressing deficiencies themselves. Due to overwhelming support from both local jurisdictions and the development community for a countywide approach to meeting deficiency plan requirements, the proposed approach should be countywide in nature.
- **Effectiveness and Flexibility of Actions** - Mitigation resulting through the deficiency plan must be effective at addressing congestion on the regional system. Furthermore, the program should remain flexible to accommodate new ideas, as well as the diversity of community characteristics within Los Angeles County.
- **Minimizing Administrative Costs** - The deficiency plan should be as simple as possible, focus on mitigation implementation, and build upon existing processes rather than creating new analysis or bureaucratic requirements.
- **Sensitivity to the Economy and Jobs** - The program should be responsive to cycles in the economy.
- **Consistency and Fairness Among Communities and Developments** - The program should establish consistent requirements throughout the County, and account for the cumulative impacts of growth rather than focusing on specific types or sizes of development.
- **Promoting Inter-Jurisdictional Mitigation** - The program should encourage mitigation of impacts that cross jurisdictional boundaries.

- **Transit Enhancing Land Use** - Due to the impact of land use patterns on transportation, the program should create incentives for appropriate land use densities to make transit alternatives viable transportation options.

Regulatory Framework

California Government Code Section 65089.3(b) specifies the necessary elements of deficiency plans. Deficiency plans are required when portions of the CMP highway system deteriorate to LOS F, or worsen within LOS F. In summary a deficiency plan must include:

- (a) An analysis of the cause of the deficiency.
- (b) A list of improvements necessary for the deficient segment or intersection to maintain the minimum LOS otherwise required and the estimated costs of the improvements.
- (c) A list of improvements, programs, or actions, and estimates of costs that will (i) measurably improve the level of service of the system, and (ii) contribute to significant improvements in air quality.
- (d) An action plan, consisting of improvements identified in (b) or (c) above and including a specific implementation schedule.

Statute also provides guidelines for the determination of deficiencies, deficiency plan contents, and agencies that must be consulted during deficiency plan development. The city or county must forward its adopted deficiency plan to the CMA for approval.

Approach Development

The first step in developing the proposed countywide deficiency plan approach was to quantify the size of the problem. This was done by modeling the transportation system as it is anticipated to look in Year 2010 with the improvements programmed in the 30-year Plan, assessing the LOS on the 2010 System which would occur given projected Year 2010 population, employment, and housing patterns, and comparing the LOS to the 1990 base year LOS on the system to determine the degree to which programmed improvements will maintain base year mobility levels. The "congestion gap" is the magnitude of deficiencies projected to remain on the CMP system after implementation of transportation improvements programmed by the Year 2010. In general terms, model runs indicate that roughly 15 percent of the trips generated by growth within Los

Angeles County through 2010 will contribute to CMP deficiencies. This represents the size of the congestion gap which needs to be addressed through deficiency plans. This 15 percent of new trips is equivalent to 3 percent of all trips projected to occur in 2010.

The second step in the development of the proposed approach was to develop a program for assigning responsibility for addressing this congestion gap. After extensive evaluation of options, monitoring of new development activity was selected as providing the best indicator for attributing mitigation responsibility to local jurisdictions. The intent in selecting this approach was to allow the program to respond to economic cycles, by providing a method for mitigation goals to increase or decrease proportionate to development activity within local jurisdictions. The intent was also to ensure assignment of mitigation responsibilities to those jurisdictions that contribute to the impacts; to be proactive by allowing jurisdictions to plan for mitigation before the impact occurs; and to control for the variability of regional growth forecasts, by establishing mitigation goals based on actual growth, rather than assumed regional growth trends.

The third step in developing a countywide approach was to decide how to mitigate deficiencies. Based on review of the range of mitigation strategies being developed throughout the region, and the desire of many local jurisdictions to maintain flexibility for local characteristics, it was decided to provide a "Tool Box" approach to mitigation. Mitigation strategies included in the Tool Box fall into three broad categories: land use, transportation demand management, and capital improvements. Under the proposed approach, local jurisdictions may select the actions they deem most appropriate for their community from the Tool Box. Mitigation measures can be applied throughout the jurisdiction, in a subarea, or to a specific project. Jurisdictions can also work together on corridor or subregional strategies. Once the jurisdiction chooses its mitigation strategies, the basic requirement is that the overall value of the mitigation program must be commensurate with the jurisdiction's mitigation goal, as determined by new development activity.

Proposed Deficiency Plan Requirements

As a countywide program, all local jurisdictions within Los Angeles County must participate in the deficiency plan process regardless of the number of CMP intersections or congestion levels within their geographic limits. Deficiency plan preparation will require local jurisdictions to track new development, calculate the number of debit points resulting from that development, select a mix of Tool Box strategies with an equivalent mitigation value, and prepare and submit a Local Implementation Report for MTA review and approval.

Tracking of New Development and Calculation of Debit Points

Under the proposed program, each local jurisdiction must track new development activity as the basis for calculating its annual congestion mitigation goal. The goal links deficiencies on the CMP system to development activity, using a uniform point system based on the trip generation and trip length characteristics of various land uses. Under the proposed program, each jurisdiction will be required to:

- Track new development activity through building permits issued for residential dwelling units and square footage of other land uses.
- Report annually the total new development activity by land use category, less permits issued for CMP-exempted land uses. The land use categories are listed in **Table E-1** in Appendix E.
- Use the annual new development totals to calculate the jurisdiction's congestion mitigation goal, using worksheets provided by MTA. The proposed first year debit point formulas for each land use category are provided on **Table E-1** in Appendix E. It is anticipated that point values may be updated periodically, as information regarding the contribution of development to congestion on the network is updated as a result of network monitoring.

Selection of Tool Box Strategies

The local jurisdiction must then select a mix of mitigation measures from the CMP Tool Box of strategies. The 1993 CMP Update includes procedures for adding additional tools to the Tool Box. **Table E-2** in Appendix E lists the Tool Box measures and their associated mitigation point value. Point values are based on existing research regarding the effectiveness of the various strategies. It is anticipated that point values may be updated periodically, as additional information regarding the mitigation value of strategies becomes available. The Tool Box contains the following categories of strategies:

- **Land Use Strategies** - which focus on integrating complementary land uses (such as homes and shops), and on concentrating activity in areas that can be efficiently served by transit. Effectively locating land uses should reduce the demand for travel on the CMP system, thereby addressing regional traffic congestion.
- **TDM Strategies** - which include programs and provisions supporting facilities to promote travel by modes other than driving alone. As with land

use strategies, TDM actions address traffic congestion on the CMP system by reducing the demand for travel. In addition, TDM actions are intended to promote more efficient use of the CMP system by increasing the number of people travelling in the same number of vehicles.

- **Transportation Systems Management (TSM) Strategies** - which improve the operational efficiency of the existing highway system without significantly increasing right-of-way requirements, and at costs significantly lower than capital improvements. TSM strategies are intended to reduce regional traffic congestion by reducing delays and smoothing stop-and-go traffic flow on regionally significant highway facilities.
- **Capital Improvements** - which provide the basic infrastructure for moving people and goods. Highway improvements are intended to reduce delays on the CMP system by increasing the capacity for vehicle movement, either directly on the CMP system or by providing capacity on alternate routes. Transit and ridesharing capital improvements are similarly intended to benefit the CMP system, by providing the infrastructure for travel by modes other than driving alone.

Each jurisdiction may select the actions that it determines most appropriate, as long as the overall value of its mitigation program is commensurate with its mitigation goal determined by new development activity. The proposed program does not require a linkage of mitigation to individual development approvals. A jurisdiction may choose to implement strategies affecting existing activity rather than new development. Each jurisdiction has the flexibility to choose the measures it deems most appropriate - multi-jurisdictional, citywide, subarea, or project-specific. The jurisdiction may pick any combination of strategies; jurisdictions are not limited to selecting strategies from within a single category.

Funding for mitigation can be from any source programmed by the local jurisdiction. Projects funded through MTA discretionary sources, (State Flexible Congestion Relief (FCR), Traffic Systems Management (TSM) Proposition A and C Discretionary, and federal discretionary Intermodal Surface Transportation Act (ISTEA) funds), do not count toward meeting local jurisdiction deficiency plan obligations.

Where a jurisdiction contributes local match to a regional discretionary project, the local credit is based on the mitigation value of the project and the proportion contributed by the jurisdiction.

The Phase II TDM Option - The proposed program also provides local jurisdictions with the option of meeting the deficiency plan requirement through adoption of a Phase II TDM Program which meets the more stringent Air Quality Management Plan (AQMP) Transportation Control Measure (TCM) requirements. The AQMP and the RMP call for a 10 percent reduction of all trips by the year 2010 for air quality purposes. In contrast, the proposed CMP deficiency plan is designed to address the congestion gap, which represents a 3 percent reduction in projected year 2010 trips.

Local Jurisdiction Report Submittal

In preparing their report, local jurisdictions are encouraged to consult with Caltrans, adjacent jurisdictions, and other interested organizations or individuals, such as business and environmental groups. Reports can be prepared and submitted jointly by multiple jurisdictions. The report must incorporate evidence that it has been adopted at a public hearing by the local City Council or Board of Supervisors before submittal to MTA. The report is required to: contain a calculation of the jurisdiction's congestion mitigation goal based on new development activity; identify the locally selected mitigation strategies chosen from the Tool Box of mitigation strategies and the credits for those strategies; include a description and status of funds that will be used for implementation of each selected strategy; and identify the implementation timeline for each selected mitigation strategy.

MTA Review of Local Reports

Statute requires that the MTA conduct a noticed public hearing on the conformance of local jurisdiction reports, at which time the MTA may either accept or reject the report in its entirety.

Implementation Schedule

Table 2.3 lists the implementation schedule for the proposed project. Dates in boldface indicate an action or milestone for local jurisdictions. Other dates correspond to MTA actions and milestones.

TABLE 2.3 PROGRAM IMPLEMENTATION SCHEDULE

2.5 APPROVALS FOR WHICH THE EIR WILL BE USED

The MTA will use this program level EIR as part of its review and approval of the 1993 CMP Update. Local jurisdictions may reference this EIR during deficiency plan approval; and as part of environmental review, project approval, and EIR certification decisions for regionally significant projects. SCAQMD may use this EIR as part of the approval of projects that measurably improve air quality. In addition to the above approvals, agencies approving projects listed in the CIP, deficiency plans, and other regionally significant transportation projects, may use this EIR in evaluating proposed projects.

III. ENVIRONMENTAL SETTING, IMPACTS, AND MITIGATIONS

This chapter contains a discussion of the environmental setting, impacts, and mitigations associated with the potentially significant impact areas identified for the 1993 Congestion Management Program (CMP) Update. The first portion of this Chapter, Section 3.1, explains the analytic approach taken in analyzing the potential impacts of the 1993 CMP Update. The remaining sections address the issue areas identified in the Initial Study as being of concern. The issue areas discussed, and the section of this chapter in which they appear, are listed below:

- 3.2 Transportation
- 3.3 Air Quality
- 3.4 Energy
- 3.5 Land Use
- 3.6 Public Services

As appropriate, these issue areas are discussed in terms of the potential of the 1993 CMP Update to create both direct and indirect impacts. Direct impacts are the physical changes in the environment which could result from implementation of the deficiency plan program. Indirect impacts are the potential effects of the CMP program as a whole.

3.1 ANALYTIC APPROACH

The objective of the proposed deficiency plan program is to address the "congestion gap" for the County. As explained in greater detail in Chapter 2, Section 2.4, the congestion gap refers to the remaining deficiencies which are projected to occur on the regional network between 1990 and 2010 after implementation of currently programmed transportation improvements. Model runs indicate that roughly 15 percent of trips generated by growth within Los Angeles County through 2010 will contribute to CMP deficiencies. This 15 percent of new trips is equivalent to 3 percent of all trips projected to occur in 2010.

The regional ~~countywide~~ model is also able to express this gap in terms of person miles of travel (PMT). The current modeling analysis indicates that a total of 8,100,000 PMT resulting from new development must be mitigated to address the congestion gap.

The Tool Box Approach and Its Analysis

For purposes of implementing the CMP deficiency plan process and allocating mitigation responsibility throughout the County, the PMT congestion gap has been defined in terms of "points" of debits and credits. Debit points are earned by local jurisdictions as a result of development activity, with different numbers of debit points being earned by different land use types in keeping with the trip generation

value of different land uses. **Table E-1** in Appendix E lists the debit values for different land uses.

To offset their debit points, each jurisdiction within the County is responsible for selecting a market basket of mitigation strategies which is commensurate with the number of debit points earned due to the approval of new development projects. Mitigation strategies are to be selected from the Tool Box of strategies included in the 1993 CMP Update. The complete list of strategies and their mitigation value is contained in **Table E-2** in Appendix E. The point values assigned to the different mitigation strategies are based on available research as to the actual person miles of travel (PMT) reduction value of the strategies. As additional quantitative studies of the PMT value of different strategies becomes available, the CMP can be updated accordingly. Documentation for the derivation of the point values for each Tool Box measure is contained in the "Countywide Deficiency Plan Background Study," which is available from the MTA and which is incorporated herein by reference.¹ There are 50 strategies in total in the proposed Tool Box. The proposed program includes a mechanism for adding additional strategies to the Tool Box over time and for modifying the point values of individual mitigations, based on additional research regarding the effectiveness of the mitigation strategies. The strategies fall under the following categories:

- **Land Use Strategies** - which reduce the demand for vehicle trips, including strategies which focus development around transit centers, and provide for mixed use developments which reduce the need for vehicle tripmaking.
- **Demand Management Strategies** - which reduce the demand for vehicle trips, including ridesharing programs, physical ridesharing support facilities, ridesharing incentives, transit improvements and telecommunications.
- **Capital Improvement and Systems Management Strategies** - which increase or enhance system capacity, including the addition of high occupancy vehicle lanes, mixed flow lanes, intersection improvements, rail stations, goods movement facilities, signal system enhancements, and other measures.

¹1993 Congestion Management Program, Countywide Deficiency Plan Background Study, Draft. This document is available for review at the offices of the MTA, located at: 818 West Seventh Street, Los Angeles, California 90017.

The intent of the Tool Box approach is to allow individual jurisdictions to choose the strategies which are most suited to their individual circumstances as long as the total number of credit points is commensurate with the number of debit points they have accumulated.

For purposes of assessing the impacts of the proposed program, it would be ideal if the exact mix of strategies to be chosen could be predicted, then the impacts of implementation of the measures could be precisely analyzed. Due to the built-in flexibility of the program, however, it is not possible to forecast which strategies will be chosen by which jurisdictions.

Impact Assessment Method

Since it is not possible to forecast the mix of strategies to be chosen, this Environmental Impact Report (EIR) analysis focuses on two extremes of strategy selection. These extremes "bracket" the possible range of strategies that could be selected countywide. The two bracketing scenarios analyzed are as follows:

- **Trip Reduction Emphasis** - Countywide, all of the Tool Box measures chosen reflect actions which decrease demand for travel via land use strategies or transportation demand management (TDM) strategies
- **Capacity Enhancement Emphasis** - Countywide, all of the Tool Box measures chosen result in increases in system capacity via capital improvement and traffic systems management strategies

If all jurisdictions choose trip reduction strategies, the impacts on the system will be different than if all the jurisdictions choose capacity enhancements. A combination of the two extremes would result in a combined impact which would fall between the two ends of the "bracket." The purpose of using the bracketing approach to analyzing the potential Tool Box options is therefore to identify the potential extremes of impacts of the proposed program. The two ends of the bracket are described in more detail below.

Trip Reduction Emphasis - This package includes the assumption that all of the strategies chosen for credit by local jurisdictions will be from the land use and TDM options. Although it is unlikely that only land use and TDM options will be used, this end of the range enables the effectiveness of trip reduction strategies to be tested on their own. Based on the model results and the calculation of the congestion gap, it was determined by Los Angeles County Metropolitan Transportation Authority (MTA) staff that the 8,100,000 PMT congestion gap points is equivalent to approximately 3 percent of the total tripmaking in 2010. Therefore, the land use and TDM strategies were tested via the reduction of modeled trips in 2010 equivalent to 3 percent of all trips in the County. The model was then rerun including assignment to CMP links to test the effectiveness of the trip reduction package. Model output includes average speeds, vehicle miles traveled, vehicle hours traveled, and delay.

Capacity Enhancement Emphasis - This package includes the assumption that all of the strategies chosen for credit by local jurisdictions will be from the capital improvements and traffic systems management options. As with the trip reduction emphasis described above, it is unlikely that only these options will be used. Analysis of this end of the range enables the effectiveness of capacity enhancing

strategies to be tested on their own. There are several different ways that the capacity strategies could be tested in the regional countywide model. One option would be to assume that all of the improvements would directly affect capacity on the CMP system. The other is to assume that capacity improvements would occur throughout the entire transportation system, including both CMP and non-CMP facilities. The later option was chosen because CMP legislation allows off-system improvements which will benefit the system and also because it is likely that jurisdictions will choose those improvements which are closest in physical proximity and from which they most directly benefit. Also, local jurisdictions may not have the ability to implement full lane additions on CMP routes, but may be capable of implementing other Tool Box measures. Such improvements will probably be on both the CMP and non-CMP facilities and include measures such as areawide signal system projects.

If new lane capacity is used to offset the 8,100,000 PMT debit points, the total number of new arterial lane-miles required (both high occupancy vehicle and mixed flow) would be about 564 lane-miles. This equals an equivalent capacity increase of 366,600 vehicles per hour to the system. To test the effectiveness of the capacity strategy, the equivalent of 366,600 vehicle capacity hours were added to the CMP and non-CMP facilities in the model. As described above, this capacity was assumed to be distributed equally across urban arterials in the County rather than only on CMP arterials, reflecting the range of capacity strategies that are possible. The model was then rerun including assignment to CMP links to test the effectiveness of the capacity emphasis package. Again, model output which has been reviewed includes average speeds, vehicle miles traveled, vehicle hours traveled, and delay.

The MTA regional countywide model runs, which were completed for purposes of evaluating the capacity and trip reduction Tool Box measures, take into account potential "latent demand" on the transportation system. For purposes of this analysis, latent demand is defined as existing demand for travel which is currently not translated into actual trips on the highway system, or which is translated into shorter trips, as potential trip-makers respond to the level of congestion on the system. Latent demand exists when the demand to make a trip is present, but the trip is not made on the highway system, or is instead made at an off-peak time of day or to a closer destination, because of the time costs associated with the delay and low speeds which would be experienced by the person considering making the trip.

The technical model runs used in the bracket analysis of potential program impacts are based on an iterative modeling process whereby congested speeds are determined from an initial trip assignment and then are input back into the model

for a second iteration. The subsequent model run goes through the mode choice and trip distribution process once again and trips are finally assigned to the network with the congested speeds assumed. This is the most "realistic" modeling approach since it reflects the best estimate of actual speeds and trip length. Other common modeling approaches without this type of iterative loop may result in overly congested networks and will not reflect the full travel demand on the system. This approach captures latent demand by allowing mode choice to respond to changes in congestion levels.

This model output has been used in analyzing the transportation, air quality, and energy impacts of the proposed program. The impact assessment is based on a comparison of these two scenarios with the year 2010 baseline model run. This model run captures projected transportation system conditions without implementation of the 1993 CMP Update.

Likely Tool Box Use By Local Jurisdictions

Although a bracketing approach has been used to capture the range of potential program impacts, it is anticipated that on a countywide level, the total package of Tool Box measures selected will fall somewhere between the two bracket extremes. This conclusion is based on the following analysis of the possible behavioral choices of an "average" local jurisdiction.

The 1993 CMP Update establishes a Tool Box of alternatives from which local jurisdictions may choose in order to offset their congestion mitigation goal, based on new development activity. Since each local jurisdiction faces its own unique set of demographic, fiscal, and political considerations the Tool Box incorporates a range of implementation options, including land use measures, TDM strategies, Transportation Systems Management (TSM), and capital improvement opportunities. These Tool Box measures can be implemented through a variety of funding mechanisms, including use of local revenue, imposition of direct transportation costs, use of development charges or fees, or use of land use incentives. Each of these mechanisms is discussed latter in this section.

In selecting Tool Box measures it is anticipated that local jurisdictions will weigh specific public service needs in their community and funding considerations, and choose appropriate mitigation strategies that either enhance or minimize disruption to the jurisdiction's priorities. While the decision makers will have to weight the choice of implementation measures against the jurisdiction's specific objectives and constraints, there is a wide range of strategies included in the Tool Box to allow local jurisdictions flexibility in the choice of deficiency mitigation approaches. Local jurisdictions can choose any combination of strategies desired.

To understand the factors affecting a local jurisdiction's choice of mitigation measures, the following mitigation scenarios were developed for a hypothetical local jurisdiction with an employment base of 20,000 workers, contemplating permitting of a 100,000 square foot retail commercial building with a PMT debit point value of 2,223 points: mitigation through a mix of capital improvements and TDM measures, two different capital intensive approaches to mitigation, and two different TDM approaches to mitigation. The scenarios and their PMT credit point values are given in **Table 3.1.1**.

The scenarios in **Table 3.1.1** provide general information about the behavioral options open to this hypothetical jurisdiction. The jurisdiction may approach mitigation on either a jurisdictional or development-specific level.

As seen in the example, implementation of non-development specific large scale capital improvements or jurisdiction-wide TDM measures will result in a large number of PMT mitigation credits which can be used to offset the PMT debit points from a number of development projects constructed within the local jurisdiction. As also seen in the example, both of these types of mitigations are better suited to jurisdiction-wide implementation by "average" jurisdictions, jurisdictions that are not considering the permitting of regional centers or very large-scale developments. This is because, generally speaking, capital improvements are large scale in nature, and not likely to be identified in an EIR for a development project as mitigation the development is responsible for implementing, to mitigate the development's local or regional transportation impacts. These types of mitigations are more likely to be implemented occasionally by local jurisdictions acting alone, or in combination, when the improvement is a priority and funding is available. TDM may also best be suited to jurisdiction-wide implementation. As shown in **Table 3.1.1**, TDM measures implemented on a development specific basis are unlikely to result in PMT credit points which are commensurate with the development's PMT debit point contribution. Thus, TDM measures are most likely to be implemented by local jurisdictions, on a jurisdiction wide basis, with the jurisdiction receiving the incremental credit associated with the new development's participation in the existing program. Development of a jurisdiction-wide TDM requirement has the added advantage of helping the jurisdiction to meet its South Coast Air Quality Management District (SCQMD) Transportation Control Measure (TCM) responsibilities. TCM reporting requirements are discussed more fully in Section 3.6 of this chapter.

TABLE 3.1.1 HYPOTHETICAL PROJECT DEFICIENCY MITIGATION SCENARIOS

*Example Case: 100,000 Square Foot Retail Commercial Building
Debit Points: 2,223 (22.23 per 1,000 sq. ft.)
Project Employment: 188.7¹*

SCENARIO 1: Mix of Capital Improvements and TDM measures

Mitigation Category	Implementation Strategy	Credits
Land Use Strategy	Focus development along transit corridor	870
TDM Strategy	Transportation Management Association	86
	Informal Carpool/Vanpool Program	52
	Carpool Allowance	169
TSM Strategy	Two Intersection Modifications	1,150
Total		2,327

SCENARIO 2: Capital Intensive Approach (2 Options)

Mitigation Category	Implementation Strategy	Credits
1) Capital Improvement	General Use Highway Lane (1 lane, 1 mile; non-CMP network)	9,203
Total		9,203
2) TSM Strategy	Traffic Signal Synchronization (1 mile, 4 lane; non-CMP network)	1,473
	Peak Period Parking Restriction (3 hours, ½; non-CMP network)	1,380
Total		2,853

SCENARIO 3: Traffic Demand Intensive Approach (2 Options)

Mitigation Category	Implementation Strategy	Credits
1) TDM Credits for Individual Project	Transportation Management Association	86.4
	Vanpool Formation Program	20.7
	Vanpool Subsidy Program	135.4
Total		242.5
2) Citywide ordinance for small employers; affects 20,000 employees	Trip Reduction Program	7,260
	Alternative Work Schedule	1,460
	Carpool/Vanpool Program	5,600
	Transit Subsidy Program	6,400
	Preferential Ridesharing Parking	1,000
Total		21,720

SOURCE: Willdan Associates

Jurisdictions which wish to implement Tool Box measures on a development by development basis also have that option. This is most likely to be accomplished through a mix of TSM measures, most probably those identified as development specific improvements in the EIR for a development, and TDM or land use strategies. It should be noted, however, that a development specific deficiency mitigation approach becomes more difficult, if a jurisdiction has a number of developments which do not require EIRs, since the California Environmental Quality Act (CEQA) process provides a ready mechanism for the identification of development-specific mitigations.

Given the hypothetical case study described above, it is relatively safe to assume, that on a countywide basis, both development-specific and jurisdiction-wide Tool Box measures may be used. It is also safe to assume that on a countywide basis, some mix of capacity enhancing and demand reducing measures will be used; the County as a whole is unlikely to be at one bracket extreme or the other.

Approach To The Relationship Between Funding Availability And The Degree of Program Impact

Just as it is impossible to predict the exact mix of Tool Box strategies which will be selected on a countywide basis, it is impossible to predict the exact mix of mechanisms which will be used to fund deficiency mitigation by local jurisdiction. For this reason, the EIR examines, at a program level of detail, the relationship between the different funding mechanisms available, the Tool Box measures selected by local jurisdictions, and the potential for environmental impacts, specifically in the areas of land use and public services. Available funding mechanisms have been classified into four broad categories for analytic purposes, each of which is described below:

- **Use of Local Revenue** - A local jurisdiction could elect to pay for required mitigation measures through its general fund or through the wide array of formula allocated public funds which may be used for CMP deficiency mitigation. These funding sources are discussed in more detail in Section 3.6 of this chapter.
- **Imposition of Direct Transportation Costs** - Some Tool Box mitigation measures, particularly TDM-intensive measures, could be funded by imposing direct costs, such as parking fees on drivers.
- **Use of Development Charges or Fees** - To pay for required mitigation measures, a local jurisdiction may require a development contribution. The amount and nature of the contribution could vary significantly depending on

the degree to which local jurisdictions pursue capacity enhancing or demand reducing mitigations.

- **Use of Land Use Incentives** - Local jurisdictions may elect to provide mitigation by creating development incentives which foster patterns of land use for which mitigation credit is available. Incentives would likely entail measures having a monetary value to developers, such as reduced parking requirements, increased density bonuses, and expedited project processing and approval times.

The hypothetical case study and the analysis of funding categories are used in analyzing the proposed 1993 CMP Update's potential land use and public service impacts.

3.2 TRANSPORTATION

This section of the EIR examines the potential of the 1993 CMP Update to create significant impacts on: (1) the CMP's consistency with the Regional Mobility Plan (RMP); and (2) the County's transportation system.

SETTING

Regional Transportation Planning

The Los Angeles County transportation system is a central part of the six-county Southern California Association of Governments (SCAG) planning area.² As the regional planning agency, SCAG is responsible for development of the regional plan and associated mobility component. The existing plan contains four elements, the Regional Mobility Plan (RMP), the Growth Management Plan (GMP), the Air Quality Management Plan (AQMP), and the Regional Housing Needs Assessment (RHNA). The RMP serves as the Federal and State required Regional Transportation Plan (RTP). It has a 20-year planning horizon and is intended to establish the policies and actions to address the region's mobility issues. It is updated periodically. The official RTP for the SCAG Region, was adopted on February 6, 1989, and SCAG subsequently issued a conformity finding on the plan in September 1990.

²The SCAG region consists of Los Angeles, Orange, Ventura, San Bernardino, Riverside, and Imperial Counties.

SCAG is currently in the process of creating an updated regional plan which will be called the Regional Comprehensive Plan. The mobility element of the new plan will be called the Mobility Component of the Regional Comprehensive Plan. That plan is currently under development, with adoption targeted for ~~December 1993~~ February 1994. Until adoption, the 1989 plan will remain the official regional transportation plan for the region and the County of Los Angeles.

CMP statute requires that the CMP be developed consistent with the regional plan and that the CMP be incorporated into the regional plan.³ SCAG has developed a set of "Regional Consistency and Compatibility Criteria for CMPs" which outline the process and criteria that is used to evaluate the consistency between the CMP and regional planning efforts. The consistency evaluation has three parts, which are briefly described below. Appendix D of this EIR contains the full text of the consistency requirements.

1. The CMP must be consistent with the actions and programs pertaining to growth management, transportation demand management, transportation systems management and facilities development contained in the regional plan and the AQMP.
2. The CMP must demonstrate progress toward the regional mobility targets contained in the regional plan. The countywide modeling for the CMP must be consistent with SCAG's CMP planning horizon forecasts for the following indicators:
 - a) vehicle miles of travel, average trip length, and vehicle hours of travel must be maintained or reduced;
 - b) transit trips and average vehicle occupancy be maintained or increased; and,
 - c) total person trips and total vehicle trips both within and between the counties.

SCAG will develop planning horizon targets for use in determining if there are discrepancies between the SCAG forecasts and the CMP planning horizon.

3. The CMP transportation system must connect to the system designated in the adjacent counties and traffic Levels of Service (LOS) standards must be

³See Section 65089.2 of the California Government Code.

addressed using either Circular 212, the 1985 Highway Capacity Manual or a method that SCAG has found consistent with the 1985 Highway Capacity Manual.

The issue of consistency was previously addressed in the adopted 1992 CMP EIR. No significant consistency related impacts were identified for the 1992 CMP.

In February 1992 and again in November 1992, SCAG's Executive Committee formally approved an interim consistency and compatibility finding for the 1992 CMP. In April 1993, based on a recommendation from SCAG's 1246 Committee to the Executive Committee, the interim finding was accepted as a final finding of consistency and compatibility.

In addition to formal consistency with the regional plan, there are several key areas where coordination should occur between the RMP and the CMP. The areas of importance for coordination are as follows:

- Implementation of local trip reduction strategies, land use policies and transportation demand management programs.
- Local (county) implementation of capital improvement strategies on the regional street and highway system.
- Implementation of transit system improvements.

Existing and Projected Los Angeles County Transportation System Performance

Information on existing system performance is available from two sources, the regional transportation model and the system monitoring performed under the adopted CMP.

System Performance

In November 1992, the MTA adopted the first CMP for Los Angeles County. The 1992 CMP EIR includes a discussion of the CMP Highway and Transit Systems and the monitoring networks. The 1993 CMP Update includes the addition of La Cienega Boulevard from the San Diego Freeway (I-405) to the Santa Monica Freeway (I-10). A description of the existing travel characteristics and existing level of congestion on the highway system is included in the 1992 CMP EIR. Because the first year's monitoring program had not been completed, the description of existing conditions in the 1992 EIR consisted of link-based highway network LOS

information obtained from Caltrans. Although that information remains valid, this EIR includes a description of the arterial intersection and freeway level of service data obtained from the CMP monitoring effort which was not available when the 1992 CMP EIR was written. That data is described below.

The Adopted CMP Monitoring Program System Performance Findings

The adopted CMP for Los Angeles County includes requirements for monitoring intersections, freeway links, and transit routes. Intersection monitoring is the responsibility of cities and the County, freeway monitoring is the responsibility of Caltrans, and transit route monitoring is the responsibility of transit operators in the County.

Intersection Monitoring - The CMP Highway Monitoring Program was fully implemented for the first time in 1992. It is an annual program which includes monitoring of intersections throughout the CMP system. The following criteria are used to determine the locations for monitoring:

- Intersections of two (or more) CMP arterials shall be monitored.
- Monitored intersections should be capacity constraining intersections with major cross streets such as major arterials, secondary arterials, or freeway ramps. This excludes many intersections of CMP arterials with local or collector streets which are signalized but which carry relatively light volumes of cross traffic.
- A maximum spacing of 2 miles should be maintained between stations, except on rural highways where the spacing may be increased if traffic volumes and capacity are consistent over greater distances.

A total of 160 intersections were monitored during 1992, by 46 cities and the County of Los Angeles. The city responsible for monitoring the most locations is the City of Los Angeles, which is responsible for 45 intersections. It is followed by the County of Los Angeles, which monitors 14, and the Cities of Torrance and Long Beach, which monitor 10 intersections each. Most of the remaining locations are divided among the remaining cities such that each city is responsible for between one and five locations, depending on the size of the city and the presence of CMP routes within the city's boundaries.

Each monitoring agency is responsible for the following tasks as part of the monitoring program:

- Conduct traffic counts on at least two weekdays during typical traffic conditions. The counts must cover the peak time periods of 7 to 9 a.m. and 4 to 6 p.m. unless otherwise indicated by local conditions.
- Describe existing lane configurations and signal phasing.
- Complete an Intersection Capacity Utilization (ICU) calculation for each monitoring intersection using parameters described in the *CMP Manual Transportation Impact Analysis Guidelines*.

Intersection conditions are reported in terms of volume/capacity ratio (V/C) and LOS during both the AM and PM peak hour periods. LOS are based upon volume/capacity ratios and range from LOS A which represents excellent to very good conditions with little or no vehicle delay to LOS F which represents jammed conditions with significant congestion and vehicle delay. Based on CMP statute, system LOS standards are required to be set no lower than LOS E, or the current level if worse than E. The 1992 monitoring program findings are presented in **Table 3.2.1**.

TABLE 3.2.1 1992 INTERSECTION MONITORING RESULTS

Reported At:	AM Peak Hour		PM Peak Hour	
	Number of Intersections	Percent of Intersections	Number of Intersections	Percent of Intersections
LOS F	29	18%	48	30%
LOS E	34	21%	35	22%
LOS D or better	97	61%	77	22 48%

SOURCE: MTA

Based on these findings, 93 of the 160 monitoring locations are currently at the maximum allowable LOS (i.e. LOS E or the current level if worse than E) in either the AM peak, PM peak, or both. This represents 58 percent of the CMP system intersection monitoring locations. **Figures 3.2.1 and 3.2.2** display the results of the AM and PM peak hour intersection LOS analyses, respectively.

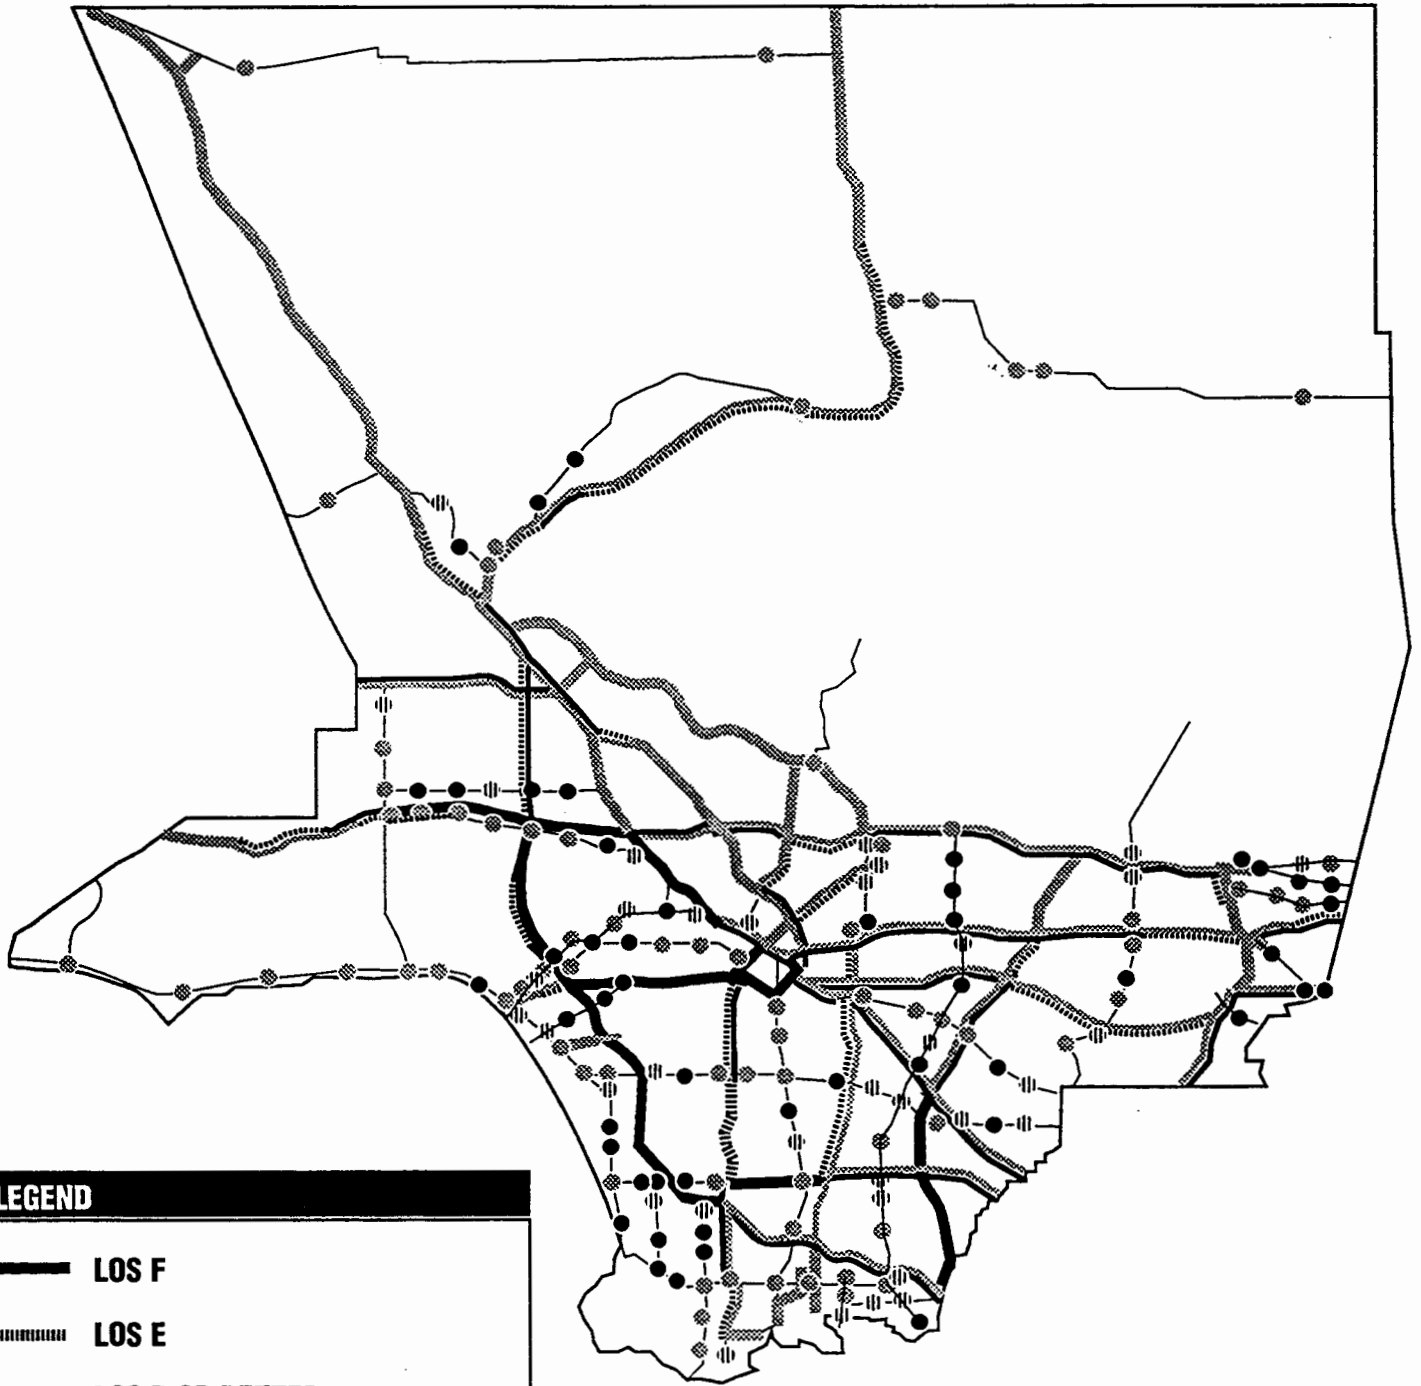

LEGEND

LEGEND

-  LOS F
-  LOS E
-  LOS D OR BETTER

Circles indicate arterial intersections.

Bars indicate freeway segments. Freeway segment congestion is schematically represented through interpolation of CMP monitoring station data provided in Appendix A.

Freeway Monitoring - As part of the 1992 CMP, Caltrans monitored volumes and LOS at 79 freeway locations throughout the CMP system. A total of 17 State Routes were included in the monitoring program. The monitoring was conducted in both directions on each route during both the AM and PM peak hour periods. Freeway level of service conditions are measured differently from arterial intersection LOS. They are based upon demand-to-capacity ratios and extend from LOS A to LOS F0, F1, F2, and F3 rather than a simple measurement of LOS F. This gradation within LOS F represents LOS F conditions with successively longer duration. The results of the freeway monitoring program are presented in **Table 3.2.2**.

Transit Monitoring - CMP statute also requires monitoring of transit systems to determine conformance with established standards. For purposes of transit monitoring, the County's transit system has been broken into 11 corridors. Within each corridor specific CMP routes and the transit lines which operate on those routes have been identified for monitoring. A total of 90 bus lines plus the Metro Blue Line, the Metro Red Line, and Metrolink Commuter Rail System are included in the monitoring program.

TABLE 3.2.2 1992 FREEWAY MONITORING RESULTS

Reported At:	AM Peak Hour		PM Peak Hour	
	Number of Segments	Percent of Segments	Number of Segments	Percent of Segments
LOS E or F in the northbound/eastbound directions	25	32%	50	63%
LOS E or F in the southbound/westbound directions	53	67%	30	38%
LOS E or F in one or both directions	86	86%	63	86%

SOURCE: MTA

THRESHOLDS OF SIGNIFICANCE

For purposes of this analysis a significant adverse transportation impact is defined as: (1) creation of an inconsistency with the regional transportation plan; (2) an increase in vehicle miles traveled (VMT), vehicle hours traveled (VHT); or (3) vehicle delay compared to projected Year 2010 baseline conditions or a decrease in speed compared to the Year 2010 baseline. These thresholds are based on

SCAG's "Regional Consistency and Compatibility Criteria for CMPs," as well as standard transportation planning practices.

IMPACTS

Regional Transportation Planning

As explained in the setting section, the CMP must demonstrate consistency with the regional planning process and the CMP must be incorporated into the regional transportation plan. The 1992 CMP EIR discussed the purpose of the regional plan and the consistency between the CMP and the plan. The finding in the 1992 CMP EIR is that the CMP is designed to be consistent with the regional transportation plan and that the CMP has been developed to work toward the implementation of transportation projects and strategies recommended in the RMP, and is therefore consistent.

The major element of the CMP which is proposed as part of the 1993 program update, the deficiency plan process, is also designed to work toward the implementation of projects and policies which are consistent with regional transportation plan goals. The findings of consistency for the 1992 CMP also apply to the deficiency plan process as currently proposed, for the following reasons:

- All modeling analysis which was conducted for purposes of determining the congestion gap and the number of debit points to be mitigated through the CMP deficiency plan process was based on the MTA regional countywide model which was originally obtained from SCAG. The modeling inputs including socioeconomic data, highway networks and transit networks are consistent with the SCAG regional model as is all modeling methodology such as trip generation rates/equations, assignment algorithms and mode choice criteria.
- Implementation of capacity increasing measures that are part of the toolbox could arguably result in an increase in VMT, average trip length, or VHT, which would not meet the Regional Consistency and Compatibility Criteria due to the effects of "latent demand" which may be present in the County. This issue is discussed in the 1992 CMP EIR with respect to the adopted CMP. The deficiency plan process is not expected on an aggregate basis, however, to result in such increases since on a Countywide basis toolbox choices will likely result in a mixture of capacity enhancing measures as well as trip reduction measures. The modeling analysis associated with the capacity enhancing measures indicates that VMT could increase slightly

(approximately one percent on average over the whole system) if only capacity Tool Box measures are chosen. VHT would increase less than one percent although overall delay would actually decrease based on the modeling analysis of the capacity enhancing measures.

- The deficiency plan process as proposed will result in the implementation of capacity improvements which are generally in conformance with RMP projects, therefore, the deficiency plan is not expected to significantly alter the RMP's analysis of transportation demand. If, however, the CMP deficiency plan process resulted in only capacity enhancing measures being implemented, an increase in VMT, VHT, or average trip length could arise, thereby resulting in an inconsistency finding with respect to the RMP (although delay may decrease and speeds may remain the same on average).
- The deficiency plan process is oriented toward the mitigation of future deficiencies on the CMP system, with deficiencies defined as a change to LOS E, or worse than E if already at LOS E. If already at LOS F, a deficiency is defined as a worsening within LOS F. Because deficiencies are only defined at relatively poor levels of service (not at LOS D as in many local cities), and because the goal of the CMP is to maintain, rather than improve mobility, it is possible that even if only capacity enhancing measures are chosen as part of the toolbox, no net increase in VMT or VHT will occur. This is because VMT and VHT will increase from today's levels primarily as a result of development and other growth factors which add to the congestion and thus which creates the deficiency. Improvements to mitigate the deficiency may therefore decrease VMT and VHT when compared to deficient conditions, but not when compared to existing (pre-deficiency) conditions.
- The deficiency plan process includes both transit system improvements and a considerable number of transportation demand management actions among the Tool Box of measures, therefore, it promotes maintaining or increasing transit trips and average vehicle occupancy.
- Implementation of the deficiency plan does not alter the connection of the CMP system with adjacent counties nor does it impact the analysis of traffic LOS standards.

Future updates of the CMP must also be consistent with the new regional transportation plan once it is adopted. Adoption of the Regional Comprehensive Plan and Mobility Element are not expected until ~~December 1993~~ February 1994.

therefore, a determination of consistency of this year's CMP with the new regional plan cannot be made at this time.

Direct Impacts - The 1992 adopted EIR found that the CMP program was designed to be consistent with the RMP, thus the CMP should have a positive direct impact on working toward attainment of regional mobility goals. The deficiency plan program was also designed to result in the implementation of RMP projects and therefore should assist in attaining RMP goals and is consistent with the adopted regional transportation plan. The furthering of RMP goals is a **significant benefit** of the 1993 CMP Update.

System Performance

As described in section 3.1 of this chapter, model runs were made for two deficiency plan scenarios, a trip reduction emphasis scenario and a capacity emphasis scenario. These two scenarios bracket the range of possible 1993 CMP Update transportation system impacts. **Tables 3.2.3 and 3.2.4** display the results of the model runs in terms of baseline 2010 transportation system conditions (i.e. without the CMP deficiency plan process implemented). The tables compare VHT, average speed, VMT, and vehicle hours of delay for the two scenarios to the 2010 baseline. The results of each modeling analysis are summarized below in **Table 3.2.5**.

Direct Impacts - The regional **countywide** model analysis indicates that the trip reduction emphasis package would result in measurable improvements in the CMP system as well as non-CMP facilities. The improvements generally occur across the board and affect most measures of transportation system effectiveness including the overall amount of vehicle travel, the level of vehicle delay and speeds. The capacity emphasis package results in increases in VMT and VHT, but an overall decrease in delay.

Therefore, based on the modeling analysis, if only the capacity enhancing measures available in the deficiency plan Tool Box are chosen by local jurisdictions, there would be a net increase in VMT, VHT or average trip length. Based on the probability that many different Tool Box measures will be chosen (including trip reducing measures), the overall program should not result in increases in those travel characteristics and the 1993 CMP Update should result in a **significant benefit** to the transportation system.

SOURCE: MTA

TABLE 3.2.5 PROJECTED EFFECTS OF THE DEFICIENCY PLAN SCENARIOS ON THE COUNTY'S TRANSPORTATION SYSTEM (Project Compared to 2010 Baseline)

	Trip Reduction Emphasis	Capacity Emphasis
Vehicle Miles Traveled	Reduction of less than 1 percent in overall daily VMT, which is consistent over the AM and PM peak periods. On a daily basis the total reduction is approximately 1.9 million vehicle miles traveled.	Increase of approximately 1 percent in daily VMT, which is consistent over the AM and PM peak periods. Total daily increase is approximately 2.2 million VMT.
Vehicle Hours Traveled	Reduction of 2 percent in VHT on a daily basis, equivalent to 117,300 hours of travel per day.	Increase of less than 1 percent in VHT on a daily basis, equivalent to 31,100 hours of travel per day.
Vehicle Delay	Reduction of 3 percent in PM peak and overall daily delay, with the AM peak delay decreasing by 2 percent. On a daily basis the reduction is approximately 75,000 hours of delay.	Reduction of 5 percent in AM peak and 2 percent overall daily delay, with the PM peak delay increasing by less than 1 percent. On a daily basis the reduction is approximately 58,900 hours of delay.
Speed	Increase in average speed of 1 percent indicated in the AM and PM peak hours which is equivalent to an average of less than 1 mile per hour. It is important to note that speed is an average of all facilities and is not representative of the actual increase which will occur on links which will be improved. Those increases in speed will be higher.	Increase in average speed of approximately 2 percent indicated in the AM and less than 1 percent in the PM peak hours which is equivalent to an average of less than 1 mile per hour. It is important to note that speed is an average of all facilities and is not representative of the actual increase which will occur on links which will be improved. Those increases in speed will be higher.

SOURCE: Meyer, Mohaddes Associates, Inc.

MITIGATION MEASURES

None required, the proposed program would have a beneficial impact on the transportation system.

3.3 AIR QUALITY

This section of the EIR examines the 1993 CMP Update's potential to create significant impacts on the region's air quality.

SETTING

This section incorporates by reference basic air quality information presented in the South Coast Air Quality Management District's (SCAQMD) California Environmental Quality Act (CEQA) Air Quality Handbook as well as the additional background information pertaining to air quality conditions in Los Angeles County presented in the 1992 CMP EIR.⁴ A description of the South Coast Air Basin was provided in the 1992 CMP EIR along with salient climate and emissions data, and information pertaining to the applicable regulations. Monitoring data presented in that document covered the period through 1991.

Available 1992 monitoring data suggest there has been an improvement in air quality in the Los Angeles County area. A comparison of 1991 and 1992 data is shown in **Tables 3.3.1 through 3.3.5**. The key changes in air quality are summarized below:

- **Carbon Monoxide (CO)** - The highest recorded concentration in the 1983 to 1992 period was 33 ppm recorded at the Lynwood station in 1985. The average maximum concentration for all stations in Los Angeles County has ranged from 12 ppm in 1992 to 18 ppm in 1983 and 1985. The average maximum concentration in 1992 was 12 ppm and is 78 percent of the average for the 10-year period. Compared to 1991, two ppm of the 15 monitoring stations in 1992 recorded increases in concentrations; eight stations recorded decreases; and five stations reported no change.
- **Ozone (O₃)** - The highest recorded concentration in the 1983 to 1992 period was 0.39 ppm recorded at the Glendora station in 1985. The average maximum concentration for all stations in Los Angeles County has ranged from 0.19 ppm in 1990 to 0.28 ppm in 1983. The average maximum concentration in 1992 was 0.21 ppm and is 88 percent of the average for

⁴CEQA Air Quality Handbook, April 1993, SCAQMD, is herein incorporated by reference. Portions of this document are summarized in relevant sections of this EIR. The document is available for review at the offices of the MTA, located at: 818 West Seventh Street, Los Angeles, California 90017.

the 10-year period. Compared to 1991, eight stations in 1992 recorded increase in concentrations; six stations recorded decreases; and one station reported no change.

- **Nitrogen Dioxide (NOX)** - The highest recorded concentration in the 1983 to 1992 period was 0.54 ppm recorded at the Los Angeles station in 1988. The average maximum concentration for all stations in Los Angeles County has ranged from 0.20 ppm in 1992 to 0.29 ppm in 1993. The average maximum concentration in 1992 was 0.20 ppm and is 83 percent of the average for the 10-year period. Compared to 1991, three stations in 1992 recorded increase in concentrations; 11 stations recorded decreases; and one station reported no change.
- **Sulfur Dioxide (SOX)** - The highest concentration in the 1983 to 1992 period was 0.54 ppm recorded at the Los Angeles station in 1988. The average maximum concentration for all stations in Los Angeles County has ranged from 0.04 ppm in 1989 to 0.08 ppm in 1984. The average maximum concentration in 1992 was 0.07 ppm and is 116 percent of the average for the period. Compared to 1991, four of the six reporting stations in 1992 recorded increase in concentrations; and two stations recorded decreases.
- **Particulate Matter Less Than 10 Microns (PM10)** - The highest recorded concentration in the 1983 to 1992 period was 780 microns per cubic meter (ug/m³) recorded at the Lancaster station in 1991. The average maximum concentration for all stations in Los Angeles County has ranged from 109 ug/m³ in 1988 to 142 ug/m³ in 1986. The average maximum concentration in 1992 was 120 ug/m³ and is 96 percent of the average for the period. Compared to 1991, two of the seven reporting stations in 1992 recorded increases in concentrations, and the remaining five stations recorded decreases.

Existing mobile emissions in Los Angeles County are shown in **Table 3.3.6**. These emissions are based on the results of the Countywide Travel Model, which calculates an estimated 167.1 million vehicle miles of travel in the County. Pollutant emissions are based on EMFAC7EP series emission factors applied to the daily vehicle miles traveled at an average speed of approximately 30 miles per hour.

TABLE 3.3.6 EXISTING LOS ANGELES COUNTY DAILY MOBILE EMISSIONS

Pollutant	Tons Per Day
Carbon Monoxide	1,818
Reactive Organic Gas	293
Nitrogen Dioxide	258
PM10	26
Sulfur Dioxide	13

SOURCE: VMT from Countywide Travel Model (167.1 million vehicle miles) with applied EMFAC7EP emission factors for 30 miles per hour. Emission factors calculated using method described by SCAQMD in CEQA Air Quality Handbook, April, 1993.

THRESHOLDS OF SIGNIFICANCE

The SCAQMD in its 1993 CEQA Air Quality Handbook has established daily emissions thresholds in pounds per day. These threshold are specifically designed for the evaluation of impacts from site specific projects. The proposed 1993 CMP Update is not site specific and moreover the proposed project encompasses potential mobile emissions that may be created over the more than 4,000 square mile area of Los Angeles County. Thus, for purposes of this analysis, it was determined that emissions that exceed the 2010 baseline emissions, which assume the same socioeconomic characteristics in Los Angeles County as the AQMP and the GMP, would be considered adverse significant impacts. Application of EMFAC7EP series emissions factors to the 202.9 million VMT in Los Angeles County generated by the Countywide Travel Model under the above assumptions is shown on **Table 3.3.7** below.⁵

⁵Emission factors were calculated using the method and assumptions described in the SCAQMD Air Quality CEQA Handbook, April 1993.

TABLE 3.3.7 DAILY 2010 BASELINE AIR POLLUTANT MOBILE EMISSIONS IN LOS ANGELES COUNTY (tons)/a/

Pollutant	Tons
Carbon Monoxide	590
Reactive Organic Gas	38
Nitrogen Dioxide	87
PM10	36
Sulfur Dioxide	20

/a/ Emission factors were calculated using the method and assumptions described in the SCAQMD Air Quality CEQA Handbook, April, 1993.

The creation of air quality "hot spots" would also be considered an adverse impact.

IMPACTS

As discussed more fully in Chapters 1 and 2 of this EIR, the key change in the CMP contained in the 1993 CMP Update is the addition of the deficiency plan approach with its Tool Box menu of credits and debits that must be used by local jurisdictions to offset development-related impacts on the CMP transportation network. As explained in detail in Section 3.1 of this chapter, in order to analyze the potential impacts of the proposed deficiency plan approach, two scenarios were simulated using the Countywide Travel Model, a Trip Reduction Emphasis scenario and a Capacity Enhancement Emphasis scenario. In addition, the No-1993 CMP Update - Year 2010 Baseline Scenario was run for comparison purposes.

Direct Impacts - Results of the Countywide Travel Model runs indicate that both the proposed program would result in countywide emissions less than the AQMP 2010 baseline. The greatest improvement, an approximately 2.5 percent reduction in air pollutants, would be achieved by the Trip Reduction Emphasis. In contrast, the Tool Box choices favoring increased capacity through capital improvements would result in pollutant levels similar or slightly greater than the AQMP baseline emissions, an approximately 0.1 percent reduction as compared to baseline emissions. Based on these results, and given the range of mitigation choices provided local jurisdictions through the Tool Box, the proposed deficiency plan approach would provide **air quality benefits** as compared to baseline conditions. No significant adverse air quality impacts are anticipated on a countywide level. The range of effects are illustrated in **Table 3.3.8**. As can be seen from the table,

a systematic selection of capacity increasing measures by local jurisdictions could result in mobile carbon monoxide and nitrogen dioxide emissions somewhat greater than (2 percent) the 2010 baseline. These effects would be considered significant and adverse.

TABLE 3.3.8 COMPARISON OF 2010 EMISSIONS FOR LOS ANGELES COUNTY (Tons Per Day)

Pollutant	2010 Baseline	CMP Deficiency Plan Tool Box Range	
		Trip Reduction Emphasis	Capacity Emphasis
CO	590	584	597
ROG	38	38	38
NOX	87	86	88
PM10	36	36	36
SOX	20	20	20

SOURCE: Metropolitan Transportation Authority, Countywide CMP Travel Model with applicable EMFAC7EP series emission factors. VMT estimates for each scenario condition are as follows: AQMP 2010 Baseline - 202 million VMT; Demand Reduction - 201 million VMT; Capacity Increase - 205 million VMT.

It should be noted that the air quality analysis of the 1992 CMP acknowledged that while there would be regional air quality benefits there may be localized adverse affects including the affects of facility construction, realignment of facilities near sensitive land uses, and the creation of "hot spots" near transit centers/stations and/or park and ride lots. These highly localized adverse impacts of otherwise beneficial transportation improvements have become an important consideration in the South Coast Air Basin due to the requirements of the Clean Air Act Amendments of 1990 where federally funded projects cannot be sponsored if the number of violations and/or severity of air quality violations increases due to a transportation improvement.

To address this issue, the MTA has participated with SCAG and the SCAQMD along with other local agencies in developing a series of procedures and guidelines to address the "hot spot" issue on a project basis through a document called the Carbon Monoxide Transportation Project Protocol. This protocol requires that the air quality effects of proposed projects be fully evaluated and the adverse effects mitigated to be extent that there is no increase in the number of air quality violations or an increase in the severity of concentrations of existing violations.

Application of this protocol by local project sponsors to Tool Box measures will ensure conformity with the AQMP and no additional mitigation is required.

MITIGATION MEASURES

The following mitigation measure, as well as mitigation measures C.1 and C.4 from the 1992 CMP EIR will reduce the potential for direct air quality impacts resulting from the selection of capacity enhancement deficiency Tool Box measures.

3.3.1 MTA will develop its Tool Box in consultation with SCAG and the SCAQMD to ensure air quality goals are addressed.

3.4 ENERGY

This section of the EIR examines the 1993 CMP Update's potential to create significant impacts on energy use.

SETTING

According to the Draft EIR for the RMP, Los Angeles County consumed approximately 61 percent of all motor vehicle fuel in the six-county SCAG region. Development of the 1993 CMP, including the deficiency plan component and the associated Tool Box program, has involved extensive use of the Countywide Travel Model. In depicting conditions for 1990, the model results indicate that approximately 167.1 million vehicle miles were travelled Countywide, which suggests that approximately 9.3 million gallons of gasoline were consumed daily, as shown on **Table 3.4.1**. Existing commuter rail, rail transit, and bus fleets in the County also contribute to energy consumption.

TABLE 3.4.1 EXISTING (1990) DAILY ENERGY CONSUMPTION, LOS ANGELES COUNTY STREETS AND HIGHWAYS

Facility Type	Vehicle Miles (millions)	Fuel Consumption (millions of gal)
Freeway	81.9	4.6
Arterial	72.2	4.0
HOV and Other	13.0	0.7
TOTAL	167.1	9.3

SOURCE: MTA, CMP Countywide Travel Model, 1990 Base Year Run Results. Fuel consumption in gallons per vehicle mile based on SCAQMD CEQA Manual, Table A9-5-0. A fuel consumption rate of 0.056 gallons per vehicle mile is assumed (approximately 17.9 mpg).

THRESHOLDS OF SIGNIFICANCE

The CEQA Statutes and Guidelines indicate that a significant energy impact is one that would either greatly increase energy consumption or one that would require the identification of new energy sources.

IMPACTS

As discussed more fully in Chapters 1 and 2 of this EIR, the key change in the CMP contained in the 1993 CMP Update is the addition of the deficiency plan approach with its Tool Box menu of credits and debits that must be used by local jurisdictions to offset development-related impacts on the CMP transportation network. As explained in detail in Section 3.1 of this chapter, in order to analyze the potential impacts of the proposed deficiency plan approach, two scenarios were simulated using the Countywide Travel Model, a Trip Reduction Emphasis scenario and a Capacity Enhancement scenario. In addition, the No-1993 CMP Update - Year 2010 Baseline Scenario was run for comparison purposes.

Direct Impact - These scenarios and the corresponding fuel consumption are shown on **Table 3.4.2**. As shown in **Table 3.4.2**, the Trip Reduction Emphasis scenario would result in reduced consumption of approximately 100,000 gallons per day when compared to 2010 baseline conditions. When compared to 2010 Baseline Conditions, the Capacity Enhancement Emphasis scenario would not result in a gasoline consumption reduction, and would result in a 1 percent increase in fuel use compared to the 2010 baseline (approximately 100,000 gallons). Given the flexibility provided local jurisdictions in their choice of Tool Box

measures, the proposed deficiency plan approach would have a **beneficial impact** on energy use on a Countywide basis.

TABLE 3.4.2 COMPARISON OF DAILY ENERGY CONSUMPTION, LOS ANGELES COUNTY STREETS AND HIGHWAYS

Scenario	Vehicle Miles (millions)	Fuel Consumption (millions of gallons)
2010 Baseline	202.9	7.7
2010 With Demand Reduction Emphasis	201.0	7.6
2010 With Capacity Enhancing Emphasis	205.2	7.8

SOURCE: Metropolitan Transportation Authority, CMP Countywide Travel Model, 2010 Results. Fuel consumption in gallons per vehicle mile based on SCAQMD CEQA Manual, Table A9-5-0. A 0.038 gallons per vehicle mile (26.3 mpg) is assumed.

It should be recognized, however, that as local jurisdictions place more emphasis on TDM-intensive measures, the energy consumption characteristics of alternate travel modes will become a more significant part of the energy consumption equation. Specifically, emphasis on transit would increase consumption of fossil fuels for electric power generation for rail transit and commuter rail, as well as for electric buses and cars. In the short-term, an emphasis on transit would also increase diesel fuel consumption by existing bus fleets serving the County. Overall, it should be emphasized that a shift toward high vehicle occupancy modes would increase energy efficiency in the County by decreasing energy consumption per person trip. This would be a **beneficial impact**.

It is possible that there would be increases in fuel consumption in and around transit stations or park and ride lots due to increased traffic delays and reduced traffic speeds at these centers. The increase in fuel consumption is not anticipated to have a material affect on the overall beneficial aspects of the proposed project. Specifically, if it is assumed that fuel consumption per vehicle mile is twice as high within these center areas as it is countywide (0.076 gallons per vehicle miles versus 0.038 gallons per vehicle mile), it is unlikely that more than 1.2 to 1.5 million total vehicle miles would take place within one-half mile of approximately 50-75 potential centers throughout the County. This amount of vehicle miles traveled would be less than 1 percent of the total vehicle miles of travel and it would not increase the estimated vehicle fuel consumption factor of 0.038 gallons per vehicle

mile when the center areas are taken into account. As a result, the potential increase in energy consumption would **not be significant**.

The construction of capital projects would result in a short-term consumption of energy. However, the amount would be typical of capital construction projects and is thus not anticipated to result in a need for new energy sources or large amounts of energy. Construction energy use would be greater under the capacity enhancement than the trip reduction scenario. However, under both scenarios, the short-term consumption of energy for construction purposes would be a **non-significant impact** of the proposed project.

MITIGATION MEASURES

None required.

3.5 LAND USE

This section of the EIR examines the potential of the 1993 CMP Update to systematically alter land use in a way which would result in a distribution of land uses, which is: (1) significantly different than the GMP policy future; or (2) constitutes a systematic alteration in the markets for office, industrial, and residential uses.

SETTING

Land use within the 4,060 square miles of Los Angeles County is characterized by the density and distribution of housing and employment. The generalized distribution of these factors is shown in **Table 3.5.1 and 3.5.2**.

Figures 3.5.1 through 3.5.4 illustrate the generalized distribution of housing units and non-residential space (office, retail, and industrial) in the 4,060-square mile area of Los Angeles County. Future land use decisions are guided by the general and specific plans of each jurisdiction within Los Angeles County. At the regional level, the SCAQMD and the SCAG have developed regional goals and objectives for the distribution of population, housing, and employment growth in conjunction with local jurisdictions, particularly through the AQMP, in order that air quality improvements can be achieved. These desired patterns are included within the adopted GMP for the region.

TABLE 3.5.1 HOUSING GROWTH TREND COMPARED TO GMP GOALS

SOURCE: SCAG, Regional Mobility Plan, Technical Appendix, 1989.

The forecast year for the GMP is 2010. As a desired policy outcome, the GMP differs from a straight line extrapolation of existing trends into the future. The analysis conducted by SCAG for the GMP indicated the following:

- Under existing trends, Los Angeles County would capture 37.6 percent of the housing growth, and 48.2 percent of the employment growth in the region. Under the GMP, the County would capture 38.8 percent, and 44.9 percent of the regional housing and employment growth, respectively, as shown on **Tables 3.5.1 and 3.5.2**.
- Within Los Angeles County, nine geographic subareas were defined for analysis. These subareas are shown on **Figure 2.3**. Under existing trends, the distribution of housing growth would favor the East San Gabriel Valley and Santa Monica Bay and, to a lesser extent, Glendale/Pasadena and Central Los Angeles. The GMP attempts to focus housing growth on Santa Monica Bay and Central Los Angeles. Employment growth trends favor Santa Monica Bay, the San Fernando Valley, and Central Los Angeles. Under the GMP, the distribution of growth would be channeled away from Santa Monica Bay and Central Los Angeles and encouraged in the East San Gabriel Valley and the Santa Monica Mountains, as shown on **Table 3.5.2**. Within the region, housing would be channeled into Los Angeles County and employment would be channeled out of the County into other portions of the SCAG region.

It should also be recognized that, as yet, the GMP does not provide specific requirements and regulations to achieve the desired land use distribution patterns. Discretionary approvals regarding the character and intensity of growth are a function of local decision making. Growth pressures at the local level are a function of market conditions, local land use policies, and growth objectives. Thus, there currently exists no method by which the goals and objectives contained within the GMP may be confidently achieved.

Within Los Angeles County there are established and emerging markets for office, retail, and industrial space and for single- and multi-family housing. For example, the strongest office space markets are in West Los Angeles-Century City, Downtown Los Angeles, Glendale-Burbank, and the South Bay. Industrial markets are strong in the South Bay and along the I-10/SR60 corridor in the eastern portion of the County. Single-family home markets are strong in the areas at the urban fringe, such as north San Fernando Valley, eastern San Gabriel Valley, and the Antelope Valley.

THRESHOLDS OF SIGNIFICANCE

The basic focus of the CMP provisions will be at the jurisdictional level. It will be local jurisdictions, that, in order to meet the requirements of the deficiency plan program, will need to select Tool Box measures to offset the effects of residential and non-residential growth. The assessment presented herein will provide a methodology to test whether the combined effect of these local decisions will:

- Systematically result in land use patterns substantially different than those anticipated in the GMP.
- Systematically alter land use development patterns associated with the office, industrial, retail, and residential markets.

Either of these types of alterations in land use would be significant.

IMPACTS

It should be emphasized that it is not possible to actually predict how decision makers in a given jurisdiction will respond to the program requirements and which Tool Box measures will be selected. However, for the purposes of this assessment, several possible local response scenarios have been identified; these response scenarios will be evaluated to determine the propensity to significantly shift land use patterns.

The potential areas of local response will entail how Tool Box mitigation measures would be funded and whether capacity enhancing or demand reducing Tool Box measures are selected. Possible funding scenarios are as follows: use of local revenue; imposition of transportation costs; use of development charges or fees; and use of land use incentives. The land use implication of each of these measures is described below. The choice of Tool Box measures are discussed under each of these funding scenarios only when a local jurisdiction's choice of Tool Box measures at the capacity enhancing or demand reduction end of the program implementation bracket would affect the degree of land use impact.

Use Local Revenue Scenario

A jurisdiction could elect to pay for required mitigation measures through various local funding sources (i.e., General Funds, Local Return Sales Tax, State Gas Tax return, Redevelopment Funds, etc.). Jurisdictions exercising this option would tend to be fiscally sound, having revenues exceeding expenditures in their current budgets. Data on local jurisdictions' 1992 budgets suggest that about 35 percent

of the jurisdictions in Los Angeles County had revenues that exceeded expenditures. Moreover, 28 percent of the jurisdictions were operating with an unfavorable expenditure to revenue ratio during this time period. Fiscally sound jurisdictions could pursue this option with the recognition that increased retail sales and other taxes generated by new development would offset the potential costs of mitigation measures.

Land Use Effect - No direct land use effects would result from this approach. Indirectly, however, a consistent use of General Fund revenues could reduce some other function or service within the jurisdiction. Should this reduction become a significant local issue, it is possible that local pressure could be applied to curtail or slow the rate of development and indirectly affect land use. This outcome is unlikely, however, because new development would generate revenue, new sources for the City that could be used to maintain existing functions and service levels in the jurisdiction, although the actual costs associated with implementing Tool Box mitigation measures could be either greater or less than projected revenues associated with a particular project. Overall, the use of local revenues would not result in significant impacts.

Impose Direct Transportation Costs Scenario

Some Tool Box mitigation measures, particularly TDM-intensive measures, could be funded by imposing direct costs such as, parking fees on drivers.

Land Use Effect - A cost or fee directly imposed by a local jurisdiction on a transportation mode choice, such as auto travel or parking, as well as incentives offered for transit use, such as pass subsidies and free shuttle service, will likely affect travel behavior but have no direct or indirect effect on land use.

Use of Development Charges or Fees

To pay for required mitigation measures, a local jurisdiction may seek exactions from developers. The amount of these exactions could vary significantly depending on the degree to which local jurisdictions pursue capital-intensive projects, rather than TDM-intensive projects. The added costs would likely be passed on to tenants or consumers in the form of higher leases, reduced free rent on long-term leases, or higher product prices.

Land Use Effect - In theory, the imposition of exactions in the form of development fees runs the risk of discouraging development if the fees cannot be passed on and readily absorbed. As a practical matter, the jurisdictions most likely to impose exactions would be those in which a significant amount of development

is taking place, which is indicative of strong market support. Under strong market conditions, costs can be passed on to tenants and consumers in the form of higher leases or product prices and no change in land use development patterns would be apparent. In weak or marginal market conditions, exactions would likely slow development or cause a geographic shift in the development pattern. It should be recognized, however, that under weak market conditions there would be a weaker demand for development and a corresponding lessening of the need to provide CMP-based mitigation measures. Thus, the land use shifts would be small or minor in nature.

In theory, it is possible that the imposition of exactions would increase the potential for development to shift to areas where there would be no exactions or other added development costs. The potential for a jurisdiction to capture the development from another jurisdiction is limited, particularly when it is recognized that the CMP and its deficiency plan requirements are a countywide program affecting all jurisdictions. In order for a jurisdiction to capture new growth, it would also require a means of funding Tool Box measures to mitigate the effect of the new growth.

Jurisdictions in strong, established markets where future growth is generally forecasted are less likely to lose their share of development even though the cost of development may increase directly or indirectly. Jurisdictions in weak, untested markets will have less of an incentive to practice "fiscal zoning" or seek other methods of capturing growth from established areas because of the mitigation cost associated with the CMP program. New development is unlikely to be channeled into weaker markets, but could be channeled into market areas slightly weaker than the preferred market areas. The likelihood that new development will be channeled into weaker market areas by exactions is offset by the reduction in likely profit margin and may be completely eliminated or channeled into other regions in the absence of available local markets. Growth could hypothetically be captured and shifted from an established to an unestablished market if the city capturing the growth had amassed a large amount of mitigation credits. This would be an unlikely occurrence, however, because large amounts of mitigation credits may only be possible when capital improvements are selected, in transit corridors, or around transit stations. These types of improvements are typically designed to serve either existing development or strong market areas. Thus, the possibility of a less developed jurisdiction capturing growth in this way would be minimal.

The CMP appears not to significantly alter existing growth patterns and is consistent with established land development markets.

Land Use Incentives For Development To Occur In Transit-Type Corridors

Local jurisdictions may elect to provide mitigation by creating development incentives in the vicinity of transit stations or transportation terminals. Incentives would likely entail measures having a monetary value to developers such as reduced parking requirements, increased density bonuses, and expedited project processing and approval time.

Land Use Effect - As discussed above, it is anticipated that the overall effect of the CMP program on land use would not significantly alter current market trends and that too little incentive for growth to shift to untraditional growth areas would be provided. Under these circumstances, the creation of land use development incentives in transit corridors and/or transit station areas would induce the redistribution of development within a jurisdiction rather than capturing growth from other jurisdictions. This localized redistribution of development would result in greater densification of transit corridors and/or station areas. This type of change would be consistent with the objectives of the GMP and it would not likely have a significant effect on market-based land use patterns. Due to assumed reduction in trips and trip length within these areas, the overall affect would be **beneficial**.

Cumulative Effects

A final aspect of local Tool Box choices is the potential cumulative effect on land use. Of particular concern are local jurisdictions that may overwhelmingly select TDM-intensive measures or make choices that tend to favor capital intensive measures. In this situation, the management and incentive nature of TDM-intensive measures is focused on travel behavior and, as a result, the effect on land use would be indirect. If capital improvements were concentrated in undeveloped portions of the County, it could be argued that these improvements would induce growth in less developed areas by providing the necessary transportation infrastructure. However, the type of capital improvements that are likely to be considered are not geographically concentrated and in most cases are gap closure or retrofit projects on existing facilities that would not extend the County transportation system into less developed areas. As a result, a TDM focus or capital improvement focus would not appear to systematically affect land use development patterns in the County. **No significant land use impact** is anticipated.

As can be seen from the above discussion, the range of funding or mitigation responses that may be taken by local jurisdictions, whether it be use of local revenue sources, direct charges, or land use incentives for funding, or selection

of capacity enhancing or demand reduction enhancing mitigations, is not anticipated to result in significant adverse impacts.

MITIGATION MEASURES

The discussion presented above indicates that the 1993 CMP Update would not have a significant impact on land use patterns within the County under any of the local response scenarios discussed above. Furthermore, it is anticipated that local responses would have no adverse effects on achieving the objectives of the AQMP and its underlying GMP. As noted above, however, there are no overriding regulations that require local jurisdictions to approve land use developments in a manner consistent with the AQMP and GMP. In the absence of such regulations, the CMP, by requiring annual reporting of development growth in local jurisdictions, can monitor growth trends and roughly establish the correlation between Tool Box measures that are being selected by local jurisdictions and the resulting land use development consequences.

- 3.5.1 In order to ensure that the CMP is contributing to achieving the objectives of the GMP, the MTA shall evaluate the growth patterns and determine whether CMP Tool Box choices have a significant correlation to the changes in land use patterns in the County, if any, after the Deficiency Plan program has been in place for 5 years.

3.6 PUBLIC SERVICES

This section of the EIR is intended to address two major kinds of questions regarding the 1993 CMP Update's potential to impact public services: (1) will compliance with the administrative implementation aspects of the 1993 CMP Update result in a diversion of local jurisdictional resources away from the provision of other services to a degree which significantly impacts the provision of public services; and (2) will compliance with the CMP divert fiscal resources away from the provision of other services to a degree that significantly impacts the provision of public services? These are the two areas of public service related concern expressed by local jurisdictions during the development of the deficiency plan approach.

Potential impacts on specific public services associated with the GMP were discussed in the EIR for that plan.⁶ The RMP was developed to be consistent with

⁶Draft Environmental Impact Report On The Southern California Association of Government's Draft Growth Management Plan. October 1988. State Clearing

the GMP. The CMP is designed to be consistent with the RMP and the deficiency plan model runs are based on the land use future analyzed in the GMP EIR. The focus of this public service impact assessment was established, based on the prior analysis of impacts on specific public services contained in the EIR for the GMP, the CMP's relationship to the RMP and GMP, the programmatic nature of the 1993 CMP Update, and the nature of the public service concerns expressed by local jurisdictions.

SETTING

Existing Related Local Jurisdiction Administrative Requirements

In order to understand the 1993 CMP's potential to create the two kinds of public service impacts under analysis, it is important to be familiar with the existing administrative requirements of related programs, and the availability of formula allocated public funds which can be used for CMP deficiency mitigation. These two things affect the degree of additional administrative and fiscal burden created by the 1993 CMP Update and thus a judgement about whether the additional administrative burden and potential "costs" of deficiency plan compliance are significant.

The Adopted CMP

The MTA adopted a first year CMP which provided local jurisdictions with flexibility in meeting their CMP responsibilities and which stressed the benefits of coordinating a mix of transportation solutions, transportation and land use programs, and cooperation with neighboring jurisdictions. Under the adopted CMP, each local jurisdiction is responsible for:

- Monitoring the attainment of LOS standards and the collection of traffic data for CMP routes on an annual basis.
- Adopting and implementing a TDM ordinance by April 1, 1993.
- Municipal transit operators submitting data for CMP transit monitoring.
- Adopting and implementing a program to analyze the impacts of land use decisions. Local jurisdictions were required to adopt their CMP land use analysis program by April 1, 1993.

House Number 88062924.

Transportation Control Measures (TCM) Reporting

The South Coast Air Basin presently fails to meet the National Ambient Air Quality Standards or the California Clean Air Act (CCAA) standards for ozone, carbon monoxide, nitrogen dioxide and particulate matter. The federal Clean Air Act requires the South Coast Basin to attain the federal primary ambient air quality standards for ozone by 2010, the standard for particulate matter by 2001 and the standards for carbon monoxide and nitrogen dioxide by 2000. The CCAA requires all nonattainment air basins in the state to develop new attainment plans to meet federal and state air quality standards and to reduce unhealthful pollutant levels by 25 percent in 1994, 40 percent in 1997, and 50 percent in 2000. If the Basin does not meet the federal requirements, it may lose substantial federal funds for infrastructure.

The AQMP adopted by the SCAQMD and SCAG is structured to bring the Basin into compliance with or to exceed the state and National Air Quality Standards.⁷ The CCAA requires severe nonattainment areas to achieve an average of 1.5 or more persons per vehicle during commute hours by 1999. On a regional basis, this substantially exceeds the scope of SCAQMD's Regulation XV which sets the same goal but applies only to businesses with 100 or more employees. To close this gap, the 1991 AQMP contains a number of strategies, including person work trip reduction, non-motorized transportation, employer rideshare and transit incentives, parking management, High Occupancy Vehicle (HOV) facilities, transit improvements, enhanced Regulation XV, trip reduction for schools, and special activity center trip reduction.⁸

Under the AQMP, local governments are responsible for reducing emissions by energy conservation, dust control, and trip reduction. They are required to implement new regulatory ordinances, administer changes to the project review process, and assist with enforcement and data collection for monitoring effectiveness. The AQMD encourages local governments to implement TCMs at the local level and encourages local governments to take actions that will address both the AQMP and the CMP.

Local jurisdictions are currently required to report on actions taken to further implementation of TCMs listed in the 1979 State Implementation Plan (SIP), the 1989 AQMP, and the 1991 AQMP, and the 1992 CO Plan. The TCM measures that local jurisdictions are required to report on are listed in **Table 3.6.1**.

⁷Final 1991 AQMP, July 1991. SCAQMD.

⁸For additional information, please see page 6-6 of the 1991 AQMP.

SOURCE: MTA

TCM progress reporting is required to enable completion of two reports, the Expedious Implementation Report for the Amendment to the Fiscal Year (FY) 1993-1999 RTIP which is required by SCAG and is transmitted to the U.S. Environmental Protection Agency and the Federal Highways Administration, and the California Air Resources Board (CARB) Report prepared by the SCAQMD for transmittal to CARB. Local jurisdictions must prepare a report detailing, for each TCM, proposed local actions to implement the TCM, the AQMP target date, the local VT/emission reduction target date, the jurisdiction's status and schedule with regard to implementation, and the jurisdiction's implementation actions to-date.

Fiscal Resources For Transportation Projects

Local jurisdictions currently have access to an array of federal, state, and local funding sources for transportation purposes. While the older sources of funding, such as Motor Vehicle License Fees, are limited to street and highway use, the newer state and federal sources generally allow more flexible uses and include alternative transportation, transportation control measures, and demand management. As shown in **Tables 3.6.2 and 3.6.3**, the following funding sources can be used by cities and the County, respectively, to fund projects for which local jurisdictions can receive CMP deficiency plan mitigation credit:

Los Angeles County Sales Tax Funds - Funds from Propositions A and C, which each represent a 1/2 cent increment on the county sales tax, have a mandatory set aside for return to local jurisdictions. This local set aside may be used for CMP deficiency plan mitigation projects. The funds are apportioned to local jurisdictions according to their percentage of population in the county as a whole. Local jurisdictions have discretion for allocation of these monies provided they are within the broad transit and TDM guidelines of the Propositions. They can also be used for certain street improvements that will facilitate transit use, i.e., concrete bus pads on streets with heavy transit use. While the amounts generated by these Propositions vary somewhat with the economy, together, they generate about \$700 million annually, countywide, with approximately \$140 to \$175 million returned to the county and the cities.

Motor Vehicle License Fee Funds - 81.75 percent of the funds generated from state Motor Vehicle License Fees are allocated 50 percent to cities and 50 percent to counties. The allocation to each city is based on the proportion of its population to the total population of all cities. The allocation to counties is based on the proportion of its population to the total population of all counties. The apportion amounts are estimated at \$34.65 per capita for cities and \$28.22 per capita for counties. These Motor Vehicle License Fee funds can be used for general street and highway purposes.

TABLE 3.6.2

SOURCE: Marcia Mednick & Associates

The remaining 18.75 percent of the Motor Vehicle License Fees are allocated to cities that did not levy a property tax in the 1977-78 fiscal year (no-property-tax-cities); to cities which incorporated prior to June 5, 1987 and which are identified as low property tax cities; and to all counties. There are 20 cities in Los Angeles County which are eligible for the no-property-tax subvention. They receive annual amounts ranging from a low of \$34,348 a city with a population of less than 8,000 to a high of \$426,473 for a city with a population just under 100,000.

AB 2766 Funds - Assembly Bill 2766 provides for an additional \$4.00 motor vehicle registration fee to fund implementation of the AQMP and provisions of the CCAA relating to mobile sources of emissions. Forty percent of the total collected, or \$9.3 million statewide, is distributed on a population basis to cities and counties to be used in implementing programs to reduce air pollution from motor vehicles. These funds can be used for TDM.

Intermodal Surface Transportation Efficiency Act (ISTEA) Funds - The monies available from the collection of programs identified in the 1991 Intermodal Surface Transportation Efficiency Act (ISTEA) and clarified in California SB 1435 are apportioned to each city and county based on population. These replace previously received Federal Aid Urban and Secondary funds which cities and counties used for road and highway improvements. The ISTEA program provides substantially greater flexibility in allowable uses of funds. Surface Transportation Program (STP) funds established under ISTEA are intended for congestion relief. Eligible uses include transit capital projects, TDM, as well as arterial road improvements. In Los Angeles County, a portion of the funds, called STP Local funds or Guarantee funds are directly apportioned to the Cities and the County for eligible uses. These funds may be used for CMP deficiency plan mitigation projects. Local jurisdictions have been awarded these funds since 1990. However, they must comply with the CMP in order to continue receiving these monies. The entities receive 110 percent of the funding levels they received under the previous programs. All projects funded with federal STP funds require an 11.47 percent local match and projects must be included in the RTIP prepared by SCAG.

State Gasoline Taxes - The cluster of State Highway Users Taxes (Sections 2104, 2105, 2106, 2107, and 2107.5) collectively generate approximately \$102 million for the County and \$138 million for allocation to the cities from the state gasoline tax. These are distributed to the cities by their percentage of total population within the County for Section 2106 funds and by their percentage of total state population for Sections 2105 and 2107. County distribution formulas are more complex; Sections 2104 and 2105 rely on a formula based on the vehicle registration and the amount of maintained mileage, and Section 2106 is based on the county's percentage of

statewide automobile registration and percentage of property valuation. These State Highway User funds can be used for general street and highway purposes, which does not preclude their use for CMP eligible improvements. However, the monies available under Section 2105, which amount to 28 percent of the Highway User Taxes, are available to the cities and the county only if they comply with the provisions of the CMP. Section 2105 funds are the new gas tax funds created by the passage of the CMP legislation.

In addition, local jurisdictions which comply with the CMP are eligible to receive the following state and federal discretionary funds. These funds may not be used for project's which receive CMP deficiency plan mitigation credit.

State and Federal Discretionary Funds - These funding sources include the State Flexible Congestion Relief Funds (FCR), State Traffic System Management Funds (TSM), and Federal Congestion Mitigation and Air Quality Funds (CMAQ).

THRESHOLDS OF SIGNIFICANCE

Based on the expressed concerns of local jurisdictions' public service impacts are considered significant if (1) the public service benefits of compliance with the administrative implementation requirements of the proposed program do not outweigh the staff resource costs; or (2) compliance with the proposed program would result in a substantial diversion of city fiscal resources away from the provision of other public services.

IMPACTS

Administrative Implementation Impacts

Direct Impact: The intent of the State Legislature in passing the CMP legislation was to help develop California's economy to its full potential by providing a program for maintaining mobility on the regional transportation network. By maintaining mobility and providing a mechanism for addressing deficiencies on the network, the 1993 CMP Update will help to maintain or improve emergency vehicle response times. This would be a **beneficial impact** of both the CMP as a whole and the 1993 CMP Update.

Direct Impact: The State Legislature, through its passage of the CMP legislation imposed additional planning and reporting requirements on local jurisdictions. The MTA, in its development of the 1992 CMP and the 1993 CMP Update has attempted to design a program which minimizes the impact of legislated CMP requirements on local administrative resources. The 1992 CMP EIR acknowledged

the potential for the CMP to result in a diversion of local government personnel and revenues. As mitigation, the 1992 CMP EIR included requirements that (1) the MTA would work with local jurisdictions to investigate a countywide process to deal with future CMP implementation; and (2) the MTA would continue to work with public and private interests regarding CMP requirements to minimize adverse public/private cost impacts associated with the CMP. The 1993 CMP Update has been designed in consultation with local jurisdictions and other public and private interests. It is a countywide approach to deficiency mitigation, in keeping with the requirements of mitigations included in the 1992 CMP EIR.

General Administrative Costs of Compliance

Regardless of whether a jurisdiction chooses a demand reduction, capacity enhancing, or a combination approach to deficiency planning, the jurisdiction will experience certain administrative costs associated with report preparation, development tracking, and efforts to balance development specific and jurisdiction-wide mitigation efforts.

Demand Reduction Emphasis - Costs

The 1993 CMP Update deficiency plan procedures include a Phase II TDM option which is designed to reduce reporting requirements by providing an option to deficiency mitigation which meets both CMP and air quality compliance requirements. Regardless of whether a local jurisdiction chooses the Phase II TDM option or preparation of a deficiency plan which includes demand reduction measures, staff resources will be required, particularly during the initial years of the deficiency plan effort to formulate the parameters of demand reduction strategies, be they land use or TDM mitigation strategies, and to become familiar with reporting requirements.

Local jurisdictions are already required to formulate and report on locally implemented TCM measures aimed at demand reduction, however. Regardless of whether local jurisdictions coordinate their TCM effort with their deficiency planning, or their deficiency planning with their TCM effort, the incremental administrative burden of deficiency planning must be viewed within the context of existing TCM reporting requirements. This incremental administrative burden is further offset by the quantification of the trip reduction effects of various demand reduction strategies provided in the 1993 CMP Update. This quantification may further reduce the level of effort required of local jurisdictions as part of TCM reporting.

Capacity Enhancing Emphasis - Costs

Staff resources will be required, particularly during the initial years of the deficiency plan effort to become familiar with reporting requirements and to develop a mechanism for identifying capital improvements and TSM measures for inclusion in the deficiency plan. Part of the effort to identify TSM measures, however, is already occurring as part of the traffic analyses prepared for EIRs for mid to large-scale development projects. Local jurisdictions also already have experience in identifying and nominating capital improvement projects for inclusion in the RTIP. This effort is now part of the CMP process, but the effort was required in some form previously.

Public Service Benefits Resulting From CMP Compliance

Although compliance with the deficiency plan requirements would result in the use of staff resources, compliance with the CMP results in local jurisdictions obtaining Section 2105 and STP funds as well as being eligible for the following federal and state discretionary funds: FCR, TSM and CMAQ. In addition, some aspects of the 1993 CMP Update may create efficiencies that partially offset the administrative burden imposed by the 1993 CMP Update and the CMP program as a whole. Specifically: by encouraging cooperation between adjacent jurisdictions, the CMP may provide a transportation planning mechanism which ultimately requires fewer total staff members than if jurisdictions approached transportation planning and projects alone; the countywide approach to deficiency planning may provide a degree of certainty among jurisdictions, as well as the business community, which may reduce "over the counter" staff time; the experience of formulating deficiency plans should reduce the staff effort required of local jurisdictions to comply with air quality related reporting requirements, even if local jurisdictions do not choose the Phase II TDM deficiency plan option; when preparing EIRs for local projects, local jurisdictions can tier off the CMP EIRs and can demonstrate that regional impacts have been addressed by discussing local jurisdictional compliance with the deficiency plan component of the CMP; both the adopted CMP and the 1993 CMP update will result in the generation of data on transportation system performance and the effectiveness of deficiency plan measures which will provide local jurisdictions with additional information which may facilitate local transportation and land use planning.

Direct Impacts: Although the 1993 CMP Update will impose additional administrative requirements on local jurisdictions, these administrative "costs" are more than offset by the return in administrative time invested, that the jurisdiction will experience as a result of CMP compliance. This return takes the form of both access to formula allocation funds requiring CMP compliance, and the potential

administrative efficiencies created by the 1993 CMP. The administrative efficiencies created are greatest for local jurisdictions taking a demand reduction approach to deficiency mitigation, due to the ability to coordinate with TCM reporting. However, efficiencies are created through both a demand reduction and capacity enhancing approach to deficiency mitigation. Thus the fiscal and administrative efficiency benefits of compliance outweigh the administrative implementation costs of the 1993 CMP Update and the CMP as a whole. The proposed program would result in the use of additional staff resources, however, the impact is **not significant**, since the benefits of compliance outweigh the costs.

Fiscal Impacts

The 1993 CMP Update establishes a Tool Box of alternatives from which local jurisdictions may choose in order to offset their congestion mitigation goal, based on new development activity. Since each local jurisdiction faces its own unique set of demographic, fiscal, and political considerations the Tool Box incorporates a range of implementation options, including land use measures, TDM strategies, TSM, and capital improvement opportunities. These Tool Box measures can be implemented through a variety of funding mechanisms, including use of local revenue, imposition of direct transportation costs, use of development charges or fees, or use of land use incentives.

In selecting Tool Box measures it is anticipated that local jurisdictions will weigh specific public service needs in their community and funding considerations, and choose appropriate mitigation strategies that either enhance or minimize disruption to the jurisdiction's priorities. While the decision makers will have to weight the choice of implementation measures against the jurisdiction's specific objectives and constraints, there is a wide range of strategies included in the Tool Box to allow local jurisdictions flexibility in the choice of deficiency mitigation approaches. Local jurisdictions can choose any combination of strategies desired.

The degree to which compliance with deficiency plan requirements will result in fiscal impacts to local jurisdictions will depend on the ease of offsetting the mitigation debits from development with mitigation credits. An example of the level of effort required to offset the debits from a typical retail project was provided in Section 3.1 of this chapter. That example indicated that a hypothetical "average" local jurisdiction should be able to choose whether to approach deficiency mitigation through a mix of capital improvements and TDM measures, a capital intensive approach, or a traffic demand intensive approach. The Tool Box thus provides local jurisdictions with a great deal of flexibility regarding the choice of deficiency mitigation strategy.

Some of the mitigation strategies involve higher financial obligations than others. Such factors as local budgetary conditions, the revenue benefits of the project, the surrounding market conditions, and overall public benefit potential may affect how a particular jurisdiction responds regarding funding responsibilities. Since, local jurisdictions have a variety of funding approaches available for deficiency mitigation, the key question in assessing the fiscal impacts of the proposed program becomes whether or not there are sufficient funding mechanisms and mitigation options available for local jurisdictions to meet their deficiency mitigation obligations without needing to use general funds, or having to divert funds from the provision of other public services.

As discussed in Section 3.1 of this chapter, available funding mechanisms have been classified into four broad categories for analytic purposes. The availability of each of these funding mechanism for deficiency mitigation is described below:

Use of Local Revenue - A local jurisdiction could elect to pay for required mitigation measures through the wide array of formula allocated public funds which may be used for CMP deficiency mitigation. These funding sources were detailed in **Tables 3.6.2 and 3.6.3** and discussed under setting. These funds may be used for TSM, TDM and some types of capital improvements. These funds are targeted for these kinds of transportation related programs, and are not available for the provision of other public services. Therefore use of these funds should not result in a negative public service impact.

Imposition of Direct Transportation Costs - Some Tool Box mitigation measures, particularly TDM-intensive measures, could be funded by imposing direct costs, such as parking fees on users, such as drivers. This could potentially generate revenue for the local jurisdiction. This type of funding approach should not result in a negative public service impact.

Use of Development Charges or Fees - To pay for required mitigation measures, a local jurisdiction could require a development contribution. The amount and nature of the contribution could vary significantly depending on the degree to which local jurisdictions pursue capacity enhancing or demand reducing mitigations. This type of approach may be appropriate for TSM measures, particularly those specified as mitigations in development project EIRs, TDM, and some kinds of capital projects. This kind of approach would not require the use of public funds. As discussed in the land use section, the imposition of development charges could run the risk of discouraging development if the charges or fees cannot be passed on and readily absorbed. This could potentially discourage development and thus indirectly impact the local jurisdiction's tax revenues and thus the provision of public services. However, as a practical matter, the

jurisdictions most likely to impose charges or direct development mitigations would be those in which a significant amount of development is taking place, which is indicative of strong market support. Under strong market conditions, costs can be passed on to tenants and consumers in the form of higher leases or product prices, and no reduction in development activity will occur.

Use of Land Use Incentives - Local jurisdictions may elect to provide mitigation by creating development incentives which foster patterns of land use for which mitigation credit is available. Incentives would likely entail measures having a monetary value to developers, such as reduced parking requirements, increased density bonuses, and expedited project processing and approval times. There are a number of incentives available to local jurisdictions which do not require the use of public funds.

Direct Impact: Given these options, the variety of mitigation strategies available, and the sources of transportation specific funding available to local jurisdictions for deficiency mitigation, there appear to be adequate alternatives available to local jurisdictions to address the specific circumstances each might face. Therefore, **no significant impacts** on public service fiscal resources are anticipated from the 1993 CMP Update.

Indirect Impact: While it is difficult to predict how a particular community may respond with regard to the type of mitigation strategy that may be implemented, it is reasonable to expect that local jurisdictions will chose an approach which is consistent with the jurisdiction's current policies and which results in the least amount of disruption to the community. Since the mitigation strategies are intended to improve traffic flow throughout the region, it is logical to assume that a particular mitigation strategy should provide some public service improvements, including improved response time for emergency vehicles, improved air quality, and in some cases, additional services such as increased public transit opportunities. These would be **beneficial impacts** of the proposed program.

MITIGATION MEASURES

Although the administrative implementation impacts of the proposed program are less than significant the following mitigation will further reduce those impacts:

- 3.6.1 The MTA shall continue to work on both a state and regional level to integrate CMP deficiency plan reporting requirements with the reporting requirements associated with the AQMP in order reduce the administrative effort required by local jurisdictions.

In order to ensure that mitigation credits surplus can be carried over from year to year, the following mitigation is included.

3.6.2 The MTA shall allow local jurisdictions to carry-over from year to year any surplus credit points accumulated.

In order to ensure that local jurisdiction have a wide array of deficiency mitigation options, the following mitigation is included:

3.6.3 The MTA, as part of the biennial updates to the CMP, shall investigate adding additional measures to the Tool Box.

IV. IMPACT OVERVIEW

4.1 GROWTH INDUCING IMPACTS

The potential growth inducing impacts of the adopted Congestion Management Plan (CMP) were addressed in the Environmental Impact Report (EIR) for the 1992 CMP. The growth inducing impacts of the 1993 CMP would be essentially the same as for the adopted CMP. Therefore, the discussion from the 1992 CMP EIR is repeated here, with minor modifications based on the information contained in Chapter III of this EIR.

REGIONAL GROWTH

The CMP is designed to respond to and help to manage the congestion resulting from anticipated growth in the region. This growth is projected to be due primarily to natural increase rather than net in-migration.¹ Approximately 63 percent of the anticipated growth in population is anticipated to result from natural increase. The remaining 37 percent of anticipated growth is projected to result from an excess of in-migration over out-migration. However, growth due to net in-migration is anticipated to be the result of 3.3 million individuals migrating to the area from other countries, rather than domestic migration. These would be new residents primarily attracted to the economic opportunities available in the United States. The Los Angeles region acts as the port of entry for large numbers of Pacific Rim and Latin American migrants.

The purpose of the CMP legislation is to maintain mobility on the regional network in order to assist California's economy to develop to its full potential. The CMP and the 1993 CMP Update are oriented toward the mitigation of future deficiencies on the CMP system, with deficiencies defined as a change to Level of Service (LOS) E or additional degradation of portions of the system operating at LOS F. Given the nature of the anticipated population growth and the purpose of the CMP, it is not anticipated that the CMP would have a growth inducing impact on regional population.

GROWTH REDISTRIBUTION

The question then is, does the proposed deficiency plan approach have the potential to result in a redistribution of population and employment within the region which could be classified as a growth inducing impact? The key questions are whether the 1993 CMP Update would result in a land use future which is

¹Please see the discussion in the Regional Growth Management Plan (GMP). Pages II-2 to II-4.

significantly different than the policy land use future contained in the Regional Growth Management Plan (GMP) or which constitutes a systematic alteration in the markets for retail, office, industrial, or residential uses in the County.

As detailed in Chapter III, given the nature of the Tool Box, it is unlikely that the proposed deficiency plan approach would result in a substantial redistribution of land uses among jurisdictions in the County, for several reasons. First, while it is possible, in theory, that the imposition of exactions would increase the potential for development to shift to areas where there would be no exactions or other added development costs, that is not likely to be the case under the proposed deficiency plan approach. The potential for a jurisdiction in the County to capture development away from another jurisdiction is likely to be limited under the proposed deficiency approach, since the program affects all jurisdictions in the County and because the nature of the Tool Box measures and their funding make it unlikely that one jurisdiction will amass a substantial number of surplus mitigation credits which can be used to capture new growth. Secondly, it is unlikely that deficiency plan capital improvements would be concentrated in undeveloped portions of the County, such that they would induce growth. The type of capital improvements that are likely to be considered will in most cases be gap closure or retrofit projects on existing facilities that would not extend the County transportation system into less developed areas. Finally, the imposition of trip reduction measures for deficiency mitigation credit is unlikely to result in a redistribution of growth within the County which is attributable to the 1993 CMP Update, since the trip reduction goal of the 1993 CMP Update is less than the trip reduction goal under the Air Quality Management Plan (AQMP).

Similarly, the 1993 CMP Update is unlikely to result in a redistribution of growth between Los Angeles County and the other counties in the region which would be substantially different than the policy forecast. This is true because each of the counties in the region is charged with helping to work toward implementation of the Regional Mobility Plan (RMP), is subject to the CMP legislation and thus must also require deficiency planning by local jurisdictions, and will be subject to the trip reduction goals of the AQMP.

In addition, the proposed deficiency plan approach is unlikely to result in a substantial alteration in the markets for office, retail, industrial or housing. In general, significant factors continue to exist in the Los Angeles region which encourage a deconcentration of land use and the associated development of land in undeveloped areas. These factors have lead to Los Angeles's development as one of the world's first polycentric cities or urban regions. These factors include: 1) the desire to purchase affordable housing which has lead to development in less developed areas of Los Angeles County and in neighboring counties; 2) a desire

to attain a quality of life which avoids the consequences of urban development, such as congestion; and, 3) Los Angeles's reliance on the automobile as the major form of transportation in the region. In addition, market forces have resulted in the existing distribution of land uses within this largely developed County. When compared to the power of locational decisions that are based on market forces and quality of life issues, the deconcentration or redistributive effect of the 1993 CMP is arguably not significant.

Both very good and very bad LOS can encourage deconcentration. CMP LOS standards have been established at the threshold of system capacity, where congestion itself may create a disincentive for continued development, and for development to move to less congested areas. Because of the magnitude of congestion in Los Angeles County, the challenge of the deficiency planning effort will be to attain LOS standards. It is unlikely that improvements on the system will bring LOS above standard. Because the 1993 CMP Update is not anticipated to lead to substantial improvements above current LOS and associated increases in travel speed which would make housing in outlying areas more attractive to the region's workers it should not further the kind of deconcentration that results from ease of mobility. Similarly, by maintaining mobility at established LOS, the CMP will not encourage deconcentration related to avoidance of congestion.

In summary, the impact of the 1993 CMP on land use is anticipated to be negligible when compared to existing market and quality of life issues. The 1993 CMP will help to implement the goals and policies contained in the RMP and AQMP, but the major transportation planning and air quality objectives of these plans will not be met by the CMP alone. Thus the effects of the 1993 CMP are consistent with, but less than the effects of these two regional plans.

The other potential localized growth inducing affect of the CMP would be the encouragement of increased concentration around transportation centers and corridors. Deficiency plan projects could potentially increase the density of trips and traffic in center areas such as near transportation centers, rail transit stations, park and ride lots, etc. This would generally be considered a positive impact of the 1993 CMP Update, as it would be consistent with the objectives of the GMP. Thus, the 1993 CMP is consistent with local growth and density goals.

4.2 CUMULATIVE IMPACTS

As previously discussed, the CMP is both consistent with and would aid achievement of the RMP and the AQMP which are the two key components of the region's existing growth management strategy. Cumulative development in the region is both described in these two regional plans and controlled by the General

Plans of the 89 local jurisdictions in the County.² **Table 4.1** summarizes the projections of cumulative development contained in the RMP and GMP EIRs which evaluate the potential impacts of the growth and transportation projects anticipated to occur by the Year 2010.

The environmental effects of the transportation improvements planned for the Los Angeles region to accommodate anticipated growth are analyzed in the EIR for the RMP. The effects of these cumulative transportation improvements are summarized below:

- **Mobility and Access** - Cumulative transportation improvements would have a beneficial effect on mobility and access by maintaining mobility in an environment of continuing population and economic growth. This is considered a significant beneficial cumulative impact.
- **Air Quality** - Transportation Demand Management (TDM), Transportation System Management (TSM), growth management and AQMP Transportation Control Measures (TCM) will reduce the air impacts of growth and travel. This is considered a significant beneficial cumulative impact.
- **Energy** - Increased energy consumption will result from growth and increased travel. RMP gasoline consumption in the Year 2010 would exceed 1984 levels. However, with implementation of mitigation measures identified in the regional growth management plans (i.e., RMP, AQMP, and GMP) and supporting EIRs there would be a beneficial cumulative impact on energy.
- **Geology and Seismicity** - Construction of additional structures in areas of geologic hazards, including fault zones, liquefaction, landslide, and subsidence areas will result in increased risks. This is considered a non-significant adverse cumulative impact.

²The EIRs for the RMP and GMP have been previously incorporated herein by reference. The Final EIR for the Los Angeles County General Plan (dated March 1981) is herein incorporated by reference (SCH No. 87-121613). These documents are available for review at the MTA's offices located at 818 West Seventh Street, Los Angeles, California 90017.

TABLE 4.1 CUMULATIVE DEVELOPMENT

	Southern California	Los Angeles Region
Population	Would increase to 8.9 million by the Year 2010.	Would increase to 10.2 million by the Year 2010.
Employment	Would increase to 5.9 million by the Year 2010.	Would increase to 4.1 million by the Year 2010.
Housing Units	Would increase to 7.3 million by the Year 2010.	Would increase to 4.0 million by the Year 2010.
Transportation	<p>VMT would increase to 284,382,000 by the Year 2010.</p> <p>1,846 lane-miles of new and expanded mixed flow facilities and 1,251 lane-miles of added high-occupancy vehicle facilities would be constructed.</p> <p>The following improvements would be installed: 600 freeway ramp meters; synchronization of over 8,000 signalized intersections and physical improvement of 500 intersections to reduce vehicle-hours of delay.</p>	<p>The facilities described in the setting section of the transportation section of Chapter III would be constructed.</p> <p>The STIP projects and the TSM projects would be built.¹</p>
Air Quality	<p>Emission in tons per day would be as follows in the Year 2010:</p> <p>ROG - 231 NOX - 281 SOX - 36 PMIO - 44 CO - 2,259</p>	<p>Mobile emission in tons per day would be as follows in the Year 2010 under baseline conditions:²</p> <p>ROG - 38 NOX - 87 SOX - 20 PMIO - 36 CO - 590</p>

Note: 1) These projects are listed in Appendix D and Table 5 of the 1992 CMP EIR.
2) Based on estimates contained in Chapter 3, Section 3 of this EIR.

SOURCE: SCAG, RMP EIR

- **Biological Resources** - Several of the new highways and transportation corridors planned for the region traverse sensitive areas and will cause loss of habitat or risk to rare or endangered species. This is considered a significant adverse cumulative impact.
- **Water Resources** - Several of the regional projects may change flow patterns, increase runoff, and reduce runoff water quality. This is considered a non-significant cumulative adverse impact with implementation of mitigation measures identified in the regional growth management plans and supporting EIRs.
- **Visual Resources** - With proper design, new regional facilities will have a beneficial impact by opening access to scenic resources. Construction of new freeways and transit guideways, especially aerial alignments, can disrupt or block views. This is considered a significant adverse cumulative impact.
- **Noise** - Lower congestion may reduce trip diversion and neighborhood traffic intrusion resulting in a cumulative beneficial impact. New roadways and transit facilities constructed in the region will add to existing noise sources. Aerial alignments will expand noise contours. Alternative work schedules may create more traffic noise during sensitive times of day. This is considered a significant adverse cumulative impact which would be further studied through project level EIRs.
- **Cultural Resources** - Construction of new facilities without proper safeguards could result in destruction of cultural or scientific resources. This is considered a non-significant cumulative adverse impact with implementation of mitigation measures identified in the regional GMPs and supporting EIRs.
- **Social Impacts** - Regional transportation improvements will improve access to transportation facilities for the growing transit dependent population. These would be beneficial cumulative impacts. Some new facilities will result in displacement of houses and businesses. Construction and operation of facilities may disrupt communities. This is considered a significant cumulative adverse impact with implementation of mitigation measures identified in the regional GMPs and supporting EIRs.
- **Urban Form and Growth** - Overall, the RMP and cumulative transportation improvements accommodate planned growth and incorporate measures to improve job/housing balance. This is considered a significant beneficial cumulative impact.

- **Regional Economy** - Regional transportation improvements will provide access to employment centers, facilitate goods movement and stimulate local economies. This is a beneficial cumulative impact. Some aspects of RMP TDM measures are perceived as a cost to business. On balance, however, regional economic impacts are considered a significant beneficial cumulative impact.

In addition to these impacts, the cumulative addition of local jurisdictional planning, program implementation, and reporting requirements, which are not accompanied by additional funding, has a cumulative impact on local jurisdictional staff and fiscal resources and the ability of local jurisdictions to maintain existing levels of public service provisions.

4.3 SIGNIFICANT UNAVOIDABLE ADVERSE IMPACTS

The 1993 CMP Update would result in the creation of additional air quality hot spots. The potential for significant adverse project level impacts to remain after implementation of the project specific mitigations specified in the 1992 CMP EIR, incorporated herein, and contained in Appendix B, and mitigation developed as part of deficiency plan project specific environmental review, can only be assessed on a project specific basis.

4.4 SHORT-TERM USES VERSES LONG-TERM PRODUCTIVITY

As with the RMP and adopted CMP, many of the potential adverse impacts associated with the 1993 CMP Update are due to construction of deficiency plan related transportation facilities; although construction activities for major facilities may be phased over several years, resultant impacts must be analyzed in the context of the long-term productivity of the environment especially in mobility and related subject areas. This section summarizes the potential impacts regarding trade-offs between short-term value and long-term productivity of the environment, associated with the CMP and the addition of the 1993 Update. These are the same as for the RMP.

Land Use - With mitigation, the CMP is not anticipated to result in a long-term impact on the land use pattern described in regional and local planning documents.

Transportation - The CMP would result in long-term improvements in mobility and accessibility throughout the region.

Air Quality - The CMP will help to further long-term attainment of air quality standards and cleaner air.

Noise - The CMP would result in short-term intermittent impacts in localized areas as a result of construction of CMP projects. Regional noise levels are not anticipated to change significantly in the long term.

Geology - The CMP could result in replacement and upgrading of many facilities with improvements better able to withstand geologic hazards. However, construction of CMP projects could result in alterations to topography in the long term.

Water Resources - Construction impacts on water resources would be short-term and could be mitigated; long-term changes to water courses could potentially occur as a result of channelization and construction of culverts, etc.

Biological Resources - With mitigation, the CMP is not anticipated to result in a long-term impact on biological resources.

Cultural Resources - The CMP is not anticipated to result in long-term impacts to cultural resources with proper mitigation.

Public Services - With mitigation, the CMP is not anticipated to result in a long-term impact on public services. Short-term impacts on police and fire services resulting from CMP construction activities could be mitigated. The CMP is anticipated to result in a long-term improvement in fire and police response times.

V. ALTERNATIVES

In adopting the Regional Mobility Plan (RMP), the Southern California Association of Governments (SCAG) analyzed five alternatives to the adopted RMP.¹ Those alternatives were: the No-Project Alternative; a Facility-Intensive Response to Growth Trends Alternative; a Facility-Emphasis with Balanced Growth Alternative; a Demand Management Emphasis with Balanced Growth Alternative; and a Demand Management Response to Growth Trends Alternative. The Congestion Management Program (CMP) is required to be consistent with the RMP. Chapter V of the Environmental Impact Report (EIR) for the adopted 1992 CMP summarized the findings of the RMP alternatives analysis. That discussion is herein incorporated by reference.

The EIR for the adopted 1992 CMP contained an analysis of four alternatives to the 1992 CMP: a No-Project Existing Transportation System Alternative; a No-Project, No Future State Funding Alternative; and two alternatives designed to be consistent with the adopted RMP, but which stressed assistance in meeting different portions of the RMP program, a Transportation Demand Management (TDM) Intensive Alternative and a Capital Intensive Alternative. That discussion is herein incorporated by reference.²

This 1993 CMP EIR, therefore, looks at alternatives to the proposed 1993 CMP Update. Specifically this analysis focuses on alternatives to the proposed deficiency plan strategy. The five alternatives analyzed are as follows:

- Alternative 1 - The No-Project Alternative (No Deficiency Plan Addition)
- Alternative 2 - The No-Countywide Deficiency Plan Alternative
- Alternative 3 - The Countywide Fee Alternative
- Alternative 4 - The Monitoring-Based Approach Alternative
- Alternative 5 - The Modified Tool Box - Hot Spot Reducing Approach Alternative

Alternative 1 is the California Environmental Quality Act (CEQA) mandated No-Project Alternative.³ Alternatives 2, 3, and 4 are alternatives which were seriously considered by the Los Angeles County Metropolitan Transportation Authority (MTA), but rejected because they did not meet the MTA's goals and objectives in adopting a deficiency plan component of the CMP. Alternative 5 has been

¹Please see Chapter 6 of the Draft EIR for the RMP (State Clearinghouse No. 87-121613) previously incorporated herein by reference.

²Please see Chapter V of the 1992 CMP EIR, State Clearinghouse No. 91121063.

³See CEQA Guidelines, Section 15126, subd. (d)(2).

developed with the intent of reducing one of the few significant impacts identified for the 1993 CMP Update, hot spot air quality impacts.

5.1 THE NO-PROJECT ALTERNATIVE (NO DEFICIENCY PLAN ADDITION)

Under this alternative, no deficiency plan component would be added to the CMP and the MTA would not review and approve any deficiency plans generated by local jurisdictions. The existing adopted CMP would remain in place. The lack of a deficiency plan mechanism would result in local jurisdictions losing their Section 2105 monies, losing their ability to compete for state funding through the State Transportation Improvement Program (STIP), and the loss of federal funds linked to compliance with the CMP. The net result would be no change in the existing transportation system. None of the programmed improvements would be built. This alternative would have the same impacts as the No-Project (Existing System) Alternative discussed in the 1992 CMP EIR.

Transportation - On a systemwide basis, this alternative would result in 10,911,636 vehicle hours of travel (VHT), 5,661,786 hours of delay, and 218,389,015 vehicle miles of travel (VMT) in the region, compared to ~~7,945,118~~ **7,345,118** VHT, 2,467,030 hours of delay, and 205,154,425 VMT under the worst case (Countywide use of only capacity enhancement Tool Box strategies) for the proposed deficiency plan approach.

Air Quality - Under this alternative air quality emissions would be substantially higher than with the proposed project. Year 2010 emissions are estimated at 707 tons per day (tpd) of Carbon Monoxide (CO), 38 tpd of Ozone (ROC), 87 tpd of Nitrogen Dioxide (NOX), 22 tpd of Sulfur Dioxide (SOX), and 38 tpd of particulates (PM10) compared to 597 tpd of CO, 38 tpd of ROC, 88 tpd of NOX, 20 tpd of SOX, and 36 tpd of PM10 under the worst case scenario (Countywide use of only capacity enhancement Tool Box strategies) for the proposed deficiency plan approach.

Energy - Fuel consumption due to VMT in the County would be significantly greater under this alternative than under the proposed deficiency plan approach, 8.3 million gallons per day, compared to 7.8 gallons per day under the worst case (Countywide use of only capacity enhancement Tool Box strategies) for the proposed deficiency plan approach.

Land Use - Under this alternative, the transportation system would not be improved to accommodate anticipated growth. This would have a significant effect on future land use. It can be expected that land use would be displaced from congested core parts of the County to areas of the County where the

transportation system still had existing capacity. In addition, growth would be displaced to other adjacent counties which were still making the transportation improvements included in the RMP. Both the displacement within the County and the displacement to other counties would result in additional urban sprawl, which would in turn have an indirect impact on air quality not anticipated in the model runs which are the basis of the air emission figures cited above.

Public Services - The loss of funding for transportation improvements would likely result in local jurisdictions using additional general fund revenues for maintenance of the transportation system. This would have a significant impact on public service provision. Increased congestion on the regional network would increase emergency vehicle response times, which would be a significant impact under this alternative.

This alternative would not comply with the requirements of the CMP statute since there would be no deficiency plan component incorporated in the CMP by the time deficiencies are identified on the CMP network. This alternative would fail to fulfill the aims of the CMP legislation and would be inconsistent with the RMP. It is, therefore, not considered feasible.

5.2 THE NO-COUNTYWIDE DEFICIENCY PLAN ALTERNATIVE

Under this alternative no uniform Countywide approach to deficiency planning would be adopted. Instead, the CMP Update would specify the general content of deficiency plans, and local jurisdictions would be left to develop their plans individually. Local jurisdictions would also be responsible for determining the degree to which mitigations result in an improvement in deficiency conditions. Plans would then be submitted to the MTA for review and approval.

Under this alternative, local jurisdictions would be held responsible for mitigating any deficiencies identified on portions of the network within their jurisdiction, regardless of the degree to which they contributed to the creation of the deficiency, since no method for sharing responsibility for deficiency creation would be in place. Jurisdictions on portions of the network serving as key connectors between portions of the County would be unfairly burdened with the responsibility for mitigating deficiencies on these segments. Imposition of additional TDM requirements within the impacted jurisdiction may have little impact on curing a deficiency, since the deficiency may be largely the result of trips originating and terminating in other jurisdictions. This would mean that deficiency mitigation would primarily take the form of capacity enhancements, which have less environmental

benefit than trip reduction approaches, as a general rule.⁴ Local jurisdictions on heavily traveled portions of the network would thus have the burden of major capital improvements. Jurisdictions faced with mitigation costs which exceeded the funds available to the jurisdiction from public or private sources could potentially choose to not participate in the CMP and thus lose their Section 2105 funding, their ability to compete for state funding through the STIP, and all federal funds that are linked to compliance with the CMP.

Transportation - This alternative would not encourage the degree of additional TDM activities encouraged by the proposed program, and it would place a greater responsibility for the funding of capacity enhancing mitigations on jurisdictions containing heavily traveled portions of the network which act as regional connectors. This approach would increase the probability that identified deficiencies would not be mitigated, which would have a significant impact on the maintenance and improvement of the transportation system, as well as the consistency of the CMP with the RMP.

Air Quality - It is anticipated that air quality emissions would be somewhere between the levels identified for the Baseline Scenario and the levels identified for the capacity enhancement scenario for the proposed program. Air quality emissions would, therefore, be higher than under the proposed program.

Energy - Similarly, it is anticipated that energy use would be somewhere between the levels identified for the Baseline Scenario and the levels identified for the capacity enhancement scenario for the proposed program. Energy use would thus be greater than under the proposed program.

Land Use - Under this alternative, it is anticipated that unmitigated deficiencies may occur on portions of the network which serve as major County connectors and that the jurisdictions containing these portions of the network would have disproportionately high mitigation costs, which would effect their ability to mitigate deficiencies, as well as the likelihood they would enact deficiency mitigation related fees or exactions. Since the urban core portions of the County are the portions containing the majority of these segments of the network, this alternative may result in additional urban deconcentration as potential growth responds to either the additional congestion which could occur under this alternative, or the higher mitigation costs in core areas which might occur under this alternative.

⁴Please see the discussion of the capacity enhancement and trip reduction scenarios used to bracket the range of impacts of the proposed program. This discussion is contained in Sections 3.2, 3.3, and 3.4 of this EIR.

Public Services - Under this alternative, jurisdictions containing portions of the network which serve as major regional connectors would have higher mitigation costs and less ability to mitigate deficiencies through TDM and land use controls than under the proposed program, thus their mitigation costs would be higher. This could result in public service provision impacts. Unmitigated deficiencies would result in increases in the response times of emergency vehicles, which would be a significant public service impact. In addition, the lack of deficiency plan development assistance under this alternative could increase local jurisdictional staff resources used for plan development substantially.

This alternative does not meet the MTA's deficiency plan goals and objectives regarding provision of a Countywide approach, minimization of administrative costs, consistency among jurisdictions, sensitivity to the economy or jobs, or promotion of inter-jurisdictional mitigation. It is unclear the degree to which the alternative meets the MTA's remaining goals of effectiveness and flexibility of actions or transit enhancing land use. Therefore, this alternative was rejected by the MTA.

5.3 THE COUNTYWIDE FEE ALTERNATIVE

The Countywide Fee Alternative received extensive investigation, prior to rejection by the MTA Board, as part of the development of the adopted CMP. Under this alternative, a Countywide traffic impact fee would be imposed on new development. It would be established based on a nexus study which would establish the casual connection between the creation of deficiencies on the network and development activity. The fee would be used to fund capacity enhancements on the regional network.

Transportation - This alternative would have similar transportation system benefits as the capacity enhancement scenario discussed for the proposed program. Therefore, the benefits would be somewhat less than under the proposed program, which is likely to result in a combined use of demand reduction and capacity enhancement strategies, on a Countywide basis.

Air Quality - This alternative would have similar air quality benefits as the capacity enhancement scenario discussed for the proposed program. Therefore, the benefits would be somewhat less than under the proposed program, which is likely to result in a combined use of demand reduction and capacity enhancement strategies, on a Countywide basis.

Energy - This alternative would have similar energy benefits as the capacity enhancement scenario discussed for the proposed program. Therefore, the benefits would be somewhat less than under the proposed program, which is likely

to result in a combined use of demand reduction and capacity enhancement strategies, on a Countywide basis.

Land Use - The countywide fee would be imposed Countywide. It is possible that this would make development less attractive in areas with weak markets, than in areas with strong markets, but it is difficult to ascertain without conducting special land use impact related studies for this alternative, whether or not it would result in a systematic displacement of land uses. Any development inhibiting impacts of this alternative are likely to be greater than under the proposed program, which allows flexibility in the degree to which mitigations are funded with public or private resources.

Public Services - This alternative would not require local jurisdictions to use their existing fiscal resources to fund capacity enhancements under deficiency plans. Less staff resources would be required for deficiency planning purposes than under the proposed program, since much of the responsibility for deficiency mitigation identification and implementation would be conducted by the MTA. This alternative is, therefore, likely to have less public service impacts than the proposed program. If this alternative did, however, act as a disincentive to development activity within the County, it could have an indirect impact on local jurisdictional fiscal resources by reducing revenues.

This alternative was rejected by the MTA because it met fewer of the MTA's deficiency plan goals and objectives than the proposed program. Specifically, it did not provide the deficiency mitigation and funding flexibility of the proposed program, the sensitivity to the economy or jobs, or the transit-enhancing land use effects. It does meet the MTA's goals regarding a Countywide approach, minimization of administrative costs, consistency among jurisdictions, and the promotion of inter-jurisdictional mitigation.

5.4 THE MONITORING BASED APPROACH ALTERNATIVE

Under this alternative, the MTA would not provide a mitigation Tool Box. Instead, each local jurisdiction would select their own mitigation measures, monitor their effectiveness, and get credit based on the demonstrated effectiveness of their mitigation measures.

Local jurisdictions would still be responsible for calculating and mitigating the effects of development within their boundaries. The impacts of new development activity would still be calculated according to formulas prepared by the MTA staff and used countywide. However, rather than using the standardized list of options for mitigation credits, where the benefits have been prequantified by the MTA staff, each local jurisdiction would implement its own measures and, through monitoring,

determine their effectiveness in reducing the impacts of new development. The monitoring results would be submitted to the MTA for their evaluation. This alternative would add a strong element of uncertainty to the process of compliance with the CMP.

Transportation - Because jurisdictions could tend to select mitigation options where the benefits could be easily monitored and ascertained, there would be a concentration of certain capital improvements, traffic system management improvements and those demand management options that are easily quantified. Land use measures and those demand management measures that reduce or shorten the long term need for trips would be harder to monitor or quantify and would tend to be selected less frequently. As a result, this alternative is likely to result in selection of more capacity enhancing measures than the proposed project.

Air Quality - Because the selection of mitigation measures would be skewed towards capacity enhancement measures, this alternative could have similar air quality effects as the capacity enhancement scenario discussed for the proposed program. Therefore, the air quality benefits would be somewhat less than under the proposed program, which would result in selection of a mix of demand reduction and capacity enhancement measures.

Energy - Because the selection of mitigation measures would be skewed towards capacity enhancement measures, this alternative would have a similar energy use effect as the capacity enhancement scenario discussed for the proposed program. Therefore, the energy benefits would be somewhat less than under the proposed program, which would result in selection of a mix of demand reduction and capacity enhancement measures.

Land Use - While this alternative would continue the flexibility of allowing jurisdictions to choose their mitigation strategies, the short term difficulty in quantifying or monitoring the benefits of transit facilities could decrease the attractiveness of these types of mitigation strategies. This alternative could, therefore, provide less incentives for local jurisdictions to consider the siting of new development in close proximity to transit facilities.

Public Services - This alternative would place substantially more responsibility on local jurisdictions. The monitoring based approach would eliminate the element of certainty that exists in the Tool Box approach, and the reporting process would be substantially lengthened. In addition, jurisdictions would have to select appropriate monitoring strategies and conduct their monitoring on a regular basis. After implementation and monitoring a strategy, local staffs might find that it did not produce the anticipated results; they would then have to select and implement

additional strategies to mitigate their development credits. This alternative would also make the mitigation process much more subjective, requiring additional staff time from the local jurisdiction as well as from the MTA staff. The larger burden on both staffs could result in increased administrative costs for the local jurisdiction and the MTA and result in less allocated and discretionary funds available for project implementation.

This alternative was rejected by the MTA because of the administrative cost to local jurisdictions and the MTA, and because it did not meet the MTA's goals and objectives regarding transit enhancing land use, effectiveness and flexibility of actions, sensitivity to the economy and jobs, and consistency and fairness among communities and developments.

5.5 THE MODIFIED TOOL BOX - HOT SPOT REDUCING APPROACH ALTERNATIVE

Under this alternative, those Tool Box measures which are likely to result in air quality hot spots would be eliminated from the Tool Box. Strategies targeted for removal would include: land use strategies which result in an intensification of land use; rideshare support facilities such as passenger loading areas for carpools; capital improvements such as park and ride lots, transit and goods movement facilities, High Occupancy Vehicle (HOV) lanes and general use highway lanes; and some transportation systems management improvements, such as, potentially some intersection modifications.

Transportation - Classes of project's included in the RMP would be precluded from nomination for STIP funding under this alternative. The prohibition on projects which create air quality hot spots would, therefore, be inconsistent with the RMP. This would invalidate the CMP and could, under a worst case scenario, result in the same effect as the No-Project Alternative.

Air Quality - As long as sufficient strategies remain in the Tool Box to allow local jurisdictions to meet their mitigation obligations, air quality impacts should be similar on a regional level as under the proposed program.

However, elimination of all hot spot producing mitigations is likely to constrain the choices available to jurisdictions such that impacts would be somewhere between those of the proposed program and the No-Project Alternative. If this alternative is found inconsistent with the RMP, the effect could be the same as the No-Project Alternative. This alternative would reduce or eliminate the hot spot impacts identified for the proposed program.

Energy - As long as sufficient strategies remain in the Tool Box to allow local jurisdictions to meet their mitigation obligations, energy impacts should be similar on a regional level as under the proposed program. However, elimination of all hot spot producing mitigations is likely to constrain the choices available to jurisdictions such that impacts would be somewhere between those of the proposed program and the No-Project alternative. If this alternative is found inconsistent with the RMP, the effect could be the same as the No-Project Alternative.

Land Use - Land uses effects would generally be similar as those under the proposed program as long as deficiency mitigation occurred. Otherwise, land use effects would be similar to the No-Project Alternative.

Public Services - This alternative would provide local jurisdictions with fewer Tool Box measures and thus less flexibility in meeting deficiency mitigation targets. Less flexibility could result in greater staff resources needed for deficiency planning and greater use of fiscal resources. Local jurisdictions would be limited in the projects they could nominate for the STIP. If this alternative is found inconsistent with the RMP, local jurisdictions could lose their Section 2105 funding, their ability to compete for state funding through the STIP, and all federal funds that are linked to compliance with the CMP.

This alternative would provide less flexibility of action than under the proposed program. It may be difficult to achieve the MTA's goals and objectives regarding the promotion of transit enhancing land uses, and this alternative may not be found consistent with the RMP. Given the number of strategies which could product hot spots, this alternative is unlikely to meet the CMP statute's requirement to measurably improve congestion and air quality.

5.6 THE ENVIRONMENTALLY SUPERIOR ALTERNATIVE

Alternative 5, the Hot Spot Reducing Approach will have less air quality hot spot creating impacts than the proposed program. However, regional air quality impacts may be greater if the Alternative is found inconsistent with the RMP. By providing for fewer Tool Box measures, the alternative will make it more difficult for local jurisdictions to meet their deficiency mitigation obligations. This may result in greater public service impacts than the proposed program. This alternative is, therefore, not clearly environmentally superior to the proposed program. It would be clearly inferior to the proposed program if found inconsistent with the RMP.

In addition, this alternative would be less able to meet the MTA's deficiency plan approach goals and objectives. It would provide less flexibility of action than under the proposed program and it may be difficult to achieve the MTA's goals and objectives regarding the promotion of transit enhancing land uses.

The other alternatives are clearly inferior to the proposed 1993 CMP Update deficiency plan approach. Alternative 1, the No-Project Alternative, would have negative transportation, air quality, energy, land use, and public service impacts. Alternative 2, the No-Countywide Deficiency Plan Approach Alternative, would have less air quality and energy benefits than the proposed program and it could have negative transportation, land use, and public service impacts. Alternative 3, the Countywide Fee Alternative, would have less transportation, air quality, and energy benefits than the proposed program, and could have land use impacts. Public service effects may be less than under the proposed program, however, Alternative 4, the Monitoring Based Approach Alternative, would have less transportation, air quality, and energy benefits than the proposed program. It would encourage less densification around transit stations and it would result in significant public service impacts.

VI. REPORT AUTHORS AND CONSULTANTS, PEOPLE AND ORGANIZATIONS CONSULTED

EIR CONSULTANTS

This report was prepared for the Los Angeles County Metropolitan Transportation Authority by Willdan Associates. Mr. Steve Nystrom was the Principal Planner-In-Charge. Dr. Susan O'Carroll was the Project Manager.

The transportation analysis contained in this report was prepared by Meyer, Mohaddes Associates, Inc. Mr. Gary Hamrick was the Task Manager.

The land use, air quality, and energy analyses contained in this report were prepared by Terry A. Hayes & Associates. The Mitigation Monitoring Program for the proposed project was also prepared by Terry A. Hayes & Associates. Mr. Terry Hayes was the Task Manager.

Ms. Marcia Mednick of Marcia Mednick & Associates, Inc., assisted with the preparation of the public services analysis.

All of the above-named consultant team members participated in the development of the analytic strategy.

VIII. COMMENTS RECEIVED ON THE DRAFT ENVIRONMENTAL IMPACT REPORT AND AGENCY RESPONSES

The Draft Environmental Impact Report (DEIR) for the 1993 Congestion Management Program (CMP) Update was released for public comment on July 30, 1993. The close of the public comment period was 5:00 p.m. on September 13, 1993. Comments on the DEIR were requested to be marked as such and directed to:

Kendra Morries, Land Use Project Manager
Los Angeles County Metropolitan Transportation Authority
818 West Seventh Street (M/S 2200)
Los Angeles, CA 90017

In addition, the Los Angeles County Metropolitan Transportation Authority (MTA) accepted comments at two public workshops on the document, and by fax. Fax comments were directed to be sent to Ms. Kendra Morries, no later than the close of the public comment period at the following number: (213) 244-6025. The two public workshops were held at the following locations on the following dates:

Tuesday, August 24, 1993
1:00 p.m. Union Station Room
Los Angeles County Metropolitan Transportation Authority
818 West Seventh Street
Los Angeles, California

Wednesday, August 25, 1993
2:00 p.m., Auditorium Room
City of Long Beach Gas Department
2400 East Spring Street
Long Beach, California

The transcript and attendance for the workshops is provided in Section C of this response to comments. None of the workshop attendees elected to comment on the DEIR at the workshops.

Notice of the availability of the DEIR and the public workshops was published in the Los Angeles Times on the following date: August 5, 1993. Concerned parties were also notified through the MTA's monthly CMP Technical Forum and CMP Policy Advisory Committee (PAC) meeting and through the CMP newsletter, Up To Speed.

Comments on the 1993 Draft CMP Update were solicited separately. Comments on the program were requested to be submitted by 5:00 pm on September 9, 1993. Program comments were requested to be mailed or faxed to Mr. Ed

Shikada. MTA staff has prepared responses to comments received on the program. That document is herein incorporated by reference.¹ A summary of program changes made in response to comments received on the program is provided in Response to Comment 41 on the DEIR.

Appendix A of the DEIR contains a complete list of the acronyms used in this Response to Comments, as well as their definitions.

¹*Los Angeles County Metropolitan Transportation Authority, Congestion Management Program, Comment Letters Received and Agency Responses, July 1993 Draft CMP.* This document is available for review at the offices of the MTA located at: 818 West Seventh Street, Los Angeles, California 90017.

RE: 1993 Update Los Angeles County Congestion Management Program -
 Draft Environmental Impact Report

Dear Ms. Morries:

Thank you for providing SCAG with the opportunity to review and comment on the 1993 Congestion Management Program (CMP) Environmental Impact Report (EIR). SCAG has reviewed the EIR and has the following comments.

Modeling Analysis

It is suggested that land use and air quality impacts associated with the CMP are generally consistent with those described in the 1989 Regional Mobility Plan EIR. Therefore, the impacts have been evaluated and incorporated in previous regional planning efforts.

1

Emission Factors

It appears that EMFAC7EP was used as opposed to the most recent factors, EMFACE7EPSCF2. The emission calculations should be adjusted accordingly.

2

Land Use Analysis

Improved congestion may induce more trips per household or may result in increased development with each effect resulting in increased trips. The end result may be more trips and longer trips. SCAG's basic concern is that, although the DEIR acknowledges this impact, increased trips due to improved access to different destinations have not been considered.

Deficiency Plan Alternative

SCAG does not agree that the findings for consistency for the 1992 CMP also applies to the Deficiency Plan Alternative. Notably, transportation control measures are not addressed in the Deficiency Plan Alternative. SCAG views the Deficiency Plan Alternative as a major update and new element to the 1992 CMP.

4

Additionally, the number of points assigned to different strategies appears to suggest a prioritization of the strategies. However, the unit of measure assigned to reflect the point values for the different categories are not comparable. As a result it is not possible to actually tell which is of greater priority.

5

For example, growth management plays a unique foundational role in making other emission reduction strategies presented in the Tool Box more effective. Urban form is probably the most powerful long term determinant of transportation behavior, and numerous individual TCM strategies depend for their success on complementary land use decisions. Additionally, growth management measures are relatively permanent, thus ensuring long term effectiveness in improving congestion and reducing emissions. Further, it is easier to influence travel patterns to and from new development simply through selecting appropriate siting, pedestrian and transit friendly design. Finally, efficient land use planning ensures emission reductions and an efficient transportation system. Local jurisdiction need to consider this opportunity wherever new development is proposed.

6

Other Comments

Page 18 - second Paragraph - SCAG recommends highway, transit and TDM and Operational improvements for inclusion in the STIP.

7

Page 29 - The Phase II TDM program provides local jurisdictions with the option of meeting the deficiency plan requirements through adoption a Phase II TDM Program which meets the more stringent AQMP TCM requirements. No information is provided regarding this Phase II program nor how it will achieve the TCMS of the AQMP. This appears to be a proposed alternative that should have been considered for analysis in the EIR if indeed the Phase II program would be used for both CMP and AQMP purposes.

8

Page 33 - No mention is made of how the effectiveness of the individual strategies that are in the toolbox will be determined. In addition, some discussion of the assignment of mitigation values to the various strategies should be provided.

9

Ms. Kendra Morries
September 13, 1993
Page 3

Page 34 - The EIR should look at implementing the RMP to the extent possible as a scenario given that the RMP is adopted policy of the jurisdictions in the region. 10

Page 34 - Phase II TDM Program is an option that the local jurisdictions have to meet their deficiency plan requirements. How will this impact be assessed? 11

Page 34 - First bullet: Under the trip reduction emphasis - land use strategies ~~or~~ transportation demand management strategies were evaluated. These appear to be two different scenarios, each of which could result in various different outcomes. The effectiveness of these strategies should be tested independent of the other to determine the benefits to be derived and in combination to determine their impacts. This is especially important given the fact that the Phase II TDM option will be available to jurisdictions. 12

Page 34 - Third Paragraph - Trip Reduction Emphasis - The land use and TDM strategies were tested via the reduction of modeled trips in 2010 equivalent to 3 percent of the total trip-making in 2010. Given this reduction, how are the strategies actually evaluated and how do the credit points relate to the trip reductions? 13

Capacity Enhancement Emphasis - This strategy does not identify how the operational improvements mentioned are accounted for in the modeling process or in the impact assessment. 14

Overall, the document references the regional model. References to the regional model should be changed to county-wide model to indicate the distinction between the regional model developed and maintained by SCAG and the county-wide model developed and maintained by MTA. 15

Page 35 - Second Paragraph - the distribution between mixed-flow and HOV lanes should be indicated. The lane mileage should be consistent with the lane mileage within the 1989 RMP. Also, for clarification, insert "miles" after "564 lanes". 16

Page 41 - Adoption of the RME is currently scheduled for February 1994. See also Page 49, same comment. 17

Page 42 - The AB 1246 Committee recommended to the Executive Committee that the interim CMP consistency and compatibility finding be made finding and that the inconsistencies between the CMPs would be resolved in the 1993 CMPs or they would be found inconsistent. 18

Ms. Kendra Morris
September 13, 1993
Page 4

Page 42 - The CMP should be coordinated with all other SCAG adopted regional plans and policies which are included in the RMP by reference, including the AQMP, the RHNA, and the GMP.

19

Page 47 - Results of Transit Monitoring should be discussed.

20

Page 48 - First bullet - The deficiency Plan approach cannot be construed to consistent without due consideration of the other regional policy which is included by reference in the Regional Mobility Plan. Notably, the TCMS of the South Coast AQMP are not addressed in the Deficiency Plan approach.

21

Page 49 - second bullet - The document states that VMT and VHT will increase from today's levels as a result of the congestion which creates the deficiency. Congestion will not cause the deficiency. The deficiency will result from development either cumulative or project specific.

22

Page 49 - Fourth bullet - The mere availability of the strategy in the tool box may promote the strategy but it is not clear what priority the strategy has relative to the other strategies. Priorities should be developed and appropriate credits assigned relative to the priorities. These priorities should be consistent with the RMP and should promote its implementation as well as other SCAG policies, goals objectives, including TCMS.

7.1 RESPONSES TO LETTERS RECEIVED ON THE CONGESTION MANAGEMENT PROGRAM DRAFT ENVIRONMENTAL IMPACT REPORT

Letter 1. **Response to Comments from Arnold I Sherwood, Ph.D, Director of Forecasting, Analysis & Monitoring, Southern California Association of Governments (SCAG), September 13, 1993.**

1. Yes, this is true. Both the 1992 CMP EIR and the DEIR for the 1993 CMP update are tiered from the EIR for the 1989 Regional Mobility Plan (RMP). The RMP EIR was incorporated in the DEIR by reference on page 2. The consistency of the 1993 CMP update with the air quality and land use impacts of the RMP are discussed in Sections 3.3 and 3.5 of the DEIR.
2. The South Coast Air Quality Management District (SCAQMD) has established guidelines for the preparation of air quality impact analyses contained in Environmental Impact Reports (EIRs). These guidelines are contained in the April 1993 California Environmental Quality ACT (CEQA) Air Quality Handbook. The emission factors used in the CMP analysis are EMFAC7EP rates. These rates are published in the SCAQMD handbook.

The EMFACE7EP9CF2 factors are not generally available. Neither the SCAQMD or the California Air Resource Board (CARB) has made these factors available for use.

3. As discussed on page 99 of the DEIR in relation to potential deconcentration affects of the CMP, CMP Level of Service (LOS) standards have been established at the threshold of system capacity, where congestion itself may create a disincentive for continued development, and for development to move to less congested areas. Because of the magnitude of congestion in Los Angeles County, the challenge of the deficiency planing effort will be to attain LOS standards. It is unlikely that improvements on the system will bring LOS above standard. Because the 1993 CMP Update is not anticipated to lead to substantial improvements above current LOS and thus associated increases in travel speed which would make housing in outlying areas more attractive to the region's workers, it should not further the kind of deconcentration that results from ease of mobility. Therefore, no model runs were required to analyze the

trip making effects of a CMP induced regional land use redistribution, since such a redistribution is not anticipated to result from the CMP.

As explained on pages 34-36 of the DEIR, the model runs which were done to analyze the potential impacts of the Trip Reduction Emphasis and Capacity Enhancement Emphasis used an iterative modeling process in order to account for the effect of latent demand, without any change in the anticipated Year 2010 distribution of population, employment and housing. As detailed in Section 3.3 (Transportation), Chapter 5 (Alternatives), Table S-1, and summarized in **Table S-2** which follows, the proposed program would result in between 202 and 205 Vehicle Miles Traveled (VMT) compared to 202 million VMT under Year 2010 baseline conditions. Actual program effects are anticipated to be somewhere in the middle of the specified range. The high end of the range captures the latent demand effects of use of a pure capacity enhancement approach to CMP deficiency mitigation. Requirements for implementation of air quality Transportation Control Measures (TCM) by local jurisdictions will likely create additional encouragement for local jurisdictions to include demand reduction strategies among their choice of selected mitigations.

As noted above, and discussed in Section 3.5 (Land Use) of the DEIR, it is anticipated that the overall effect of the CMP program on land use would not significantly alter current market trends and that insufficient incentive for growth to shift to untraditional growth areas would be provided. The CMP does not contain the kind of incentives which would result in an overall increase in development. However, the CMP does include the creation of land use incentives aimed at making development in transit corridors and/or transit station areas more attractive than is currently the case. These incentives would induce the redistribution of development within a jurisdiction rather than capturing growth from other jurisdictions, with the intent of concentrating development along transit corridors and around stations to achieve a reduction in total single occupancy vehicle trip making. These types of land use incentives are among the demand reduction deficiency mitigation options which could be selected by jurisdictions taking a more Demand Reduction Emphasis approach to deficiency mitigation, and are therefore part of the Demand Reduction Emphasis analyzed in the EIR.

TABLE S-2 SUMMARY OF IMPACTS - PROPOSED PROJECT VERSES THE ALTERNATIVES

<u>Proposed Project</u>	<u>Alternative 1 - No Project</u>	<u>Alternative 2 - No Countywide Approach</u>	<u>Alternative 3 - Countywide Fee</u>	<u>Alternative 4 - Monitoring Based Approach</u>	<u>Alternative 5 - Hot-Spot Reducing Approach</u>
TRANSPORTATION					
<p>The 1993 CMP Update is designed to be consistent with the Regional Mobility Plan (RMP).</p> <p>The proposed program would result in between 202 million and 205 million vehicle miles of travel (VMT), 7.1 million and 7.3 million vehicle hours of travel (VHT) and 2.45 million and 2.46 million hours of delay on the regional transportation system compared to 202 million VMT, 7.3 million VHT and 2.52 million hours of delay under Year 2010 baseline conditions. Actual program effects are anticipated to be in the middle portion of the range indicated due to selection of a mix of demand reducing and capacity increasing strategies on a countywide basis.</p>	<p>This alternative is inconsistent with the RMP.</p> <p>On a systemwide basis, this alternative would result in 10,911,636 vehicle hours of travel (VHT), 5,661,786 hours of delay, and 218,389,015 vehicle miles of travel (VMT) in the region, compared to 7,345,118 VHT, 2,467,030 hours of delay, and 205,154,425 VMT under the worst case (Countywide use of only capacity enhancement Tool Box strategies) for the proposed deficiency plan approach.</p>	<p>This alternative may be inconsistent with the RMP.</p> <p>This alternative would not encourage the degree of additional TDM activities encouraged by the proposed program, and it would place a greater responsibility for the funding of capacity enhancing mitigations on jurisdictions containing heavily traveled portions of the network which act as regional connectors. This approach would increase the probability that identified deficiencies would not be mitigated, which would have a significant impact on the maintenance and improvement of the transportation system, as well as the consistency of the CMP with the RMP.</p>	<p>This alternative is consistent with the RMP.</p> <p>This alternative would have similar transportation system benefits as the capacity enhancement scenario discussed for the proposed program. Therefore, the benefits would be somewhat less than under the proposed program, which is likely to result in a combined use of demand reduction and capacity enhancement strategies, on a Countywide basis.</p>	<p>This alternative would be consistent with the RMP.</p> <p>Because jurisdictions could tend to select mitigation options where the benefits could be easily monitored and ascertained, there would be a concentration of certain capital improvements, traffic system management improvements and those demand management options that are easily quantified. Land use measures and those demand management measures that reduce or shorten the long term need for trips would be harder to monitor or quantify and would tend to be selected less frequently. As a result, this alternative is likely to result in selection of more capacity enhancing measures than the proposed project.</p>	<p>This alternative would be inconsistent with the RMP.</p> <p>Classes of project's included in the RMP would be precluded from nomination for STIP funding under this alternative. The prohibition on projects which create air quality hot spots would, therefore, be inconsistent with the RMP. This would invalidate the CMP and could, under a worst case scenario, result in the same effect as the No-Project Alternative.</p>

TABLE S-2 SUMMARY OF IMPACTS - PROPOSED PROJECT VERSES THE ALTERNATIVES

<u>Proposed Project</u>	<u>Alternative 1 - No Project</u>	<u>Alternative 2 - No Countywide Approach</u>	<u>Alternative 3 - Countywide Fee</u>	<u>Alternative 4 - Monitoring Based Approach</u>	<u>Alternative 5 - Hot-Spot Reducing Approach</u>
AIR QUALITY					
<p>Air quality emissions (in tons per day) would be between 584 and 597 for Carbon Monoxide (CO), 38 for Reactive Organic Gas (ROG), 86 and 88 for Nitrogen Dioxide (NOX), 36 for particulates (PM10), and 20 for Sulfur Dioxide (SOX), compared to 590 tons per day of CO, 38 of ROG, 87 of NOX, 36 of PM10, and 20 of SOX under Year 2010 baseline conditions. Actual program effects are anticipated to be in the middle portion of the range indicated due to selection of a mix of demand reducing and capacity increasing strategies on a countywide basis.</p> <p>There may be localized adverse affects including the affects of facility construction, realignment of facilities near sensitive and uses, and the creation of "hot spots" near transit centers/stations and/or park and ride lots. These are highly localized adverse impacts of otherwise beneficial</p>	<p>Under this alternative air quality emissions would be substantially higher than with the proposed project. Year 2010 emissions are estimated at 707 tons per day (tpd) of Carbon Monoxide (CO), 38 tpd of Reactive Organic Gas (ROG), 87 tpd of Nitrogen Dioxide (NOX), 22 tpd of Sulfur Dioxide (SOX), and 38 tpd of PM10 compared to 597 tpd of CO, 38 tpd of ROG, 88 tpd of NOX, 20 tpd of SOX, and 36 tpd of PM10 under the worst case scenario (Countywide use of only capacity enhancement Tool Box strategies) for the proposed deficiency plan approach.</p>	<p>It is anticipated that air quality emissions would be somewhere between the levels identified for the Baseline Scenario (programmed improvements only) and the levels identified for the capacity enhancement scenario for the proposed program. Air quality emissions would, therefore, be higher than under the proposed program.</p>	<p>This alternative would have similar air quality benefits as the capacity enhancement scenario discussed for the proposed program. Therefore, the benefits would be somewhat less than under the proposed program, which is likely to result in a combined use of demand reduction and capacity enhancement strategies, on a Countywide basis.</p>	<p>Because the selection of mitigation measures would be skewed towards capacity enhancement measures, this alternative could have similar air quality effects as the capacity enhancement scenario discussed for the proposed program. Therefore, the air quality benefits would be somewhat less than under the proposed program, which would result in selection of a mix of demand reduction and capacity enhancement measures.</p>	<p>As long as sufficient strategies remain in the Tool Box to allow local jurisdictions to meet their mitigation obligations, air quality impacts should be similar on a regional level as under the proposed program. However, elimination of all hot spot producing mitigations is likely to constrain the choices available to jurisdictions such that impacts would be somewhere between those of the proposed program and the No-Project Alternative. If this alternative is found inconsistent with the RMP, the effect could be the same as the No-Project Alternative.</p> <p>This alternative would reduce or eliminate the hot spot impacts identified for the proposed program.</p>

TABLE S-2 SUMMARY OF IMPACTS - PROPOSED PROJECT VERSES THE ALTERNATIVES

<u>Proposed Project</u>	<u>Alternative 1 - No Project</u>	<u>Alternative 2 - No Countywide Approach</u>	<u>Alternative 3 - Countywide Fee</u>	<u>Alternative 4 - Monitoring Based Approach</u>	<u>Alternative 5 - Hot-Spot Reducing Approach</u>
ENERGY					
<p>Fuel consumption (in millions of gallons) would be between 7.6 million and 7.8 million gallons compared to 7.7 million gallons without the proposed program. Actual program effects are anticipated to be in the middle portion of the range indicated due to selection of a mix of demand reducing and capacity increasing strategies on a countywide basis.</p> <p>In addition the proposed program would result in a shift toward high occupancy modes.</p> <p>The project may result in an increase in fuel consumption in and around transit stations or park and ride lots due to increased localized traffic delays and reduced speeds at these centers.</p> <p>Construction of capital projects would result in a short-term consumption of energy.</p>	<p>Fuel consumption due to VMT in the County would be significantly greater under this alternative than under the proposed deficiency plan approach, 8.3 million gallons per day, compared to 7.8 gallons per day under the worst case (Countywide use of only capacity enhancement Tool Box strategies) for the proposed deficiency plan approach.</p>	<p>Similarly, it is anticipated that energy use would be somewhere between the levels identified for the Baseline Scenario and the levels identified for the capacity enhancement scenario for the proposed program. Energy use would thus be greater than under the proposed program.</p>	<p>This alternative would have similar energy benefits as the capacity enhancement scenario discussed for the proposed program. Therefore, the benefits would be somewhat less than under the proposed program, which is likely to result in a combined use of demand reduction and capacity enhancement strategies, on a Countywide basis.</p>	<p>Because the selection of mitigation measures would be skewed towards capacity enhancement measures, this alternative would have a similar energy use effect as the capacity enhancement scenario discussed for the proposed program. Therefore, the energy benefits would be somewhat less than under the proposed program, which would result in selection of a mix of demand reduction and capacity enhancement measures.</p>	<p>As long as sufficient strategies remain in the Tool Box to allow local jurisdictions to meet their mitigation obligations, energy impacts should be similar on a regional level as under the proposed program. However, elimination of all hot spot producing mitigations is likely to constrain the choices available to jurisdictions such that impacts would be somewhere between those of the proposed program and the No-Project alternative. If this alternative is found inconsistent with the RMP, the effect could be the same as the No-Project Alternative.</p>

TABLE S-2 SUMMARY OF IMPACTS - PROPOSED PROJECT VERSES THE ALTERNATIVES

<u>Proposed Project</u>	<u>Alternative 1 - No Project</u>	<u>Alternative 2 - No Countywide Approach</u>	<u>Alternative 3 - Countywide Fee</u>	<u>Alternative 4 - Monitoring Based Approach</u>	<u>Alternative 5 - Hot-Spot Reducing Approach</u>
LAND USE					
<p>The proposed program will not systematically result in a land use pattern which is substantially different than the adopted regional forecast of which is systematically different than market patterns.</p> <p>The proposed program may result in a localized redistribution of development in the form of greater densification of transit corridors and/or station areas.</p>	<p>Under this alternative, the transportation system would not be improved to accommodate anticipated growth. This would have a significant effect on future land use. It can be expected that land use would be displaced from congested core parts of the County to areas of the County where the transportation system still had existing capacity. In addition, growth would be displaced to other adjacent counties which were still making the transportation improvements included in the RMP. Both the displacement within the County and the displacement to other counties would result in additional urban sprawl, which would in turn have an indirect impact on air quality not anticipated in the model runs which are the basis of the air emission figures cited above. sprawl, which would in turn have an indirect impact on air quality not anticipated in the model runs which are the basis of the air</p>	<p>Under this alternative, it is anticipated that unmitigated deficiencies may occur on portions of the network which serve as major County connectors and that the jurisdictions containing these portions of the network would have disproportionately high mitigation costs, which would effect their ability to mitigate deficiencies, as well as the likelihood they would enact deficiency mitigation related fees or exactions. Since the urban core portions of the County are the portions containing the majority of these segments of the network, this alternative may result in additional urban deconcentration as potential growth responds to either the additional congestion which could occur under this alternative, or the higher mitigation costs in core areas which might occur under this alternative.</p>	<p>The countywide fee would be imposed Countywide. It is possible that this would make development less attractive in areas with weak markets, than in areas with strong markets, but it is difficult to ascertain without conducting special land use impact related studies for this alternative, whether or not it would result in a systematic displacement of land uses. Any development inhibiting impacts of this alternative are likely to be greater than under the proposed program, which allows flexibility in the degree to which mitigations are funded with public or private resources.</p>	<p>While this alternative would continue the flexibility of allowing jurisdictions to choose their mitigation strategies, the short term difficulty in quantifying or monitoring the benefits of transit facilities could decrease the attractiveness of these types of mitigation strategies. This alternative could, therefore, provide less incentives for local jurisdictions to consider the siting of new development in close proximity to transit facilities.</p>	<p>Land use effects would generally be similar as those under the proposed program as long as deficiency mitigation occurred. Otherwise, land use effects would be similar to the No-Project Alternative.</p>

TABLE S-2 SUMMARY OF IMPACTS - PROPOSED PROJECT VERSES THE ALTERNATIVES

<u>Proposed Project</u>	<u>Alternative 1 - No Project</u>	<u>Alternative 2 - No Countywide Approach</u>	<u>Alternative 3 - Countywide Fee</u>	<u>Alternative 4 - Monitoring Based Approach</u>	<u>Alternative 5 - Hot-Spot Reducing Approach</u>
PUBLIC SERVICES					
<p>The proposed program will help to maintain or improve emergency vehicle response times.</p> <p>Although the proposed program will impose additional administrative requirements on local jurisdictions, these administrative "costs" are more than offset by the return in administrative time invested, that the jurisdiction will receive in the form of revenue eligibility and service production efficiencies.</p> <p>There appear to be sufficient funding mechanisms and mitigation options available for local jurisdictions to meet their deficiency mitigation obligations while avoiding the use of general funds, or diversion of funds from the provision of other public services.</p>	<p>The loss of funding for transportation improvements would likely result in local jurisdictions using additional general fund revenues for maintenance of the transportation system. This would have a significant impact on public service provision. Increased congestion on the regional network would increase emergency vehicle response times, which would be a significant impact under this alternative.</p>	<p>Under this alternative, jurisdictions containing portions of the network which serve as major regional connectors would have higher mitigation costs and less ability to mitigate deficiencies through TDM and land use controls than under the proposed program, thus their mitigation costs would be higher. This could result in public service provision impacts. Unmitigated deficiencies would result in increases in the response times of emergency vehicles, which would be a significant public service impact. In addition, the lack of deficiency plan development assistance under this alternative could increase local jurisdictional staff resources used for plan development substantially.</p>	<p>This alternative would not require local jurisdictions to use their existing fiscal resources to fund capacity enhancements under deficiency plans. Less staff resources would be required for deficiency planning purposes than under the proposed program, since much of the responsibility for deficiency mitigation identification and implementation would be conducted by the MTA. This alternative is, therefore, likely to have less public service impacts than the proposed program.</p>	<p>This alternative would place substantially more responsibility on local jurisdictions. The monitoring based approach would eliminate the element of certainty that exists in the Tool Box approach, and the reporting process would be substantially lengthened. In addition, jurisdictions would have to select appropriate monitoring strategies and conduct their monitoring on a regular basis. After implementation and monitoring a strategy, local staffs might find that it did not produce the anticipated results; they would then have to select and implement additional strategies to mitigate their development credits.</p>	<p>This alternative would provide local jurisdictions with fewer Tool Box measures and thus less flexibility in meeting deficiency mitigation targets. Less flexibility could result in greater staff resources needed for deficiency planning and greater use of fiscal resources. Local jurisdictions would be limited in the projects they could nominate for the STIP. If this alternative is found inconsistent with the RMP, local jurisdictions could lose their Section 2105 funding, their ability to compete for state funding through the STIP, and all federal funds that are linked to compliance with the CMP.</p>

TABLE S-2 SUMMARY OF IMPACTS - PROPOSED PROJECT VERSES THE ALTERNATIVES

<u>Proposed Project</u>	<u>Alternative 1 - No Project</u>	<u>Alternative 2 - No Countywide Approach</u>	<u>Alternative 3 - Countywide Fee</u>	<u>Alternative 4 - Monitoring Based Approach</u>	<u>Alternative 5 - Hot-Spot Reducing Approach</u>
			<p>If this alternative did, however, act as a disincentive to development activity within the County, it could have an indirect impact on local jurisdictional fiscal resources by reducing revenues.</p>	<p>This alternative would also make the mitigation process much more subjective, requiring additional staff time from the local jurisdiction as well as from the MTA staff. The larger burden on both staffs could result in increased administrative costs for the local jurisdiction and the MTA and result in less allocated and discretionary funds available for project implementation.</p>	

TABLE S-2 SUMMARY OF IMPACTS - PROPOSED PROJECT VERSES THE ALTERNATIVES

<u>Proposed Project</u>	<u>Alternative 1 - No Project</u>	<u>Alternative 2 - No Countywide Approach</u>	<u>Alternative 3 - Countywide Fee</u>	<u>Alternative 4 - Monitoring Based Approach</u>	<u>Alternative 5 - Hot-Spot Reducing Approach</u>
GOALS AND OBJECTIVES					
<p>The proposed program is consistent with the MTA's goals and objects for the deficiency plan approach.</p>	<p>This alternative would not comply with the requirements of the CMP statute since there would be no deficiency plan component incorporated in the CMP by the time deficiencies are identified on the CMP network. This alternative would fail to fulfill the aims of the CMP legislation and would be inconsistent with the RMP. It is, therefore, not considered feasible</p>	<p>This alternative does not meet the MTA's deficiency plan goals and objectives regarding provision of a Countywide approach, minimization of administrative costs, consistency among jurisdictions, sensitivity to the economy or jobs, or promotion of inter-jurisdictional mitigation. It is unclear the degree to which the alternative meets the MTA's remaining goals of effectiveness and flexibility of actions or transit enhancing land use. Therefore, this alternative was rejected by the MTA.</p>	<p>This alternative was rejected by the MTA because it met fewer of the MTA's deficiency plan goals and objectives than the proposed program. Specifically, it did not provide the deficiency mitigation and funding flexibility of the proposed program, the sensitivity to the economy or jobs, or the transit-enhancing land use effects. It does meet the MTA's goals regarding a Countywide approach, minimization of administrative costs, consistency among jurisdictions, and the promotion of inter-jurisdictional mitigation.</p>	<p>This alternative was rejected by the MTA because of the administrative cost to local jurisdictions and the MTA, and because it did not meet the MTA's goals and objectives regarding transit enhancing land use, effectiveness and flexibility of actions, sensitivity to the economy and jobs, and consistency and fairness among communities and developments.</p>	<p>This alternative would provide less flexibility of action than under the proposed program. It may be difficult to achieve the MTA's goals and objectives regarding the promotion of transit enhancing land uses, and this alternative may not be found consistent with the RMP. Given the number of strategies which could product hot spots, this alternative is unlikely to meet the CMP statute's requirement to measurably improve congestion and air quality.</p>

The DEIR states that an increase in overall VMT of approximately 1 percent could occur if capacity enhancing Tool Box measures are chosen exclusively. This conclusion is based on the technical model runs from the MTA countywide transportation model described above. If only trip reduction measures are chosen from the Tool Box, then by definition congestion will improve and there will also be a decrease in trips. This was demonstrated by model run results which indicated that overall system VMT and Vehicle Hours Travelled (VHT) are forecast to decrease under the demand reduction emphasis model run. Increased trips due to improved access to different destinations have therefore been considered in the analysis, although it is not feasible to analyze the specific locations of such increases due to the variability in future land use development and transportation facility improvements.

Research regarding the impacts of transportation improvements in terms of changes in trip lengths, trips origins/destinations and the number of trips generated is ongoing throughout the state. The California Air Resources Board is undertaking a study regarding these issues and the Southern California Association of Governments (SCAG) has completed research which includes regional model runs to test the impacts of improvement projects on travel patterns. Volume V, Section 13 of SCAG's fiscal year (FY) 1993-1999 Regional Transportation Improvement Program (RTIP) discusses some of SCAG's modeling research. The results of the research indicate that the impact of RTIP projects (build scenario) is in general a decentralization of land uses, but only very small changes to trips and vehicle miles travelled are noted. Overall, based on the build scenario, SCAG estimates that the "regional number of vehicle miles travelled increases by just over 1 percent, the total number of trips declines slightly, while the average speed increases slightly" (FY 1993-1999 RTIP, Volume V, Section 13, Page 45). Employment is shown to experience relatively less shift in locational patterns and trip making impacts than housing.

While the results of the SCAG and MTA analyses cannot be directly compared since they are based on different improvement assumptions, they both indicate the order-of-magnitude of change that would be expected in trips and VMT due to improvements which increase capacity and reduce congestion. The SCAG findings as outlined in the RTIP technical documentation correlate very closely with the MTA model results which indicate an approximate 1 percent

increase in VMT resulting from implementation of only capacity enhancing Tool Box measures. SCAG also examined the changes by subregion in terms of employment location and found very minor changes ranging from zero to 1.2 percent by subregion. These results indicate little potential for a large shift in land use patterns or corresponding change in tripmaking, trip length, and VMT.

In summary, no projection of increased trips due to improved access to different destinations is included in the EIR, since: (1) the CMP EIR is not anticipated to result in a change in land use patterns on a regional level; (2) the land use changes which the CMP could induce within jurisdictions are intended to result in a reduction in VMT, and are included at a conceptual level as part of the Demand Reduction Emphasis analysis; (3) increased trip making due to latent demand engendered by capacity increases and implementation of Transportation Demand Management (TDM)/land use measures is included in the analysis; and (4) the specific destinations which would have improved access can not be reliably predicted.

It should also be noted that Mitigation Measure C.3, included in the 1992 CMP EIR, acts as a safeguard by providing for monitoring to insure that no CMP induced land use changes take place without corrective action. Measures C.3, which is included in Appendix B of the 1993 CMP Update DEIR, reads as follows: "The (MTA), where possible, through the congestion monitoring, highway and transit network modeling and land use analysis program elements of the CMP, shall determine the similarity between observed travel behavior with growth rates and geographic distribution assumptions of the RMP. The success of the program in working toward regional land use and mobility goals will be assessed as part of future CMP updates, and appropriate changes to work toward regional goals will be proposed in consultation with local, regional and state agencies."

4. As discussed on page 42 of the DEIR and in Response to Comment 18, SCAG's Executive Committee formally approved an interim consistency and compatibility finding for the 1992 CMP. The 1993 CMP Update will also be subject to SCAG's formal consistency finding procedures. As discussed on pages 48-50 of the DEIR, the 1993 CMP, and the CMP as a whole, are designed to be consistent with and work toward the implementation of transportation projects and strategies recommended in the RMP.

The deficiency plan Tool Box strategies are based on the TCM's of the adopted 1991 Air Quality Management Plan (AQMP) and the 1992 Carbon Monoxide (CO) Plan. By adopting both plans, the SCAQMD Board has established a list of strategies that it has determined improve air quality. MTA has identified a subset of these strategies as contributing to both air quality improvement and congestion relief and incorporated them into the CMP Tool Box.

TCM measures are discussed in Section 3.6 of the EIR. TCM reporting requirements are described on pages 81-84. Table 3.6.1 contains a complete list of TCMs. As discussed on page 91, the Phase II TDM option is designed to meet both CMP and TCM requirements. Pages 91-93 discuss the way the deficiency plan addresses TCMs.

5. The "Countywide Deficiency Plan Background Study" provides a detailed explanation of the methodology that was used to assign value to the different mitigation strategies contained in the Tool Box. In summary, a unit of measure for project scope was selected for each strategy (such as dwelling units provided, employees served, or lane-miles added). The direct travel demand of each action was estimated based on available studies (such as ridership on transit projects, trips eliminated by increased density or mixed-use development, trips eliminated by demand management programs, or delay reduced by traffic flow improvements). This travel effect was then expressed in "points" per unit (per dwelling unit, per employee, etc.).

On numerous occasions the Policy Advisory Committee (PAC) discussed in detail the pros and cons of adding a "policy" weight to the land use and transportation demand management strategy categories. The PAC has consistently recommended that this not be done and that the number of points available for a particular strategy only reflect a strategy's ability to affect travel demand.

Documentation for the derivation of the point values for each Tool Box measure is contained in the "Countywide Deficiency Plan

Background Study," which is available from the MTA and which is incorporated herein by reference.²

6. MTA agrees that land use strategies are effective and has included them in the Tool Box of strategies available for selection by the local jurisdiction. A listing of these strategies is found in Appendix E, Table E-2 of the DEIR.
7. The sixth sentence in the second paragraph on page 18 is modified to read:

This program is a list of highway, transit, TDM and operational improvement projects that SCAG recommends to the State for inclusion in the State Transportation Improvement Program (STIP).

8. Please refer to Response to Comment No. 11.
9. The following is added after the third sentence of the first full paragraph of page 33, i.e., after the sentence ending: ... **Table E-2** in Appendix E.

The point values assigned to the different mitigation strategies are based on available research as to the actual person miles of travel (PMT) reduction value of the strategies. As additional quantitative studies of the PMT value of different strategies becomes available, the CMP can be updated accordingly. Documentation for the derivation of the point values for each Tool Box measure is contained in the "Countywide Deficiency Plan Background Study," which is available from the MTA and which is incorporated herein by reference.^{fn}

The following footnote (fn) is also added to page 33 :

1993 Congestion Management Program, Countywide Deficiency Plan Background Study, Draft. This document is available for review at the offices of the MTA, located at: 818 West Seventh Street, Los Angeles, California 90017.

²*1993 Congestion Management Program, Countywide Deficiency Plan Background Study.* This document is available for review at the offices of the MTA, located at: 818 West Seventh Street, Los Angeles, California 90017.

10. This was done in the 1992 CMP EIR. As discussed on page 7-8 of the DEIR, the 1992 CMP EIR examined the following alternatives to the CMP: the No-Project (Existing Transportation System) Alternative; the No-Project (No CMP, No Future State Funding) Alternative; and two alternatives designed to be consistent with the balance between TDM and capital intensive approaches to maintaining mobility selected in the RMP. These two alternatives were a Capital Intensive Alternative which accelerated much of the capital component of the RMP into the 7 years of the CMP's Capital Improvement Program (CIP), and a TDM Intensive Alternative, which emphasized implementation of additional TDM measures, while delaying capital improvements until late in the RMP's implementation. The adopted CMP represents a balance between implementation of the capital intensive and TDM strategies contained in the adopted RMP. The proposed deficiency plan Tool Box has been designed to strike the same balance between capital intensive and TDM approaches to maintaining mobility analyzed in the 1992 CMP EIR and found to be both the environmentally superior alternative and the approach which best represented implementation of the RMP to the extent authorized by CMP Statute. For additional information regarding the reasoning behind this judgement, please refer to pages 152-174 of the 1992 CMP EIR. As discussed on page 9 of the DEIR, since the deficiency plan component was the addition to the CMP contained in the 1993 Update with the potential to create significant impacts, and since the 1992 CMP EIR evaluated alternatives to the CMP as a whole, the 1993 CMP Update DEIR examined the potential impacts associated with alternatives to the proposed deficiency plan approach.

11. The CMP's goal is to address the congestion gap, which represents a 3-percent reduction in projected Year 2010 trips; the AQMP calls for a 10-percent reduction. (See discussion on page 29 of the DEIR).

Local jurisdictions can choose to implement the Phase II Countywide TDM program being developed as an incentive program to meet both AQMP and deficiency plan responsibilities. Local jurisdictions may claim credit for TDM strategies funded through MTA's Phase II TDM program. The credit claim need not be limited to the level of local funding participation. This will provide incentive to local jurisdictions to participate in the program's objective of working towards both CMP and AQMP goals. This is also consistent with the baseline modelling. In order to ensure a consistent level of effort,

local jurisdictions participating in the Phase II TDM program will still be required to participate in the new development activity tracking and annual reporting requirements of the deficiency plan. Local jurisdictions have been very supportive of this concept, as it creates added incentive for accelerating TCM implementation while meeting deficiency plan responsibilities.

As deficiency plan strategies are implemented, the MTA will establish procedures for evaluating the effectiveness of those actions, leading to refinements in expected benefits. Such refinements, will be incorporated into the biennial update of the CMP.

The analysis contained in the DEIR credits the CMP with only the portion of the air quality and transportation benefits which would result from actions which would be required to meet the CMP's requirements. Although reductions beyond the CMP target may be achieved, if local jurisdictions select the Phase II TDM option in order to benefit from additional funding eligibility provided to jurisdictions which comply in a timely fashion with TCM requirements, these reductions are considered the result of a local jurisdiction's efforts to comply with the AQMP. The DEIR thus contains a "worst-case" analysis; it does not include reductions beyond the CMP target, since to do so would credit the CMP with air quality and trip reduction benefits which are effected by the AQMP.

The Phase II TDM option, as discussed above, provides a way of reducing the administrative burden to local jurisdictions associated with CMP and AQMP compliance. The benefits of providing this method of meeting both AQMP and CMP requirements via Phase II TDM are discussed as part of the Public Services impact analysis contained in Section 3.6 of the DEIR.

The CMP program provides for monitoring of both development activity and LOS on the CMP network. This will allow the effect of the CMP program to be assessed. The CMP Statute provides for refinement of the CMP through the biennial update process to reflect information gained through experience with program implementation.

12. As explained in Response to Comment 9, Tool Box mitigation values are based on the available research as to the PMT reduction/accommodation value of each strategy. The transportation, air quality and energy impacts of various Tool Box

measures are determined by whether they result in trip reductions, or capacity increases. Since both land use strategies and TDM strategies will result in a net reduction of trips and substitution of single occupant vehicle trips with transit trips and other shared ride trips, they are grouped together for purposes of assessing their air quality, transportation and energy impacts. Although there is some difference in the way that trip reduction will occur under each strategy, the net result is less demand for vehicle travel on the system. This differs significantly from the capital improvements and the Transportation System Management (TSM) improvements portion of the Tool Box which will provide added capacity and better traffic flow to the system. Since it is not possible to predict the level of implementation of any Tool box measure, an infinite number of possible combinations could be tested. Therefore, the methodological approach chosen in the DEIR was to analyze the two possible ends of the range of potential impacts: 1) expanding the capacity of the transportation system, and 2) reducing the demand for travel.

To the degree that TDM and land use strategies have the potential to result in different land use and public service impacts, they are discussed separately in those sections of the DEIR.

13. Both the Draft CMP and the 1993 CMP "Countywide Deficiency Plan Background Study" contain a full listing of the Tool Box measures and the proposed credit factors for each mitigation measure. MTA developed the measures in the Tool Box and the associated credit values in consultation with the CMP Technical Forum and CMP Policy Advisory Committee. The "Countywide Deficiency Plan Background Study" provides a detailed explanation of the methodology that was used to assign value to the different mitigation strategies contained in the Tool Box. In summary, a unit of measure for project scope was selected for each strategy (such as dwelling units provided, employees served, or lane-miles added). The direct travel demand of each action was estimated based on available studies (such as ridership on transit projects, trips eliminated by increased density or mixed-used development, trips eliminated by demand management programs, or delay reduced by traffic flow improvements). This travel effect was then expressed in "points" per unit (per dwelling unit, per employee, etc.).

For purposes of analysis in the DEIR, it was assumed that the total credit points would add up to the 8,100,000 congestion gap points needed to address the congestion gap. (In other words, the combination of all credit points assigned to individual jurisdictions would add up to 8,100,000). As stated in the DEIR, it is not possible to predict exactly which strategies will be chosen to add up to the required number of points. A combination of strategies will be chosen by cities to meet the goal. Ultimately, once the program is implemented, a combination of strategies will be selected by local jurisdictions which adds up to the 8,100,000 credit points needed to mitigate the congestion effects of projected development. Calculations were made which indicated that it was possible for local jurisdictions to meet the 8,100,000 credit point target through selection of a combination of trip reduction Tool Box measures.

The countywide travel model includes a series of traffic analysis zones (TAZs) which are used to geographically define land use, socioeconomic data, and the origins and destinations of trips. TDM strategies were evaluated in the countywide travel model by reducing all trip tables (i.e., the matrix of trips describing trip origins and destinations) by 3 percent. The model was then re-run with the lower trips totals reflective of the implementation of various TDM measures.

14. The operating improvements are accounted for via the use of an assumed system-wide increase in capacity on the arterial system of 5 percent. This assumed increase was developed directly from the credit point system, as follows:

As shown in Table E-2 in Appendix E of the DEIR, the Tool Box credit values developed by MTA through the CMP Technical Forum and CMP Policy Advisory Committee included an average credit of 14,357 points for one lane mile addition of HOV and one general use lane mile on an arterial. Therefore, the number of equivalent lane miles required system wide to fully offset the congestion gap debit points equals 564 lane miles. ($8,100,000 \text{ points} / 14,357 \text{ average point credits per lane mile}$). The 564 lane miles was converted into an equivalent vehicle carrying capacity based on assumed capacities of 650 and 600 vehicles per lane per hour for major and primary arterials, respectively. The total increase in capacity is therefore estimated to be approximately 366,600 vehicles per hour, which equals about 5 percent of the total arterial system capacity.

This increase in capacity was then allocated throughout the system on a link-by-link basis to all arterials since it is not known where the capacity enhancements would occur. In actual application, it is likely that many of the chosen capacity enhancements would be taken from categories such as traffic signal synchronization, intersection modifications, peak hour turning movement restrictions, and other measures which are easier and less costly to implement than major widenings and lane additions. Therefore, spreading the capacity increase throughout the arterial system provides a more realistic and reasonable forecast of future conditions than assuming arterial widening projects at limited locations.

15. The references to the regional model have been changed as requested. On page 32, the first sentence of the second paragraph, under Analytic Approach is modified to read:

The countywide model is also able...

On page 35, the second line is modified to read:

... capacity strategies could be tested in the countywide model. One...

On page 35 the first sentence of the second full paragraph is modified to read:

The MTA countywide model runs, which were completed ...

On page 48 the third line of the first bullet item is modified to read:

... based on the MTA countywide model which ...

On page 50, under the heading System Performance, under Direct Impacts, the first sentence is modified to read:

The countywide model analysis indicates that ...

16. An average credit point value for High Occupancy Vehicle (HOV) and mixed use lanes was used; therefore, the assumed distribution was equal. The word "miles" will be inserted as noted. The revised text on page 35 will read:

... would be about 564 lane-miles.

17. The second full sentence on page 41 is modified to read:

That plan is currently under development, with adoption targeted for February 1994.

The last line on page 49 is modified to read:

...Plan and Mobility Element are not expected until February 1994, therefore, a...

18. As noted in the comment letter, page 42 of the DEIR indicates that in February 1992, and again in November 1992, SCAG's Executive Committee formally approved an interim consistency and compatibility finding for the 1992 CMP's in the SCAG region. The AB 1246 Committee, in April 1993, recommended to SCAG's Executive Committee that the interim CMP consistency and compatibility finding be made final.

The 1993 CMP will also be subject to SCAG's formal consistency and compatibility finding procedures.

19. As required by state statute, the CMP has been developed consistent with the RMP, which incorporates elements of the Regional Growth Management Plan (GMP) and the AQMP.

20. The CMP Transit Monitoring Network and performance indices were adopted as part of the 1992 CMP. As a planning tool, the CMP transit monitoring network is used to identify potential problems in service, and functions similar to a pulse reading. The data collected through monitoring of the transit system is for comparative purposes only. The Final CMP draft will incorporate the 1992 transit monitoring data, establishing the baseline for future CMP transit standard reviews.

21. The deficiency plan Tool Box strategies are based on the TCM's of the adopted 1991 AQMP and the 1992 CO Plan. By adopting both plans, the SCAQMD Board has established a list of strategies that it has determined improve air quality. The MTA has identified a subset of these strategies as contributing to both air quality improvement and congestion relief and incorporated them into the deficiency plan Tool Box. In addition, the SCAQMD trip reduction ordinance handbook has been a primary resource in the development of the

CMP countywide deficiency plan, both in terms of the strategies and the credit system.

22. The fourth sentence under the second bullet on page 49 is modified to read:

This is because VMT and VHT will increase from today's levels primarily as a result of development and other growth factors which add to congestion and thus create the deficiency.

23. Please refer to Response to Comments 5 and 21.

From : DEPARTMENT OF TRANSPORTATION

Subject : Document Review Comments
SCH# 93051061

Caltrans has reviewed the above-referenced document and the Draft Congestion Management Program. Based on the information received, we have the following comments:

We would like to express our support for the Congestion Management Program and its attempt to address the transportation and air quality issues resulting from land use decisions. We concur with the concepts stated in this document but have the following concerns:

There is a need to take a second look at a trip fee structure if the CMP is to achieve its intended purpose. Without a fee, the gap between available funding for the system and the additional funding needed to forestall deterioration of the system will be too great.

Credit factors for Transportation Demand Management (TDM) strategies appear excessive. The extent to which TDM will reduce congestion on the CMP Roadway System is untested.

The Adopted CMP Monitoring Program System Performance Findings; Page 43 - States that "Intersection monitoring is the responsibility of the cities and the County". We request that Caltrans be given the opportunity to review and comment on all studies prepared by the cities and or County that involve State Conventional Highways or Freeway ramp and local street intersections.

Page 44, last paragraph - It is stated that "... 93 of the 160 monitoring locations are currently at the maximum allowable LOS" In fact, table 3.2.1 shows there are 63 intersections in the AM peak and 83 intersections in the PM peak currently at maximum allowable LOS. Also, the percent of intersections of "LOS D or Better" during the PM peak hour for 77 intersections should be 48% not 22%.

Letter 2. Response to Comments from Jerry B. Baxter, District Director, California Department of Transportation (Caltrans), September 9, 1993.

24. MTA appreciates Caltrans' support of the CMP and its participation in the development of the program. Individual concerns are addressed in Response to Comments 25 to 28.
25. The Countywide fee alternative to deficiency mitigation is discussed in Section 5.3, on page 109 of the DEIR. As indicated, this alternative received extensive investigation, but it was dropped in response to widespread concern over its imposition. The MTA's deficiency plan procedures were developed through extensive consultation with the CMP Policy Advisory Committee and the CMP Technical Forum consisting of representatives from local jurisdictions, regional and state agencies, transit operators, and the environmental and business communities. Meetings were and continue to be open to the public.

Choice of the funding approach for deficiency mitigation under the proposed Tool Box approach is being left to the discretion of local jurisdictions. Existing fiscal resources for deficiency mitigation are listed on pages 84-90 of the DEIR. The possible imposition of development charges or fees and their potential impacts are considered on pages 76-77 and 94 to 95.

26. Please refer to Response to Comment 5.
27. Caltrans has opportunity through the CEQA process to review and comment on site-specific CMP projects involving State conventional highways or freeway ramp and local street intersections.
28. The figure of 93 monitoring locations at LOS E or F is based on a combined total. This includes both the AM and the PM peak periods together. Taken individually, there are 63 locations in the AM peak period and 83 in the PM peak period at LOS E or F. Since there is overlap in the two categories (i.e., some locations are deficient in both peaks), the total number at LOS E and F is not the sum of AM and PM (which would be 146), but rather is 93 locations total when accounting for common locations at LOS E or F in both periods.

The percentage correction in Table 3.2.1 is noted and will be made.
The fifth row of Table 3.2.1 is amended to read as follows:

LOS D or better 97 61% 77 48%

Ms. Kendra Morries, Land Use Project Manager
Los Angeles County Metropolitan Transportation Authority
818 West Seventh Street (M/S 2200)
Los Angeles, California 90017

Dear Ms. Morries:

Re: 1993 Update: Los Angeles County Congestion Management Program

Thank you for providing us the opportunity to comment on the Draft Environmental Impact Report (EIR) for the Congestion Management Program (CMP).

Hot Spot Emissions and PM10:

The Los Angeles Unified School District has been concerned about "hot spot" emissions. Because fine particle (PM10) pollution is the most serious form of pollution in terms of health impacts on children and young adults, we are especially concerned that the analysis of these emissions at sensitive receptor schools be thorough. Since PM10 is caused mainly by traffic, and secondarily by construction, it is important that all generators of PM10 be included when "hot spot" analyses are undertaken. Without careful planning of routes, and thorough analysis of impacts, CMP highway improvements might be major contributors to hot spot emissions near sensitive receptor schools.

Please clarify whether the existing mobile emissions and the daily 2010 baseline emissions of PM10 (in Tables 3.3.6 and 3.3.7) include PM10 which is caused by roadway dust reentrainment.

If the existing and the threshold levels of PM10 do not include PM10 reentrainment, please provide an estimate of what these levels would be.

PM10 caused by tailpipe emissions is much less significant than that caused by reentrainment. The following paragraph, taken from an Environmental Protection Agency publication, mentions several generators of PM10. All should be considered when analyzing PM10 emissions:

29

30

31

32

PAVED URBAN ROADS. Various field studies have indicated that dust emissions from paved street are a major component of the material collected by high volume samplers. Reentrained traffic dust has been found to consist primarily of mineral matter similar to common sand and soil, mostly tracked or deposited onto the roadway by vehicle traffic itself. Other particulate matter is emitted directly by the vehicles from, for example, engine exhaust, wear of bearings and brake linings, and abrasion of tires against the road surface. Some of these direct emissions may settle to the street surface, subsequently to be reentrained.*

32

If the existing and the threshold levels of PM10 do include reentrainment, please clarify what percentages result from tailpipe emissions, and what portion from roadway dust reentrainment. What portion comes from other sources such as brake linings and abrasion of tires?

33

The CMP EIR Should Direct Agencies to Provide Accurate Assessments of PM10:

Can mitigation be provided through the CMP to ensure that agencies approving projects which come under the purview of the CMP, and which are adjacent to or close to sensitive receptor schools, will provide a "hot spot" assessment of PM10 emissions impacts which is based on an analysis of both tailpipe emissions and roadway dust reentrainment?

34

One of the few effective and positive mitigation measures for PM10 impacts is the provision of air filtration/air condition systems to schools so as to maximize the "filtering out" of fine particulates, and the enclosure of impacted school facilities (such as open-air lunch areas which are adjacent to expanding highways). Could such mitigation be provided through the Tool Box measures, or by other means?

35

Need to Consider a Modified Alternative 5, to Reduce Hot Spot Emissions at Sensitive Receptors:

Finally, in respect to your consideration of Alternatives to the 1993 CMP Update, we wish to encourage you to support a modified version of Alternative 5 - The Modified Tool Box-Hot Spot Reducing Approach Alternative. Because Alternative 5, as outlined on pages 112 and 113 of the Draft EIR, provides perhaps too little flexibility of action and may interfere with the achievement of goals and objectives of this Program, please consider a variation of this: an Alternative where Tool Box measures which are likely to result in air quality hot spots at sensitive receptors would be eliminated from the Tool Box.

36

*United States Environmental Protection Agency, Office of Air Quality Planning and Standards, AP-42.

Ms. Morries

- 3 -

September 13, 1993

Please comment on the effectiveness of such a modified Alternative 5. What is the likelihood that this modified Alternative would be consistent with the Regional Mobility Plan?

36

Thank you very much for your consideration of our concerns.

Very truly yours,

Elizabeth J. Harris
California Environmental Quality Act Officer
for the Los Angeles Unified School District

EJH:ldf

c: Mr. Koch
Mr. Prescott
Mr. Brown
Ms. Wong

Letter 3. Response to Comments from Elizabeth J. Harris, California Environmental Quality Act Officer, Los Angeles Unified School District, September 13, 1993.

29. Comment noted.
30. The SCAQMD has established guidelines for the preparation of air quality impact analyses contained in EIRs. These guidelines are contained in the April 1993 CEQA Handbook. The emission factors used in the CMP analysis are EMFAC7EP rates. These rates are published in the SCAQMD Handbook. The published emission rates for particulates less than 10 microns include exhausts and tire wear sources. The SCAQMD emission rates used in the calculations did not include reentrainment.
31. The analysis and air quality thresholds of significance used in the DEIR are those specified by the SCAQMD. The SCAQMD is the agency responsible for air quality management for the South Coast Air Basin. The SCAQMD has established standards of significance for use in the preparation of air quality impact analyses. These guidelines are contained in the April 1993 SCAQMD CEQA Handbook. The SCAQMD has identified a calculation method and a standard of significance, which does not include reentrainment. According to the US Environmental Protection Agency (EPA), reentrainment would add a worst case emission factor of 2 grams per mile.
32. Please refer to Response to Comment 30.
33. Based on available information, tailpipe exhaust emissions are approximately 0.01 grams per mile, tire wear emissions are 0.01 grams per mile, and reentrainment emissions are 2 grams per mile. Please refer to Response to Comment 31.
34. As described in the DEIR, the MTA cannot predict what specific Tool Box measures or projects will be enacted by a local jurisdiction in response to CMP requirements. Specific projects implemented within a local jurisdiction will be subject to environmental review under CEQA. The CMP EIR does not provide CEQA clearance for individual site specific projects; it does provide a program-level EIR off which subsequent project-level environmental review may be tiered. The air quality analysis of projects at the local level will have

to satisfy SCAQMD requirements. As presented in the SCAQMD's CEQA handbook, schools within the vicinity of a proposed project would be considered as sensitive receptors requiring assessment of potential impacts. It is the responsibility of SCAQMD to determine whether the CEQA Handbook should be amended to require an analysis of dust reentrainment as part of the particulate impact assessment in EIRs.

35. Please refer to Responses to Comments 31 and 34.
36. While this alternative may appear attractive, it is not practical at the program level, due to the impossibility of identifying which Tool Box measures would affect sensitive receptors. All of the Tool Box measure eliminated as part of Alternative 5 - The Hot Spot Reducing Alternative, could potentially be located near sensitive receptors. Therefore there is no difference between the suggested alternative and the one analyzed in the DEIR.

Mr. Ed Shikada, Interim Director
Congestion Management Program
L.A. County Metropolitan Transportation Authority
818 West Seventh Street, MS - 2200
Los Angeles, CA 90017

RE: COMMENTS ON DRAFT CONGESTION MANAGEMENT PROGRAM AND
DRAFT SUBSEQUENT ENVIRONMENTAL IMPACT REPORT

Dear Mr. Shikada:

The City of Santa Clarita has reviewed the Draft Congestion Management Program (CMP) and the accompanying Draft Subsequent Environmental Impact Report (Draft SEIR), dated July 1993. Our comments on the draft documents are as follows:

1. DRAFT CMP

- The "toolbox" approach to mitigation strategies is a good, well organized approach, though the City believes there is still merit in an approach that utilizes a countywide mitigation fee. The CMP indicates that local jurisdictions can employ other strategies not currently in the "toolbox" with approval by the MTA. The details of this approval process needs to be developed in cooperation with local jurisdictions.
- The MTA should continue its ongoing effort to assist local jurisdictions in implementing the various new requirements of the CMP. A clear outline of all deadlines, reporting requirements, and other responsibilities should be provided.

2. DRAFT SEIR

- In the City's letter responding to the Notice of Preparation of the Draft SEIR, a concern was raised regarding the manner in which the values of new trips added to the CMP routes and intersections were assigned (Comment No. 2, letter dated June 21, 1993). According to the charts on pp. 51 and 52 of the DEIR, new trips are still apparently given equal weight, although they are distributed among freeways, major arterials, primary arterials, secondary arterials, and HOV lanes. In the Final SEIR, please address whether or not projects that help improve the jobs/housing balance and/or shift trips to under-utilized segments of the highway network are treated the same as projects that add trips to already deficient highway segments.

Letter 4. Response to Comments from Richard Henderson, City Planner, City of Santa Clarita, September 13, 1993.

37. Local jurisdictions will be able to utilize a consultation process to address unique situations not accounted for within the countywide deficiency plan. This includes credit requests for mitigation strategies not currently included in the Tool Box, or for strategies currently included in the Tool Box but which vary from the credit factors used. As information becomes more available on potential mitigation strategies and their effectiveness, future year CMP updates can expand the Tool Box options accordingly.
38. The Appendices in the CMP were developed with the intent of consolidating local jurisdiction implementation requirements, deadlines, reporting forms, etc., in one place. MTA staff will continue to work with local jurisdictions to assist in ensuring that CMP implementation is as smooth as possible.
39. All projects are treated the same way as part of the debit calculation portion of CMP deficiency planning procedures. Projects do, however, receive differential treatment at the credit calculation stage. Jobs/housing balance related mitigation strategies are included in the deficiency plan mitigation Tool Box, as shown in Table E-2 in Appendix E of the DEIR. Similarly, although the Tool Box does not specify credit points for shifting trips to under-utilized segments of the highway network, many of the Tool Box measures included under Capital Improvements and Transportation Systems Management have that effect, and are therefore eligible for credit. The credit points assigned to each of the strategies in the Tool Box are based on existing research as to the trip reduction value of potential strategies.

COMMENTS ON THE CONGESTION MANAGEMENT PROGRAM (CMP) NOTICE OF PREPARATION (NOP) OF A DRAFT ENVIRONMENTAL IMPACT REPORT (DEIR) AND INITIAL STUDY

The Department of Transportation, with the assistance of other City departments, has reviewed the NOP prepared for the CMP and submits the following comments:

1. **GENERAL COMMENTS** - The 1993 DEIR should not be a reiteration of the CMP, but rather should examine, quantify, and adequately analyze the potential environmental impacts of the CMP. 42

2. **DEFICIENCY PLAN** - All provisions of the CMP Deficiency Plan, particularly the valuation of mitigation strategies (which is not yet complete), must be considered in the EIR analysis. This is a significant element of the CMP and any analysis that fails to include it would be inadequate. 43

As identified on page 5, subsection 5 (Proposed 1993 CMP Update, Deficiency Plan procedures), the 1993 CMP will include a provision for Deficiency Plan procedures. As such, the EIR should discuss the potential impacts of implementing the mitigation strategies as required by the Deficiency Plan. Since the mitigation strategies have not yet been determined, or at least agreed upon, all potential mitigation alternatives must be discussed in the EIR. 44

3. **SOCIO-ECONOMIC IMPACTS** - Under the California Environmental Quality Act (CEQA), the economic and social impacts of a project, as they relate to physical changes in the environment, must be addressed. Socio-economic analysis of the CMP seems appropriate given the potential for large scale changes in the regional transportation network and land use patterns. A comprehensive analysis of the impacts on jobs and business is necessary. The CMP, particularly the Capital 45

46
47

Improvement Program (CIP) projects, will result in a large number of physical changes, yet no socio-economic analysis is presented. The Department of Transportation recommends that the EIR include a discussion of, and provide mitigation for, these cumulative impacts. In particular, attention should be paid to the CMP's potential to affect the supply of housing; its potential to disrupt the structure of communities; its impact on local governments' provision of public services; its possible effects on population, household income, and employment opportunities; and its potential economic impacts on the business and development community.

47

The DEIR should evaluate how the CMP will benefit the mobility of all economic groups. Data should be included which will illustrate how the trip needs of commuters from low income inner city communities will be accommodated as effectively as suburban commuters.

48

4. **DECONCENTRATION/LAND USE** - The City of Los Angeles' Centers Concept has a central goal of citywide congestion reduction, linking new development with transportation systems. This is also the objective governing the MTA in its development of the Joint Land-use Transportation Policy, developed in conjunction with the City. If the CMP results in urban deconcentration, it would be in direct conflict with our mutual objectives of jobs/housing balance and densification at transit stations. Such deconcentration will reduce housing opportunities for city workers, increase commuting distances, increase Vehicle Miles of Travel (VMT), add to the deterioration of air quality, and create development pressure on open space and sensitive ecological areas. The EIR needs to better address the above issues, including the Centers Concept.

49

The CMP might significantly alter the land use in the region; thus, the DEIR should contain discussion of the CMP's effect on density, distribution, growth rate, or relocation of population.

50

The NOP should provide an adequate analysis of the CMP's impacts on deconcentration. The EIR must fully analyze and address the CMP's impacts, particularly its relationship to land use. Moreover, the EIR should discuss the CMP's effect on the long-term goals of improving the region's jobs/housing balance and reducing VMT as outlined in the Regional Mobility Plan (RMP) and General Mobility Plan (GMP).

51

The 1992 DEIR stated that land use impacts associated with the CMP would include potential community disruption and displacements, changes in community character, and community revitalization effects (page 45, 1992 DEIR). It is further reported that various classes of CMP CIP projects could lead

52

to the localized displacement of adjacent business and residences. These issues warrant a study of the effects on population, employment, and housing in the 1993 CMP EIR.

52

- 5. **CONSTRUCTION IMPACTS** - The 1992 DEIR indicated that the RMP EIR requires the use of construction techniques that minimize disruption effects (on the surrounding community) as a mitigation measure; these construction techniques should be clearly stated in the 1993 EIR.

53

The impact of noise is listed as "no." This should be changed to "maybe" and the impact of noise during construction should be addressed.

54

- 6. **VEHICLE MILES TRAVELED** - The CMP's use of Level of Service (LOS) standards as the principal measurement of congestion does not account for density shifts and the location of development, including residential construction near job centers, transit stations, and urban centers. While concentrating development around centers and transit stations may increase specific area congestion as measured by LOS, it will reduce VMT citywide. Accordingly, the City of Los Angeles recommends the consideration of VMT as an additional measure of countywide congestion. An analysis of vehicle miles reduced from these policies should also be included. This additional gauge will measure whether or not deconcentration occurs with implementation of the CMP. Deconcentrating effects of the CMP should be offset or mitigated.

55

56

- 7. **LINKAGE WITH RMP** - The Southern California Association of Governments (SCAG) is preparing an update to the RMP, a Regional Mobility Element (RME), as part of the Regional Comprehensive Plan. The TDM population, housing, and employment assumptions, in the new RME appear to be substantially different from those used in the 1988 RMP. We urge the MTA to use the updated population, employment, and TDM assumptions in the 1993 RMP.

57

- 8. **CUMULATIVE IMPACTS** - The DEIR fails to adequately address the potential cumulative impacts of the CMP. Consideration of the project's long-term cumulative impacts, that might otherwise be slighted in a case-by-case analysis, is one of the primary purposes for preparing a Program EIR.

58

- 9. **AIR QUALITY** - The NOP lists four potential direct impacts of the 1993 CMP that were not covered in the 1992 CMP EIR. In addition to the impacts listed, the construction and/or operation of CIP projects that add general traffic lanes to freeways or highways could encourage additional vehicle trips on the affected roadways by providing additional capacity

59

(latent demand). Public transit and/or rideshare trips could be encouraged to change back to single occupant vehicle trips if general traffic commute times decrease on the affected roadways. This potential impact must be analyzed, and mitigation measures required, in the air quality section of the DEIR. In mitigation measure C.1, construction phase emissions and criteria pollutant concentrations should be compared to SCAQMD quarterly, as well as daily, emission thresholds. (See 1993 SCAQMD CEQA handbook, Chapter 9.)

59

60

The NOP discusses the indirect impacts of the Deficiency Plan requirement resulting in the changes in land use and states that this impact will be assessed in the 1993 CMP EIR. Since this analysis has not yet taken place, it is premature to state that Mitigation Measure C.3 would be sufficient to address this indirect impact. In the 1993 CMP EIR, additional mitigation measures must be considered to mitigate this impact.

61

Mitigation Measure C.4, proposed by the 1992 EIR to mitigate potential "hot spots" created by CMP-related improvements, assumes that regional emission reductions would represent a trade-off with new, localized hot spots. Rather, the 1993 DEIR should require mitigation measures to reduce the creation of new hot spots. This impact, and recommended mitigation, should be addressed in the 1993 EIR.

62

10. **HOUSING AND POPULATION** - The analysis under the housing and population sections of the DEIR should include an analysis of the potential increase in housing demand, and therefore population, in outlying areas (if deconcentration results from CMP projects) as well as increases in housing demand and population in central and transit areas if concentration results.

63

The NOP states that the 1992 EIR did not contain an analysis of utilities impacts since the RMP was formulated in conjunction with the Regional Growth Management Plan (GMP). If this EIR will rely on the analysis in the GMP EIR for utilities impacts, the GMP EIR should be incorporated by reference.

64

11. **MOVEMENT OF GOODS** - The movement of goods is vital to the economic health of the region yet is virtually ignored in the CMP. Providing efficient access to LAX and the Port of Los Angeles is critical to maintaining a healthy standard of living in Southern California.

65

The CMP does not consider the special mobility issues related to trucks and goods movement. Trucks have two major impacts on the County's highway system:

- a. Trucks are not as easy to maneuver as cars. The bigger the truck, and the more trailers it carries, the more highway capacity it uses up. Trucks require more highway capacity, especially in heavy traffic, and can hold up traffic significantly when making turns at intersections and driveways.
- b. Truck accidents can cause a great deal more congestion than cars. One truck accident can close a highway for several hours. Also, accidents involving trucks transporting hazardous waste can close an entire area for hours.

While trucks make deliveries throughout the County, certain parts of the County (such as the cities of Commerce and Vernon), including portions of the City of Los Angeles (e.g., the Port, Union Station, and the Alameda Corridor), are major generators of truck traffic. The EIR should quantify the extent of truck traffic in the County, consider the specific problems created by them, and determine ways to mitigate them.

Additionally, the CMP should look into monitoring truck traffic and, with the help of local jurisdictions, find ways to reduce truck traffic and alleviate their impacts.

- 12. **REGIONALLY SIGNIFICANT PUBLIC FACILITIES** - The CMP does not adequately deal with trips generated by regionally significant public facilities such as major airports and harbors. Los Angeles International Airport and the Port of Los Angeles are unique public facilities that serve the entire Southern California region. Additionally, the City of Los Angeles itself is a business center that serves the Southern California region, thus attracting trips from outside the County. As such, an impact analysis should be included for these public facilities that includes the impact of trips generated from outside the County of Los Angeles.

Thank you for the opportunity to respond to the CMP NOP. If you have any questions, feel free to call Sami Wassef, of my staff, at (213) 237-2873.

65

66

Letter 5. Response to Comments from John Ferraro, President, Los Angeles City Council and Richard Riordan, Mayor, City of Los Angeles, September 2, 1993, with attached letter from Thomas K. Conner, General Manager, City of Los Angeles, June 23, 1993.

40. Since the commentator does not indicate which of the City's comments submitted in response to the Notice of Preparation (NOP) are still of concern, Responses to Comments 42 to 66 address each of the City's NOP comments in turn.

41. Since release of the CMP draft in July 1993, further work with the Policy Advisory Committee (PAC) and comments received on the draft CMP, have resulted in refinements that will be incorporated into the Final CMP. These refinements do not alter significantly the program described in the July 1993 CMP draft, and do not result in changes to the environmental analysis. The refinements that will be incorporated into the Final CMP draft are summarized as follows:

- The relationship of the CMP to the AQMP will be further defined. A policy statement will be developed for review by the CMP PAC. In addition, further clarification will be provided relating to strategies and reporting mechanisms.
- Further guidance will be provided for submitting additional strategies through the consultation process and for future CMP updates.
- The Final draft will reinforce that the Tool Box measures are not mandatory and that flexibility is provided for local jurisdictions to choose mitigation strategies most appropriate for them. The final draft will also reflect that a variety of implementation mechanisms are available for CMP deficiency plan strategies. Included are ordinances, resolutions, memorandums of understanding, resolutions, development agreements, and conditions of approval.
- Refinements will simplify and broaden demolition adjustments to allow for all the adjustments of all demolitions occurring within a reporting period. The final draft will also provide an exemption from debit assessment for construction for which

the local jurisdiction has no siting approval/disapproval authority, for instance a post office or prison.

- The definitions of transit center and transit corridor for land use strategies will be added.
- The final draft will emphasize that the program does not require project specific mitigation. Mitigation strategies may be applied throughout a jurisdiction, within a subarea, within a specific project, or in concert with other jurisdictions.
- Where appropriate, the final draft will provide technical clarification. Examples include clarifying that the unit of measurements used for mixed-use encompass the entire building, and adding example calculations for some of the Tool Box strategies.

The CMP Response to Comments and the Final CMP will be publicly circulated prior to the October 1993 meeting of the CMP PAC. The Final CMP will be presented to the MTA Board for adoption at their November 1993 meeting.

42. The DEIR looks at the proposed project's potential transportation, air quality, energy, land use, and public service impacts. The NOP and Initial Study for the proposed project identified these as the areas in which there was the potential for significant program impacts. These issue areas are evaluated in Sections 3.2 to 3.6 of the DEIR. Section 3.1 explains the analytic approach used to evaluate the proposed program.
43. As explained on page 9 of Section 1.3 of the DEIR, it was the conclusion of the Initial Study that: (1) the 1993 deficiency plan addition to the CMP did have the potential to create significant effects on the environment, not previously analyzed and (2) that the other proposed changes in the program either did not pose the potential for significant effect on the environment, or had the potential to create effects, but that mitigations included in the 1992 CMP EIR are sufficient to address these potential effects. Therefore the deficiency plan addition is the focus of the DEIR.

As discussed in Section 3.1 of the DEIR, the analysis of potential 1993 CMP Update impacts used a bracketing approach to identifying

the potential range of deficiency plan impacts. The two ends of the bracket were deficiency mitigation purely through use of demand reduction techniques and deficiency mitigation purely through use of capacity enhancement techniques.

44. Please refer to Response to Comment 43. Section 3.1 of the DEIR explains the analytic approach used for the analysis of potential deficiency plan mitigations. The list of mitigation Tool Box measures is contained in Appendix E of the DEIR.
45. Section 3.5 of the DEIR discusses the potential for the proposed project to result in large scale changes in regional land use patterns. It is the conclusion of the analysis that the CMP would not significantly alter current market trends; the CMP Update would provide insufficient incentive for growth to shift to untraditional growth areas. The creation of land use development incentives in transit corridors and/or transit station areas would induce the redistribution of development within a jurisdiction rather than capturing growth from other jurisdictions. Therefore only a localized alteration of land use patterns would occur. This localized redistribution could result in air quality "hot spots" which are identified as a significant program impact. The intent of localized densification around transit stations and corridors is to reduce trip making, as described in the DEIR.

Please refer also to Response to Comment 46.

46. Section 3.5 of the DEIR discusses the potential of the proposed project to affect locational decisions and concludes that the incentives contained in CMP are insufficient to result in large scale changes in land use. The 1992 CMP EIR, from which the current EIR is tiered, discusses the potential jobs and housing impacts of the proposed project at a program level of detail and concludes that certain classes of capital improvement projects could lead to the localized displacement of businesses and residences. (See Section III.A - Land Use and Planning of the 1992 CMP EIR). The 1992 EIR includes a mitigation measure to insure that displacement issues are dealt with during project-level environmental review. (See Mitigation Measure A.4 of the 1992 CMP EIR). The Mitigation Monitoring Program for the 1992 CMP is included as Appendix B of the DEIR.

As indicated and explained in Section 1.3 of the DEIR, the 1993 CMP Update EIR is a subsequent tiered program-level EIR, from which the

environmental documentation for specific capital improvement projects under the CMP will be tiered. Given (1) the programmatic nature of the CMP and CMP EIRs; (2) the fact that the CIP is periodically updated and that capital projects selected by local jurisdictions as deficiency mitigation are specified annually; and (3) that the amount of jobs and housing disruption will depend largely on the specifics of the design and implementation of capital improvement projects, a comprehensive and quantitative analysis of potential displacement issues is not possible at the program level of analysis.

47. Please refer to Response to Comment 46. Public Service impacts are discussed in Section 3.6 of the DEIR.
48. The explicit purpose of the CMP program and enabling legislation is to reduce congestion on arterials and highways. What is relevant to the CMP is that there are no biases in the structure of the Tool Box program that would cause reductions in congestion to occur more rapidly in one type of community versus another. The CMP is designed to be impartial with respect to this issue.
49. The City of Los Angeles' goal of linking new development with the transportation system parallels the intent of the Tool Box land use strategies, which provides substantial mitigation credits for focusing development around transit centers. The Land Use strategies (detailed in Table E-2 of Appendix E) are also structured to encourage residential and commercial mixed use projects, particularly around transit centers. These measures are supportive of policies such as the City of Los Angeles' Centers Concept. If they are carried out by the individual jurisdictions, these measures would decrease commuting distances and VMT.

As indicated under *IMPACTS* on Page 75, it is not possible to predict how decision makers in a given jurisdiction will respond to the program requirements, and which Tool Box Measures will be selected. However, the CMP sets up incentives for each jurisdiction to implement mixed use projects and linkage of new development with transportation centers.

As discussed in detail in Section 3.5 (Land Use) of the DEIR, the proposed program is not anticipated to result in deconcentration.

50. Please refer to Section 3.4 of the DEIR which evaluates the proposed programs potential land use impacts.
51. Please refer to Responses to Comments 49-50.
52. Please refer to Response To Comment 46.
53. As noted in the comment, the 1992 CMP EIR listed on pages 45-47 the construction techniques contained in the RMP EIR to minimize the disruption effects of capital improvement projects. The 1993 CMP DEIR is a subsequent tiered program EIR. As such, it analyzes potential impacts not analyzed in the 1992 CMP EIR.
54. The direct construction noise effects of CMP capital improvement projects are discussed in the 1992 CMP EIR. Please see page 84 of that document. Mitigation measure D.1 of the 1992 CMP EIR is designed to address these potential impacts. The Mitigation Monitoring Program for measures included in the 1992 CMP EIR is contained in Appendix B of the DEIR for the 1993 CMP Update.
55. The credit system used in the countywide deficiency plan uses person-miles travelled as the measure of mobility benefit for the various multimodal improvement strategies, and does not simply focus on highway levels of service. Use of this performance measure addresses the issue of localized congestion impacts of concentrated development, and allows also for measurement of non-automobile strategies such as transit service improvements. Person-miles travelled is easily converted to vehicle miles travelled. In addition, the statewide CMP/Air Quality coordination study currently underway is examining a wide range of alternative performance measures, including vehicle miles travelled, for consideration in future CMP updates.

The analysis of the potential transportation impacts of the proposed program contained in Section 3.2 of the DEIR examines the projects potential effects on VMT, VHT, and hours of delay.

56. The potential for the CMP to result in deconcentration effects is examined in the Land Use section of the DEIR, (Section 3.5), as well as discussed in Section 4.2, Cumulative Impacts. Please refer also to Response to Comments 45 and 55.

57. The CMP is required by law to be consistent with the adopted RMP. The DEIR examines the proposed project's consistency with the adopted RMP forecasts. Adoption of the 1993 CMP is scheduled for November 1993. Adoption of the Regional Mobility Element (RME) is currently scheduled for February 1994. (As indicated in Letter 1, Comment 17 from SCAG). The next update to the CMP will be in 1995, and will be based on the adopted plans and programs current at that time.
58. Section 4.2 of the DEIR for the 1993 CMP Update contains a discussion of potential cumulative impacts of the CMP. This discussion updates the discussion contained in the 1992 CMP EIR.
59. As explained in Response to Comment 3, the model runs used for the traffic, air quality, and energy analyses contained in Section 3.3 of the DEIR use an iterative process intended to capture the effects of latent demand. The CMP traffic and air quality analyses included a Capacity Enhancement scenario that reflected changes in mode choice should there be an increase in arterial and highway capacity. This is a very conservative (worst case) scenario since many jurisdictions will choose measures which actually reduce trips rather than increase capacity. The results of the analysis indicated that a small increase in VMT and VHT is forecast if only capacity enhancing Tool Box measures are chosen. The assessment of this alternative presented in the DEIR indicated that the emissions would be slightly higher than the Year 2010 baseline. However, it is also concluded that the project will not result in a net increase in either VMT or VHT since in actual implementation both trip reducing measures and capacity enhancing measures will be chosen. Please refer also to Response to Comment 3.
60. Specific Tool Box measures selected by local jurisdictions must satisfy SCAQMD air quality assessment requirements, which include the assessment of quarterly construction emissions.
61. Section 3.5, Land Use, of the DEIR examines the potential deconcentrating effects of the deficiency plan requirement. Since no deconcentrating effects are anticipated, based on the analysis, no additional mitigations besides mitigation C.3 from the 1992 CMP EIR, which remains in place, are specified in the DEIR. Mitigation Measure C.3 is a safeguard mitigation measure, designed to verify the analysis in the CMP EIR regarding potential deconcentration

effects. It provides for modification, should inconsistencies between observed and predicted behavior be discovered. Measures C.3, which is included in Appendix B of the 1993 CMP Update DEIR, reads as follows: "The (MTA), where possible, through the congestion monitoring, highway and transit network modeling and land use analysis program elements of the CMP, shall determine the similarity between observed travel behavior with growth rates and geographic distribution assumptions of the RMP. The success of the program in working toward regional land use and mobility goals will be assessed as part of future CMP updates, and appropriate changes to work toward regional goals will be proposed in consultation with local, regional and state agencies."

62. Page 63 of the DEIR acknowledges that hot spots created by the CMP will have to respond to Clean Air Act provisions and to the CO Protocol developed in conjunction with the EPA. At the project level, hot spots will have to be assessed on their own merits and mitigation measures will need to be adopted by local jurisdictions that select measures that result in hot spot effects.
63. The analysis contained in Section 3.5 of the DEIR indicates that no deconcentration effects are anticipated.

The Tool Box does include measures which encourage some increased densification in the vicinity of transit centers and corridors. The intent of these measures is to reduce VMT, which is a beneficial impact. The CMP Tool Box measures provide an incentive rather than a requirement for densification around transit centers and corridors. If selection of densification measures would result in significant public service impacts, that would be considered by a local jurisdiction, when deciding whether or not to select use of the measure.

Please refer to Response to Comments 3, 45, 61, 70 and 91.

64. "The Draft and Final Environmental Impact Report on the Southern California Association of Government's Draft Growth Management Plan" (State Clearinghouse Number 88062924) is herein incorporated by reference. The document is available for review at the MTA offices, located at: 818 W. Seventh Street, Los Angeles, CA 90017. Public service impacts, including impacts to utilities, are discussed in Chapter 6 of that document.

The GMP EIR includes an analysis of water supply and quality (p. 6-1 to 6-15), wastewater treatment (p. 6-15 to 6-24), solid waste (p. 6-24 to 6-31), hazardous waste (p. 6-31 to 6-35), schools (p. 6-35 to 6-40), law enforcement (p. 6-40 to 6-45), fire protection (p. 6-45 to 6-48), healthcare and social services (p. 6-48 to 6-56), and energy (p. 6-56 to 6-64) issues. **Table 3-1**, pages 3-11 to 3-18 of the GMP EIR, which is reproduced on the following pages, summarizes the public service impacts and mitigations identified in the GMP EIR.

Energy impacts associated with the 1993 CMP Update are considered in Section 3.4 of the 1993 CMP Update DEIR.

65. By maintaining mobility on the regional system, the CMP will facilitate the movement of goods. As shown in Table E-2 in Appendix E of the DEIR, the CMP Tool Box includes deficiency mitigation credit points for goods movement facilities.
66. Statute does not provide exemption for local public facilities from CMP mitigation requirements. Therefore, new trips added by the development of City facilities, such as LAX and the Port of Los Angeles, will be included in the City's deficiency plan responsibilities.

To the extent that these new trips originate from growth in other jurisdictions within the County, those other jurisdictions will be responsible for addressing their share of responsibility. The proportion of these new trips that originate outside Los Angeles County are not included in the City's responsibilities. Where future expansion of regional facilities is planned, the CMP Land Use Analysis Program provides a means through which regional access to these facilities can be assured. The impact of trips attached to these future facilities from outside Los Angeles County are accounted for in the Transportation Impact Analysis guidelines contained in the CMP.

Table 3-1. Continued

Impact Category	Significant Impacts	Mitigation Measures Necessary to Reduce Significant Impacts to Less than Significant
PUBLIC SERVICES	Possible damage, destruction, or removal of recorded and unrecorded cultural resources	<p>Local jurisdictions should require that the following measures be undertaken, prior to approving development, to protect cultural resources:</p> <ul style="list-style-type: none"> o map areas of prime cultural resource significance; o consult with the appropriate archeological or historical information center and clearinghouse (i.e., University of California at Los Angeles, University of California at Riverside, San Bernardino County Museum, or Imperial Valley College Museum) to identify known cultural resources and potential cultural resources that could be found on land proposed for development; and o implement an archeological field survey if a development area is identified as "sensitive." If the field survey identifies significant cultural resources, preservation and mitigation measures should be recommended.
Water Supply	Regional water supply shortfall of 1.2 million acre-feet (MAF) (15 percent shortfall) in 2010, of which 0.7 MAF (21 percent shortfall) would occur in the coastal plain subregion and 0.5 MAF (11 percent shortfall) in the outlying subregion	<p>The Metropolitan Water District of Southern California and other water providers in the region should increase dependable annual supplies at a regional level by 2010 to at least 8.0 MAF and make the fullest use of existing resources by implementing the following measures as needed:</p> <ul style="list-style-type: none"> o increase State Water Project (SWP) yields through implementation of a Coordinated Operation Agreement between the State and the U. S. Bureau of Reclamation; completion of various Delta facility capacity improvements, offstream storage programs, Central Valley Project and other SWP programs; and implementation of water transfer agreements between agricultural and urban SWP contractors; o obtain maximum use of Colorado River supplies; o store up to 3.0 MAF of surplus water in groundwater basins; and o make optimum use of existing resources and minimize adverse effects of supply shortfalls by local wastewater reclamation, groundwater protection, groundwater treatment, water conservation, surface water storage, and drought contingency planning projects.

1993 Update Congestion Management Plan Draft Environmental Impact Report Comments

Dear Ms. Morries:

The City of Culver City appreciates the opportunity to comment on the Draft Environmental Impact Report (EIR) on the 1993 Congestion Management Program for Los Angeles County (CMP). Culver City has been an active participant in the CMP process. City staff reviewed the NOP and provided comment. Since some of the NOP comments have not been addressed in the Draft EIR as discussed below, we have attached a copy of our NOP comments. We have reviewed the Draft EIR and have the following comments.

- o The Project is Not Defined -- The comments on the CMP were due last week on September 9. We provided comments on the CMP for that deadline under separate cover, as requested by LACMTA. The Draft EIR was circulated well before that time and clearly cannot reflect any revisions to the CMP which may be required in response to comments on the CMP. Whether or not the revisions in response to comments constitutes significant new information necessitating recirculation of the Draft EIR will have to be determined. In any event, the Final EIR should clearly denote changes made to the EIR and CMP text in response to comments on the Draft CMP, beyond those made in revising the document from the 1992 to 1993 versions.
- o Significant Changes in Land Use -- The CMP does significantly and systematically alter land use development patterns. We commented on the NOP that this impact is key to understanding the impacts of the CMP and must be addressed in the EIR. Instead the Draft EIR contradicts itself and determines that no adverse impacts are expected. On page 75 of the Draft EIR, the thresholds of significance for land use are defined to include alteration of development patterns. On page 77, the Draft EIR states that "the CMP appears not to significantly alter existing growth patterns". The first items listed in the CMP toolbox (Appendix G of the Draft CMP July 1993) are land use strategies focusing development around transit centers and corridors. These strategies are clearly an alteration in land use development patterns. Therefore, in context with the thresholds of significance, the CMP will have significant impact on land use. These potential impacts are environmentally adverse

67

68

Page 2

in that areas where development will be concentrated cannot, in most cases, absorb the intensification called for in the CMP without significant improvements in the supporting infrastructure, not to mention impacts associated with dislocation of existing homes and businesses during construction. As stated in our comments on the CMP, mitigation strategies which give credit for focused residential and commercial development along transit corridors and at transit centers should only be allowed if the corridors and centers are funded and the alignment set. Regionally and in the long-term, the impacts of land use intensification around transit centers and corridors may be beneficial, but locally, the impacts could be devastating.

70

- o Loss of Parking is a Potential Impact -- As the City of Culver City commented on the Draft CMP, the legislation on which the parking cash-out program is based does not require the CMP to address parking cash-out, but instead shall consider such programs during the development and update of the trip reduction and travel demand element. The CMP requirement is different than the requirement of the statute. The EIR does not address the potential impacts to any parking provisions of the CMP, including the cash-out program. We request that the CMP and EIR be revised to include the full provisions of the parking cash-out program statute and discuss the potential environmental impacts of this program.

71

Again, we appreciate the opportunity to comment on the Draft EIR for the CMP. We anticipated that, after review of the comments on the CMP, LACMTA will notify us about the determination regarding possible recirculation of the Draft EIR. We do not intent to needlessly delay the CMP process, but are concerned about the adequacy of impact analysis in the EIR. If you have any questions about the above comments, please do not hesitate to call me at (310) 280-5949, or John Rivera, Associate Planner, at (310) 202-5783.

72

Sincerely,

Steven L. Gerhardt
Interim CEQA Coordinator

1993 CMP NOTICE OF PREPARATION COMMENTS

Dear Ms. Morries:

The City of Culver City appreciates the opportunity to comment on the Notice of Preparation (NOP) of a Draft Environmental Impact Report (EIR) on the 1993 Congestion Management Program (CMP) for Los Angeles County. Culver City has been an active participant in the CMP process. City staff has reviewed the NOP and the City has the following comments.

- o Tiering from Previous Programs and EIRs -- While we appreciate and encourage the tiering concept and understand its usefulness in this instance, the Draft EIR should be completed in such a way that the resulting document stands alone and is understandable to readers who may not have several years of experience with the CMP process. The CMP has evolved significantly in the past year. The quantification of impacts and credits and other vital components of the CMP are now available. It is important for the public to understand the refinements and changes that have occurred and the potential impacts of the program as is now exists. The changes are more profound than the addition of the deficiency plan to the CMP. Key passages from past RMP and CMP program documents, or their EIRs, and from the current NOP/Initial Study should be repeated or referenced in the EIR and provided in the appendices for this EIR. In no instances should local or regional potential impacts discussed in subsequent project-specific (i.e., CIP project) EIRs address issues which were not identified as potential impacts in the 1993 CMP EIR, which is intended to serve as the master tiering environmental document.

73

At minimum, the complete set of CMP mitigation measures should be provided in the EIR. The existing and proposed measures could be separated for clarity. As discussed below, the RMP and 1992 CMP EIRs do not provide comprehensive impact analysis for several environmental issues. Additional analysis in the 1993 CMP EIR will be required. The 1993 CMP EIR and the guidelines together should provide a complete picture of the requirements and goals of the CMP.

73

- o Supplements to the CMP -- The CMP NOP (Page 5) indicates that a brief supplement to the CMP guidelines for analysis of longer range and more generalized development programs will be forthcoming. In our discussions with MTA staff, we have learned that the supplement will be incorporated into the CMP Draft EIR. Standard practice throughout the CMP process has allowed interested parties to review proposed revisions and additions to the CMP guidelines prior to including them. The CMP EIR will also consider the addition of La Cienega Boulevard, from I-10 (Santa Monica Freeway) to I-405 (San Diego Freeway). This addition needs to be reviewed and analyzed. At this point, it appears that timing for the EIR may not allow this type of preliminary review, or that the review of the supplement and network change with the Draft EIR will occur concurrently. In the past, the LACMTA (or its predecessors) has asked that comments on the program be submitted separately from comments on the EIR itself. We therefore reserve the right to comment on the supplement as part of the EIR. We will make our comment separately during the EIR review period if requested.
- o Benefits as Well as Impacts Should be Discussed -- The initial study indicates no potential impacts for Water (III.e), and provides a summary of impact discussion and mitigation from the 1992 CMP EIR. It should be emphasized in the EIR, as mentioned in the Initial Study, that the levels of pollution deposited on roadways for eventual transport to the storm drain system would vary with the number and length of trips made on these facilities. The CMP encourages fewer trips or reduced length trips. The potential benefit in terms of potentially improved water quality should be discussed in the EIR. Similarly, other environmental benefits of implementation of the CMP should be discussed in the EIR, as was in the RMP EIR (Page 152).

74

75

- o Impacts not Identified in the Initial Study Should be Discussed -- Potential impacts in the form of traffic hazards to motor vehicles, bicyclists or pedestrians should be discussed as a potential impact. The initial study states that the 1993 CMP does not contain any element that would increase traffic hazards. It is conceivable that lane reconfigurations or restriping, signal timings, and other changes could create traffic hazards, particularly for pedestrians and bicyclists. This is a potential impact that should have been checked "maybe" in the initial study. Discussion of potential impacts should not be discounted in the CMP EIR since this EIR will be used for tiering project-specific projects under the CMP that may have traffic hazard impact potential. The EIR should discuss this impact potential.

76

The CMP encourages the use of alternative fuel and zero-emission (electric) vehicles. These could potentially impact power or natural gas utilities. Items XVI.a and XVI.b should have been checked "maybe" and the EIR should discuss potential impacts from increased use of alternative fuel and zero-emission vehicles on energy utilities.

77

The RMP EIR only discussed the energy impacts of Amtrak trains in terms of passenger rail transit. Although transit improvements that have come on line since 1988, such as the MetroRail Red and Blue lines, do not consume fuel, they should be considered for potential energy conservation issues. This issue was not raised in the 1992 CMP EIR.

78

Similarly, the CMP encourages telecommuting. The potential impact on communications systems should be discussed. The impact of fax machines, cellular networks, and other devices on communication systems in recent years has been tremendous. The number of area codes now serving Los Angeles County is ample evidence of this impact. Telecommuting from home or from satellite telecommuting centers in suburban areas has the potential to continue to impact communication systems. This impact should be discussed in the EIR.

79

The potential for CMP roadway improvements to create aesthetic impacts should be discussed in the EIR. Grade-separated crossings, for instance, could create aesthetic impacts and block views. Culver City commented about the need for adequate aesthetic impact analysis during preparation of the 1992 CMP EIR.

80

Fiscal impacts on businesses has not been adequately addressed in the two previous EIRs from which the 1993 CMP EIR will be tiered. Discussion focused on business relocations, employment growth, access to employment areas, and other issues, but did not discuss the fiscal impact on adjacent businesses in terms of lost on-street parking resulting from roadway widenings and restripings. The urban design quality and aesthetics for sustaining and attracting businesses along CMP roadways may negatively affected by street widenings, and needs to be addressed in the CMP EIR.

81

Cultural resources that have yet to be discovered are protected by mitigation measures provided in the State CEQA Guidelines in Appendix K. Since the CMP may involve disturbing cultural resources to complete facilities, the potential for impacts should be identified in the CMP EIR. Subsequent project-specific EIRs should also discuss this potential impact even if cultural resource inventories do not anticipate a likelihood of impacting cultural resources. Appendix K provides mitigation measures in the event unanticipated or previously unidentified cultural resources are discovered during construction.

82

- o Growth Inducement – The 1992 CMP EIR states that the potential of the CMP to foster urban deconcentration is negligible. Specifically, the EIR states that "in order to avoid congested areas, and any costs associated with developing in areas subject to deficiency plans, developers may prefer to initiate new projects in relatively uncongested areas. Therefore, the CMP may provide an additional incentive for growth in outlying areas . . . This impact is considered minor, when compared to existing incentive to locate new development in less congested areas" (1992 CMP EIR, Page 145). While it might be argued that other forces, such as land prices and housing affordability, are the major contributors to urban sprawl, the impact of the CMP to encourage growth in outlying areas should not be discounted.

83

The avoidance of mitigation measures for congestion for initial development in an area, depending on future "last one on the block" developments for mitigation is a tradition in this region that has led to the congestion problems the CMP was created to address. The potential for improved travel time to encourage longer commutes should be an integral part of the impact discussion in the CMP EIR. The relationships between regional land use control, growth management and the underlying reasons for traffic congestion should also be thoroughly discussed in the CMP EIR.

84

85

86

The RMP EIR stated that the RMP did not create an inducement to growth, it redistributes population and employment growth to achieve better job/housing balance within each subregion (RMP EIR, Page 157). The CMP EIR, on the other hand, states that the CMP is not anticipated to affect the distribution of population and employment at the SCAG subregional level (1992 CMP EIR, Page 44). While the argument that the CMP is not likely to induce regional population growth makes sense, the CMP has the potential to greatly impact the distribution of population and employment within the region. The impact on subregions and local jurisdictions could be significant. Since it is unlikely that the project-specific EIRs for CIP projects will consider subregional impact potential, these impacts should be considered in the 1993 CMP EIR. As Culver City has commented on the 1992 CMP EIR, the discussion on growth inducement potential needs on a subregional or local level, if not regional, and must be supported by recent data and supportable analysis.

87

- o Regional Centers -- The development of regional centers linked by transit is encouraged in the CMP. However, the establishment of regional centers in jurisdictions other than the City of Los Angeles and County of Los Angeles requires intergovernmental coordination, perhaps even Memoranda of Understanding or Joint Powers Agreements. Culver City has commented on this issue for the 1992 CMP EIR.

88

Local jurisdictions do not want to allow increased density around transit centers until development of the transit system and transit center are guaranteed. Allowing the increased density, only to see the transit improvements not come to fruition has created some of the most congested areas in the region. The offset of localized "hot spot" impacts to regional air emission reductions has been documented in the 1992 CMP EIR (1993 CMP Initial Study, Page 19). The relationship of local land use policy decisions to create regional centers in association and coordination with regional transit facilities should be discussed in the 1993 CMP EIR.

89

90

The localized impacts of concentrating development at transit centers has been briefly discussed in the previous EIRs. The RMP EIR did not consider impacts to regional centers in the Urban Form and Growth analysis section. Centers were listed on Page 134 and discussed in terms of county employment growth as part of the regional economy analysis (RMP EIR, Page 138). The 1992 CMP EIR states that individual CIP projects may result in localized adverse traffic impacts, which will be addressed in future project-specific EIRs (1992 CMP EIR, Page 60).

91

Since the CMP network has been developed to include the major highways and roadways that are currently experiencing congestion, it is logical to assume that the transit centers designated through the CMP process will also be on or near CMP roadways. Concentrated development densities of the intensity and scale considered in the CMP will create additional impacts on these already congested roadways. Even if the capture rate for commuter trips is high for development around these transit centers, the addition of trips by those coming to and leaving the regional centers each day plus daily local trips by transit center residents and employees outside the transit center will add significant numbers of local trips to the already congested local traffic system. Thereby, even though the transit center will facilitate regional mobility, the density of the transit centers will actually increase local congestion and limit local mobility. This impact has been vaguely referenced in previous EIRs and needs to be completely analyzed in the 1993 CMP EIR, as well as future project-specific EIRs. The CMP EIR cannot ignore this potential impact, or defer the basic analysis to future project EIRs, where the impact potential will be fragmented.

91

In order to analyze the potential impact the CMP EIR should consider the level of concentrated development at a transit center and identify the associated impacts of that increased development. The analysis of traffic impacts alone is not sufficient. The impact on existing infrastructure, such as water and sewer lines (conveyance and treatment capacity), emergency services [the ability to provide service to the transit center and system, not just get around town as discussed in the 1992 CMP EIR (Page 139)], and other public services and utilities, must be discussed as potential impacts of the policies of the CMP itself in the 1993 CMP EIR. Detailed discussion can be provided in CIP project EIRs as these projects relate to specific localized conditions for individual projects.

92

The real world intensity and potential impacts of the development required to support the transit centers has not been fully considered in any of the previous environmental analysis. We would urge you to review the work recently completed by the UCLA Graduate School of Architecture and Urban Planning under Professor Jurg Lang, to understand potential impacts of regional center development concentration. Those studies of the Exposition Right-of-Way may further assist in the preparation of the 1993 CMP EIR.

93

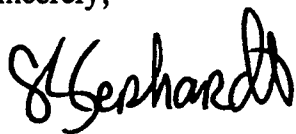

Ms. Kendra Morries, Land Use Project Manager

Letter 6. Response to Comment from Steven L. Gerhardt, Interim CEQA Coordinator, City of Culver City, September 13, 1993 with attached letter of June 23, 1993.

67. Since the commentator does not indicate which of the City's comments submitted in response to the NOP are still of concern, Responses to Comments 73 to 93 address each of the City's NOP comments in turn.
68. Please refer to Response to Comment Number 41.
69. The discussion on page 77 relates to the proposed project's potential to affect the regional land use pattern. The DEIR indicates that the 1993 CMP Update will have two major land use impacts (please see page S-6). First: "(t)he proposed program will not systematically result in a land use pattern which is substantially different than the adopted regional forecast or which is systematically different than market patterns." A mitigation, measure 3.5.1, is included to require monitoring as to the validity of this conclusion and the impact is categorized as "Not Significant." Second: "(t)he proposed program may result in a localized redistribution of development in the form of greater densification of transit corridors and/or station areas. This impact is categorized as a "Beneficial Impact." Both of the potential impacts identified by the commentator are thus discussed in the DEIR.
70. The CMP Tool Box measures provide an incentive rather than a requirement for densification around transit centers and corridors. Jurisdictions are provided with the flexibility to select those Tool Box measures which accomplish CMP deficiency mitigation targets in a way that is best suited to the local jurisdiction. If selection of densification measures would result in significant public service impacts, that would be considered by a local jurisdiction, when deciding whether or not to select use of the measure. Therefore public service impacts from selection of these types of measures were not considered significant. The 1992 CMP EIR discusses potential dislocation issues associated with the construction of capital improvement projects.

As indicated in Appendix G to the CMP, any "(p)roposed station or facility must be funded and alignment set by a certified EIR" to obtain credit. (See for example condition C of strategies I.1 and I.2 on p G3

of the Draft CMP). Because of the inclusion of this requirement, the CMP is not anticipated to result in the type of impact described by the commentator. The full text of the CMP was incorporated in the DEIR by reference (see page 4 of the DEIR).

71. The final CMP will amend the description of "Parking Cash-Out Programs" to include reference to the applicable Government Code Section.

As required by statute, MTA has considered parking cash-out programs and determined that it is an appropriate strategy for the deficiency plan mitigation Tool Box. It should also be noted that a city does not need to select this strategy if it does not fit local jurisdiction mitigation needs. The Tool Box is intended to provide flexibility to choose the most appropriate strategies. The specific effects of a local jurisdiction's parking cash-out program and the appropriate mitigation measures would be addressed as part of the local jurisdiction's review and adoption process.

The parking cash-out program is listed as a deficiency mitigation Tool Box measure in Table E-2 in Appendix E of the DEIR.

72. Please refer to Response to Comment 41.
73. Chapter II of the DEIR explains the relationship between the 1992 and 1993 CMPs and their associated EIRs. The 1993 CMP EIR contains a stand-alone analysis of the addition of the deficiency plan component to the CMP as well as cumulative impacts. The 1992 CMP EIR, in tandem with the 1993 CMP Update EIR, are the joint master documents from which project specific EIRs can be tiered. They should be viewed as volumes I and II of the program EIR for the CMP. Mitigation Measures from the 1992 CMP EIR are included as Appendix B of the DEIR.
74. Section 2.4 of the DEIR contains a summary of the elements proposed for inclusion in the 1993 CMP and analyzed in the DEIR. These elements include: update of the 1993 Highway and Transit Monitoring Network; additions to the CMP Highway and Roadway System; refinement of the Land Use Analysis Program; update of the Capital Improvement Program; and addition of deficiency plan procedures.

Please refer also to Response to Comment No. 41.

75. The DEIR identifies the following beneficial program impacts: consistency with the RMP; reduced VHT and hours of delay; air emissions reductions; fuel savings; a shift towards high occupancy modes further reducing energy consumption; densification of transit corridors and/or station areas; and maintenance or improvement of emergency vehicle response times.

Since VMT under the proposed program would range from 202 to 205 million VMT, compared to 202 million VMT under the baseline conditions, water quality benefits are not anticipated, and the analysis contained in the 1992 CMP EIR remains valid.

76. Ultimately, traffic hazards to motor vehicles, bicyclists or pedestrians should be decreased as a result of the project, since the goal is to manage and reduce congestion on the CMP system. Standard construction traffic safety practices should result in less than significant traffic hazards during the actual construction of improvements. The potential for implementation of improvement projects to result in traffic hazards would be evaluated as part of standard project-level environmental review under CEQA, once such improvements are identified. No significant traffic hazard related issues are anticipated at the program level.
77. The CMP does not address the use of alternate fuels. Please refer also to Response to Comment 78.
78. The potential energy impacts of increased use of high occupancy vehicles is discussed on page 66 of the DEIR. It is acknowledged that some Tool Box measures are oriented to increasing the transit share of total person trips in the County. These trips would take place on the bus or rail transit system. In the short term, the shift to bus use would entail increased diesel fuel consumption and over the long term the shift to electric buses will result in increased power plant consumption of coal, thermal, or hydroelectric sources. Overall, a shift toward high vehicle occupancy modes would increase energy efficiency in the County by decreasing the energy consumption per person trip.
79. Over the last 5 years, there has been a rapidly growing, worldwide, use of fax machines, cellular networks, and other electronic means

of instant communication. This has been accompanied by technological developments that have reduced the price of such equipment and increased the capacity of the communications infrastructure. The CMP does encourage the use of telecommuting as an alternative to driving. However, it is unclear the degree to which local jurisdictions will choose to select telecommuting related Tool Box measures. As this telecommuting is implemented, as a result of CMP, AQMP, and general business practice changes, it will result in an increased use of, and demand for, new communication technologies. However, it is unlikely that the CMP's contribution to this impact will be significant given the stricter AQMP requirements, the range of measures included in the Tool Box, and the other societal forces affecting the overall change in communication patterns which is currently taking place.

80. The RMP EIR includes a discussion of the factors which determine a project's potential to create aesthetic impacts as well as a discussion of both how classes of RMP projects and specific RMP projects would affect aesthetics. (Please refer to pages 86 - 96 of the DEIR for the RMP). The classes of RMP projects discussed in the RMP EIR are TDM, TSM, high-flow arterial, high-occupancy vehicle facilities, mixed-flow facilities, transit facilities, and non-motorized transportation. The RMP EIR includes, at a program level of detail, mitigation measures for aesthetic impacts. The DEIR for the CMP is tiered from the EIR for the RMP and the RMP EIR was incorporated in the DEIR by reference (see page 2 of the DEIR). Both the 1992 CMP EIR (see page 149) and the DEIR for the 1993 CMP (see page 102) state that the construction of new freeways and transit guideways, especially aerial alignments, can disrupt or block views and indicate that such projects would have a significant cumulative impact on visual resources. Because both the RMP and CMP EIR's are program level documents, and the specific nature and mitigation for a capital project's aesthetic impacts can only be determined during project level analysis, the program level discussion of visual impacts included in the RMP EIR was felt to be adequate for purposes of CMP evaluation.
81. Given the speculative nature of which Tool Box measures will be selected by a local jurisdiction, it is not possible to accurately predict the magnitude of economic and fiscal effects on local businesses. It is acknowledged, however, that local implementation of measures that restrict on-street parking or widen facilities to remove parking

would adversely affect adjacent businesses if no mitigation measures were considered by the local jurisdiction.

82. Mitigation Measure H.1 of the 1992 CMP EIR provides mitigations for potential cultural resource impacts. Please see Appendix B of the DEIR.
83. The discussion in Chapter IV of the DEIR includes an updated discussion of the CMP's potential to create deconcentration effects.
84. The 1993 CMP proposes to address the impacts of cumulative development through the addition of the deficiency plan component to the CMP program. In summary, the countywide deficiency plan provides that each local jurisdiction will be responsible for tracking and reporting all new development activity on an annual basis. Local jurisdictions then off-set the impacts of new development by selecting and implementing mitigation strategies they deem most appropriate for their community.

The countywide deficiency plan does not, however, require linkage of mitigation, or credits, to individual or specific development approvals. Jurisdictions are therefore free to choose the mitigation strategies they deem most appropriate. Mitigation measures can be applied throughout the jurisdiction, within a subarea, at a specific project level, or in cooperation with other jurisdictions. The program requires only that local jurisdictions implement mitigation strategies commensurate with its annually calculated congestion mitigation goal.

85. As explained on pages 34-36 of the DEIR, the model runs which were done to analyze the potential impacts of the Trip Reduction Emphasis and Capacity Enhancement Emphasis used an iterative modeling process in order to account for the effect of latent demand.

Please refer also to Response to Comment 3.

86. The issues of regional land use controls and growth management are highly political in nature and controversial as they have the potential of diminishing each jurisdiction's control over land use within its boundaries. Rather than imposing regional land use measures or controls, the CMP offers various land use options within the menu of mitigation strategies. The mitigation strategy values are

listed in Table E-2 of Appendix E of the CMP EIR. Each jurisdiction has the ability to choose those options that will best further their own needs and may be able to offset their deficiency plan debits entirely with capital improvement, TSM and demand management strategies. The CMP offers a coordinated regional congestion management strategy while maintaining local jurisdictional control over the choice of mitigation strategies.

87. Sections 3.5 and 4.1 of the DEIR discuss, in detail, the potential of the CMP to create a subregional redistribution of population, employment, and housing within the County. This discussion supplements and updates the discussion in the 1992 CMP EIR.
88. Comment noted.
89. Credit for development along transit centers will be subject to the requirement that the transit center have received prior environmental clearance and funding for construction.
90. Comment noted.
91. There is a potential for future localized increases in congestion and tripmaking due to the centralization of development activity around transit centers. As stated in the comment, however, the goal of the program and the development intensification is to capture a relatively larger share of trips on the transit system and to eliminate trips via interaction of mixed land uses. The overall system-wide congestion would therefore decrease even if there is some localized increase in tripmaking (i.e., shifting the inevitable future trip increases to centralized locations rather spreading it out throughout the County). It is not feasible to measure the impacts of such localized trip increases on a countywide basis since it is not known where development activity will be intensified or to what level. This Tool Box measure is entirely within the control of local governmental agencies through the land use planning and development approval process.
92. The CMP Tool Box measures provide an incentive rather than a requirement for densification around transit centers and corridors. Jurisdictions are provided with the flexibility to select those Tool Box measures which accomplish CMP deficiency mitigation targets in a way that is best suited to the local jurisdiction. If selection of

densification measures would result in significant public service impacts, that would be considered by a local jurisdiction, when deciding whether or not to select use of the measure. Therefore public service impacts from selection of these types of measures were not considered significant. The 1992 CMP EIR discusses potential dislocation issues associated with the construction of capital improvement projects. The 1993 CMP EIR discusses the potential "hot spot" creating impacts of densification around transit centers/stations and identifies this as a significant impact of the proposed project.

93. The comment points out the need for analysis of the impacts of transit center development. The scale of such impacts would hinge on many details including the size of the center; its location relative to other land uses; the accessibility of the facility to shuttle buses, pedestrians, or automobiles; the adequacy of parking facilities; accommodations for child care and/or other support facilities; provisions for joint development; and the nature of surrounding land uses. Each local jurisdiction will determine the parameters and, correspondingly, the scope of potential impacts of its transit centers.

Mr. Ed Shikada, Director
Congestion Management Program
Los Angeles County
Metropolitan Transportation Authority
818 West Seventh Street, MS-2200
Los Angeles, CA 90017-3425

Dear Mr. Shikada:

DRAFT ENVIRONMENTAL IMPACT REPORT COMMENTS
1993 UPDATE CONGESTION MANAGEMENT PROGRAM

The Los Angeles County Department of Public Works and Regional Planning Department have reviewed the Los Angeles County Metropolitan Transportation Authority's (MTA) Draft Environmental Impact Report (EIR) for the MTA's 1993 Update Congestion Management Program (CMP) and have the following comments.

- Comments on impacts from technical and other aspects of the CMP, especially the Countywide Deficiency Plan, are the same as those we provided on the Draft 1993 CMP (copy enclosed). 94
- Since several sections in the Draft 1993 CMP, including the Capital Improvement Program and designation of Transit Corridors/Centers are not yet completed, we would appreciate an opportunity to comment on those sections when they become available. 95

Should you have any questions on this matter, please contact Mr. Barry S. Witler of the Transportation Planning Section at (818) 458-4351.

Very truly yours,

T. A. TIDEMANSON
Director of Public Works

CARL L. BLUM
Deputy Director

cc: Ms. Rose Hamilton (Regional Planning Department)

COMMENTS ON DRAFT 1993 CONGESTION MANAGEMENT PROGRAM

General Comments on CMP

- Los Angeles County's adopted Land Use Analysis Guidelines include the requirement for proponents of development projects to consult with transit operators. Although the 1992 CMP and 1993 Draft CMP state that this requirements should be part of the TDM Ordinance, the County was advised that its transit consultation requirement was acceptable. The 1993 CMP should reflect the option to include it with the Land Use Analysis Program. 96
- If regional improvements from the 30-Year Plan have been incorporated into the 20-year CMP model and have been used to forecast countywide congestion levels, how will congestion levels be affected if the MTA Board converts to a 10-year plan? Should not there be some mention of this newly proposed policy direction? (See Page 1-4.) 97
- Pages 1-5 indicates that the CMP will be incorporated into the Regional Mobility Plan (RMP). Does this mean that the CMP cannot be modified unless the RMP is also amended? Since the RMP carries certain federal requirements, how will local government authority be impacted? This area should include an expanded discussion. 98
- Will all projects proposed through CMP require a conformity finding with the AQMP? (See Page 3-4.) 99

Comments on the Deficiency Plan

- At various meetings with the MTA, we raised the issue of grant funding for TSM projects. Jurisdictions should either receive credit or the congestion reduction should be subtracted out of the "congestion gap" calculation, thereby reducing the local jurisdictions' mitigation responsibility. 100
- Please clarify the current relationship of the Phase II TDM Program to the CMP Deficiency Plan requirement (see Page 6-3, 10-11). 101
- MTA indicates they will investigate applying the newly developed credit system for quantifying the regional significance of project applications in the call for projects. Until all the "bugs" are eliminated from the credit system, this should be discouraged (see Page 8-2). 102

- AQMD is using vehicle trips as their mitigation value for their strategies. Since many of the strategies are similar to those in the deficiency plan, how will localities convert person miles of travel into vehicle trips? Hopefully, CMP and AQMD staff give similar points for similar mitigation strategies (see Page 10-9). 103
- Transit Centers and Transit Corridors have not been defined. This is critical to determine the feasibility of land use strategies around major transit facilities. Also, CMP staff should be able to provide alignment maps for all transit centers and transit corridors to local jurisdictions. 104
- On Page G-5, the credit for mixed use is unclear. Credit factor should be for each unit and gross square feet of commercial space. There are no points given for the minimum 15 percent of commercial space. 105
- Why is less credit given for development along transit corridors than transit centers? Since no definitions have been provided it is difficult to understand the logic behind this. 106
- It is strongly recommended that minimum residential densities not exceed 15 d.u. to receive credit for development at transit centers/corridors. Existing land use along many of the centers and corridors in the County are medium to low density. Also, many of the areas in the unincorporated areas along the blue line and green line have been recently downzoned to medium density. The residents in these communities are opposed to high density development. Twenty dwelling units per acre would classify as high density. Jurisdictions without major urban cores would not be able to utilize land use strategies as a means of mitigating congestion. 107
- Development to 20 d.u. would also be expensive because of parking standards. Increasing the floor area ratio would also necessitate underground parking for many developments and this would price many developers out of the market in areas where reinvestment is being encouraged. Developers may have a hard time getting financing for these projects. The issue of equity in communities experiencing disinvestment should be considered. 108
- Appendix G cannot stand alone without concrete examples and clarification of some of the terminology such as "reduction factors". A planner applying this methodology two years from now without the benefit of the numerous study sessions held by the CMP staff would have a great deal of difficulty applying this approach. The document is not "user friendly". 109

- Section 4.2.3 of the Countywide Deficiency Plan Background Study describes the methodology used to disaggregate the countywide congestion gap to units of new development. The units of measure as proposed in Exhibit 8 of this Section are expressed in dwelling units or thousands of square feet, as appropriate for each land use category, and based on the units used in the Institute of Transportation Engineers (ITE) "Traffic Generation" and San Diego Association of Governments (SANDAG) "Traffic Generators" publications. For hotel/motel lodging type of development, the Study recommends using 1,000 square feet as the unit of measure. However, the trip generation rates in ITE or SANDAG publications for these types of land use are not available in 1,000 square feet, but in the units of rooms or employees. Therefore, we recommend the Metropolitan Transportation Authority reevaluate these factors and use rooms or employees as the unit of measure for lodging. 110
- Categories used in Appendix F of the Draft 1993 CMP and other CMP sections to track new development activity do not correlate to those used to track for the United States Census Bureau. The primary differences occur in three areas: 1) Eating, Drinking, and Dining Establishments, 2) Medical Offices, and 3) Government Building. We recommend making CMP categories consistent with those used to track United States Census Bureau information. 111

**Letter 7. Response to Comments from Carl L. Blum, Deputy Director,
County of Los Angeles, September 13, 1993.**

94. Comment noted.
95. Please refer to Response to Comment No. 104 for the definitions of transit center and transit corridor.
- Please refer also to Response to Comment No. 41.
96. The final CMP will revise Section 7.2.4 to indicate that incorporating the transit operator consultation requirements into the same resolution or ordinance containing the requirements of the land use analysis program is acceptable.
97. For the 1995 CMP update, and future updates to the countywide deficiency plan, traffic congestion modelling will be based on the regional improvement plans current at that time. If this necessitates a shift to a ten-year or other time horizon, consistent growth estimates will be incorporated.
98. State statute requires that the adopted CMP be integrated into the Action Element of SCAG's RMP and MTA is currently working with SCAG staff to define the mechanisms through which the CMP can be incorporated. The current role of SCAG in the development and review of county CMPs is described in "SCAG's Regional Consistency and Compatibility Criteria for CMPs" (incorporated as Supplement 4 in the 1992 CMP). This information will also be incorporated in the final CMP.
99. The CMP is not directly subject to air quality analysis. Air quality conformity analysis is conducted at the regional level through the development of the Regional Mobility Element and the Regional Transportation Improvement Program. As a result, major aspects identified in the capital improvement program undergo conformity analysis when integrated at the regional level. Local jurisdictions must consult with the SCAQMD regarding conformity analysis for specific projects.
100. TSM projects are creditable under the deficiency plan, to the extent that they are implemented through funds programmed by local

jurisdictions. Regional discretionary funding of such improvements are not creditable because they are included in the baseline estimate of funds available for improvements within the forecast horizon. In addition, discretionary funding awards are based on criteria which include but are not limited to: congestion management, regional significance, inter-modal integration, environmental enhancement, cost effectiveness, project need, equity and economic development, prior commitments, and leveraging of fund sources. Since these additional criteria are involved in discretionary funding decisions, allowing local jurisdiction credit for these awards would create inequities among other local jurisdictions given equal responsibilities under the countywide deficiency plan.

Furthermore, in terms of modelling the size of the congestion gap, TSM improvements are not specifically included because these improvements are not detectable at the macro-level analysis of the model. It could be argued, in fact, that the arterial capacity inputs already assume optimum traffic signal timing and progression. Since this is rarely the case in actuality, it could be argued that TSM improvements assist in obtaining the operations assumed in the baseline deficiency forecast. Given these considerations, TSM improvements cannot be removed from the baseline forecast of countywide deficiencies.

101. Local jurisdictions may claim credit for TDM strategies funded through MTA's Phase II TDM program. The credit claim need not be limited to the level of local funding participation. This will provide incentive to local jurisdictions to participate in the programs objective of working towards both CMP and AQMP goals. This is also consistent with the baseline modeling. In order to ensure a consistent level of effort, local jurisdictions participating in the Phase II TDM program will still be required to participate in the new development activity tracking and annual reporting requirements of the deficiency plan.
102. MTA concurs that expanding the use of the credit system should be approached cautiously.
103. The SCAQMD Trip Reduction Ordinance handbook has been a primary resource in the development of the CMP countywide deficiency plan, both in terms of the strategies and the credit system, and MTA has and will continue to coordinate efforts wherever possible. The measure of credit for the deficiency plan (person-miles) does, however, differ from the measure used for air quality

purposes (vehicle trips). As stated in the CMP Deficiency Plan Background Study Section 5.3.1, use of person-miles is necessary for the deficiency plan in order to provide a multi-modal measure of mobility that can be applied to various types of improvements, can be readily measured, and which recognizes that trips of different lengths will differ in congestion impact. For air quality purposes, vehicle trips have been found to be the primary determinant of vehicle emissions.

Vehicle trips are easily converted to person-miles, and MTA staff will continue to provide assistance whenever requested. The use of different measures reflects the differing objectives of the programs. In practical terms, however, this means that when a project is evaluated for credit, simply one more statistic will need to be provided. Since the information needed to calculate both statistics is readily available, the effort required will be minimal. MTA will continue efforts to simplify and, where appropriate, automate the calculation of project statistics to minimize burdens on local agencies.

104. The final CMP draft is being amended to add the following definitions for "transit centers" and "transit corridors:"

"Transit Center" is a fixed facility that consolidates and supports passenger loading, and includes:

- A. Passenger Rail Stations such as those along the Metro Red Line, Blue Line and Metrolink, and
- B. Major Bus Transfer Centers served by at least eight bus lines, and providing a sheltered waiting area, signage with bus routes and schedule information, and bus bays restricted to bus use.

To receive credit, the transit center must have received environmental clearance and funding for construction.

"Transit Corridor" consists of a transit node defined as the intersection of two bus lines, each with evening peak hour headways of 8 minutes or less. A transit corridor may be made up of several transit nodes, however, jurisdictions will receive credit for focussing applicable development around any single node.

A 1/4 mile radius will continue to be used to define eligible development related to transit centers and transit corridors.

MTA will investigate the possibility of providing transit center and transit corridor location maps.

105. The final CMP will be revised to indicate that credit calculations for mixed use development will be based on the combined total of all residential dwelling units and all commercial square footage contained in a project.
106. Please refer to Response to Comment No. 104 for the definitions of transit center and transit corridor. Higher mitigation credit is available for development adjacent to transit centers than transit corridors based on available research and case studies demonstrating greater trip reduction.
107. The density definitions of low, medium, and high are not uniform throughout the County. The minimum dwelling units per acre proposed for the land use strategies are based on existing research and case studies that evaluate the minimum densities needed to adequately support various transit modes. The common finding of this research is that a minimum of 7-30 or more dwelling units per acre (some studies place this range as high as 20-50 units per acre), and a minimum commercial floor area ratio of 2.0 - 5.0 is necessary to support fixed rail and bus transit with headways in the 9-15 minute range. The selection of a minimum density of 24 units per acre and a floor area ratio of 2.0 is therefore conservative. The intent of the minimum densities and floor area ratios associated with the land use strategies is to ensure that sufficient massing is provided that will result in the intended synergy between residential/commercial development and the transit system.

Consistent with CMP policy, the ultimate discretion for land use decisions will remain with the local jurisdiction.

108. The land use strategies are not intended as disincentives to development. On the contrary, jurisdictions receive deficiency plan credit for the provision of residential/commercial development in areas served by transit. Research demonstrates that development located near transit is more effective in reducing trips. Jurisdictions may choose to evaluate the reduced need for parking, and grant parking reductions as further incentive to development.
109. The final CMP will be revised to add examples to explain application of the credit system, particularly where credit factors are not provided and individual project evaluations are necessary. In addition, MTA

will make available computer spreadsheets to further simplify usage of the credit system.

110. The categories and units of measure for new development activity tracking were the specific topic of two technical working sessions and extensive additional consultation while being developed. Square footage was selected as the most appropriate unit of measure to be applied to lodging related building permits, in order to avoid the need to separately account for ancillary uses such as restaurants and conference facilities. The trip generation factors were converted from per-room rates using an overall estimate of 1000 square feet per room, including common areas. This provides a logical connection between the trip generation characteristics of each land use category, while remaining sensitive to the need to minimize administrative burdens for data collection and analysis.
111. The land use categories and related definitions for new development activity tracking were the specific topic of two technical working sessions and extensive additional consultation while being developed. As noted in the "Countywide Deficiency Plan Background Study," land use categories developed for tracking development activity are based on Standard Industrial Classification (SIC) codes provided by SCAG. SIC codes are the uniform employment classification system developed by the federal government for statistical reporting. Where implementation experience demonstrates the need, future CMP updates can address modifications.

Ms. Kendra Morries
Land Use Project Manager
Los Angeles County Metropolitan Transportation Authority
818 West Seventh Street (M/S 2200)
Los Angeles, California 90017

Re: Comments on Los Angeles County Congestion Management Program
Draft Environmental Impact Report dated July 1993 (SCH # 93051061)

Dear Ms. Morries:

We submit the following comments on the Los Angeles County Congestion Management Program ("CMP") Environmental Impact Report dated July 1993 (the "Draft EIR") on behalf of Latham & Watkins, which represents a number of clients affected by the CMP. We appreciate the efforts of the Los Angeles County Metropolitan Transportation Authority ("MTA") to develop a program which seeks to relieve regional congestion without inhibiting County-wide economic growth. As you know, we consistently have focussed on the potential impacts of the CMP's deficiency plan on continued growth in the County. We believe that a thorough assessment of the potential impacts of deficiency plan implementation is essential in order to assist local jurisdictions in selecting effective mitigation strategies that do not overburden new development with the responsibility for resolving the County's long-standing congestion problem.

The CMP deficiency plan allows each local jurisdiction to select the measures that will be implemented in order to satisfy its mitigation requirements. The Draft EIR recognizes that this flexibility makes it difficult to predict which strategies will be selected by each jurisdiction and to project the extent of impacts associated with implementation of the deficiency plan throughout the various jurisdictions within the County. However, the Draft

112

113

Ms. Kendra Morries
September 13, 1993
Page 2

EIR does outline potential impacts associated with various mitigation strategies and funding mechanisms, including project-specific development fees.

The Draft EIR recognizes that imposing "exactions in the form of development fees runs the risk of discouraging development if the fees cannot be passed on and readily absorbed." (Draft EIR, page 76). However, the Draft EIR discounts this potential adverse impact by concluding that under strong market conditions such costs "can be passed on to tenants and consumers in the form of higher leases or product prices and no change in land use development patterns would be apparent." (Draft EIR, page 77). However, due to current economic conditions throughout Los Angeles County, project sponsors and owners are under extreme pressure to reduce the overall costs of development at all levels in order to ensure that projects remain profitable. At the same time, new development is required to fund and implement a growing number of programs that address the impacts of years of growth and inadequate infrastructure improvements. Such excess costs generally cannot be passed on to tenants and consumers at this time due to poor market conditions and high vacancy rates.

113

Therefore, MTA and local jurisdictions selecting mitigation strategies must recognize that it is likely that additional increases in development fees could render many projects infeasible and discourage development that would increase revenues, create jobs and greatly benefit local economies. Contrary to the conclusions of the Draft EIR, in such an economic climate it is far more likely that growth will be channeled to those jurisdictions that seek to satisfy their mitigation requirements through jurisdiction-wide strategies that spread the costs of congestion-relief over a broad range of existing developments and activities, rather than imposing an inequitable burden on new development projects.

In fact, based on the analysis of the Draft EIR, MTA has rejected the imposition of a traffic impact fee as an alternative to the proposed deficiency plan. The Draft EIR recognizes that such an approach would be insensitive to the economy and could be a "disincentive to development activity within the County." (Draft EIR, page 110). Moreover, such an alternative could result in "an indirect impact on local jurisdictional fiscal resources by reducing revenues." (Draft EIR, page 110).

114

A thorough consideration of the adverse impacts identified in the Draft EIR will facilitate the selection of appropriate and effective mitigation strategies at the local level. However, the Draft EIR recognizes that the potential adverse impacts of each mitigation strategy is likely to vary widely from jurisdiction to jurisdiction. Moreover, because the mix of mitigation strategies and funding sources that may be selected by any jurisdiction is uncertain, the Draft EIR cannot provide a comprehensive assessment of the various approaches that may be adopted and the likely impacts to any particular jurisdiction.

115

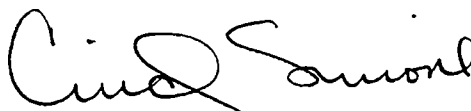

Ms. Kendra Morries
September 13, 1993
Page 3

Therefore, it is essential that each individual jurisdiction conduct its own comprehensive assessment of potential impacts as it determines which mitigation strategies will be implemented and the sources of funding for congestion-relief.

115

We look forward to working with local jurisdictions as they adopt deficiency plans and to continuing our work with MTA to evaluate the actual impacts of the CMP deficiency plan as it is implemented on the local level to assess whether program modifications should be implemented through the annual CMP update to address any economic and land use impacts that may result.

Very truly yours,

Cynthia K. Simons
of LATHAM & WATKINS

cc: Lucinda Starrett, Esq.

Letter 8. Response to Comments from Cynthia K. Simons, Latham & Watkins, September 13, 1993.

112. Comment noted.

113. The countywide approach to mitigating deficiencies on the CMP systems lead to the development of a Tool Box of various strategies that jurisdictions can choose from. The countywide deficiency plan does not, however, require linkage of mitigation, or credits, to individual or specific development approvals. Mitigation measures can be applied throughout the jurisdiction, within a subarea, at a specific project level, or in cooperation with other jurisdictions. The program requires only that local jurisdictions implement mitigation strategies commensurate with its annually calculated congestion mitigation goal.

This Tool Box approach allows local jurisdictions to choose those strategies which the jurisdiction feels most appropriate for it based on local needs, conditions, etc. The approach also provides incentives for jurisdictions to participate in multi-agency improvements and strategies by crediting local contributions to those improvements.

114. Please refer to Response to comment No. 25.

115. The CMP strategy Tool Box is intended to provide flexibility to choose the most appropriate strategies. It should also be noted that a local jurisdiction does not need to select any particular strategy if it does not fit local jurisdiction mitigation needs. The specific effects of a local jurisdiction's selected mitigation strategies would be addressed as part of the local jurisdictions review and adoption process.

116. Comment noted.

7.2 STAFF INITIATED CHANGES

On page 106 of the DEIR, under the discussion of Transportation, the figure in the third line which reads 7,945,118 is corrected to read:

... 7,345,118

On page 44, the third bullet item is modified to read:

...monitoring intersection using parameters described in the CMP Transportation Impact Analysis Guidelines.

The following acronym definitions are added to Appendix A.

DEIR	Draft Environmental Impact Report
FY	Fiscal Year
EPA	U. S. Environmental Protection Agency
SIC	Standard Industrial Classification
TAZ	Traffic Analysis Zone

7.3 RESPONSE TO COMMENTS RECEIVED AT THE PUBLIC HEARINGS

Two public hearings on the DEIR were held. The hearing transcript is attached. No comments were received at either hearing. Hearing attendees are listed below:

August 24, 1993 - T.K. Prime, City of Los Angeles Department of Transportation
August 25, 1993 - Karen Hoo and Matt Goldman, Port of Los Angeles

PUBLIC WORKSHOP
TO RECEIVE COMMENTS ON THE DRAFT EIR
FOR THE 1993 CMP UPDATE
LOS ANGELES

THE TRANSCRIPT OF PROCEEDINGS OF LOS ANGELES
COUNTY TRANSPORTATION COMMISSION, taken at 818 West 7th
Street, Los Angeles, California, at 1:00 P.M., Tuesday, August
24, 1993, before KIMBERLY ARIAL, C.S.R., 9805, pursuant to
Public Notice.

APPEARANCES:

- KENDRA MORRIES
- DR. SUSAN O'CARROLL
- T.K. PRIME

1 Los Angeles, California, Tuesday, August 24, 1994

2 1:00 P.M.

3
4 MS. MORRIES: For purposes of the record, I want to
5 indicate that we do have a court reporter here who is taking
6 down all comments and questions. This is considered a
7 workshop on the 1993 Final Draft EIR, and so any comments or
8 questions that you have at this time will be considered a part
9 of the record and will be answered and addressed as part of
10 the Response to Comments Document that will be issued, I
11 believe, in October.

12 I suppose I should also tell you that my name
13 is Kendra Morries, and I'm the Land Use Project Manager for
14 Los Angeles County Metropolitan Transportation Authority. And
15 also participating in this workshop will be Dr. Susan
16 O'Carroll with Willdan and Associates, who is the consulting
17 firm who's prepared the EIR for us.

18 The focus or agenda for today's workshop is
19 really four fold. One, just in terms of the purpose of the
20 workshop, what we're really here to talk about is the
21 Environmental Impact Report and not the CMP. I'll be giving
22 you information in a while about where to address your
23 comments on the Congestion Management Program itself.
24 Dr. O'Carroll will go through the basics and a description of
25 the information that's contained in the Draft EIR, and then at

1 the end we'll be glad to take comments and ask for questions.

2 There are two public workshops that are
3 scheduled. Obviously, today is the first, and there is also
4 another workshop being held tomorrow in the City of Long Beach
5 facilities, starting at 2:00 P.M. The deadline for comments
6 on the Draft EIR is September 13, at 5:00 o'clock. Comments
7 on the EIR should be addressed to myself, care of Los Angeles
8 County Metropolitan Transportation Authority, at 818 West 7th
9 Street, Mail Stop 2200, Los Angeles, 90017. We will accept
10 facsimile comments provided they are also received by the
11 deadline on September 13, and that you use the correct fax
12 number, which is area code (213) 244-6025. And again to
13 reiterate, we need to receive all of the comments by 5:00 P.M.
14 on September 13.

15 Again, the focus of today's workshop is to
16 address the Draft Environmental Impact Report, which is the
17 companion document to the '93 CMP update. At this workshop,
18 we will not be talking directly about the '93 Congestion
19 Management Program. If you have comments on that program, the
20 comment deadline is 5:00 o'clock, September 9, and those
21 comments should be addressed to Ed Shikada, also care of the
22 MTA, at 818 West 7th Street, Mail Stop 2200, Los Angeles,
23 90017. And Ed will also be accepting facsimile comments on
24 the CMP at area code (213) 244-6025, if they're also received
25 by 5:00 P.M. on September 9.

1 These are not the only opportunities to
2 participate in the development of the '93 program. We have
3 monthly CMP Technical Forum and Policy Advisory Committee
4 meetings. We have had a substantial number of periodic and
5 issue related workshops for the CMP and will continue to have
6 some of those meetings. We also have a monthly newsletter
7 called "Up-To-Speed." And you can get yourself on the mailing
8 list and find out when the next related meetings are, and any
9 of that information you can also get by calling the CMP
10 hotline at (213) 244-6599.

11 Very quickly before Dr. O'Carroll talks about
12 the EIR, and just in very brief fashion, let me highlight for
13 you that the '93 CMP update builds on the work that was done
14 in the adopted '92 CMP. In this year's update, we were
15 looking at updating the information related to the '93 highway
16 and transit monitoring data. One proposed solution to the
17 highway system addition is at La Cienega Boulevard between the
18 405 Freeway and the 10 Freeway. We're looking at refinement
19 to the land use analysis program, essentially providing more
20 interpretational information for cities who are doing EIR's
21 related to things like general plan and specific plans. The
22 TIA guidelines in the '92 program were really meant to address
23 projects where there's a level of information about the
24 projects such as the driveway location, what specific types of
25 land uses there are going to be, square footage of the

1 building -- and what we have found in the implementation is
2 that for general plan and specific, that all of the
3 information is not known, and the intersection analysis that
4 the TIAs address really can't be done. So what we've provided
5 this year is some information that essentially provides for a
6 regional analysis that can be done for the larger scope
7 projects where you don't have that level of detail. We'll
8 also be updating the capital improvement programs, and
9 finally, adding for the first time the deficiency plan
10 procedures. With that very short description, I'm going to
11 turn it over to Dr. O'Carroll who's going to walk through
12 the '93 EIR itself.

13 DR. O'CARROLL: Thank you, Kendra.

14 A key thing about the '93 CMP update EIR is
15 that it's a subsequent tiered program level EIR. Subsequent
16 in that we did an EIR last year for the 1992 CMP which was the
17 first of the CMP program, and tiered, which is a concept under
18 CEQA, which is intended to reduce paperwork by allowing
19 programs that sort of fit within each other to have EIRs that
20 focus on what's new and specific about the program rather than
21 having to address all impacts that have been previously
22 addressed at a sufficient level of detail in prior
23 environmental impact reports.

24 With tiering in the initial study for a
25 program, the intent is to determine the degree to which

1 impacts have been addressed by prior EIRs or require new
2 analysis in the specific EIR in question. In terms of the
3 tiering structure for this EIR, basically this EIR is tiered
4 from the EIR from the 1992 CMP. What the initial study
5 discusses is the fact that the major component that was added
6 is the Deficiency Plan Component, and that is the component
7 with the potential to create impacts, and there was sufficient
8 mitigation included in the '92 EIR to address the other
9 changes in the program. The '92 EIR was in turn tiered from
10 the EIR for the Regional Mobility Plan since the CMP is
11 required to be consistent with the RMP, the Regional Mobility
12 Plan. As explained in both the '92 and '93 EIR, it's
13 anticipated that there will be EIRs for specific capital
14 improvement programs as appropriate, and that those EIRs will
15 be tiered from the '92 and '93 CMP EIRs. And so that was the
16 general structure.

17 Just to give you a quick sense of what kind of
18 impacts were addressed inside each of these EIRs that the
19 current one is tiered from, the Regional Mobility Plan EIR was
20 developed in concert with the air quality management plan and
21 the growth management plan. It looked at the following
22 potential impacts: Mobility and access, air quality, energy
23 and conservation, geology and seismicity, biological
24 resources, water resources, visual resources, noise, cultural
25 resources, social, urban form and growth, and regional

1 economy, and it evaluated five alternatives to the RMP: A
2 No-Project Alternative, which is required by CEQA, two
3 facilities-intensive alternatives, and two demand management
4 intensive alternatives.

5 The '92 CMP EIR was designed to be consistent
6 with the general mix of TDM and capital intensive strategies
7 in the RMP the DRMP. It was tiered as previously mentioned
8 from the EIR for the RMP. It evaluated the five key
9 components of the CMP: The highway and roadway system
10 element, the CMP transit element, the transportation demand
11 management element, the land use analysis program, and the
12 capital improvement program. And it looked at the following
13 impacts: Land use and planning, transportation, air quality,
14 noise, geology, water resources, biological resources,
15 cultural resources, and public services. And it evaluated
16 four alternatives to the CMP. The No Project alternative,
17 which was the existing transportation system remaining
18 unimproved, and a No Project alternative where there was no
19 CMP and thus no future state funding for transportation
20 project, and then two program alternatives: A more TDM
21 intensive alternative and a more capital intensive
22 alternative, that was indicated in the adopted RMP.

23 That gets us to the '93 CMP update, which as I
24 previously mentioned, primarily looks at the potential impacts
25 associated with the addition of the deficiency plan

1 component. As mentioned, the CMP is designed to be consistent
2 with the general TDM/Capital mix approach of the RMP and 1992
3 CMP. The EIR looked at the impacts, potential impacts, in
4 terms of land use, public services, transportation, air
5 quality, and energy. And it evaluates alternative deficiency
6 plan approaches as opposed to CMP approaches since alternative
7 CMP approaches were evaluated in the 1992 CMP.

8 I want to briefly mention a sort of analytic
9 approach taken in the document since what the deficiency plan
10 lets jurisdictions do is select from a tool box of mitigation
11 strategies. And they can select either land use strategies,
12 TSM strategies, capital intensive strategies, or travel demand
13 management strategies, to mitigate the effect of land use
14 deficiencies within the jurisdiction and their subsequent
15 impact on the CMP network.

16 So given the potential makeup of market basket
17 sort of tool box strategies that could be used, what we did is
18 we used a bracketing approach to the analysis, and we looked
19 at what would be the impacts if all jurisdictions chose
20 measures which had the effect of reducing trips or if all
21 jurisdictions chose mitigations which had the result of
22 increasing capacity. And so we basically did model runs that
23 looked at those two kinds of scenarios which were intended to
24 bracket the range of potential program impacts.

25 The EIR also looked at where certain bracket

1 jurisdictions might fall in their collection of mitigations.
2 The key question was would it be likely that jurisdictions
3 would behave in a way that would put them all at one end of
4 the bracket or all at the other end of the bracket? So
5 there's a discussion of the mix of measures they might use and
6 basically the conclusion was that on a county-wide basis, that
7 mitigations would fall somewhere between the two ends of the
8 bracket.

9 The EIR also looks at the interaction between
10 choice of funding strategy and mitigation selected and whether
11 there was potential there for impacts, particularly in the
12 area of land use and public services. And the basic
13 conclusion in the EIR was that there was sufficient tool box
14 measures and funding measures available to jurisdictions, that
15 public service and land use impacts were not anticipated to be
16 significant.

17 Let me quickly just point out the highlights of
18 the EIR findings and mitigations. Basically, what was found
19 is that the program largely has a beneficial impact in a
20 number of areas. It's beneficial in terms of the impact on
21 the transportation system. The one significant impact that
22 was identified is the potential for the creation of local air
23 quality hot spots. However, as you see from the next slide,
24 it's anticipated that on an area wide basis, however, air
25 quality impacts will be beneficial. Similarly, energy impacts

1 are anticipated to be beneficial. Land use impacts are
2 anticipated to be largely nonsignificant with a beneficial
3 impact in terms of potential for redistributing development in
4 a way that places it in closer proximity to transit. Public
5 service was sort of a mix of either beneficial impacts
6 particularly in the area of maintaining energy by having
7 response times or nonsignificant kinds of impacts. So those
8 were the basic findings of the EIR.

9 In terms of alternatives, the EIR looked at
10 these alternative deficiency plan approaches: A No Project
11 Alternative, where no deficiency plan mechanism was added to
12 the CMP. Otherwise, a No County-Wide Deficiency Plan
13 Alternative, which put the deficiency planning more on local
14 jurisdictions; a Countywide Fee Alternative; a Monitoring
15 Based Approach Alternative; and a Modified Tool Box Approach,
16 which was intended to remove those tools in the tool box which
17 had the potential for producing hot spots.

18 And what the EIR concluded after looking at
19 these five alternatives was that, in fact, the project was
20 environmentally superior to the alternative five considered.
21 So that's a basic summary the contents of the EIR, and with
22 that, we'd like to open it up for public comments.

23 MS. MORRIES: Do you have any questions or comments
24 that you want to give?

25 MR. PRIME: No, I don't think so. I think we'll have

1 our comments submitted in writing.

2 MS. MORRIES: Okay. Anybody else? Going once,
3 twice, okay. Thank you T.K. for coming. We'll officially
4 close the public workshop at this time.

5 (At 1:35 P.M. the public workshop was concluded.)

PUBLIC WORKSHOP
TO RECEIVE COMMENTS ON THE DRAFT EIR
FOR THE 1993 CMP UPDATE
LONG BEACH

THE TRANSCRIPT OF PROCEEDINGS OF LOS ANGELES
COUNTY TRANSPORTATION COMMISSION, taken at 2400 East Spring
Street, Long Beach, California, at 2:15 P.M., Wednesday,
August 25, 1993, before KIMBERLY ARIAL, C.S.R., 9805, pursuant
to Public Notice.

APPEARANCES:
KENDRA MORRIES
DR. SUSAN O'CARROLL

1 Los Angeles, California, Wednesday, August 25, 1994

2 2:15 P.M.

3
4 (Ms. Morries made some introductory comments,
5 explained the purpose of the workshop and gave a presentation
6 explaining the background of the '93 CMP. Subsequently,
7 Dr. O'Carroll gave a presentation on the '93 EIR itself.)
8

9 MS. MORRIES: Do you have any questions or comments
10 about the EIR? Well, I want to thank you for coming out on
11 such a hot afternoon. I hope you learned something. There's
12 lots of handouts on the table back there to take with you.
13 And with that, I'll officially close the workshop.

14 (At 2:34 P.M. the public workshop was concluded.)

APPENDIX B
MITIGATION MONITORING PROGRAM - 1992 CMP

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
A. LAND USE		
<u>Direct Impact:</u> Individual CMP projects may result in localized changes in land use.	A.1 The LACTC shall consult with other adjacent CMAs in reviewing LOS standards to ensure that differences in LOS standards between counties do not encourage a land use pattern which is inconsistent with local land use or regional goals.	Less than significant.
<u>Indirect Impacts:</u> Should implementation of the CMP result in increased urban deconcentration or concentration or expansion development in outlying areas, which has not been anticipated in the regional plans, the CMP could have a negative effect on land use.	A.2 The LACTC shall participate in on-going forums, regarding interjurisdictional impacts including land use issues and impact analysis procedures.	Less than significant.
Increasing system capacity may encourage additional trips (latent demand) on the system, by reducing the costs (time and stress) associated with trip-making.	A.3 The LACTC shall investigate the use of other mobility and system performance indices such as Vehicle Miles Traveled and Average Vehicle Ridership and shall compare the effectiveness of such indices with LOS as standards for determining both system mobility and motor vehicle emissions performance. These supplemental measures shall be incorporated into the program if determined to be effective for reconciling localized decreases in service against regional improvements.	Less than significant.

-B1-
S-3

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

ENVIRONMENTAL IMPACT

MITIGATION

LEVEL OF SIGNIFICANCE AFTER MITIGATION

Direct Impacts: The following classes of CMP CIP projects could lead to the localized displacement of adjacent businesses and residences: Class 1 - freeway system management (specifically the construction of HOV lanes); Class 2 - freeway gap closures; Class 6 - rail improvements; Class 4 - commuter rail stations; transit centers and park-n-ride lots; and, to a more limited degree, Class 3 - arterial system improvements. Of the 1992 CIP projects (see Table 5) Class 2 and 3 projects present the greatest potential for disruption.

The CMP's Land Use Analysis Program, in combination with CMP network monitoring and modeling should provide better information on which local jurisdictions can base their analysis.

Indirect Impacts: The CMP's TDM component may result in increased density in the vicinity of transit centers and rail facilities. This would be supportive of the centers development goals of a number of local jurisdictions.

A.4 The LACTC shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project-level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the land use impacts of individual CMP CIP projects. As part of the review the LACTC may comment on the adequacy of the analysis and mitigations.

None required.

A.5 The LACTC shall explore with the cities the desirability of including mechanisms in the CMP for encouraging the creation of increased density in targeted centers areas. Possible mechanisms include specification of density related CIP project selection criteria; inclusion of density encouraging mechanisms in the TDM component of the CMP; or inclusion of mechanisms to encourage targeted density development as a component of future deficiency planning.

Less than significant.

Beneficial Impact

Less than Significant

S-4
-B2-

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
B. TRANSPORTATION		
Direct Impact: The CMP has been designed to be consistent with the RMP, thus the CMP should have a positive impact on working towards attainment of Regional Mobility goals.	None required.	Significant Beneficial Impact
Direct Impact: Any potential impacts of the highway and roadway element of the CMP are likely to be related to the implementation of the specific CIP improvement projects within the framework of the CMP process. CIP projects will help to maintain LOS.	Mitigation measure A.4 would mitigate the direct effects of the CIP element of the CMP.	CIP projects will have a beneficial impact County-wide on LOS. The potential for localized CMP CIP project specific traffic impacts to remain after implementation of CIP project specific mitigations developed as part of CIP project specific environmental review can only be assessed on a project specific basis.
Traffic may be re-routed during the construction of a particular facility. It is possible that the implementation of a transportation improvement project may cause traffic to be diverted into or through sensitive areas including residential neighborhoods, creating localized noise or air quality impacts.	B.1 The LACTC shall review EIRs for CIP projects to ensure that mitigation measures are included requiring that the Lead Agency give transit operators and affected City Departments of Transportation advanced notice of construction activities which might impact the transportation system.	
Should implementation of the CMP result in increased urban deconcentration, or concentration or expansion of development in outlying areas, which has not been anticipated in the regional plans, the CMP could have a negative effect on the	Mitigation Measures A.1 - A.3 would mitigate the indirect effects of the CIP element of the CMP; mitigation measures A.1 - A.3 and mitigation B.1 would mitigate the indirect effects of the CMP Highway and Roadway System element.	Less than significant.

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
<p>Direct Impact: The construction and/or operation of CIP transportation improvement projects could have the following localized negative air quality impacts adjacent to the improvement alignment or right-of-way:</p> <ul style="list-style-type: none"> • Construction of roadway and/or transit improvements would have short-term construction impacts. Earth moving activities would increase localized particulate levels. Improvements to existing roadways may also require detours and delays during construction which would cause short-term increases in emissions. • New route locations or freeway gap closures have the potential to bring mobile emission sources closer to existing sensitive land uses as well as create new line sources of pollutant emissions in areas where such sources may not have existed before. • Providing increased roadway capacity by widening or re-striping may move vehicle travel lanes closer to sensitive land uses adjacent to the roadway. 	<p>In addition to mitigation measure B.1, the following mitigation measures would partially mitigate direct impacts associated with CMP CIP projects:</p> <p>C.1 The LACTC shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project-level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the air quality impacts of individual CMP CIP projects. As part of the review the LACTC may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas in the EIR:</p> <ul style="list-style-type: none"> • preparation in accordance with applicable guidelines (SCAQMD, CALTRANS, FHWA, EPA etc.); • both construction and operation phase emissions and criteria pollutant concentrations, and compare emissions and concentrations to established SCAQMD daily emissions thresholds, as well as to California Ambient Air Quality Standards (CAAQS); • consistency with the Air Quality Management Plan; 	<p>The potential for localized CMP CIP project specific air quality impacts to remain after implementation of the mitigations and CIP project specific mitigations developed as part of CIP project specific review can only be assessed on a project specific basis.</p>

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

ENVIRONMENTAL IMPACT	MITIGATION	LEVEL OF SIGNIFICANCE AFTER MITIGATION
<ul style="list-style-type: none"> Creation of rail transit stations and transit centers has the potential to attract a significant number of vehicles to parking locations. Particularly during peak periods, localized carbon monoxide "hot spots" may be created by vehicles idling or queuing at access points to parking facilities. Station circulation may also impeded vehicle flow on adjacent arterial streets and this increase delays, idling and localized emissions. 	<ul style="list-style-type: none"> demonstration that significant air quality impacts have been mitigated in a manner consistent with the provisions of applicable State and Federal clean air legislation. <p>C.2 The LACTC shall seek Environmental Enhancement and Mitigation Demonstration Program Funds made available under Section 164.56(b)(1) of the Street and Highways Code for highway landscaping and urban forestry projects designed to offset vehicular emissions of carbon dioxide associated with CIP projects.</p>	
<p>Indirect Effects: Should implementation of the CMP result in increased urban deconcentration, or concentration or expansion of development in outlying areas, which has not been anticipated in the regional plans, the CMP could have a negative effect on air quality by increasing vehicle miles traveled. The potential for the CMP to reinforce urban deconcentration is discussed in detail as part of the growth inducing impacts analysis contained in Chapter IV - Impact Overview, where it is concluded that the potential of the CMP to foster urban deconcentration is negligible.</p>	<p>C.3 The LACTC, where possible, through the congestion monitoring, highway and transit network modeling and land use analysis program elements of the CMP, shall determine the similarity between observed travel behavior with growth rates and geographic distribution assumptions of the RMP. The success of the program in working toward regional land use and mobility goals will be assessed as part of future CMP updates, and appropriate changes to work toward regional goals will be proposed in consultation with local, regional, and state agencies.</p>	Less than Significant.

-B6-
S-8

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
<p>CMP-related improvements could potentially increase the density of trips and traffic in center areas such as near transportation centers, rail transit stations, park and ride lots, etc. In these cases, the air quality affect of the CMP could create "hot spots" of pollutant concentrations, particularly carbon monoxide.</p>	<p>C.4 The LACTC shall encourage and participate in the evaluation and reconciliation of localized adverse impacts with regional improvements. Such evaluation is intended to broaden the understanding of "hot spots" of pollutant emissions, and the tradeoffs between hot spot creation and regional emission reductions.</p>	<p>Less than Significant</p>
<p>D. NOISE</p>	<p>D.1 The LACTC shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project-level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the noise impacts of individual CMP CIP projects. As part of the review the LACTC may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas in the EIR:</p> <ul style="list-style-type: none"> • preparation in accordance with applicable local and State guidelines (FHWA FHMP 773, State Office of Noise Control, local noise ordinance and general noise element, etc.) 	<p>The potential for localized CMP CIP project specific noise impacts to remain significant after implementation of the mitigations and CIP project specific mitigations developed as part of CIP specific review can only be assessed on a project specific basis.</p>
<p>Noise from the construction of CIP projects may be disruptive. Circumstances where noise conditions may increase and adverse impacts may result including the following:</p>		
<ul style="list-style-type: none"> - Construction of new routes or freeway gap closures through sensitive residential areas. - Widening of facilities on the existing CMP highway network that would bring travel lanes and mobile noise sources closer to sensitive adjacent land use receptors. - Construction of elevated HOV lanes or elevated rail transit within or adjacent to facilities passing through residential areas or adjacent to sensitive land uses. 		

S-9
-B7-

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
<ul style="list-style-type: none">- Operational improvements on the CMP network that would increase traffic speed and flow that may incremental increase noise levels.- Increase in the frequency of transit service (bus and/or rail) would increase Community Noise Equivalent Levels (CNEL).- New transit alignments or the construction of new elevated transit facilities would increase ambient noise levels.- New transit stations may cause an increase in mobile and stationary levels for adjacent land uses.- New park-and-ride locations may cause an increase in mobile noise levels for adjacent land uses as a result of a significant increase in vehicle trips to the area. Stationary noise levels may also increase as a result of the construction of parking structures with ventilation systems or from parking areas where sounds such as engine run-ups, door slams, car alarms etc. would be more common.	<ul style="list-style-type: none">• demonstration that all significant noise impacts have been mitigated in a manner consistent with the provisos of applicable local ordinances, as well as State and Federal guidelines.	

S-10
-B8-

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
<p><u>Indirect Effects:</u> Should implementation of the CMP result in increased urban deconcentration, or concentration or expansion of development in outlying areas, which has not been anticipated in the regional plans, the CMP could have a negative effect on noise by increasing traffic in areas with relatively low background noise levels. The potential for the CMP to reinforce urban deconcentration is discussed in detail as part of the growth inducing impacts analysis contained in Chapter IV - Impact Overview, where it is concluded that the potential of the CMP to foster urban deconcentration is negligible. Also a possibility is that CMP-related improvements could increase the density of trips and traffic in center areas such as near transportation centers, rail transit stations, park-and-ride lots, etc. In these cases, the noise effect of the CMP could concentrate an increase in both mobile and stationary noise levels in the immediate vicinity of these new facilities.</p>	<p>Mitigation measure C.3 addresses indirect noise impacts.</p>	<p>Less than significant.</p>

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
<p>E. GEOLOGY</p> <p><u>Direct Effects:</u> Construction of CIP projects could result in the following geotechnical impacts: construction related erosion; increased risk of slope failures, mudslides, and rock falls; a limited potential for subsidence or soil-related impacts; and seismic risks.</p>	<p>E.1 The LACTC shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project-level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the geological impacts of individual CMP CIP projects. As part of the review the LACTC may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas in the EIR:</p> <ul style="list-style-type: none"> • preparation in accordance with applicable local and State guidelines (Caltrans, Division of Mines Geology, local ordinances). • adequate geotechnical investigations regarding grading, slope stability, seismic hazards, potential ground acceleration. • the appropriate level of coordination with the State Division of Mines and Geology and identify specific mitigation measures to be implemented. 	<p>The potential for localized CMP CIP project specific geotechnical impacts to remain after implementation of the mitigations and CIP project specific mitigations developed as part of CIP project specific review can only be assessed on a project specific basis. With mitigation, the CMP is not anticipated to result in any significant regional geotechnical impacts.</p>

S-12
-B10-

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
<p>Indirect Effects: Should implementation of the CMP result in increased urban deconcentration, or concentration or expansion of development in outlying areas, in closer proximity to active faults which has not been anticipated in the regional plans, the CMP could have a negative effect on seismic risk by increasing vehicle miles traveled. The potential for the CMP to reinforce urban deconcentration is discussed in detail as part of the growth inducing impacts analysis contained in Chapter IV - Impact Overview, where it is concluded that the potential of the CMP to foster urban deconcentration is negligible.</p>	<ul style="list-style-type: none"> • are designed in accordance with County and local code requirements for seismic ground shaking with special attention to the seismic design of bridges, elevated structures and tunnels. • demonstrate that all significant geotechnical factors have been mitigated in a manner consistent with the provisions of sound engineering practice and applicable local ordinances. <p>Mitigation measure C.3 addresses indirect geological impacts.</p>	<p>Less than Significant</p>

S-13
-B11-

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
<p>Also a possibility is that CMP-related improvements could increase pressures for increased population and employment density in areas adjacent to transit stations, transit lines, transportation centers, etc. A new concentration of population and/or employment, particularly in multi-story buildings could increase human exposure seismic event risks.</p>		
<p>F. WATER</p>		
<p><u>Direct Impacts:</u> CIP projects could affect beneficial uses through the destruction of habitat and changes in surface water quality. Implementation of the CMP could have a short-term adverse effect on nearby surface water bodies during construction CIP related projects. these effects would include increased sedimentation engendered by excavation and grading activities, as well a pollution from vehicular oils and grease. Long-term impacts could result from increased highway and transit associated facilities operations and their associated pollution (such as vehicular oils and grease emissions). The level of pollution produced would be a function of the number and lengths of trips made on these new facilities.</p>	<p>F.1 The LACTC shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project-level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the water resource impacts of individual CMP CIP projects. As part of the review the LACTC may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas in the EIR:</p> <ul style="list-style-type: none"> For large-scale capital improvement projects, such as freeway, HOV, rail and interchange projects, appropriate ecologically-oriented maps are obtained and used during the planning process for CIP projects. Every effort is made to avoid areas that are currently used or are anticipated 	<p>With implementation of the mitigation measures, program level water resource impacts on beneficial uses, supply and demand, and water quality are not anticipated to be significant. The potential for significant adverse water resource impacts to remain after implementation of CIP project specific mitigations developed as part of CIP project specific environmental review, can only be assessed on a project specific basis.</p>

S-14
-B12-

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

ENVIRONMENTAL IMPACT

MITIGATION

**LEVEL OF
SIGNIFICANCE
AFTER MITIGATION**

to be used for ecologically beneficial purposes. Every effort is made to minimize all disturbances in areas where construction is mandatory. All areas are restored to their original pre-construction condition, including the re-introduction of all uncontaminated soil and the replacement of all native vegetation. In the coastal zone, coastal zone planning and management programs reduce adverse impacts to coastal water quality and preserve or improve areas of special water quality significance such as bays and estuaries.

- For large-scale CIP projects such as freeway, HOV, rail and interchange projects, a comprehensive site investigation is conducted by ecological and water quality specialists to provide input into the above planning and mitigation design process and to confirm expected onsite conditions prior to the initiation of demolition and construction activities.
- Planning, construction, and operational activities are coordinated with appropriate ecological and water resources agencies and are conducted in accordance with the requirements of the Federal Water Pollution Control Act, the Water Quality Act and the Clean Water Act, including NPDES and Section 404 permit requirements.

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

ENVIRONMENTAL IMPACT	MITIGATION	LEVEL OF SIGNIFICANCE AFTER MITIGATION
	<ul style="list-style-type: none">• Natural conditions are maintained or simulated wherever possible to minimize effects at stream crossing. Single-span bridges are used when feasible.• Erosion control measures and runoff management, such as drainage channels, detention basins, and vegetated buffers, are employed to prevent pollution of adjacent water resources by runoff from transportation facilities. Wherever physically feasible, detention basins are equipped with oil and grease traps which are cleaned regularly. Treatment and disposal of excavated materials is well-planned.• Water conservation measures listed in the BMP are incorporated into the planning and design of CIP projects and their mitigations.• Use of permeable surfaces and channelization of flows to recharge areas are incorporated into project design, where possible, to promote water percolation and removal of metals.• All demolition, construction, and operational activities are conducted in accordance with all applicable regulatory requirements. <p>Mitigation measure A.3 would reduce long-term water quality impacts associated with CIP project operation:</p>	

S-16
-B14-

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
<p>Indirect Effects: Should implementation of the CMP result in increased urban deconcentration or concentration or expansion of development in areas containing beneficial uses, significant indirect impacts could result.</p> <p>Deconcentration could also decrease the amount of open land that is currently available for ground water recharge, either through natural means or through use of reclaimed water. Efforts to foster reclamation projects to increase local ground water supplies could be significantly curtailed because of the area requirements associated with the reuse of treated effluent. Lastly, the interdependent effects of deconcentration would increase the need for and restrictiveness of large-scale water conservation programs.</p>	<p>Mitigation measure C.3 would reduce the indirect impacts of the CMP of beneficial uses and the water supply/demand balance:</p>	<p>Less than Significant</p>

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
<p>G. BIOLOGICAL RESOURCES</p> <p>Direct Impacts: To the extent that the CMP is successful in maintaining LOS in the vicinity of SEAs, the CMP would have a beneficial impact as a result of reduced congestion and air pollution. If the CMP results in the diversion of traffic to corridors passing through SEAs, or from already-congested corridors to corridors which are currently relatively free-flowing, leading to increased levels of congestion, traffic, and air pollution in proximity to SEAs, the CMP may have an adverse effect on biological resources. Some CMP CIP projects may be routed through SEAs. Any capital improvement projects located in or near SEAs pose the potential for significant biological impacts.</p>	<p>G.1 The LACTC shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project-level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the biological resource impacts of individual CMP CIP projects. As part of the review the LACTC may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas in the EIR:</p> <ul style="list-style-type: none">• Prior to any new construction on existing or proposed highways within the boundaries of an SEA, the need for construction is reviewed and substantiated, and alternative alignments or appropriate mitigation measures are investigated and implemented as feasible. If no feasible alternative or mitigation is found, the project is performed in the most environmentally sensitive manner possible.	<p>With implementation of the mitigation measures listed above, program level biological resource impacts are not anticipated to be significant. The potential for significant adverse biological resource impacts to remain after implementation of CIP project specific mitigation's developed as part of CIP project specific environmental review, can only be assessed on a project specific basis.</p>

S-18
-B16-

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
	<ul style="list-style-type: none">• Site-specific studies are required for each CMP capital improvement project located in the vicinity of an SEA, or in any area identified as potentially environmentally significant by the local jurisdiction, to determine whether significant plant or animal life or plant or animal life protected by local ordinance is present in a proposed alignment, and the level of impact on those resources. In consultation with the California Department of Fish and Game, the U.S. Fish and Wildlife Service and the local jurisdiction in which the project is located, detailed biological surveys are conducted prior to the adoption of roadway alignments which have the potential to adversely affect significant or protected biological resources.• Appropriate consultation with the California Department of Fish and Game occurs to determine if special status species, not identified under the SEA program, occur in the project vicinity.• Vegetation removal occurs only where absolutely necessary for grading; revegetation with appropriate native plants is implemented as feasible.• Capital improvement projects which take place in recognized wetlands comply with local, state, and federal regulations governing the protection of these areas.	

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

ENVIRONMENTAL IMPACT	MITIGATION	LEVEL OF SIGNIFICANCE AFTER MITIGATION
<p><u>Indirect Impacts:</u> Should implementation of the CMP result in increased urban deconcentration, or concentration or expansion of development in outlying areas, particularly areas containing significant ecological resources, which has not been anticipated in the regional plans, the CMP could have a negative effect on biological resources. The potential for the CMP to reinforce urban deconcentration is discussed in detail as part of the growth inducing impacts analysis</p>	<ul style="list-style-type: none"> • Capital improvement projects within the coastal zone comply with coastal zone planning and local government management programs which prevent or reduce impacts on biological resources within the coastal zone. <p>G.2 The LACTC shall seek Environmental Enhancement and Mitigation Demonstration Program Funds made available under Section 164.56(b)(2) of the Streets and Highways Code for acquisition or enhancement of resource lands to mitigate the loss of, or the detriment to, resource lands lying within the right-of-way acquired for proposed transportation improvements</p>	<p>Less than significant.</p>

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
<p>contained in Chapter IV - Impact Overview, where it is concluded that the potential of the CMP to foster urban deconcentration is negligible.</p>		
<p>H. CULTURAL RESOURCES</p>		
<p>Direct Impacts: While prehistoric sites or artifacts could be discovered in the urbanized areas of Los Angeles County, it is likely that any archaeological sites on the surface would have been destroyed during past urbanization. Generally in the urbanized or urbanizing areas, archaeological and paleontological resources are uncovered during the construction phase of a project.</p>	<p>H.1 The LACTC shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project-level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the cultural resource impacts of individual CMP CIP projects. As part of the review the LACTC may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas into the EIR:</p> <ul style="list-style-type: none"> The project sponsor contacts either the archeological resource information depository at UCLA or Cal State Northridge to determine the status of each site or corridor proposed for development, if it is determined during project-specific environmental review that the site or corridor is likely to contain archaeological resources. 	<p>With implementation of the mitigation measures listed above, program level cultural resource impacts are not anticipated to be significant. The potential for significant adverse cultural resource impacts to remain after implementation of CIP project specific mitigation's developed as part of CIP project specific environmental review, can only be assessed on a project specific basis.</p>
<p>The National Register entries, National Landmarks, State Landmarks, local designations, and Los Angeles Historic-Cultural Monuments are located along or near many of the streets and highways of the CMP Roadway System. Inclusion of a roadway or highway segment on the CMP network could ultimately lead to improvement projects on or near that segment, should service deteriorate below CMP Level of</p>

Service standards. This could potentially lead to impacts on historic structures as part of CIP projects.	<ul style="list-style-type: none"><li data-bbox="812 428 1482 586">• A professional archaeologist is retained to aid in the assessment of those sites or corridors considered to have moderate to high likelihood of containing archaeological resources, and to recommend a course of action for preservation of significant resources.<li data-bbox="812 626 1482 911">• During construction, at sites judged to have moderate to high likelihood of containing paleontological resources, a qualified paleontologist approved by the California Archaeological Inventory Regional Information Center is on call to remove fossil remains found during construction. If fossil remains are discovered during construction, all activity at the fossil site shall be stopped until the paleontologist has removed the remains.<li data-bbox="812 951 1482 1198">• For those sites or corridors for which environmental review or subsequent analysis indicates a less than moderate likelihood of containing archaeological resources, the following measures are taken: If any archaeological materials are encountered during the course of the project development, the project shall be halted. The services of an archaeologist shall be secured by contacting the Center for Public Archaeology - Cal	

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
<p><u>Indirect Impacts:</u> Should implementation of the CMP result in increased urban deconcentration, or concentration or expansion of development in outlying areas or the mountain or desert portions of the County, which has not been anticipated in the regional plans, the CMP could have a negative effect on cultural and archaeological resources in these areas.</p>	<p>State University, Northridge, or a member of the Society of Professional Archaeologist (SOPA), or a SOPA-qualified archaeologist to assess the resources and evaluate the impact. Copies of the archaeological survey, study or report are submitted to the UCLA Archaeological Information Center. All specimens collected are donated to the most appropriate educational research not possible to evaluate the potential impact until specific projects are proposed.</p> <ul style="list-style-type: none">• The environmental assessment adequately evaluates the potential for significant impacts to nearby historic resources, including locally designated resources, and includes appropriate mitigations. <p>Mitigation measure C.3 would reduce the indirect impacts of the CMP on historic resources:</p>	<p>Less than significant.</p>

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
<p>I. PUBLIC SERVICES</p>	<p>I.1 The LACTC shall review project-level EIR's for CMP CIP projects. The review shall be intended to ensure that as part of project-level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the public service impacts of individual CMP CIP projects. As part of the review the LACTC may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas in the EIR:</p> <ul style="list-style-type: none"> • Prior to the construction of individual CMP capital improvement projects, the lead agency consults with affected police and fire departments to ensure these agencies adequate access to the affected portions of the CMP roadway network. • An assessment of the potential impacts to parks and recreational facilities is included in the environmental assessment of any CMP transportation facilities to be located in proximity to parks and recreational facilities which includes an assessment of traffic, noise, and access impacts. • An assessment of the potential impacts to schools is included in the environmental assessment of any CMP capital improvement project to be located in proximity to a school, which includes an assessment of traffic, noise, and access impacts. 	<p>With implementation of the mitigation measures listed above, program level public services impacts are not anticipated to be significant. The potential for significant adverse police, fire and parks and recreational impacts to remain after implementation of CIP project specific mitigation's developed as part of CIP project specific environmental review, can only be assessed on a project specific basis.</p>
<p><u>Direct Effects:</u> The construction of individual CIP projects may temporarily slow police and fire department responses and disrupt access.</p> <p>Some CIP projects may require additional right-of-way adjacent to existing parks and recreational facilities, reducing the already limited parkland in the County. Increased traffic volumes and/or speed in proximity to parks and recreational facilities could result in increased noise impacts, inhibited access to facilities, and an increased number of automobile-related accidents. Site-specific studies required for each capital improvement project of the CMP with a potential for adversely affecting parks and recreational facilities will determine the level of impact on those facilities.</p>

TABLE S-1: SUMMARY OF IMPACTS AND MITIGATION MEASURES (continued)

<u>ENVIRONMENTAL IMPACT</u>	<u>MITIGATION</u>	<u>LEVEL OF SIGNIFICANCE AFTER MITIGATION</u>
Local governments' compliance with the CMP could result in the diversion of local government personnel and revenues.	I.2 The LACTC shall seek Environmental Enhancement and Mitigation Demonstration Program Funds made available under Section 164.56(b)(2) of the Streets and Highways Code for acquisition or enhancement of resource lands to mitigate the loss of, or the detriment to, resource lands lying within the right-of-way acquired for proposed transportation improvements	With implementation of the mitigation measures listed, impacts are not anticipated to be significant.
	I.3 The LACTC shall work with local jurisdictions to investigate a county-wide process to deal with future year CMP implementation.	
	I.4 The LACTC shall continue to work with public and private interests regarding CMP requirements to minimize adverse public/private cost impacts associated with the CMP.	

APPENDIX C
INITIAL STUDY, NOTICE OF PREPARATION (NOP)
AND RESPONSES TO NOP

MAY 21 1993

NOTICE OF PREPARATION AND INITIAL STUDY

COUNTY CLERK

DEPUT

To: County Clerk, 111 North Hill Street, Room 106,
Los Angeles, California 90012

From: Los Angeles County Metropolitan Transportation Authority

Subject: Notice of Preparation of a Draft Environmental
Impact Report and Initial Study

Project: 1993 Congestion Management Program for Los Angeles County

Los Angeles County
Metropolitan
Transportation
Authority

818 West Seventh Street
Suite 300
Los Angeles, CA 90017

213.623.1194

The Los Angeles County Metropolitan Transportation Authority (MTA) will be the Lead Agency for the preparation of an Environmental Impact Report for the 1993 Congestion Management Program for Los Angeles County (CMP). We encourage the submittal of comments from agencies regarding those aspects of the scope and content of the Environmental Impact Report which are germane to the agency's statutory responsibilities in connection with the proposed project. We would also welcome comments from concerned organizations, parties and persons regarding aspects of the scope and content of the Environmental Impact Report which are felt to be of concern. General comments on the Congestion Management Program should be sent separately and labelled separately.

Due to the time limits of State law, your response must be sent at the earliest possible date, but not later than 5:00 p.m. on June 23, 1993. Facsimile submittals will be accepted provide they are received prior to the deadline, and are sent only to (213) 244-6025. Please address your responses to Kendra Morries, Land Use Project Manager, Congestion Management Program, at 818 West Seventh Street, M/S 2200, Los Angeles, California 90017. Please include the name of a contact person.

A description of the proposed 1993 Congestion Management Program and the potential environmental effects of the proposed program are contained in the attached Initial Study. More information on the Congestion Management Program is available by calling the CMP Hotline at (213) 244-6599. Information about on-going CMP related meetings and work progress is also available by calling the Hotline.

INITIAL ENVIRONMENTAL STUDY 1993 CONGESTION MANAGEMENT PROGRAM (CMP)

I. BACKGROUND

1. Name of Proponent: Los Angeles County Metropolitan Transportation Authority
2. Address of Proponent: 818 West Seventh Street, MS-2200, Los Angeles California, 90017
3. Date of Environmental Assessment: May 1993
4. Contact Person: Kendra Morries, Land Use Project Manager, Congestion Management Program, (213) 244-6579
5. Name of Proposal: 1993 Congestion Management Program for Los Angeles County
6. Location of Proposal: Los Angeles County

Assembly Bill 152, signed by Governor Pete Wilson on May 19, 1992, merged the Los Angeles County Transportation Commission (LACTC) and Southern California Rapid Transit District (SCRTD) into the new Los Angeles County Metropolitan Transportation Authority (MTA). Effective February 1, 1993, the new MTA assumed responsibility for all programs and services previously provided by LACTC and SCRTD. Among these will be the responsibilities of the Congestion Management Agency and the implementation and administration of the CMP. Therefore, the new MTA has been referred to throughout this document.

In November of 1992 the Los Angeles County Metropolitan Transportation Authority (MTA) adopted the first Congestion Management Program (CMP) for Los Angeles County and certified the accompanying Final Environmental Impact Report (EIR). That EIR is a Program EIR and is tiered from the EIR for the 1989 Regional Mobility Plan (RMP). The CMP is required by law to be consistent with the RMP which is prepared by the Southern California Association of Governments (SCAG). The EIRs for both the 1992 CMP and RMP are incorporated herein by reference.¹

¹Los Angeles County Congestion Management Program Final Environmental Impact Report, November 1992 (SCH NO. 91121062; SCAG Clearing House #LA55794-MT); Draft Environmental Impact Report Regarding the SCAG Regional Mobility Plan, October 1988 and the Final Environmental Impact Report Regarding the 1988 SCAG Regional Mobility Plan, (SCH# 87-121613), December 1988. Portions of the CMP EIR are summarized in

Because the CMP was a new program, the MTA adopted a first year CMP that was designed to meet the basic legislative requirements for a CMP and to establish a countywide planning framework for addressing congestion on the regional transportation network. The requirement for a CMP originated in the State Legislature with the passage of Assembly Bill 471 (1989) and Assembly Bill 1791 (1990). The requirement for a CMP became effective when California voters approved Proposition 111 in June of 1990, which increased the state gas tax by nine-cents-per-gallon. These revenues are expected to generate approximately \$18.5 billion to fund transportation investment statewide over a ten year period. A portion of these funds are returned to local governments for transportation related purposes. In order to receive these funds, local jurisdictions must comply with local CMP requirements, established in Section 65088 through 65089.2 of the California Government Code.

Each urban county in the state is required to designate a Congestion Management Agency (CMA) to develop and periodically update a CMP. The Los Angeles County Metropolitan Transportation Authority (MTA) is the CMA for Los Angeles County. Preparation of a CMP is a condition for eligibility to receive the new gas tax subventions. Government Code Section 65089 (b) requires that each CMP contain the following elements:

1. An element designating the CMP transportation system and establishing LOS standards for the highways and roadways included in that system.
2. A transit standards element for service frequency, routing, and coordination among multiple transit agencies operating within the CMP's jurisdiction.
3. A transportation demand and trip reduction element that includes alternatives to single-occupant auto use and promotes strategies to manage overall travel demand.
4. A land use program to analyze the impacts of land use decisions by local jurisdictions on the regional transportation system.
5. A seven-year capital improvement program (CIP) to maintain or improve the traffic and transit standards or to mitigate the impact of new development.

The adopted 1992 CMP for Los Angeles County approached each of the elements required by CMP statute as follows:

relevant sections of this Initial Study. All three EIRs are available for review at the offices of the MTA located at: 818 West Seventh Street, Los Angeles, California 90017.

- **Highway System.** Designation of 1,000 miles of freeways, state highways and roads as the CMP system in Los Angeles County. Over time, CMP effectiveness will be measured by the Levels of Service (LOS) on this system. Levels of Service range from "A" (free-flow) to "F" (heaviest congestion). One of the objectives of the CMP is to maintain this system at LOS E, or prevent further degradation if it's already at "F".

Traffic volumes were measured during spring 1992 to establish the base year LOS. This base year monitoring provides the first uniform countywide picture of how our transportation system is currently operating. Local jurisdictions and Caltrans will take these measurements annually which will help track changes in travel patterns, determine the impact of growth on countywide mobility, and determine the effect of transportation improvements.

- **Transit Standards.** Designation of a transit monitoring network comprised of transit routes on, or parallel to, the CMP highway system. Information gathered annually about passenger volumes, seat capacity, and travel speed in broad transit corridors will provide a picture of how transit assists in relieving congestion and where transit will be needed in the future.
- **Transportation Demand Management (TDM).** Transportation Demand Management programs encouraging transit ridership, carpooling, vanpooling, bicycling, or otherwise reducing the number of vehicles on the road. The CMP required local jurisdictions to adopt their own TDM ordinance by April 1, 1993.

To help cities meet this requirement, a model ordinance was developed to complement existing efforts by the South Coast Air Quality Management District. The ordinance requires "TDM-friendly" design standards for new non-residential construction. Local jurisdictions must also provide transit operators the opportunity to comment on the impacts of new development through the California Environmental Quality Act (CEQA) process.

- **Land Use.** When making land use decisions, the CMP requires local jurisdictions to consider the impact of new development on the regional transportation system. Transportation Impact Analysis (TIA) guidelines incorporated in the CMP, provide a common measure countywide for assessing these regional impacts. CMP Transportation Impact Analysis is required only for projects preparing an Environmental Impact Report (EIR). This approach effectively coordinates CMP requirements with the California Environmental Quality Act (CEQA), thereby minimizing additional analysis requirements. The ultimate decision on addressing congestion concerns identified in an EIR remains the responsibility of the local jurisdiction. Local

jurisdictions were required to adopt the this CMP land use analysis program by April 1, 1993.

- **Capital Improvement Program.** In order to qualify for funds through the State Transportation Improvement Program (STIP), projects must first demonstrate a benefit to the CMP highway system. The Capital Improvement Program for the 1992 CMP identifies those State funded projects that are already included in the 1992 STIP. Statute requires that these projects be included in the CMP in order to remain eligible for State funding.

PROPOSED 1993 CMP UPDATE:

The 1993 CMP Update includes the following proposed modifications:

1. **1993 Highway and Transit Monitoring Data**

The 1992 CMP produced the first consistent, multi-jurisdictional analysis of traffic congestion throughout the County. The 1993 CMP will provide comparable data, and identify changes in congestion levels over the past year. Transit frequency and routing data are also being compiled, through information provided by transit operators as part of the Short Range Transit Plan.

2. **Addition to the CMP Highway and Roadway System**

The 1992 CMP established a mechanism for adding routes through the biennial CMP update. In January 1993, local jurisdictions were asked to nominate routes that they would like considered for addition to the CMP system. In response to that request, routes recommended from various jurisdictions were considered.

The CMP Policy Advisory Committee (PAC) discussed this issue in great detail in March and April of 1992. As a result of this discussion, the PAC recommended that La Cienega Boulevard between the Santa Monica Freeway (I-10) and the San Diego Freeway (I-405) be added to the system.

3. **Refinement of the Land Use Analysis Program**

The 1992 CMP established guidelines for analyzing the impacts of new development on the regional transportation system, integrated through existing California Environmental Quality Act (CEQA) requirements. These guidelines

included technical procedures for analyzing the impacts of individual development projects at CMP intersections and freeway segments.

Through implementation, CMP staff has found that a brief supplement to these guidelines would allow for the analysis of longer range and more generalized development programs such as local general plans and community plans. By allowing the analysis of these plans to focus on CMP street segment analysis rather than intersections, comparable evaluation of regional impacts and mitigation measures can be provided. This supplement will improve effectiveness of the land use analysis program at capturing cumulative development impacts, while permitting more generalized technical evaluation appropriate to the nature of general plans and minimizing administrative costs.

4. **Update of the Capital Improvement Program**

State programming statutes require that projects competing for state Flexible Congestion Relief (FCR) funds be included in the CMP, and that projects competing for Traffic System Management (TSM) funds be consistent with the CMP. 1992 CMP monitoring data and analysis have been integrated into the MTA's ongoing Multi-Year Call for Projects, and will be used in evaluating the regional significance of project applications. Once project selection is complete, those projects which are proposed for State funding will be incorporated into the 1993 CMP Capital Improvement Program.

5. **Deficiency Plan Procedures:**

Statute requires that local jurisdictions prepare deficiency plans when portions of the CMP highway system deteriorate to LOS F, or worsen within LOS F. The purpose of the deficiency plan is to implement strategies that either fully mitigate congestion or alternatively, provide measurable improvement to congestion and air quality. The contents of a deficiency plan are specified in statute, as are guidelines for the determination of deficiencies and the agencies that must be consulted.

In March 1992, a workshop was held to discuss CMP deficiency plan requirements. In response to previous Commission direction, staff reported on various CMP deficiency plan alternatives. Based on extensive testimony, the Commission directed staff to develop a coordinated, countywide approach to meet deficiency plan responsibilities. The countywide approach described below has now been developed and is being proposed for addition to the CMP as part of the 1993 update. It includes:

- Identification of the magnitude of deficiencies anticipated to occur on the CMP highway system by the year 2010, with completion of transportation improvements expected to be funded during this time period. CMP model runs indicate that roughly 15% of the trips generated by growth within Los Angeles County through the year 2010 will contribute to deficiencies on the CMP highway system. This 15% is new trips is equivalent to 3% of all trips in the year 2010.
- A program for assigning deficiency points to jurisdictions based on local land use decisions and their contribution to deficiencies on the CMP highway system. Local jurisdictions will annually track and report on new development activity, in order to establish its congestion mitigation goal.
- The local jurisdiction implements mitigation measures by selecting from a toolbox of capital, demand reducing, and land use strategies. A local jurisdiction is responsible for balancing its congestion mitigation goal with commensurate mitigation strategies. Mitigation points will be based on the trip reduction value of various mitigation strategies. Both the impact and mitigation point systems will be refined over time.
- Local jurisdictions claim credits for mitigation strategies implemented after January 1, 1990. The actions for which credit can be claimed and the amount of credit is determined by the CMP mitigation toolbox and value system. If a local jurisdiction contributes partial funding to a mitigation project, the credit is based on the mitigation value of the project and the proportion contributed by the jurisdiction. Local jurisdictions report the *implementation* of mitigation actions. The MTA is responsible for assessing the *effectiveness* of mitigation actions, not local jurisdictions.
- Since mitigation goals are determined annually for each jurisdiction based on total new development activity, there is no required linkage of mitigation to project-by-project development approvals. A jurisdiction may, in fact, choose to implement mitigation actions which affect existing activity rather than new development. Each jurisdiction has the flexibility to choose mitigation measures - multi-jurisdictional, citywide, subarea, or project-specific - it deems most appropriate.
- Funding for implementation of mitigation actions can be from any source programmed by the local jurisdiction. Projects funded through MTA discretionary sources, such as State Flexible Congestion Relief (FCR) funds, DO NOT count toward meeting local jurisdiction deficiency plan obligations.

This avoids double counting of mitigation actions that reduce the countywide congestion gap.

- As a countywide program, all local jurisdictions must participate in the deficiency plan process, regardless of the number of CMP intersections or congestion levels specifically within their geographic limits. This required participation recognizes the complexity of Los Angeles County travel patterns and related interjurisdictional impacts. Local CMP conformance is determined by participation in the program, defined by: (1) tracking new development activity, (2) selecting commensurate mitigation strategies, and (3) implementing selected mitigation strategies. First-year CMP conformance requirements (highway and transit monitoring, TDM ordinance, and land use analysis) will also continue.

Environmental Review of the 1993 CMP

According to Section 21094 of CEQA, where a prior environmental impact report has been prepared and certified for a program, plan, policy, or ordinance, the lead agency for a later project shall examine significant effects of the later project upon the environment by using a tiered environmental impact report, except that the report on the later project need not examine those effects which the lead agency determines were either (i) mitigated or avoided pursuant to subdivision (a) of Section 21081 of CEQA as a result of the prior environmental impact report, or (2) examined at a sufficient level of detail in the prior environmental impact report to enable those effects to be mitigated or avoided by site specific revisions, the imposition of conditions, or by other means in connection with the approval of the later project.

The EIR prepared for the 1992 CMP, and the EIR prepared for the Southern California Association of Governments (SCAG) 1989 Regional Mobility Plan (RMP), shall be considered the "first tier" of the CEQA process for the 1993 CMP. The 1993 CMP EIR shall constitute the second tier and shall be limited to examining impacts and mitigation measures which were not evaluated in the 1992 CMP EIR or the 1989 RMP EIR as provided by State CEQA Guidelines Section 15152.

The purpose of an Initial Study for a tiered project or program is to analyze whether the later project or program may cause significant effects on the environment that were not examined in the prior Environmental Impact Report(s). That is the purpose of this Initial Study. Section II of this Initial Study contains a checklist assessment of the 1993 CMP's potential to create additional impacts not previously analyzed. The basis for the checklist judgements are explained in Section III of this Initial Study.

II. ENVIRONMENTAL IMPACTS

May the 1993 CMP result in significant effects on the environment that were not examined in the RMP EIR or the 1992 CMP EIR? (Explanations of all "yes" and "maybe" answers are provided in Section III.)

		Yes	Maybe	No
I. EARTH. Will the proposal result in:				
a)	Unstable earth conditions or changes in geologic substructures?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b)	Disruptions, displacements, compaction, or overcovering of the soil?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c)	Change in topography or ground surface relief features?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d)	The destruction, covering, or modification of any unique geologic or physical features?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e)	Any increase in wind or water erosion of soils, either on or off the site?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f)	Changes in deposition or erosion of beachsands, or changes in siltation, deposition, or erosion which may modify the channel of a river or stream or the bed of the ocean or any bay, inlet, or lake?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g)	Exposure of people or property to geologic hazards, such as earthquakes, landslides, mudslides, ground failure, or similar hazards?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
II. AIR. Will the proposal result in:				
a)	Substantial air emissions or deterioration of ambient air quality?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b)	The creation of objectionable odors?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c)	Alteration of air movement, moisture, or temperature, or any change in climate, either locally, or regionally?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

		Yes	Maybe	No
III. WATER. Will the proposal result in:				
a)	Changes in currents, or the course or direction of water movements, in either marine or freshwaters?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b)	Changes in absorption rates, drainage patterns, or the rate and amount of surface runoff?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c)	Alterations to the course or flow of flood waters?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d)	Changes in the amount of surface water in any water body?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e)	Discharge into surface waters, or in any alteration of surface water quality, including, but not limited to, temperature, dissolved oxygen or turbidity?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f)	Alteration of the direction or rate of flow of ground waters?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g)	Change in the quantity of ground waters, either through direct additions or withdrawals, or through interception of an aquifer by cuts or excavations?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
h)	Substantial reduction in the amount of water otherwise available for public water supplies?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
i)	Exposure of people or property to water related hazards such as flooding or tidal waves?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
IV. PLANT LIFE. Will the proposal result in:				
a)	Change in the diversity of species, or number of any species of plants (including trees, shrubs, grass, crops, and aquatic plants)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b)	Reduction of the numbers of any unique, rare, or endangered species of plants?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c)	Introduction of new species of plants into an area, or in a barrier to the normal replenishment of existing species?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d)	Reduction in acreage of any agricultural crop?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	<i>Yes</i>	<i>Maybe</i>	<i>No</i>
V. ANIMAL LIFE. Will the proposal result in:			
a) Change in the diversity of species, or numbers of any species of animals (birds; land animals, including reptiles; fish and shellfish, benthic organisms or insects)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Reduction of the numbers of any unique, rare, or endangered species or animals?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Introduction of new species of animals into an area, or result in a barrier to the migration or movement of animals?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Deterioration to existing fish or wildlife habitat?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
VI. NOISE. Will the proposal result in:			
a) Increases in existing noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Exposure of people to severe noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
VII. LIGHT AND GLARE. Will the proposal:			
a) Produce new light or glare?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
VIII. LAND USE. Will the proposal result in:			
a) Substantial alteration of the present or planned land use of an area?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
IX. NATURAL RESOURCES. Will the proposal result in:			
a) Increase in the rate of use of any natural resources?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Substantial depletion of any non-renewable natural resource?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

	Yes	Maybe	No
X. RISK OF UPSET. Will the proposal result in:			
a) A risk of an explosion or the release of hazardous substances (including, but not limited to: oil, pesticides, chemicals, or radiation) in the event of an accident or upset conditions?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Possible interference with an emergency response plan or an emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
XI. POPULATION. Will the proposal:			
a) Alter the location, distribution, density, or growth rate of the human population of an area?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
XII. HOUSING. Will the proposal:			
a) Affect existing housing, or create a demand for additional housing?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
XIII. TRANSPORTATION/CIRCULATION. Will the proposal result in:			
a) Generation of substantial additional vehicular movement?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Effects on existing parking facilities, or demand for new parking?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Substantial impact upon existing transportation systems?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d) Alterations to present patterns of circulation or movement of people and/or goods?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
e) Alterations to waterborne, rail, or air traffic?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
f) Increase in traffic hazards to motor vehicles, bicyclists, or pedestrians?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

		Yes	Maybe	No
XIV. PUBLIC SERVICES. <i>Will the proposal have an effect upon, or result in a need or for a new or altered governmental services in any of the following areas:</i>				
a)	Fire protection?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b)	Police protection?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c)	Schools?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d)	Parks or other recreational facilities?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
e)	Maintenance of public facilities, including roads?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
f)	Other governmental services?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
XV. ENERGY. <i>Will the proposal result in:</i>				
a)	Use of substantial amounts of fuel and energy?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b)	Substantial increase in demand upon existing sources of energy, or require the development of new sources of energy?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

	Yes	Maybe	No
XVI. UTILITIES AND SERVICE SYSTEMS. <i>Will the proposal result in a need for new systems, or substantial alterations to the following utilities:</i>			
a) Power or natural gas?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Communications systems?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Water?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Sewer or septic tanks?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Storm water drainage?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Solid waste and disposal?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
XVII. HUMAN HEALTH. <i>Will the proposal result in:</i>			
a) Creation of any health hazard or potential health hazard (excluding mental health)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Exposure of people to potential health hazards?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
XVIII. AESTHETICS. <i>Will the proposal result in:</i>			
a) The obstruction of any scenic vista or view open to the public?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) The creation of an aesthetically offensive site open to public view?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
XIX. RECREATION. <i>Will the proposal result in:</i>			
a) Impact upon the quality or quantity of existing recreational opportunities?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

		Yes	Maybe	No
XX. CULTURAL RESOURCES. Will the proposal:				
a)	Result in the alteration of or the destruction of a prehistoric or historic archaeological site?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b)	Result in adverse physical or aesthetic effects to a prehistoric or historic building, structure, or object?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c)	Have the potential to cause a physical change which would affect unique ethnic cultural values?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d)	Restrict existing religious or sacred uses within the potential impact area?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
XXI. MANDATORY FINDINGS OF SIGNIFICANCE.				
a)	Potential to degrade: Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b)	Short-term: Does the project have the potential to achieve short-term, to the disadvantage of long-term, environmental goals? (A short term impact on the environment is one which occurs in a relatively, brief, definitive period of time. Long term impacts will endure well into the future.)	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c)	Cumulative: Does the project have impacts which are individually limited but cumulatively considerable? (A project may impact on two or more separate resources where the impact on each resource is relatively small, but where the effect on the total of those impacts on the environment is significant.)	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
d)	Substantial adverse: Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

III. DISCUSSION OF ENVIRONMENTAL EVALUATION (Narrative description environmental impacts).

1. Earth

- a.-g. **No.** The 1992 CMP EIR addressed earth related impacts. It identified the following direct and indirect effects of the CMP:

Direct Effects: Construction of Capital Improvement Program (CIP) projects could result in the following geotechnical impacts: construction related erosion; increased risk of slope failures, mudslides, and rock falls; a limited potential for subsidence or soil-related impacts; and seismic risks.

This would be true as well for Deficiency Plan related mitigation projects or any CIP updates. The following mitigation was included in the 1992 CMP EIR for these impacts:

- E. 1 The MTA shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the geological impacts of individual CMP CIP projects. As part of the review, the MTA may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas in the EIR:
- preparation in accordance with applicable local and State guidelines (Caltrans, Division of Mines Geology, local ordinances).
 - adequate geotechnical investigations regarding grading, slope stability, seismic hazards, potential ground acceleration.
 - the appropriate level of coordination with the State Division of Mines and Geology and identify specific mitigation measures to be implemented.
 - are designed in accordance with County and local code requirements for seismic ground shaking with special attention to the seismic design of bridges, elevated structures, and tunnels; and
 - demonstrate that all significant geotechnical factors have been mitigated in a manner consistent with the provisions of sound engineering practice and applicable local ordinances.

The 1993 CMP Deficiency Plan mitigation projects and projects included in any CIP update would have the same impacts as those described in the 1992 EIR. The 1992 discussion is adequate to address these impacts and no additional discussion of these impacts is required in the 1993 CMP EIR.

Indirect Effects: Should implementation of the CMP result in increased urban deconcentration or concentration or expansion of development in outlying areas, in closer proximity to active faults which has not been anticipated in the regional plans, the CMP could have a negative effect on seismic risk. The potential for the CMP to reinforce urban deconcentration is discussed in detail as part of the growth inducing impacts analysis contained in Chapter IV - Impact Overview of the 1992 CMP EIR, where it is concluded that the potential of the 1992 CMP to foster urban deconcentration is negligible.

Also discussed in the 1992 CMP EIR is the possibility that CMP related improvements could increase pressures for increased population and employment density in areas adjacent to transit stations, transit lines, transportation centers, etc. A new concentration of population and/or employment, particularly in multi-story buildings could increase human exposure to seismic event risks.

As discussed under Item 8 of this Initial Study, the addition of the Deficiency Plan requirement may result in changes in land use. However, given the region's seismic activity, the prevalence of faults, existing building code requirements, and statutory requirements for assessing seismic risk as part of the development permitting, it is not anticipated that a general redistribution of population, if any, would have a significant effect of seismic risk.

Mitigation Measure C.3, included in the 1992 CMP EIR, provides for monitoring for changes from the anticipated regional land use pattern.

The 1992 CMP discussion of earth impacts is sufficient to address potential 1993 CMP earth impacts. No additional discussion of these impacts is required in the 1993 CMP EIR.

2. Air

- a. **Maybe.** The 1992 CMP EIR included a qualitative discussion of potential air quality impacts. That document identified the following impacts and included the following mitigation measures:

Direct Impact: The 1992 CMP is consistent with the AQMP and would help to improve regional air quality in the County.

The 1993 CMP Deficiency Plan component would add additional capital improvement and TDM related projects to the list of planned improvements. Although these projects are consistent with the goals of the AQMP the 1993 CMP with the deficiency plan component may result in significant positive or negative impacts not previously addressed. The 1993 CMP EIR will contain such an analysis.

Direct Impact: The construction and/or operation of CIP transportation improvement projects could have the following localized negative air quality impacts adjacent to the improvement alignment or right-of-way:

- Construction of roadway and/or transit improvements would have short-term construction impacts. Earth moving activities would increase localized particulate levels. Improvements to existing roadways may also require detours and delays during construction which would cause short-term increases in emissions.
- New route locations or freeway gap closures have the potential to bring mobile emission sources closer to existing sensitive land uses as well as create a new source of pollutant emissions in areas where such sources may not have existed before.
- Providing increased roadway capacity by widening or restriping may move vehicle travel lanes closer to sensitive land uses adjacent to the roadway.
- Creation of rail transit stations and transit centers has the potential to attract a significant number of vehicles to parking locations. Particularly during peak periods, localized carbon monoxide "hot spots" may be created by vehicles idling or queuing at access points to parking facilities. Station circulation may also impeded vehicle flow on adjacent arterial streets and this increase delays, idling and localized emissions.

This would be true as well for Deficiency Plan mitigation projects or any CIP updates. The following mitigation was included in the 1992 CMP EIR for these impacts:

In addition to Mitigation Measure B.1 , the following mitigation measures would partially mitigate direct impacts associated with CMP CIP projects:

- C.1 The MTA shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the air

quality impacts of individual CMP CIP projects. As part of the review the MTA may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas in the EIR:

- Preparation in accordance with applicable guidelines (SCAQMD, CALTRANS, FHWA, EPA, etc.);
- Both construction and operation phase emissions and criteria pollutant concentrations, and compare emissions and concentrations to established SCAQMD daily emissions thresholds, as well as to California Ambient Air Quality Standards (CAAQS) ;
- Consistency with the Air Quality Management Plan; and
- Demonstration that significant air quality impacts have been mitigated in a manner consistent with the provisions of applicable State and Federal clean air legislation.

C.2 The MTA shall seek Environmental Enhancement and Mitigation Demonstration Program Funds made available under Section 164.56(b)(1) of the Street and Highways Code for highway landscaping and urban forestry projects designed to offset vehicular emissions of carbon dioxide associated with CIP projects.

The 1993 CMP capital projects and mitigation projects included in the Deficiency Plan would have the same impacts as those described in the 1992 EIR. The 1992 EIR discussion is adequate to address these impacts. No additional discussion of these impacts is required in the 1993 CMP EIR.

Indirect Effects: Should implementation of the CMP result in increased urban deconcentration or concentration or expansion of development in outlying areas, which has not been anticipated in the regional plans, the CMP could have a negative effect on air quality by increasing vehicle miles traveled. The potential for the CMP to reinforce urban deconcentration is discussed in detail as part of the growth inducing impacts analysis contained in Chapter IV of the 1992 CMP EIR - Impact Overview, where it is concluded that the potential of the CMP to foster urban deconcentration is negligible.

As discussed under Item 8 of this Initial Study, the addition of the Deficiency Plan requirement may result in changes in land use which will be assessed in the 1993 CMP EIR. The following mitigation was included in the 1992 CMP EIR and was designed to monitor for such changes and to trigger additional analysis if they occur:

- C.3 The MTA, where possible, through the congestion monitoring, highway, and transit network, modeling, and land use analysis program elements of the CMP, shall determine the similarity between observed travel behavior with growth rates and geographic distribution assumptions of the RMP. The success of the program in working toward regional land use and mobility goals will be assessed as part of future CMP updates, and appropriate changes to work toward regional goals will be proposed in consultation with local, regional, and state agencies.

This mitigation would be sufficient to address this potential indirect effect of the 1993 CMP as long as significant unmitigatable land use redistribution impacts are not found to result from the 1993 CMP.

The 1992 CMP EIR also discussed the fact that CMP related improvements could potentially increase the density of trips and traffic in center areas, such as near transportation centers, rail transit stations, park and ride lots, etc. In these cases, the air quality affect of the CMP could create "hot spots" of pollutant concentrations, particularly carbon monoxide. The following mitigation was included in the 1992 CMP EIR for this potential indirect impact:

- C.4 The MTA shall encourage and participate in the evaluation and reconciliation of localized adverse impacts with regional improvements. Such evaluation is intended to broaden the understanding of "hot spots" of pollutant emissions, and the tradeoffs between hot spot creation and regional emission reductions.

This mitigation would be sufficient to address this potential impact of the 1993 CMP. No additional discussion of these impacts is required in the 1993 CMP EIR.

- b.-c. **No.** The 1993 CMP does not contain any elements that would create objectionable odors, or alter air movement or climate.

3. Water

- a.-i. **No.** The 1992 CMP EIR included a qualitative discussion of potential water related impacts. That document identified the following impacts and included the following mitigation measures:

Direct Impacts: CIP projects could affect beneficial uses through the destruction of habitat and changes in surface water quality. Implementation of the CMP could have a short-term adverse effect on nearby surface water bodies during construction of CIP related projects. These effects would include increased sedimentation endangered by excavation and grading activities, as well as pollution

from vehicular oils and grease. Long-term impacts could result from increased highway and transit associated facilities operations and their associated pollution (such as vehicular oils and grease emissions). The level of pollution produced would be a function of the number and lengths of trips made on these new facilities.

This would be true as well for Deficiency Plan mitigation projects or any CIP updates. The following mitigation was included in the 1992 CMP EIR for these impacts:

- F. 1 The MTA shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the water resource impacts of individual CMP CIP projects. As part of the review, the MTA may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas in the EIR:
- For large-scale capital improvement projects such as freeway, HOV, rail and interchange projects, appropriate ecologically-oriented maps are obtained and used during the planning process for CIP projects. Every effort is made to avoid areas that are currently used or anticipated to be used for ecologically beneficial purposes. Every effort is made to minimize all disturbances in areas where construction is mandatory. All areas are restored to their original preconstruction condition, including the reintroduction of all uncontaminated soil and the replacement of all native vegetation. In the coastal zone, coastal zone planning and management programs to reduce adverse impacts to coastal water quality and preserve or improve areas of special water quality significance such as bays and estuaries.
 - Planning, construction, and operational activities are coordinated with appropriate ecological and water resources agencies and are conducted in accordance with the requirements of the Federal Water Pollution Control Act, the Water Quality Act, and the Clean Water Act, including NPDES and Section 404 permit requirements.
 - Natural conditions are maintained or simulated wherever possible to minimize effects at stream crossing. Single span bridges are used when feasible.

- Erosion control measures and runoff management, such as drainage channels, detention basins, and vegetated buffers, are employed to prevent pollution of adjacent water resources by runoff from transportation facilities. Wherever physically feasible, detention basins are equipped with oil and grease traps which are cleaned regularly. Treatment and disposal of excavated materials is well planned.
- Water conservation measures listed in the BMP are incorporated into the planning and design of CIP projects and their mitigations.
- Use of permeable surfaces and channelization of flows to recharge areas are incorporated into project design, where possible, to promote water percolation and removal of metals.
- All demolition, construction, and operational activities are conducted in accordance with all applicable regulatory requirements.

In addition, Mitigation Measure A.3 included in the 1992 CMP EIR would reduce long-term water quality impacts associated with CIP project operation.

With implementation of the mitigation measures, program level 1992 CMP and 1993 CMP water resource impacts on beneficial uses, supply and demand, and water quality are not anticipated to be significant. The potential for significant adverse water resource impacts to remain after implementation of CIP project specific mitigations developed as part of CIP project specific environmental review, can only be assessed on a project specific basis as part of subsequent environmental review.

The 1993 CMP capital projects and mitigation projects included in the Deficiency Plan would have the same impacts to those described in the 1992 EIR. The 1992 discussion is adequate to address these impacts. No additional discussion of these impacts is required in the 1993 CMP EIR.

Indirect Effects: Should implementation of the CMP result in increased urban deconcentration or concentration or expansion of development in areas containing beneficial uses, significant indirect impacts could result. Deconcentration could also decrease the amount of open land that is currently available for ground water recharge, either through natural means or through use of reclaimed water. Efforts to foster reclamation projects to increase local ground water supplies could be significantly curtailed because of the area requirements associated with the reuse of treated effluent. Lastly, the interdependency effects of deconcentration would increase the needed for and restrictiveness of large-scale water conservation programs.

Mitigation Measure C.3 included in the 1992 CMP EIR would reduce the indirect impacts of the 1992 CMP and 1993 CMP on beneficial uses and the water supply/demand balance.

No additional impacts are expected to result from the 1993 CMP. The discussion of potential CMP related impacts contained in the 1992 CMP EIR is sufficient to address potential 1993 CMP impacts.

4. Plant Life

a.-d. No. The 1992 CMP EIR included a qualitative discussion of potential biological resource impacts of the CMP. That document identified the following impacts and included the following mitigation measures:

Direct Impacts: To the extent that the CMP is successful in maintaining LOS in the vicinity of Significant Ecological Areas (SEAs), the CMP would have a beneficial impact as a result of reduced congestion and air pollution. If the CMP results in the diversion of traffic to corridors passing through SEAs, or from already-congested corridors to corridors which are currently relatively free-flowing, leading to increased levels of congestion, traffic, and air pollution in proximity to SEAs, the CMP may have an adverse effect on biological resources. Some CMP CIP projects may be routed through SEAs. Any capital improvement projects located in or near SEAs pose the potential for significant biological impacts.

This would be true as well for the 1993 CMP for mitigation projects included in the Deficiency Plan or any CIP updates. The following mitigation measure was included in the 1992 CMP EIR for these potential impacts.

G.1 The MTA shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the biological resource impacts of individual CMP CIP projects. As part of the review, the MTA may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas in the EIR:

- Prior to any new construction on existing or proposed highways within the boundaries of an SEA, the need for construction is reviewed and substantiated, and alternative alignments or appropriate mitigation measures are investigated and implemented as feasible. If no feasible alternative or mitigation is found, the project is performed in the most environmentally sensitive manner possible.

- Site-specific studies are required for each CMP capital improvement project located in the vicinity of an SEA, or any area identified as potentially environmentally significant by the local jurisdiction, to determine whether significant plant or animal life or plant or animal life protected by local ordinance is present in a proposed alignment, and the level of impact on those resources. In consultation with the California Department of Fish and Game, the U.S. Fish and Wildlife Service and the local jurisdiction in which the project is located, detailed biological surveys are conducted prior to the adoption of roadway alignments which have the potential to adversely affect significant or protected biological resources.
 - Appropriate consultation with the California Department of Fish and Game occurs to determine if special status species, not identified under the SEA program, occur in the project vicinity.
 - Vegetation removal occurs only where absolutely necessary for grading; revegetation with appropriate native plants is to be implemented as feasible.
 - Capital improvement projects, which take place in recognized wetlands comply with local, state, and federal regulations governing the protection of these areas.
 - Capital improvement projects within the coastal zone comply with coastal zone planning and local government management programs, which prevent or reduce impacts on biological resources within the coastal zone.
- G.2 The MTA shall seek Environmental Enhancement and Mitigation Demonstration Program Funds made available under Section 164.56(b)(2) of the Streets and Highways Code for acquisition or enhancement of resource lands to mitigate the loss of, or the detriment to, resource lands lying within the rights-of-way acquired for proposed transportation improvements.

With implementation of the mitigation measures listed above, program level biological resource impacts are not anticipated to be significant. The potential for significant adverse biological resource impacts to remain after implementation of CIP project specific mitigation's developed as part of CIP project specific environmental review, can only be assessed on a project specific basis as part of subsequent project level environmental review.

The 1993 CMP capital projects and mitigation projects included in the Deficiency Plan would have the same impacts to those described in the 1992 EIR. The 1992 discussion is adequate to address these impacts. No additional discussion of these impacts is required in the 1993 CMP EIR.

Indirect Impacts: Should implementation of the CMP result in increased urban deconcentration, or concentration or expansion of development in outlying areas, particularly areas containing significant ecological resources, which has not been anticipated in the regional plans, the CMP could have a negative effect on biological resources.

Mitigation Measure C.3 included in the 1992 CMP EIR would reduce the indirect impacts of the CMP on biological resources.

No additional impacts are expected to result from the 1993 CMP. The discussion of potential CMP related impacts contained in the 1992 CMP EIR is sufficient to address potential 1993 CMP impacts.

5. Animal Life

a.-d. No. See discussion under Item 4 above.

6. Noise

a.-b. No. The 1992 CMP EIR included a qualitative discussion of potential noise impacts of the CMP. That document identified the following impacts and included the following mitigation measures.

Direct Effect - Noise from the construction of CIP projects may be disruptive. Circumstances where noise conditions may increase and adverse impacts may result including the following:

- Construction of new routes or freeway gap closures through sensitive residential areas.
- Widening of facilities on the existing CMP highway network that would bring travel lanes and mobile noise sources closer to sensitive adjacent land use receptors.
- Construction of elevated HOV lanes or elevated rail transit within or adjacent to facilities passing through residential areas or adjacent to sensitive land uses.

- Operational improvements on the CMP network that would increase traffic speed and flow that may incrementally increase noise levels.
- Increase in the frequency of transit service (bus and/or rail) would increase Community Noise Equivalent Levels (CNEL).
- New transit alignments or the construction of new elevated transit facilities would increase ambient noise levels.
- New transit stations may cause an increase in mobile and stationary levels for adjacent land uses.
- New park and ride locations may cause an increase in mobile noise levels for adjacent land uses as a result of a significant increase in vehicle trips to the area. Stationary noise levels may also increase as a result of the construction of parking structures with ventilation systems or from parking areas where sounds such as engine run-ups, door slams, car alarms, etc., would be more common.

This would be true as well for mitigation projects included in the Deficiency Plan or any CIP updates. The following mitigation was included in the 1992 CMP EIR for these impacts:

- D. 1 The MTA shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the noise impacts of individual CMP CIP projects. As part of the review, the MTA may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas in the EIR:
- Preparation in accordance with applicable local and state guidelines (FHWA FHMP 773, State Office of Noise Control, local noise ordinances and general plan noise elements, etc.).
 - Demonstration that all significant noise impacts have been mitigated in a manner consistent with the provisions of applicable local ordinances, as well as state and federal guidelines.

The potential for localized CMP CIP project specific noise impacts to remain significant after implementation of the mitigations and CIP project specific mitigations developed as part of CIP specific review can only be assessed

on a project specific basis. This would occur as part of subsequent project specific environmental review.

The 1993 CMP capital projects and mitigation projects included in the Deficiency Plan would have the same impacts to those described in the 1992 EIR.

Indirect Effects: Should implementation of the CMP result in increased urban concentration, or concentration or expansion of development in outlying areas, which has not been anticipated in the regional plans, the CMP could have a negative effect on noise by increasing traffic in areas with relatively low background noise levels. The potential for the CMP to reinforce urban deconcentration is discussed in detail as part of the growth inducing impacts analysis contained in Chapter IV of the 1992 CMP EIR - Impact Overview, where it is concluded that the potential of the CMP to foster urban deconcentration is negligible. Also, a possibility is that CMP related improvements could increase the density of trips and traffic in center areas, such as near transportation centers, rail transit stations, park and ride lots, etc. In these cases, the noise effect of the CMP could concentrate an increase in both mobile and stationary noise levels in the immediate vicinity of these new facilities.

Mitigation Measure C.3 included in the 1992 CMP EIR addresses indirect noise impacts.

No additional impacts are expected to result from the 1993 CMP as long as significant unmitigatable land use changes are not created by the addition of the Deficiency Plan component.

The Deficiency Plan process would result in additional capital, land use, and TDM type mitigations aimed at mitigating deficiencies. The intent of the 1992 and 1993 CMPs is to maintain the level of service standards on the CMP highway system. In general, a doubling or halving of traffic on roadways is required to create noticeable changes in noise levels. The 1993 CMP will not result in this magnitude of change when compared to traffic levels under the 1992 CMP, except potentially in the vicinity of capital improvement projects which would be subject to project specific level environmental review. The 1992 CMP EIR discussion is therefore adequate to address potential 1993 CMP noise impacts. No additional discussion of these impacts is required in the 1993 CMP EIR.

7. Light and Glare

No. As explained in the Initial Study for the 1992 CMP EIR, individual projects included in the CMP could potentially create light and glare. The degree of impact would depend on the type of project and the specifics of the project design. Individual improvement projects would be subject to subsequent environmental review in accordance with CEQA. Additional project specific mitigations would be identified, as needed to mitigate significant project impacts, as part of any necessary subsequent project level environmental review. Therefore, light and glare impacts were not addressed in the 1992 CMP EIR. This will be true for the 1993 CMP as well.

8. Land Use

Maybe. The 1992 CMP EIR included an assessment of the 1992 program's potential to create land use changes. It was concluded that the potential for the 1992 CMP to affect land use was limited and the following impacts and mitigations were described for the 1992 CMP:

Direct Impact: Individual CIP projects may result in localized changes in land use.

This direct and indirect impact would be true as well for Deficiency Plan related capital improvement projects, land use mitigation strategies, or any CIP updates. The following mitigation was included in the 1992 CMP EIR for these impacts:

- A. 1 The MTA shall consult with other adjacent CMAs in reviewing LOS standards to ensure that differences in LOS standards between counties do not encourage a land use pattern which is inconsistent with local land use or regional goals.

Indirect Impacts: Should implementation of the CMP result in increased urban deconcentration or concentration or expansion development in outlying areas, which has not been anticipated in the regional plans, the CMP could have a negative effect on land use.

This would be true as well for Deficiency Plan related mitigation projects or any CIP updates. The following mitigation was included in the 1992 CMP EIR for these impacts:

- A.2 The MTA shall participate in on-going forums, regarding interjurisdictional impacts including land use issues and impact analysis procedures.

Indirect Impacts: Increasing system capacity may encourage additional trips (latent demand) on the system, by reducing the costs (time and stress) associated with

trip-making. This would be true as well for Deficiency Plan related capital improvement projects, land use mitigation strategies, or any CIP updates. The following mitigation was included in the 1992 CMP EIR for these impacts:

- A. 3 The MTA shall investigate the use of other mobility and system performance indices such as Vehicle Miles Traveled and Average Vehicle Ridership and shall compare the effectiveness of such indices with LOS as standards for determining both system mobility and motor vehicle emissions performance. These supplemental measures shall be incorporated into the program if determined to be effective for reconciling localized decreases in service against regional improvements.

Direct Impacts: The following classes of CMP CIP projects could lead to the localized displacement of adjacent businesses and residences: Class 1 - freeway system management (specifically the construction of HOV lanes); Class 2 - freeway gap closures; Class 6 - rail improvements; Class 4 - commuter rail stations; transit centers and park-n-ride lots; and, to a more limited degree, Class 3 - arterial system improvements. Of the 1992 CIP projects (see Table 5) Class 2 and 3 projects present the greatest potential for disruption.

This would be true as well for mitigation projects included in the Deficiency Plan or any CIP updates. The following mitigation was included in the 1992 CMP EIR for these impacts:

- A. 4 The MTA shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of the project level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the land use impacts of individual CMP CIP projects. As part of the review, the MTA may comment on the adequacy of the analysis and mitigations.

Indirect Impacts: The CMP's Land Use Analysis Program, in combination with CMP network monitoring and modeling should provide better information on which local jurisdictions can base their analysis. This is a beneficial impact of both the 1992 and 1993 CMPs.

Indirect Impacts: The CMP's TDM component may result in increased density in the vicinity of transit centers and rail facilities. This would be supportive of the centers development goals of a number of local jurisdictions. The following mitigation was included in the 1992 CMP EIR for these impacts:

- A.5 The MTA shall explore with the cities, the desirability of including mechanisms in the CMP for encouraging the creation of increased density in targeted center areas. Possible mechanisms include specification of

density related CIP project selection criteria; inclusion of density encouraging mechanisms in the TDM component of the CMP; or inclusion of mechanisms to encourage targeted density development as a component of future deficiency planning.

This would be true as well of the 1993 CMP. No further analysis of these issues is required.

The key change in the 1993 CMP which could potentially impact land use is the addition of the Deficiency Plan requirement. The 1992 CMP relied on compliance with CEQA to identify and deal with potential development related impacts on the regional system. CEQA allows for the permitting of projects which would create significant unmitigatable impacts as long as the proper Findings and Statement of Overriding Considerations are made. The addition of the Deficiency Plan component may create greater mitigation requirements and additional costs for development, which could potentially result in changes in land use locational decisions. Potential impacts associated with the Deficiency Plan component of the 1993 CMP include: (1) the potential to foster development patterns inconsistent with local and regional plans within the County; (2) the potential to alter the geographic distribution of current and projected development patterns within the County; and (3) the potential to retard or stimulate the assumed rate of growth either based on historical trends or on the levels of development anticipated in local and regional plans. The potential for the 1993 CMP to result in these three types of impacts will be assessed in the EIR for the program.

9. Natural Resources

- a.-b. No.** As explained in the Initial Study for the 1992 CMP, Natural Resource impacts were not addressed in the RMP EIR. Aggregate Resource impacts are addressed in the EIR for the Growth Management Plan (GMP), which is also incorporated herein by reference. The construction of CMP related capital improvement projects may increase the rate of use of gravel and concrete materials in the region. However, no significant depletion of these resources is anticipated to result from the implementation of the CMP since these resources are plentiful. Implementation of the CMP would also affect fuel use. Fuel use impacts are assessed under the discussion of energy. Thus no further discussion of these types of impacts is required in the 1993 CMP EIR.

10. Risk of Upset

- a.-b. No.** As explained in the Initial Study for the 1992 CMP, construction of CMP related capital improvements may disrupt surface traffic during the construction period. The construction of capital improvements could therefore create short-term localized interference which could slow emergency vehicle response time. This is addressed as part of the traffic discussion in the 1992 CMP EIR. Implementation of the CMP should improve overall emergency response time by maintaining mobility on the region's highway system. Response time impacts are discussed in the Public Services section of the 1992 CMP EIR and this Initial Study.

No increased risk of explosion or release of hazardous substances is anticipated as a result of the implementation of the CMP. Individual projects under the CMP would be subject to subsequent environmental review in accordance with CEQA. If individual projects are determined to present the potential to create risk of upset, the potential will be assessed as part of subsequent environmental review. Thus no further discussion of these types of impacts is required in the 1993 CMP EIR.

11. Population

Maybe. See discussion under Item 8, Land Use, above.

12. Housing

Maybe. See discussion under Item 8, Land Use, above.

13. Transportation/Circulation

- a.-e. Maybe.** The 1992 CMP EIR included a qualitative discussion of the potential transportation/circulation related impacts. That document identified the following impacts and included the following mitigation measures:

Direct Impacts: The CMP has been designed to be consistent with the RMP, thus the CMP should have a positive impact on working towards attainment of Regional Mobility goals. This is true of the 1993 CMP as well, although the 1993 CMP consistency with the RMP has not been formally assessed. The 1993 CMP EIR will include a discussion of the 1993 CMPs consistency with the RMP.

Direct Impact: Any potential impacts of the highway and roadway element of the CMP are likely to be related to the implementation of the specific CIP improvement projects within the framework of the CMP process.

Traffic may be re-routed during the construction of a particular facility. It is possible that the implementation of a transportation improvement project may cause traffic to be diverted into or through sensitive areas, including residential neighborhoods, creating localized noise or air quality impacts. These potential for these impacts to occur would be addressed as part of subsequent project specific level environmental review.

This would be true as well for Deficiency Plan related capital improvement projects or any CIP updates. The following mitigation was included in the 1992 CMP EIR for these impacts:

Mitigation Measure A.4 included in the 1992 CMP EIR would mitigate the direct effects of the CIP element of the CMP.

B. 1 The MTA shall review EIRs for CIP projects to ensure that mitigation measures are included requiring that the Lead Agency give transit operators and affected City Departments of Transportation advanced notice of construction activities which might impact the transportation system.

CIP projects will have a beneficial impact county-wide on LOS. The potential for localized CMP CIP project specific traffic impacts to remain after implementation of CIP project specific mitigations developed as part of CIP project specific environmental review can only be assessed on a project specific basis. This is true as well of 1993 CMP CIP and Deficiency Plan projects.

Direct Impact: The CMP will help to maintain LOS. This is a beneficial impact which would be true as well of the 1993 CMP. However, the Deficiency Plan component of 1993 CMP will result in the implementation of additional land use, TDM and capital improvement strategies. The congestion and system impacts of the Deficiency Plan Component have not previously been formally assessed. The 1993 CMP EIR will therefore include an assessment of the potential congestion and transportation system impacts of the Deficiency Plan component.

Indirect Effect: Should implementation of the CMP result in increased urban deconcentration or concentration or expansion of development in outlying areas, the CMP could have a negative effect on the transportation system by increasing vehicle miles traveled. The potential for the CMP to reinforce urban deconcentration is discussed in detail as part of the growth inducing impacts analysis contained in Chapter IV of the 1992 CMP EIR, Impact Overview, where it is concluded that the potential of the CMP to foster urban deconcentration is negligible.

The 1993 CMP could potentially also have these same impacts. The following mitigation was included in the 1992 CMP EIR for these impacts:

Mitigation Measures A.1 - A.3 included in the 1992 CMP EIR would mitigate the indirect effects of the CIP element of the CMP; mitigation measures A.1 - A.3 and mitigation B.1 from the 1992 CMP EIR would mitigate the indirect effects of the CMP Highway and Roadway System Element.

No additional impacts of this kind are expected to result from the 1993 CMP as long as significant unmitigatable land use changes are not created by the addition of the Deficiency Plan component.

Direct Impact: The Highway and Transit Elements would provide monitoring information to assist in planning. This is a beneficial impact of both the 1992 and 1993 CMPs.

- f. **No.** The 1993 CMP does not contain any element that would increase traffic hazards to motor vehicles, bicyclists, or pedestrians.

14. Public Services

- a.-f. **Maybe.** The 1992 CMP EIR included a qualitative discussion of the potential public service related impacts. That document identified the following impacts and included the following mitigation measures:

Direct Effects: The construction of individual CIP projects may temporarily slow police and fire department responses and disrupt access.

Some CIP projects may require additional right-of-way adjacent to existing parks and recreational facilities, reducing the already limited parkland in the County. Increased traffic volumes and/or speed in proximity to parks and recreational facilities could result in increased noise impacts, inhibited access to facilities, and an increased number of automobile-related accidents. Site-specific studies required for each capital improvement project of the CMP with a potential for adversely affecting parks and recreational facilities will determine the level of impact on those facilities.

This would be true as well for Deficiency Plan related capital improvement projects or any CIP updates. The following mitigation was included in the 1992 CMP EIR for these impacts:

- l.1 The MTA shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project level planning and the

environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the public service impacts of individual CMP CIP projects. As part of the review, the MTA may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas in the EIR:

- Prior to the construction of individual CMP capital improvement projects, the lead agency consults with affected police and fire departments to ensure these agencies adequate access to the affected portions of the CMP roadway network.
- An assessment of the potential impacts to parks and recreational facilities is included in the environmental assessment of any CMP transportation facilities to be located in proximity to parks and recreational facilities which includes an assessment of traffic, noise, and access impacts.
- An assessment of the potential impacts to schools is included in the environmental assessment of any CMP capital improvement project to be located in proximity to a school, which includes an assessment of traffic, noise, and access impacts.

- I.2 The MTA shall seek Environmental Enhancement and Mitigation Demonstration Program Funds made available under Section 164.56(b)(2) of the Streets and Highways Code for acquisition or enhancement of resource lands to mitigate the loss of, or the detriment to, resource lands lying within the right-of-way acquired for proposed transportation improvements.

With implementation of the mitigation measures listed above, program level public services impacts are not anticipated to be significant. The potential for significant adverse police, fire, and parks and recreational impacts to remain after implementation of CIP project specific mitigation's developed as part of CIP project specific environmental review, can only be assessed on a project specific basis.

No additional impacts are expected to result from the 1993 CMP. The discussion of potential CMP related impacts contained in the 1992 CMP EIR is sufficient to address these potential 1993 CMP impacts.

Direct Effect: Local government's compliance with the CMP could result in the diversion of local government personnel and revenues.

This would be true as well for the 1993 CMP. The following mitigation was included in the 1992 CMP EIR for these impacts:

- I.3 The MTA shall work with local jurisdictions to investigate a county-wide process to deal with future year CMP implementation.
- I.4 The MTA shall continue to work with public and private interests regarding CMP requirements to minimize adverse public/private cost impacts associated with the CMP.

The level of detail of the discussion in the 1992 CMP EIR was based on the level of refinement of the description of the program elements. The new Deficiency Plan component of the 1993 CMP addresses mitigation measure I.3. However, the potential of the proposed approach to: (1) result in a diversion of local jurisdictional resources away from the provision of other services to a degree which significantly impacts the provision of public services; and, (2) the administrative implementation impacts has not been assessed. This will be done in the 1993 CMP EIR.

15. Energy

- a.-b. **Maybe.** The 1993 CMP will result in the construction of additional capital improvement projects and will result in a greater level of mobility on the regional system than the 1992 CMP. This will result in the expenditure of additional construction energy and will affect fuel use in the County. The 1993 CMP will assess these potential energy impacts.

16. Utilities and Service Systems

- a.-f. **No.** As explained in the Initial Study for the 1992 CMP EIR, the RMP EIR does not contain an analysis of utilities impacts since the RMP was formulated in conjunction with the Regional Growth Management Plan (GMP) and utilities impacts associated with the land use pattern changes resulting from the GMP are discussed in the EIR for the GMP. As long as the CMP does not result in a land use future which is significantly different than the adopted regional forecast, no additional negative program level impacts are anticipated.

Individual projects under the CMP would be subject to subsequent environmental review in accordance with CEQA. If an individual project is determined to present the potential to create utilities impacts, the potential will be assessed as part of the environmental assessment for that project.

Construction of individual CMP related capital projects could alter existing storm drainage. The nature of the alteration would depend on the specifics of the design

of the individual projects. Individual projects under the CMP would be subject to subsequent environmental review in accordance with CEQA.

For these reasons no utilities impact discussion was included in the 1992 CMP, and no discussion is required in the 1993 CMP EIR.

17. Human Health

- a.-b. **No.** As explained in the Initial Study for the 1992 CMP EIR, the RMP EIR does not include a discussion of human health impacts. Human health impacts associated with seismic safety and air quality impacts of the CMP are discussed under those issue areas. No exposure to agents of disease is expected to result from the CMP. Any human health impacts involving risk of upset would be the result of the specific design and operation of facilities and facilities improvements funded under the CMP. Individual projects under the CMP and updates to the CMP would be subject to subsequent environmental review in accordance with CEQA. If an individual project, or CMP update, is determined to present the potential to create human health impacts, the potential will be assessed as part of the subsequent environmental review of those projects.

For these reasons, no human health section will be included in the 1993 CMP EIR.

18. Aesthetics

- a.-b. **No.** As explained in the Initial Study for the 1992 CMP EIR, the RMP EIR includes a discussion of the factors which determine a project's potential to create aesthetic impacts as well as a discussion of how classes of RMP projects and specific RMP projects would affect aesthetics. The classes of RMP project's discussed in the RMP EIR are TDM, TSM, high-flow arterial, high-occupancy vehicle facilities, mixed-flow facilities, transit facilities, and non-motorized transportation. The RMP EIR concludes that the adverse impacts of RMP facilities can be reduced through design, the specific aesthetic elements of which must be determined on a case by case basis. It includes under mitigations general considerations which should be incorporated in facilities design. These mitigations are incorporated by reference in the CMP EIR since the CMP EIR is tiered off the RMP EIR. Individual projects under the CMP and updates to the CMP would be subject to subsequent environmental review in accordance with CEQA. If an individual project, or CMP update, is determined to present the potential to create aesthetic impacts, the potential will be assessed as part of the subsequent environmental review of those projects.

For these reasons, no aesthetics section will be included in the 1993 GMP EIR.

19. Recreation

- a. **No.** Recreation impacts are addressed as part of the Public Service discussion in the 1992 CMP EIR. As explained under 14 above, no additional impacts are anticipated to result from the 1993 CMP, and no further analysis is required.

20. Cultural Resources

- a.-d. **No.** The 1992 CMP EIR included a qualitative discussion of the potential cultural resource related impacts. The 1992 CMP EIR identified the following impacts and included the following mitigation measures:

Direct Impacts: While prehistoric sites or artifacts could be discovered in the urbanized areas of Los Angeles County, it is likely that any archaeological sites on the surface would have been destroyed during past urbanization. Generally in the urbanized or urbanizing area, archaeological and paleontological resources are uncovered during the construction phase of a project.

The National Register entries, National Landmarks, State Landmarks, local designations, and Los Angeles Historic-Cultural Monuments are located along or near many of the streets and highways of the CMP Roadway System. Inclusion of a roadway or highway segment on the CMP network could ultimately lead to improvement projects on or near that segment, should service deteriorate below CMP LOS standards. This could potentially lead to impacts on historic structures as part of CIP projects.

This would be true as well for mitigation projects included in the Deficiency Plan, any CIP updates, or any network additions included in the 1993 CMP. The following mitigation was included in the 1992 CMP EIR for these impacts:

- H.1 The MTA shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the public service impacts of individual CMP CIP projects. As part of the review, the MTA may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas in the EIR:

- The project sponsor contacts either the archeological resource information depository at UCLA or Cal State Northridge to determine the status of each site or corridor proposed for development, if it is

determined during project-specific environmental review that the site or corridor is likely to contain archaeological resources.

- A professional archaeologist is retained to aid in the assessment of those sites or corridors considered to have moderate to high likelihood of containing archaeological resources, and to recommend a course of action for preservation of significant resources.
- During construction, at sites judged to have moderate to high likelihood of containing paleontological resources, a qualified paleontologist approved by the California Archaeological Inventory Regional Information Center is on call to remove fossil remains found during construction. If fossil remains are discovered during construction, all activity at the fossil site shall be stopped until the paleontologist has removed the remains.
- For those sites or corridors for which environmental review or subsequent analysis indicates a less than moderate likelihood of containing archaeological resources, the following measures are taken: If any archaeological materials are encountered during the course of the project development, the project shall be halted. The services of an archaeologist shall be secured by contacting the Center for Public Archaeology - Cal State University, Northridge, or a member of the Society of Professional Archaeologist (SOPA), or a SOPA-qualified archaeologist to assess the resources and evaluate the impact. Copies of the archaeological survey, study or report are submitted to the UCLA Archaeological Information Center. All specimens collected are donated to the most appropriate educational research facility.
- The environmental assessment adequately evaluates the potential for significant impacts to nearby historic resources, including locally designated resources, and includes appropriate mitigations.

No additional impacts are expected to result from the 1993 CMP. The discussion of these potential CMP related impacts contained in the 1992 CMP EIR is sufficient to address potential 1993 CMP impacts.

Indirect Impacts: Should implementation of the CMP result in increased urban deconcentration or concentration or expansion of development in outlying areas or the mountain or desert portions of the County, which has not been anticipated in the regional plans, the CMP could have a negative effect on cultural and archaeological resource in these areas.

Mitigation Measure C.3 included in the 1992 CMP EIR would reduce the indirect impacts of the CMP on historic resources.

No additional impacts are expected to result from the 1993 CMP. The discussion of potential CMP related impacts contained in the 1992 CMP EIR is sufficient to address potential 1993 CMP impacts.

XXI. MANDATORY FINDINGS OF SIGNIFICANCE.

- a-b,d. No.** The 1993 CMP does not contain any elements that would have the potential to degrade the quality of the environment, cause short term environmental goals to the disadvantage of long-term goals, or cause substantial adverse effects on human beings.
- c. Maybe.** The 1993 CMP will propose modifications to the adopted 1992 CMP including modifications to the highway and transit monitoring data, additions to the CMP highway system, refinement of the land use analysis program and, update of the Capital Improvement Program. The 1993 CMP will also incorporate a Deficiency Plan component whose purpose is to implement countywide mitigation strategies that either fully mitigate congestion, or alternatively, provide measurable improvement to congestion and air quality. Although the impact of individual CMP CIP or deficiency plan mitigation programs or projects alone may be small, the programs or projects as a whole may pose the potential to create significant positive or negative air quality, land use, population, housing, transportation, public service, or energy impacts. As noted in the checklist discussion of specific impact categories, the 1993 EIR will address the potential of the 1993 CMP to create significant environmental impacts in these issue areas.

As detailed in the checklist, no significant program level impacts on earth, water, plant life, animal life, noise, light and glare, natural resources, risk of upset, energy, utilities and service systems, human health, aesthetics, recreation and cultural resources are identified. The CMP CIP projects and projects included in the Deficiency Plan Mitigation Menu would have the same impacts as those described in the 1992 EIR. The 1992 CMP EIR contained qualitative discussions of these impacts, and the related adopted mitigation measures adopted for direct and indirect impacts, are sufficient to address potential 1993 CMP impacts.

IV. ENVIRONMENTAL DETERMINATION

On the basis of this initial evaluation:

I find that the proposed project **COULD NOT** have a significant effect on the environment, and a **NEGATIVE DECLARATION** will be prepared. _____

I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because the mitigation measures described on attached sheets have been added to the project. **A NEGATIVE DECLARATION WILL BE PREPARED.** _____

I find the proposed project **MAY** have a significant effect on the environment, and an **ENVIRONMENTAL IMPACT REPORT** is required.

RE: LOS ANGELES COUNTY TRANSPORTATION AUTHORITY's NOP for
1993 CONGESTION MANAGEMENT PROGRAM FOR LOS ANGELES COUNTY
SCH # 93051061

Attached for your comment is the LOS ANGELES COUNTY TRANSPORTATION AUTHORITY Notice of Preparation of a draft Environmental Impact Report (EIR) for the 1993 CONGESTION MANAGEMENT PROGRAM FOR LOS ANGELES COUNTY.

Responsible agencies must transmit their concerns and comments on the scope and content of the EIR, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of this notice. We encourage commenting agencies to respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

KENDRA MORRIES
LOS ANGELES COUNTY TRANSPORTATION AUTHORITY
818 WEST 7TH STREET- MS2200
LOS ANGELES, CA 90017

with a copy to the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the review process, call Tom Loftus at (916) 445-0613.

Sincerely,

A handwritten signature in cursive script that reads "Christine Kinne".

CITY OF CARSON

June 10, 1993

Ms. Kendra Morries
Land Use Project Manager
Congestion Management Program
LACMTA
818 W. Seventh St.
Los Angeles, CA 90017

Dear Ms. Morries:

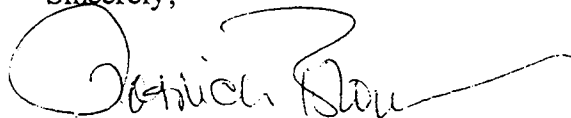

The City of Carson looks forward to the opportunity to review and comment on the draft EIR for the 1993 Congestion Management Program for Los Angeles County. The City of Carson is concerned about the economic impact of the program on cities for both the administration of the program and the funding of mitigation measures.

The cities are being required to mitigate all trips (with the exception of specified exempted trips) whether or not the project must undergo discretionary review. The roads within the City of Carson which are on the CMP system are the freeways (I-405, I-91 and I-110) and Alameda Street. There are limited improvements which the City can make to the freeway system and since the freeways are under the jurisdiction of Caltrans all proposed improvements must be approved by the State agency leaving the city few options and little control over the improvements.

The Alameda Corridor is a major improvement project on the only CMP designated street within the City. Since this improvement will be financed by federal and state funds, Carson would receive no credit for any improvements. The City of Carson has no existing or proposed mass transit stations, therefore the city can not get credit for improvements and/or development at stations. The City of Carson will be limited in the number of mitigation measures that could be implemented. If the cities can not economically enact the program, the impact on the regional system will be significant. An economic study should be completed which determines at what point the cities can not afford to participate in the CMP program.

Please forward a copy of the Draft EIR for our review and comment as soon as it is available.

Sincerely,

A handwritten signature in cursive script, appearing to read "Patrick Brown". The signature is written in black ink and is positioned above the typed name.

Patrick Brown,
Community Development Director

CK

**South Coast
AIR QUALITY MANAGEMENT DISTRICT**

21865 E. Copley Drive, Diamond Bar, CA 91765-4182 (909) 396-2000

June 10, 1993

Ms. Kendra Morries
Los Angeles County Transportation Authority
818 West 7th Street - MS2200
Los Angeles, CA 90017

Dear Ms. Morries:

**Subject: Notice of Preparation of a Draft Environmental Impact Report for
the 1993 Congestion Management Program for Los Angeles County**

SCAQMD# LAC930604-02

The South Coast Air Quality Management District (SCAQMD) appreciates the opportunity to comment on the Notice of Preparation of a Draft Environmental Impact Report (Draft EIR) for the 1993 Congestion Management Program for Los Angeles County. SCAQMD is responsible for adopting, implementing, and enforcing air quality regulations in the South Coast Air Quality Management District, which includes the project location. As a responsible agency, SCAQMD reviews and analyzes environmental documents for projects that may generate significant adverse air quality impacts. In this capacity, SCAQMD advises lead agencies in addressing and mitigating the potential adverse air quality impacts caused by projects.

To assist the Lead Agency in the preparation of the air quality analysis for the EIR, the following is a summarization for evaluating air quality impacts.

Baseline Information: Describe the existing climate and air quality of the region and project site location.

Identify and quantify all project **Sources of Emissions**.

Compare and assess anticipated project emissions with the District's **Thresholds of Significance** and the existing air quality of the region and project location.

Identify and assess **Toxic Source Emissions** at the project location.

Assess **Cumulative Air Quality Impacts** from related projects.

Assess **Consistency of the Congestion Management Program** with the AQMP.

June 10, 1993

Identify and quantify **Project Alternatives** that may attain the goals of the project with substantially fewer or less significant impacts.

Identify **Mitigation Measures** necessary to reduce air quality impacts.

For additional information please refer to SCAQMD's CEQA Air Quality Handbook, 1993 Edition to assess and mitigate adverse air quality impacts.

SCAQMD has a prescribed role in the development and implementation of the CMP. In accordance with State CMP legislation (Section 65089.3(C)), SCAQMD is assigned the responsibility of establishing and periodically revising a list of improvements, programs, and actions which local agencies can select from to address CMP deficiencies. Legislation also requires the lead agency to consult with the District during the preparation of the CMP. In addition, if any trips are exempt from the modeling analysis, then consultation with the District is required.

All elements of the CMP should be consistent with the Air Quality Management Plan (AQMP). In particular, the CMP should be consistent with the growth forecast used in the AQMP and should implement all AQMP transportation control measures (TCMs). As you are aware, the deficiency plan of the CMP should include actions that go beyond AQMP programs and actions. This can be accomplished by accelerating AQMP TCMs and adopting more stringent TCMs than those identified in the AQMP or measures that are not identified in the AQMP. CMP legislation specifically states that deficiency plans must result in a significant benefit to air quality. District Staff has appreciated working with LACTC on developing a deficiency plan.

Upon completion of the Draft Environmental Impact Report, please forward two copies to:

Office of Planning & Rules
South Coast Air Quality Management District
21865 Copley Drive
P O Box 4939
Diamond Bar CA 91765-0939

Attn: Local Government - CEQA

If you have questions regarding the environmental analysis, please call me at (909) 396-3055. If you have questions regarding the review of the CMP or deficiency plan, please call Alene Taber at (909) 396-3057.

Sincerely,

Connie Day
Program Supervisor
Local Government - CEQA

Dear Ms. Morries:

Kendra,

Thank you for the opportunity to comment on the Notice of Preparation of a Draft Environmental Impact Report and Initial Study for the 1993 Congestion Management Program for Los Angeles County.

We have reviewed the Notice of Preparation and have no comments at this time. We appreciate the cooperative nature in which the CMP has been prepared and look forward to working with you in the future.

Sincerely,

Anton Bahlerbruch
Executive Assistant

SUBJECT: 1993 CMP - REVIEW OF NOTICE OF PREPARATION AND INITIAL STUDY

Dear Ms. Morries:

On behalf of the City of South Gate, I would like to thank you for providing us with the opportunity to review and comment on the Notice of Preparation and Initial Study prepared by the Los Angeles County Metropolitan Transportation Authority (MTA) for the 1993 Congestion Management Program for Los Angeles County.

At this time, we do not have any comments with respect to the initial study. We would appreciate the continued receipt of further environmental documentation during the processing of the Draft and Final Environmental Impact Reports once they become available. Should you have any further questions, please do not hesitate to contact me directly at (213) 563-9562.

Sincerely,

ANDREW G. PASMANT

*RE: Notice of Preparation of an Environmental Impact Report (EIR) and Initial Study
for the 1993 Los Angeles County Congestion Management Program*

Dear Ms. Morries:

The City of El Segundo has reviewed the Notice of Preparation of a Draft Environmental Impact Report and Initial Study for the 1993 Congestion Management Program (CMP) for Los Angeles County. We would like to thank you for offering us the opportunity to comment on the Draft EIR for the CMP and submit the following comments:

- In regards to the Deficiency Plan Component of the 1993 CMP, the Initial Study does not provide enough information or guidance on reporting and monitoring to the Los Angeles County Metropolitan Transportation Authority (LACMTA). We believe that the Deficiency Plan responsibilities and approach should be discussed at greater length in the Draft EIR.*
- Clearly, LACMTA recognizes that the CMP may have significant impacts on land use patterns and planning decisions of local governments. We are concerned that the 1993 CMP Land Use Analysis and mitigation requirements have not been adequately defined to allow full evaluation of the environmental impacts of the projects.*

We look forward to receiving the Draft Environmental Impact Report.

Sincerely,

Sara Mosleh

**Re: Notice of Preparation/Initial Study of a Draft Environmental Impact Report for
the 1993 Congestion Management Program**

Dear Kendra:

**Thank you for the opportunity to comment on the above mentioned document.
Please forward the DEIR as we would welcome the opportunity to review that as
well. Our specific comments are as follows:**

- 1. The use of a countywide fee should be explored as a project alternative and/or a mitigation strategy. At some point, the actual cost of mitigation strategies needs to be addressed, in addition to the proposed point system. Using an in-lieu fee will provide the opportunity to assemble adequate funds from multiple projects to implement regional improvements.**
- 2. As drafted, all new trips on the CMP Network are equal, regardless of whether or not the new trips are being added to deficient or free-flowing segments of the highway network. Projects that help improve the jobs/housing balance and/or shift trips to under utilized segments of the highway network should not be treated the same as projects that add trips to deficient highway segments.**
- 3. The document specifies that mitigation measures may not necessarily be linked to specific projects, and that mitigation can be used to affect existing activity rather than new development. This approach requires additional legal review and discussion, since the ability to condition a project requires a nexus between the project's impacts and the required mitigation.**

Thank you for the opportunity to comment. Please call Kevin Michel at (805) 255-4351 if you have any questions regarding our concerns.

Sincerely,

**Lynn M. Harris
Deputy City Manager
Community Development**

1993 CMP NOTICE OF PREPARATION COMMENTS

Dear Ms. Morries:

The City of Culver City appreciates the opportunity to comment on the Notice of Preparation (NOP) of a Draft Environmental Impact Report (EIR) on the 1993 Congestion Management Program (CMP) for Los Angeles County. Culver City has been an active participant in the CMP process. City staff has reviewed the NOP and the City has the following comments.

- o Tiering from Previous Programs and EIRs -- While we appreciate and encourage the tiering concept and understand its usefulness in this instance, the Draft EIR should be completed in such a way that the resulting document stands alone and is understandable to readers who may not have several years of experience with the CMP process. The CMP has evolved significantly in the past year. The quantification of impacts and credits and other vital components of the CMP are now available. It is important for the public to understand the refinements and changes that have occurred and the potential impacts of the program as is now exists. The changes are more profound than the addition of the deficiency plan to the CMP. Key passages from past RMP and CMP program documents, or their EIRs, and from the current NOP/Initial Study should be repeated or referenced in the EIR and provided in the appendices for this EIR. In no instances should local or regional potential impacts discussed in subsequent project-specific (i.e., CIP project) EIRs address issues which were not identified as potential impacts in the 1993 CMP EIR, which is intended to serve as the master tiering environmental document.

Ms. Kendra Morris, Land Use Project Manager

Page 2

June 23, 1993

At minimum, the complete set of CMP mitigation measures should be provided in the EIR. The existing and proposed measures could be separated for clarity. As discussed below, the RMP and 1992 CMP EIRs do not provide comprehensive impact analysis for several environmental issues. Additional analysis in the 1993 CMP EIR will be required. The 1993 CMP EIR and the guidelines together should provide a complete picture of the requirements and goals of the CMP.

- o Supplements to the CMP – The CMP NOP (Page 5) indicates that a brief supplement to the CMP guidelines for analysis of longer range and more generalized development programs will be forthcoming. In our discussions with MTA staff, we have learned that the supplement will be incorporated into the CMP Draft EIR. Standard practice throughout the CMP process has allowed interested parties to review proposed revisions and additions to the CMP guidelines prior to including them. The CMP EIR will also consider the addition of La Cienega Boulevard, from I-10 (Santa Monica Freeway) to I-405 (San Diego Freeway). This addition needs to be reviewed and analyzed. At this point, it appears that timing for the EIR may not allow this type of preliminary review, or that the review of the supplement and network change with the Draft EIR will occur concurrently. In the past, the LACMTA (or its predecessors) has asked that comments on the program be submitted separately from comments on the EIR itself. We therefore reserve the right to comment on the supplement as part of the EIR. We will make our comment separately during the EIR review period if requested.
- o Benefits as Well as Impacts Should be Discussed – The initial study indicates no potential impacts for Water (III.e), and provides a summary of impact discussion and mitigation from the 1992 CMP EIR. It should be emphasized in the EIR, as mentioned in the Initial Study, that the levels of pollution deposited on roadways for eventual transport to the storm drain system would vary with the number and length of trips made on these facilities. The CMP encourages fewer trips or reduced length trips. The potential benefit in terms of potentially improved water quality should be discussed in the EIR. Similarly, other environmental benefits of implementation of the CMP should be discussed in the EIR, as was in the RMP EIR (Page 152).

Ms. Kendra Morries, Land Use Project Manager

Page 3

June 23, 1993

- o Impacts not Identified in the Initial Study Should be Discussed -- Potential impacts in the form of traffic hazards to motor vehicles, bicyclists or pedestrians should be discussed as a potential impact. The initial study states that the 1993 CMP does not contain any element that would increase traffic hazards. It is conceivable that lane reconfigurations or restriping, signal timings, and other changes could create traffic hazards, particularly for pedestrians and bicyclists. This is a potential impact that should have been checked "maybe" in the initial study. Discussion of potential impacts should not be discounted in the CMP EIR since this EIR will be used for tiering project-specific projects under the CMP that may have traffic hazard impact potential. The EIR should discuss this impact potential.

The CMP encourages the use of alternative fuel and zero-emission (electric) vehicles. These could potentially impact power or natural gas utilities. Items XVI.a and XVI.b should have been checked "maybe" and the EIR should discuss potential impacts from increased use of alternative fuel and zero-emission vehicles on energy utilities.

The RMP EIR only discussed the energy impacts of Amtrak trains in terms of passenger rail transit. Although transit improvements that have come on line since 1988, such as the MetroRail Red and Blue lines, do not consume fuel, they should be considered for potential energy conservation issues. This issue was not raised in the 1992 CMP EIR.

Similarly, the CMP encourages telecommuting. The potential impact on communications systems should be discussed. The impact of fax machines, cellular networks, and other devices on communication systems in recent years has been tremendous. The number of area codes now serving Los Angeles County is ample evidence of this impact. Telecommuting from home or from satellite telecommuting centers in suburban areas has the potential to continue to impact communication systems. This impact should be discussed in the EIR.

The potential for CMP roadway improvements to create aesthetic impacts should be discussed in the EIR. Grade-separated crossings, for instance, could create aesthetic impacts and block views. Culver City commented about the need for adequate aesthetic impact analysis during preparation of the 1992 CMP EIR.

Ms. Kendra Morries, Land Use Project Manager

Page 4

June 23, 1993

Fiscal impacts on businesses has not been adequately addressed in the two previous EIRs from which the 1993 CMP EIR will be tiered. Discussion focused on business relocations, employment growth, access to employment areas, and other issues, but did not discuss the fiscal impact on adjacent businesses in terms of lost on-street parking resulting from roadway widenings and restripings. The urban design quality and aesthetics for sustaining and attracting businesses along CMP roadways may negatively affected by street widenings, and needs to be addressed in the CMP EIR.

Cultural resources that have yet to be discovered are protected by mitigation measures provided in the State CEQA Guidelines in Appendix K. Since the CMP may involve disturbing cultural resources to complete facilities, the potential for impacts should be identified in the CMP EIR. Subsequent project-specific EIRs should also discuss this potential impact even if cultural resource inventories do not anticipate a likelihood of impacting cultural resources. Appendix K provides mitigation measures in the event unanticipated or previously unidentified cultural resources are discovered during construction.

- o Growth Inducement -- The 1992 CMP EIR states that the potential of the CMP to foster urban deconcentration is negligible. Specifically, the EIR states that "in order to avoid congested areas, and any costs associated with developing in areas subject to deficiency plans, developers may prefer to initiate new projects in relatively uncongested areas. Therefore, the CMP may provide an additional incentive for growth in outlying areas . . . This impact is considered minor, when compared to existing incentive to locate new development in less congested areas" (1992 CMP EIR, Page 145). While it might be argued that other forces, such as land prices and housing affordability, are the major contributors to urban sprawl, the impact of the CMP to encourage growth in outlying areas should not be discounted.

The avoidance of mitigation measures for congestion for initial development in an area, depending on future "last one on the block" developments for mitigation is a tradition in this region that has led to the congestion problems the CMP was created to address. The potential for improved travel time to encourage longer commutes should be an integral part of the impact discussion in the CMP EIR. The relationships between regional land use control, growth management and the underlying reasons for traffic congestion should also be thoroughly discussed in the CMP EIR.

Ms. Kendra Morris, Land Use Project Manager

Page 5

June 23, 1993

The RMP EIR stated that the RMP did not create an inducement to growth, it redistributes population and employment growth to achieve better job/housing balance within each subregion (RMP EIR, Page 157). The CMP EIR, on the other hand, states that the CMP is not anticipated to affect the distribution of population and employment at the SCAG subregional level (1992 CMP EIR, Page 44). While the argument that the CMP is not likely to induce regional population growth makes sense, the CMP has the potential to greatly impact the distribution of population and employment within the region. The impact on subregions and local jurisdictions could be significant. Since it is unlikely that the project-specific EIRs for CIP projects will consider subregional impact potential, these impacts should be considered in the 1993 CMP EIR. As Culver City has commented on the 1992 CMP EIR, the discussion on growth inducement potential needs on a subregional or local level, if not regional, and must be supported by recent data and supportable analysis.

- o Regional Centers – The development of regional centers linked by transit is encouraged in the CMP. However, the establishment of regional centers in jurisdictions other than the City of Los Angeles and County of Los Angeles requires intergovernmental coordination, perhaps even Memoranda of Understanding or Joint Powers Agreements. Culver City has commented on this issue for the 1992 CMP EIR.

Local jurisdictions do not want to allow increased density around transit centers until development of the transit system and transit center are guaranteed. Allowing the increased density, only to see the transit improvements not come to fruition has created some of the most congested areas in the region. The offset of localized "hot spot" impacts to regional air emission reductions has been documented in the 1992 CMP EIR (1993 CMP Initial Study, Page 19). The relationship of local land use policy decisions to create regional centers in association and coordination with regional transit facilities should be discussed in the 1993 CMP EIR.

The localized impacts of concentrating development at transit centers has been briefly discussed in the previous EIRs. The RMP EIR did not consider impacts to regional centers in the Urban Form and Growth analysis section. Centers were listed on Page 134 and discussed in terms of county employment growth as part of the regional economy analysis (RMP EIR, Page 138). The 1992 CMP EIR states that individual CIP projects may result in localized adverse traffic impacts, which will be addressed in future project-specific EIRs (1992 CMP EIR, Page 60).

Ms. Kendra Morris, Land Use Project Manager

Page 6

June 23, 1993

Since the CMP network has been developed to include the major highways and roadways that are currently experiencing congestion, it is logical to assume that the transit centers designated through the CMP process will also be on or near CMP roadways. Concentrated development densities of the intensity and scale considered in the CMP will create additional impacts on these already congested roadways. Even if the capture rate for commuter trips is high for development around these transit centers, the addition of trips by those coming to and leaving the regional centers each day plus daily local trips by transit center residents and employees outside the transit center will add significant numbers of local trips to the already congested local traffic system. Thereby, even though the transit center will facilitate regional mobility, the density of the transit centers will actually increase local congestion and limit local mobility. This impact has been vaguely referenced in previous EIRs and needs to be completely analyzed in the 1993 CMP EIR, as well as future project-specific EIRs. The CMP EIR cannot ignore this potential impact, or defer the basic analysis to future project EIRs, where the impact potential will be fragmented.

In order to analyze the potential impact the CMP EIR should consider the level of concentrated development at a transit center and identify the associated impacts of that increased development. The analysis of traffic impacts alone is not sufficient. The impact on existing infrastructure, such as water and sewer lines (conveyance and treatment capacity), emergency services [the ability to provide service to the transit center and system, not just get around town as discussed in the 1992 CMP EIR (Page 139)], and other public services and utilities, must be discussed as potential impacts of the policies of the CMP itself in the 1993 CMP EIR. Detailed discussion can be provided in CIP project EIRs as these projects relate to specific localized conditions for individual projects.

The real world intensity and potential impacts of the development required to support the transit centers has not been fully considered in any of the previous environmental analysis. We would urge you to review the work recently completed by the UCLA Graduate School of Architecture and Urban Planning under Professor Jurg Lang, to understand potential impacts of regional center development concentration. Those studies of the Exposition Right-of-Way may further assist in the preparation of the 1993 CMP EIR.

Ms. Kendra Morris, Land Use Project Manager

COMMENTS ON THE CONGESTION MANAGEMENT PROGRAM (CMP) NOTICE OF PREPARATION (NOP) OF A DRAFT ENVIRONMENTAL IMPACT REPORT (DEIR) AND INITIAL STUDY

The Department of Transportation, with the assistance of other City departments, has reviewed the NOP prepared for the CMP and submits the following comments:

1. **GENERAL COMMENTS** - The 1993 DEIR should not be a reiteration of the CMP, but rather should examine, quantify, and adequately analyze the potential environmental impacts of the CMP.
2. **DEFICIENCY PLAN** - All provisions of the CMP Deficiency Plan, particularly the valuation of mitigation strategies (which is not yet complete), must be considered in the EIR analysis. This is a significant element of the CMP and any analysis that fails to include it would be inadequate.

As identified on page 5, subsection 5 (Proposed 1993 CMP Update, Deficiency Plan procedures), the 1993 CMP will include a provision for Deficiency Plan procedures. As such, the EIR should discuss the potential impacts of implementing the mitigation strategies as required by the Deficiency Plan. Since the mitigation strategies have not yet been determined, or at least agreed upon, all potential mitigation alternatives must be discussed in the EIR.

3. **SOCIO-ECONOMIC IMPACTS** - Under the California Environmental Quality Act (CEQA), the economic and social impacts of a project, as they relate to physical changes in the environment, must be addressed. Socio-economic analysis of the CMP seems appropriate given the potential for large scale changes in the regional transportation network and land use patterns. A comprehensive analysis of the impacts on jobs and business is necessary. The CMP, particularly the Capital

Improvement Program (CIP) projects, will result in a large number of physical changes, yet no socio-economic analysis is presented. The Department of Transportation recommends that the EIR include a discussion of, and provide mitigation for, these cumulative impacts. In particular, attention should be paid to the CMP's potential to affect the supply of housing; its potential to disrupt the structure of communities; its impact on local governments' provision of public services; its possible effects on population, household income, and employment opportunities; and its potential economic impacts on the business and development community.

The DEIR should evaluate how the CMP will benefit the mobility of all economic groups. Data should be included which will illustrate how the trip needs of commuters from low income inner city communities will be accommodated as effectively as suburban commuters.

4. **DECONCENTRATION/LAND USE** - The City of Los Angeles' Centers Concept has a central goal of citywide congestion reduction, linking new development with transportation systems. This is also the objective governing the MTA in its development of the Joint Land-use Transportation Policy, developed in conjunction with the City. If the CMP results in urban deconcentration, it would be in direct conflict with our mutual objectives of jobs/housing balance and densification at transit stations. Such deconcentration will reduce housing opportunities for city workers, increase commuting distances, increase Vehicle Miles of Travel (VMT), add to the deterioration of air quality, and create development pressure on open space and sensitive ecological areas. The EIR needs to better address the above issues, including the Centers Concept.

The CMP might significantly alter the land use in the region; thus, the DEIR should contain discussion of the CMP's effect on density, distribution, growth rate, or relocation of population.

The NOP should provide an adequate analysis of the CMP's impacts on deconcentration. The EIR must fully analyze and address the CMP's impacts, particularly its relationship to land use. Moreover, the EIR should discuss the CMP's effect on the long-term goals of improving the region's jobs/housing balance and reducing VMT as outlined in the Regional Mobility Plan (RMP) and General Mobility Plan (GMP).

The 1992 DEIR stated that land use impacts associated with the CMP would include potential community disruption and displacements, changes in community character, and community revitalization effects (page 45, 1992 DEIR). It is further reported that various classes of CMP CIP projects could lead

to the localized displacement of adjacent business and residences. These issues warrant a study of the effects on population, employment, and housing in the 1993 CMP EIR.

5. **CONSTRUCTION IMPACTS** - The 1992 DEIR indicated that the RMP EIR requires the use of construction techniques that minimize disruption effects (on the surrounding community) as a mitigation measure; these construction techniques should be clearly stated in the 1993 EIR.

The impact of noise is listed as "no." This should be changed to "maybe" and the impact of noise during construction should be addressed.

6. **VEHICLE MILES TRAVELED** - The CMP's use of Level of Service (LOS) standards as the principal measurement of congestion does not account for density shifts and the location of development, including residential construction near job centers, transit stations, and urban centers. While concentrating development around centers and transit stations may increase specific area congestion as measured by LOS, it will reduce VMT citywide. Accordingly, the City of Los Angeles recommends the consideration of VMT as an additional measure of countywide congestion. An analysis of vehicle miles reduced from these policies should also be included. This additional gauge will measure whether or not deconcentration occurs with implementation of the CMP. Deconcentrating effects of the CMP should be offset or mitigated.
7. **LINKAGE WITH RMP** - The Southern California Association of Governments (SCAG) is preparing an update to the RMP, a Regional Mobility Element (RME), as part of the Regional Comprehensive Plan. The TDM population, housing, and employment assumptions, in the new RME appear to be substantially different from those used in the 1988 RMP. We urge the MTA to use the updated population, employment, and TDM assumptions in the 1993 RMP.
8. **CUMULATIVE IMPACTS** - The DEIR fails to adequately address the potential cumulative impacts of the CMP. Consideration of the project's long-term cumulative impacts, that might otherwise be slighted in a case-by-case analysis, is one of the primary purposes for preparing a Program EIR.
9. **AIR QUALITY** - The NOP lists four potential direct impacts of the 1993 CMP that were not covered in the 1992 CMP EIR. In addition to the impacts listed, the construction and/or operation of CIP projects that add general traffic lanes to freeways or highways could encourage additional vehicle trips on the affected roadways by providing additional capacity

(latent demand). Public transit and/or rideshare trips could be encouraged to change back to single occupant vehicle trips if general traffic commute times decrease on the affected roadways. This potential impact must be analyzed, and mitigation measures required, in the air quality section of the DEIR. In mitigation measure C.1, construction phase emissions and criteria pollutant concentrations should be compared to SCAQMD quarterly, as well as daily, emission thresholds. (See 1993 SCAQMD CEQA handbook, Chapter 9.)

The NOP discusses the indirect impacts of the Deficiency Plan requirement resulting in the changes in land use and states that this impact will be assessed in the 1993 CMP EIR. Since this analysis has not yet taken place, it is premature to state that Mitigation Measure C.3 would be sufficient to address this indirect impact. In the 1993 CMP EIR, additional mitigation measures must be considered to mitigate this impact.

Mitigation Measure C.4, proposed by the 1992 EIR to mitigate potential "hot spots" created by CMP-related improvements, assumes that regional emission reductions would represent a trade-off with new, localized hot spots. Rather, the 1993 DEIR should require mitigation measures to reduce the creation of new hot spots. This impact, and recommended mitigation, should be addressed in the 1993 EIR.

10. **HOUSING AND POPULATION** - The analysis under the housing and population sections of the DEIR should include an analysis of the potential increase in housing demand, and therefore population, in outlying areas (if deconcentration results from CMP projects) as well as increases in housing demand and population in central and transit areas if concentration results.

The NOP states that the 1992 EIR did not contain an analysis of utilities impacts since the RMP was formulated in conjunction with the Regional Growth Management Plan (GMP). If this EIR will rely on the analysis in the GMP EIR for utilities impacts, the GMP EIR should be incorporated by reference.

11. **MOVEMENT OF GOODS** - The movement of goods is vital to the economic health of the region yet is virtually ignored in the CMP. Providing efficient access to LAX and the Port of Los Angeles is critical to maintaining a healthy standard of living in Southern California.

The CMP does not consider the special mobility issues related to trucks and goods movement. Trucks have two major impacts on the County's highway system:

- a. Trucks are not as easy to maneuver as cars. The bigger the truck, and the more trailers it carries, the more highway capacity it uses up. Trucks require more highway capacity, especially in heavy traffic, and can hold up traffic significantly when making turns at intersections and driveways.
- b. Truck accidents can cause a great deal more congestion than cars. One truck accident can close a highway for several hours. Also, accidents involving trucks transporting hazardous waste can close an entire area for hours.

While trucks make deliveries throughout the County, certain parts of the County (such as the cities of Commerce and Vernon), including portions of the City of Los Angeles (e.g., the Port, Union Station, and the Alameda Corridor), are major generators of truck traffic. The EIR should quantify the extent of truck traffic in the County, consider the specific problems created by them, and determine ways to mitigate them.

Additionally, the CMP should look into monitoring truck traffic and, with the help of local jurisdictions, find ways to reduce truck traffic and alleviate their impacts.

- 12. REGIONALLY SIGNIFICANT PUBLIC FACILITIES** - The CMP does not adequately deal with trips generated by regionally significant public facilities such as major airports and harbors. Los Angeles International Airport and the Port of Los Angeles are unique public facilities that serve the entire Southern California region. Additionally, the City of Los Angeles itself is a business center that serves the Southern California region, thus attracting trips from outside the County. As such, an impact analysis should be included for these public facilities that includes the impact of trips generated from outside the County of Los Angeles.

Thank you for the opportunity to respond to the CMP NOP. If you have any questions, feel free to call Sami Wassef, of my staff, at (213) 237-2873.

APPENDIX D
SCAG CONSISTENCY CRITERIA

Final
April 4, 1991

Southern California Association of Governments'
Regional Consistency and Compatibility Criteria for CMPs

Changes to the Government Code, enacted with the passage of Proposition 111 in June 1990, require SCAG to perform the following evaluations for the Congestion Management Programs (CMPs) developed within the region:

- o consistency between the countywide model/databases and SCAG's regional model and databases;
- o consistency with the regional transportation plans;
- o compatibility with the other CMPs developed within the region; and
- o incorporation of the CMP into the Regional Transportation Improvement Program (RTIP) and the action element of the regional transportation plan, SCAG's Regional Mobility Plan or RMP.

According to the California Government Code, Section 11349, "consistency means being in harmony with, and not in conflict with or contradictory to, existing statutes, court decisions, or other provisions of law". For purposes of this document, consistency would be applied as it relates to the regional transportation plans and the regional model and databases.

This document outlines the process and criteria that will be used in making these evaluations. This is a "working" document which may be updated periodically to address issues as they arise and in response to various State and federal mandates.

THE EVALUATION PROCESS

The CMP must be evaluated to determine that it is consistent with the Regional Mobility Plan (RMP). Since the RMP incorporates elements of the the Regional Growth Management Plan (GMP) and the Air Quality Management Plans (AQMPs) for each air basin in the region, these elements must also be included in this evaluation.

It should be noted that this process needs to acknowledge the air quality conformity requirements for the RTIP. Each county transportation commission is responsible for evaluating their respective county TIP using the appropriate conformity procedures for projects, programs and plans. SCAG, as the designated metropolitan planning organization (MPO), is responsible for the full conformity finding on the RTIP.

The evaluation consists of three parts:

Part 1: The CMP must be consistent with the actions and programs pertaining to growth management, transportation demand management, transportation systems management, and facilities development contained in the RMP and the appropriate AQMP.

Note: In the case that the Congestion Management Agency (CMA) is not an implementing agency¹ for an RMP action, the following apply:

- 1) CMP guidelines must support and encourage adoption of these measures by the appropriate agencies, and
- 2) the CMP database/modeling must be consistent with SCAG's regional model and database (see Part 2).

Part 2: The CMP must demonstrate progress toward the regional mobility targets contained in the RMP. To satisfy this requirement, the countywide modeling for the CMP must be consistent with SCAG's CMP planning horizon forecasts for the following indicators:

- a. Vehicle miles of travel, average trip length, and vehicle hours of travel must be maintained or reduced.
- b. Transit trips and average vehicle occupancy must be maintained or increased.
- c. Total person trips and total vehicle trips both within and between counties.

These CMP planning horizon targets will be developed by SCAG cooperatively with the CMAs and other interested agencies and will incorporate other applicable State and federal requirements. If a discrepancy is identified between SCAG's forecast for the CMP planning horizon and the forecast provided by the CMA, SCAG's Regional Modeling Task Force and Regional Information Task Force will be consulted regarding the reason for the discrepancy. Task force recommendations will be integrated into the consistency evaluation provided to SCAG's policy committees and Executive Committee for approval.

1. "Implementing Agency", as applied in this context, refers to the agency identified in the Regional Mobility Plan or the appropriate AQMP as having a role in an action or measure contained in these plans, including planning, programming, administration, finance, construction, operation, maintenance, or monitoring.

The CMAs may rely on travel demand forecasts produced by SCAG to develop the CMP. The following criteria apply when a separate model run and/or database are used to develop the CMP and evaluate traffic impacts of land use decisions on the CMP highway system:

Database

The CMA must cooperatively develop the CMP planning horizon forecasts of population, housing and employment with local jurisdictions. These forecasts must be consistent with local General Plans. SCAG will evaluate the CMA forecast for consistency. Staff recommendations to align the forecasts will need the approval of SCAG's policy committees and ultimately the Executive Committee. If necessary, a process for reconciling the databases will be undertaken between SCAG staff and staff representatives of the CMA and will produce a forecast that will be the basis of planning applications for both SCAG and the CMA.

Modeling

The CMA must participate in an on-going regional model and database program through SCAG's Regional Information Task Force and SCAG's Regional Modeling Task Force. This program is designed to improve consistency between regional and county-level model development in the region. To support this cooperative process, the CMA must meet the following requirements:

- a. The CMP planning horizon must be consistent with that agreed upon within the region.
- b. CMP traffic analysis zones must be compatible with census tracts or SCAG's traffic analysis zones.
- c. The CMP model must produce, at a minimum, a vehicle trip production and attraction table by at least three trip types (home-based work, home-based nonwork, and nonhome-based).
- d. The CMP modeling network must contain, at a minimum, the SCAG's System of Regional Significance which is contained in the RMP.

Part 3: To ensure compatibility between the CMPs within the region in evaluating the impacts of land use decisions on the CMP highway system and for monitoring level of service, the CMP must meet the following requirements:

- a. The CMP transportation system must connect to the system designated in (the) adjacent county(y).
- b. Traffic level of service must be assessed using either Circular 212, the 1985 Highway Capacity Manual or a method that SCAG has found consistent with the 1985 Highway Capacity Manual.

RMP AMENDMENTS

Because the CMP process is intended to provide greater detail in the short-range action element of the RMP, differences may arise. The RMP amendment process² provides some flexibility to the CMAs in addressing the CMP requirements. This process would be used to evaluate a project or a program to determine whether the project or program is a refinement, i.e. an addendum, to the RMP, or would be treated as an RMP amendment. Before an RMP amendment can be adopted by SCAG, the project or program must satisfy these requirements.

APPENDIX E
DEFICIENCY PLAN CREDITS AND DEBITS

**Appendix E
Table E-1**

Deficiency Plan Debit Values

LAND USE CATEGORY	DEBIT VALUE
1 Single Family Residential	6.80 per Dwelling Unit
2 Multi-Family Residential	4.76 per Dwelling Unit
3 Group Quarters	1.98 per Bed
4.1 Commercial (less than 300,000 gsf)	22.23 per 1000 sq.ft.
4.2 Commercial (300,000 gsf or more)	17.80 per 1000 sq.ft.
5 Freestanding Eating & Drinking	66.99 per 1000 sq.ft.
6 Lodging	7.21 per 1000 sq.ft.
7 Industrial	6.08 per 1000 sq.ft.
8.1 Office (less than 50,000 gsf)	16.16 per 1000 sq.ft.
8.2 Office (50,000-299,999 gsf)	10.50 per 1000 sq.ft.
8.3 Office (300,000 gsf or more)	7.35 per 1000 sq.ft.
9 Medical	16.90 per 1000 sq.ft.
10 Government	20.95 per 1000 sq.ft.
11 Institutional/Educational	7.68 per 1000 sq.ft.
12 Other	0.71 per Daily Trip

APPENDIX G

**MITIGATION MONITORING PROGRAM
FOR THE CONGESTION MANAGEMENT PROGRAM**

Los Angeles County Metropolitan Transportation Authority

**Congestion Management Program
Environmental Impact Report**

Mitigation Monitoring Program

**MITIGATION MONITORING PROGRAM
FOR THE LOS ANGELES COUNTY CONGESTION MANAGEMENT PROGRAM**

The mitigation monitoring program summarized herein constitutes an amendment to the 1992 CMP mitigation monitoring program to add the additional mitigation measures included in the 1993 CMP EIR. All mitigation measures identified in the 1993 and 1992 CMP EIRs are included, but are identified separately. These mitigation measures shall be considered parts of a single program and shall be reported on together in the biennial reports prepared by MTA.

1993 CMP

Description of Impacts	Mitigation Measures	Implementing Party	(A) Monitoring Agency (B) Monitoring Phase (C) Implementation Completed?
AIR QUALITY			
<p><u>Direct Impact:</u> There may be localized adverse effects, including the effects of facility construction, realignment of facilities near sensitive uses, and the creation of "hot spots" near transit centers/stations and/or park-and-ride lots. These are highly localized adverse impacts of otherwise beneficial improvements.</p>	<p><u>3.3.1</u> The MTA will develop its Tool Box in consultation with SCAG and the SCAQMD to ensure air quality goals are addressed.</p>	MTA	<p>(A) MTA (B) Biennial report (C) No</p>
LAND USE			
<p><u>Indirect Impact:</u> The proposed project will not systematically result in a land use pattern which is substantially different than the adopted regional forecast or which is systematically different than market patterns.</p>	<p><u>3.5.3</u> In order to ensure that the CMP is contributing to achieving the objectives of the GMP, the MTA shall evaluate the growth patterns and determine whether CMP Tool Box choices have a significant correlation to the changes in land use patterns in the County, if any, after the Deficiency Plan Program has been in place for five years.</p>	MTA	<p>(A) MTA (B) Five years after implementation as part of 1999 biennial report (C) No</p>
PUBLIC SERVICES			
<p><u>Direct Impact:</u> There appears to be sufficient funding mechanisms and mitigation options available for local jurisdictions to meet their deficiency mitigation obligations while avoiding the use of general funds or diversion of funds from the provision of other public services.</p>	<p><u>3.6.1</u> The MTA shall continue to work on both the state and regional levels to integrate CMP deficiency plan reporting requirements with the reporting requirements associated with the AQMP in order to reduce the administrative effort required by local jurisdictions.</p> <p><u>3.6.2</u> The MTA shall allow local jurisdictions to carry over from year to year any surplus credit points accumulated.</p> <p><u>3.6.3</u> The MTA, as part of the biennial updates to the CMP, shall investigate adding additional measures to the Tool Box.</p>	<p style="text-align: center;">MTA</p> <p style="text-align: center;">MTA</p> <p style="text-align: center;">MTA</p>	<p>(A) MTA (B) Biennial report (C) No</p> <p>(A) MTA (B) Biennial report (C) Yes</p> <p>(A) MTA (B) Biennial report (C) No</p>

1992 CMP

Description of Impacts	Mitigation Measures	Implementing Party	(A) Monitoring Agency (B) Monitoring Phase (C) Implementation Completed?
LAND USE			
<p><u>Direct Impact:</u> Individual CMP projects may result in localized changes in land use.</p> <p><u>Indirect Impact:</u> Should implementation of the CMP result in increased urban deconcentration or concentration or expansion development in outlying areas, which has not been anticipated in the regional plans, the CMP could have a negative effect on land use.</p> <p><u>Indirect Impact:</u> Increasing system capacity may encourage additional trips (latent demand) on the system, by reducing the costs (time and stress) associated with trip making.</p> <p><u>Direct Impact:</u> The following classes of CMP CIP projects could lead to the localized displacement of adjacent businesses and residences: Class 1 - freeway system management, specifically the construction of HOV lanes; Class 2 - freeway gap closures; Class 6 - rail improvements; Class 4 - commuter rail stations, transit centers and park-n-ride lots; and, to a more limited degree, Class 3 - arterial system improvements. Of the 1992 CIP projects, Class 2 and 3 projects present the greatest potential for disruption.</p> <p><u>Indirect Impact:</u> The CMP's TDM component may result in increased density in the vicinity of transit centers and rail facilities. This would be supportive of the transit center development goals of a number of local jurisdictions.</p>	<p><u>A.1</u> MTA shall consult with other adjacent CMAs in reviewing LOS standards to ensure that differences in LOS standards between counties do not encourage a land use pattern which is inconsistent with local land use or regional goals.</p> <p><u>A.2</u> MTA shall participate in ongoing forums, regarding interjurisdictional impacts including land use issues and impact analysis procedures.</p> <p><u>A.3</u> MTA shall investigate the use of other mobility and system performance indices such as vehicle ridership and shall compare the effectiveness of such indices with LOS as standards for determining both system mobility and motor vehicle emissions performance. These supplemental measures shall be incorporated into the program if determined to be effective for reconciling localized decreases in service against regional improvements.</p> <p><u>A.4</u> MTA shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project-level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the land use impacts of individual CMP CIP projects. As part of the review, the MTA may comment on the adequacy of the analysis and mitigations.</p> <p><u>A.5</u> MTA shall explore with the cities the desirability of including mechanisms in the CMP for encouraging the creation of increased density in targeted centers areas. Possible mechanisms include specification of density related CIP project selection criteria; inclusion of density encouraging mechanisms in the TDM component of the CMP; or inclusion of mechanisms to encourage targeted density development as a component of future deficiency planning.</p>	<p>MTA</p> <p>MTA</p> <p>MTA</p> <p>MTA</p> <p>MTA</p>	<p>(A) MTA (B) Biennial report (C) No</p> <p>(A) MTA (B) Biennial report (C) No</p> <p>(A) MTA (B) Biennial report (C) No</p> <p>(A) MTA (B) Biennial report (C) No</p> <p>(A) MTA (B) Biennial report (C) Yes</p>

-G4-

Description of Impacts	Mitigation Measures	Implementing Party	(A) Monitoring Agency (B) Monitoring Phase (C) Implementation Completed?
TRANSPORTATION			
<p><u>Direct Impact:</u> Any potential impacts of the highway and roadway element of the CMP are likely to be related to the implementation of the specific CIP Improvement projects within the framework of the CMP process. CIP projects will help to maintain LOS.</p> <p>Traffic may be rerouted during the construction of a particular facility. It is possible that the implementation of a transportation improvement project may cause traffic to be diverted into or through sensitive areas, including residential neighborhoods, creating localized noise or air quality impacts.</p> <p><u>Direct Impact:</u> Should implementation of the CMP result in increased urban deconcentration, or concentration or expansion of development in outlying areas, which has not been anticipated in the regional plans, the CMP could have a negative effect on the transportation system by increasing vehicle miles traveled. The potential for the CMP to reinforce urban deconcentration is discussed in detail as part of the growth inducing impacts analysis contained in Chapter IV - Impact Overview, where it is concluded that the potential of the CMP to foster urban deconcentration is negligible.</p>	<p>Mitigation measure A.4 would mitigate the direct effects of the CIP element of the CMP.</p> <p><u>B.1</u> MTA shall review EIRs for CIP projects to ensure that mitigation measures are included requiring that the Lead Agency give transit operators and affected City Departments of Transportation advanced notice of construction activities which might impact the transportation system.</p> <p>Mitigation Measures A.1 - A.3 would mitigate the indirect effects of the CIP element of the CMP; mitigation measures A.1, A.3, and B.1 would mitigate the indirect effects of the CMP Highway and Roadway System element.</p>	<p style="text-align: center;">—</p> <p style="text-align: center;">MTA</p> <p style="text-align: center;">—</p>	<p style="text-align: center;">—</p> <p style="text-align: center;">(A) MTA (B) Biennial report (C) No</p> <p style="text-align: center;">—</p>

Description of Impacts	Mitigation Measures	Implementing Party	(A) Monitoring Agency (B) Monitoring Phase (C) Implementation Completed?
NOISE			
<p><u>Direct Impacts:</u> Noise from the construction of CIP projects may be disruptive. Circumstances where noise conditions may increase and adverse impacts may result include the following:</p> <ul style="list-style-type: none"> • Construction of new routes or freeway gap closures through sensitive residential areas. • Widening of facilities on the existing CMP highway network that would bring travel lanes and mobile noise sources closer to sensitive adjacent land use receptors. • Construction of elevated HOV lanes or elevated rail transit within or adjacent to facilities passing through residential areas or adjacent to sensitive land uses. <p>Operational improvements on the CMP network that would increase traffic speed and flow that may incrementally increase noise levels.</p> <p>Increase in the frequency of transit service (bus and/or rail) would increase Community Noise Equivalent Levels (CNEL).</p> <p>New transit alignments or the construction of new elevated transit facilities would increase ambient noise levels.</p> <p>New transit stations may cause an increase in mobile and stationary levels for adjacent land uses.</p> <p>New park-and-ride locations may cause an increase in mobile noise levels for adjacent land uses as a result of a significant increase in vehicle trips to the area. Stationary noise levels may also increase as a result of the construction of parking structures with ventilation systems or from parking areas where sounds such as engine run-ups, door slams, car alarms, etc. would be more common.</p>	<p><u>D.1</u> MTA shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project-level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the noise impacts of individual CMP CIP projects. As part of the review, the MTA may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas in the EIR:</p> <ul style="list-style-type: none"> • preparation in accordance with applicable local and state guidelines (FHWA FHMP 773, State Office of Noise Control, local noise ordinance and general plan noise element, etc.) • demonstration that all significant noise impacts have been mitigated in a manner consistent with the provisions of applicable local ordinances, as well as state and federal guidelines. 	<p>MTA</p>	<p>(A) MTA (B) Biennial report (C) No</p>

Description of Impacts	Mitigation Measures	Implementing Party	(A) Monitoring Agency (B) Monitoring Phase (C) Implementation Completed?
<p><u>Indirect Effects:</u> Should implementation of the CMP result in increased urban deconcentration, or concentration or expansion of development in outlying areas, which has not been anticipated in the regional plans, the CMP could have a negative effect on noise by increasing traffic in areas with relatively low background noise levels. The potential for the CMP to reinforce urban deconcentration is discussed in detail as part of the growth inducing impact analysis contained in Chapter IV - Impact Overview, where it is concluded that the potential of the CMP to foster urban deconcentration is negligible. Also a possibility is that CMP-related improvements could increase the density of trips and traffic center areas, such as near transportation centers, rail transit stations, park-and-ride lots, etc. In these cases, the noise effect of the CMP could concentrate an increase in both mobile and stationary noise levels in the immediate vicinity of these new facilities.</p>	<p>Mitigation measure C.3 addresses indirect noise impacts.</p>	<p>—</p>	<p>— — —</p>

Description of Impacts	Mitigation Measures	Implementing Party	(A) Monitoring Agency (B) Monitoring Phase (C) Implementation Completed?
GEOLOGY			
<p>Direct Effects: Construction of CIP projects could result in the following geotechnical impacts: construction related erosion; increased risk of slope failures, mudslides, and rock falls; a limited potential for subsidence or soil-related impacts; and seismic risks.</p>	<p>E.1 MTA shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project-level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the geological impacts of individual CMP CIP projects. As part of the review, the MTA may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency address, as appropriate, the following issue areas in the EIR:</p> <ul style="list-style-type: none"> • preparation in accordance with applicable local and state guidelines (Caltrans, Division of Mines and Geology, local ordinances). • adequate geotechnical investigations regarding grading, slope stability, seismic hazards, potential ground acceleration. • the appropriate level of coordination with the State Division of Mines and Geology and identify specific mitigation measures to be implemented. • are designed in accordance with County and local code requirements for seismic ground shaking with special attention to the seismic design of bridges, elevated structures and tunnels. • demonstrate that all significant geotechnical factors have been mitigated in manner consistent with the provisions of sound engineering practice and applicable local ordinances. 		

-G10-

Description of Impacts	Mitigation Measures	Implementing Party	(A) Monitoring Agency (B) Monitoring Phase (C) Implementation Completed?
<p>Indirect Effects: Should implementation of the CMP result in increased urban deconcentration, or concentration, or expansion of development in outlying areas, in closer proximity to active faults which has not been anticipated in the regional plans, the CMP could have a negative effect on seismic risk by increasing vehicle miles traveled. The potential for the CMP to reinforce urban deconcentration is discussed in detail as part of the growth inducing impacts analysis contained in Chapter IV - Impact Overview, where it is concluded that the potential of the CMP to foster urban deconcentration is negligible.</p> <p>Also a possibility is that CMP-related improvements could increase pressures for increased population and employment density in areas adjacent to transit stations, transit lines, transportation centers, etc. A new concentration of population and/or employment, particularly in multi-story building could increase human exposure to seismic event risks.</p>	<p>Mitigation measure C.3 addresses indirect geological impacts.</p>	<p>—</p>	<p>— — —</p>

-G11-

Description of Impacts	Mitigation Measures	Implementing Party	(A) Monitoring Agency (B) Monitoring Phase (C) Implementation Completed?
WATER			
<p><u>Direct Impact:</u> CIP projects could affect beneficial uses through the destruction of habitat and changes in surface water quality. Implementation of the CMP could have a short-term adverse effect on nearby surface water bodies during construction of CIP-related projects. These effects would include increased sedimentation engineered by excavation and grading activities, as well as pollution from vehicular oils and grease. Long-term impacts could result from increased highway and transit associated facilities operations and their associated pollution (such as vehicular oils and grease emissions). The level of pollution produces would be a function of the number and lengths of trips made on these new facilities.</p>	<p><u>F.1</u> MTA shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project-level planning and the environmental assessments of individual CMP CIP project, the Lead Agency incorporates appropriate mitigations in order to minimize the water resource impacts of individual CMP CIP projects. As part of the review, the MTA may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas in the EIR:</p> <ul style="list-style-type: none"> • For large-scale capital improvement projects, such as freeway, HOV, rail and interchange projects, appropriate ecologically-oriented maps are obtained and used during the planning process for CIP projects. Every effort is made to avoid areas that are currently used or are anticipated to be used for ecologically beneficial purposes. Every effort is made to minimize all disturbances in areas where construction is mandatory. All areas are restored to their original pre-construction conditions, including the reintroduction of all uncontaminated soil and the replacement of all native vegetation. In the coastal zone, coastal zone planning and management programs are utilized to reduce adverse impacts to coastal water quality and preserve or improve areas of special water quality significance, such as bays and estuaries. • For large scale CIP projects, such as freeway, HOV, rail and interchange projects, a comprehensive site investigation is conducted by ecological and water quality specialists to provide input into the above planning and mitigation design process and to confirm expected onsite conditions prior to the initiation of demolition and construction activities. 	MTA	<p>(A) MTA (B) Biennial report (C) No</p>

Description of Impacts	Mitigation Measures	Implementing Party	(A) Monitoring Agency (B) Monitoring Phase (C) Implementation Completed?
	<ul style="list-style-type: none">• Planning, construction, and operational activities are coordinated with appropriate ecological and water resources agencies and are conducted in accordance with the requirements of the Federal Water Pollution Control Act, the Water Quality Act, and the Clean Water Act, including NPDES and Section 404 permit requirements.• Natural conditions are maintained or simulated wherever possible to minimize effects at stream crossings. Single-span bridges are used when feasible.• Erosion control measures and runoff management, such as drainage channels, detention basins, and vegetated buffers, are employed to prevent pollution of adjacent water resources by runoff from transportation facilities. Wherever physically feasible, detention basins are equipped with oil and grease traps which are cleaned regularly. Treatment and disposal of excavated materials is well-planned.• Water conservation measures listed in the BMP are incorporated into the planning and design of CIP projects and their mitigations.• Use of permeable surfaces and channelization of flows to recharge areas are incorporated into project design, where possible, to promote water percolation and removal of metals.• All demolition, construction, and operational activities are conducted in accordance with all applicable regulatory requirements. <p>Mitigation measure A.3 would reduce long-term water quality impacts associated with CIP project operation.</p>		

Description of Impacts	Monitoring Measures	Implementing Party	(A) Monitoring Agency (B) Monitoring Phase (C) Implementation Completed?
<p><u>Indirect Effects:</u> Should implementation of the CMP result in increased urban deconcentration or concentration or expansion of development in areas containing beneficial uses, significant indirect impacts could result.</p> <p>Deconcentration could also decrease the amount of open land that is currently available for groundwater recharge, either through natural means or through use of reclaimed water. Efforts to foster reclamation projects to increase local groundwater supplies could be significantly curtailed because of the area requirements associated with the reuse of treated effluent. Lastly, the interdependent effects of deconcentration would increase the need for and restrictiveness of large scale water conservation programs.</p>	<p>Mitigation measure C.3 would reduce the indirect impacts of the CMP beneficial uses and the water supply/demand balance.</p>	<p>—</p>	<p>— — —</p>

Description of Impacts	Mitigation Measures	Implementing Party	(A) Monitoring Agency (B) Monitoring Phase (C) Implementation Completed?
BIOLOGICAL RESOURCES			
<p><u>Direct Impact:</u> To the extent that the CMP is successful in maintaining LOS in the vicinity of SEAs, the CMP would have a beneficial impact as a result of reduced congestion and air pollution. If the CMP results in the diversion of traffic to corridors passing through SEAs, or from already-congested corridors to corridors which are currently relatively free-flowing, leading to increased levels of congestion, traffic, and air pollution in proximity to SEAs, the CMP may have an adverse effect on biological resources. Some CMP CIP projects may be routed through SEAs. Any capital improvement projects located in or near SEAs pose the potential for significant biological impacts.</p>	<p><u>G.1</u> MTA shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project-level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the biological resource impacts of individual CMP CIP projects. As part of the review, the MTA may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas in the EIR:</p> <ul style="list-style-type: none"> • Prior to any new construction on existing or proposed highways within the boundaries of an SEA, the need for construction is reviewed and substantiated and alternative alignments or appropriate mitigation measures are investigated and implemented as feasible. If no feasible alternative or mitigation is found, the project is performed in the most environmentally sensitive manner possible. • Site-specific studies are required for each CMP CIP located in the vicinity of an SEA, or in any area identified as potentially significant by the local jurisdiction, to determine whether significant plant or animal life is present in a proposed alignment and the level of impact on those resources. In consultation with the California Department of Fish and Game and the U.S. Fish and Wildlife Service and the local jurisdiction in which the project is located, detailed biological surveys are conducted prior to the adoption of roadway alignments which have the potential to adversely affect significant biological resources. • Appropriate consultation with the California Department of Fish and Game occurs to determine if special status species not identified under the SEA program occur in the project vicinity. 	MTA	<p>(A) MTA (B) Biennial report (C) No</p>

Description of Impacts	Mitigation Measures	Implementing Party	(A) Monitoring Agency (B) Monitoring Phase (C) Implementation Completed?
<p><u>Indirect Impact:</u> Should implementation of the CMP result in increased urban deconcentration, or concentration or expansion of development in outlying areas, particularly areas containing significant ecological resources, which has not been anticipated in the regional plans, the CMP could have a negative effect on biological resources. The potential for the CMP to reinforce urban deconcentration is discussed in detail as part of the growth inducing impact analysis contained in Chapter IV - Impact Overview, where it is concluded that the potential of the CMP to foster urban deconcentration is negligible.</p>	<ul style="list-style-type: none"> Vegetation removal occurs only where absolutely necessary for grading; revegetation with appropriate native plants is to be implemented as feasible. Capital improvement projects which take place in recognized wetlands comply with local, state, and federal regulations governing the protection of these areas. Capital improvement projects within the coastal zone comply with coastal zone planning and local government management programs which prevent or reduce impacts on biological resources within the coastal zone. <p><u>G.2</u> MTA shall seek Environmental Enhancement and Mitigation Demonstration Program Funds made available under Section 164.56(b)(2) of the Streets and Highways Code for acquisition or enhancement of resource lands to mitigate the loss of, or the detriment to, resource lands lying within the right-of-way acquired for proposed transportation improvements.</p> <p>Mitigation measure C.3 would reduce the indirect impacts of the CMP on biological resources.</p>	<p>MTA</p> <hr/>	<p>(A) MTA (B) Biennial report (C) No</p> <hr/> <hr/>

Description of Impacts	Mitigation Measures	Implementing Party	(A) Monitoring Agency (B) Monitoring Phase (C) Implementation Completed?
CULTURAL RESOURCES			
<p><u>Direct Impacts:</u> While prehistoric sites or artifacts could be discovered in the urbanized areas of Los Angeles County, it is likely that any archaeological sites on the surface would have been destroyed during past urbanization. Generally in the urbanized or urbanizing areas, archaeological and paleontological resources are uncovered during the construction phase of a project.</p> <p>The National Register entries, National Landmarks, State Landmarks, local designations, and Los Angeles Historic-Cultural Monuments are located along or near many of the streets and highways of the CMP Roadway System. Inclusion of a roadway or highway segment on the CMP network could ultimately lead to improvement projects on or near that segment, should service deteriorate below CMP LOS standards. This could potentially lead to impacts on historic structures as part of CIP projects.</p>	<p><u>H.1</u> MTA shall review project-level EIRs for CMP CIP projects. The review shall be intended to ensure that as part of project-level planning and the environmental assessments of individual CMP CIP projects, the Lead Agency incorporates appropriate mitigations in order to minimize the cultural resource impacts of individual CMP CIP projects. As part of the review, the MTA may comment on the adequacy of the analysis and mitigations to ensure that the Lead Agency addresses, as appropriate, the following issue areas into the EIR:</p> <ul style="list-style-type: none"> • The project sponsor contacts either the archaeological resource information depository at UCLA or Cal State Northridge to determine the status of each site or corridor proposed for development if it is determined during project-specific environmental review that the site or corridor is likely to contain archaeological resources. • A professional archaeologist is retained to aid in the assessment of those sites or corridors considered to have a moderate to high likelihood of containing archaeological resources, and to recommend a course of action for preservation of significant resources. • During construction, at sites judged to have a moderate to high likelihood of containing paleontological resources, a qualified paleontologist approved by the California Archaeological Inventory Regional Information Center is on call to remove fossil remains found during construction. If fossil remains are discovered during construction, all activity at the fossil site shall be stopped until the paleontologist has removed the remains. 	MTA	<p>(A) MTA (B) Biennial report (C) No</p>

-G17-

Description of Impacts	Mitigation Measures	Implementing Party	(A) Monitoring Agency (B) Monitoring Phase (C) Implementation Completed?
<p><u>Indirect Impact:</u> Should implementation of the CMP result in increased urban deconcentration, or concentration or expansion of development in outlying areas or the mountain or desert portions of the County, which has not been anticipated in the regional plans, the archaeological resources in these areas.</p>	<ul style="list-style-type: none"> For those sites or corridors for which environmental review or subsequent analysis indicates a less than moderate likelihood of containing archaeological resources, the following measures are taken: If any archaeological materials are encountered during the course of the project development, the project shall be halted. The services of an archaeologist shall be secured by contacting the Center for Public Archaeology at Cal State University, Northridge, or a member of the Society of Professional Archaeologists (SOPA), or a SOPA-qualified archaeologist to assess the resources and evaluate the impact. Copies of the archaeological survey, study, or report are submitted to the UCLA Archaeological Information Center. The environmental assessment adequately evaluates the potential for significant impacts to nearby historic resources, including locally designated resources, and includes appropriate mitigations. <p>Mitigation measure C.3 would reduce the indirect impacts of the CMP on historic resources.</p>	<p>---</p>	<p>===== =====</p>

PROGRAM UPDATE**

FINDINGS, FACTS IN SUPPORT OF FINDINGS AND
STATEMENT OF OVERRIDING CONSIDERATIONS
REGARDING THE ENVIRONMENTAL IMPACT REPORT
FOR THE 1993 LOS ANGELES COUNTY
CONGESTION MANAGEMENT PROGRAM UPDATE
(STATE CLEARINGHOUSE NO. 93051061;
SCAG CLEARINGHOUSE NO. I9300263)

1.0 INTRODUCTION

1.1 State Law. The State Guidelines ("Guidelines") promulgated pursuant to the California Environmental Quality Act ("CEQA") provide:

No public agency shall approve or carry out a project for which an EIR has been completed which identifies one or more significant environmental effects of the project unless the public agency makes one or more written findings for each of those significant effects, accompanied by a brief explanation of the rationale for each finding. The possible findings are:

a. Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the Final EIR (hereinafter referred to as "finding (1)").

b. Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency (hereinafter referred to as "finding (2)").

c. Specific economic, social, or other considerations make infeasible the mitigation measures or project alternatives identified in the Final EIR (hereinafter referred to as "finding (3)").

1.2 Findings. An Environmental Impact Report ("EIR") pursuant to CEQA has been prepared by the Los Angeles County Metropolitan Transportation Authority ("Authority"). The EIR for the Los Angeles County Congestion Management Program ("CMP" or "Project") identifies significant effects on the environment which may occur as a result of the Project. Section 2.0 of this attachment identifies the significant environmental effects of the Project which cannot feasibly be mitigated to a level of insignificance. Section 3.0 sets forth potential environmental effects of the Project which are not significant because of the design of the Project or which can feasibly be mitigated to a level of insignificance. Section 4.0 summarizes the alternatives discussed in the EIR and makes findings with respect to the feasibility of alternatives and whether the alternatives would lessen the significant environmental effects of the Project. Section 5.0 sets forth a Statement of Overriding Considerations with respect to the Project.

The EIR and the administrative record concerning the CMP provide additional facts in support of the findings herein. The mitigation measures set forth in the Mitigation Monitoring Program (Attachment 2) are incorporated by reference in these findings, and the findings in sections 2.0 and 3.0 refer to individual mitigation measures as appropriate.

1.3 Scope of the Project for Environmental Review. The EIR for the 1993 CMP Update is a "program EIR" describing the effects of the CMP at the general county-wide level. Specific projects to be developed under the CMP program cannot be identified or evaluated with specificity at this time. As a result, the EIR identifies areas of environmental sensitivity which, where necessary, can be evaluated in greater detail in project-specific EIRs. The EIR for the 1993 CMP Update is a "subsequent" EIR evaluating changes to the Congestion Management Program adopted in 1992.

Further, the 1993 CMP EIR is a "tiered" EIR which builds on environmental analysis of earlier tiers in the environmental review process. Tiering is a procedure where broad EIRs are followed by the preparation of more specific EIRs which incorporate by reference the general discussions of the prior EIRs and concentrate on the issues specific to the stage of the overall program under review. Tiering is intended to increase efficiency in the CEQA process by allowing agencies to deal with broad environmental issues in EIRs at planning stages and then to provide more detailed examination of specific environmental effects in EIRs on later projects that are consistent with, or implement, the plans. As contemplated by CEQA, in a tiered environmental review, an EIR at a later tier need not examine those effects which were evaluated and mitigated or avoided as part of the prior EIRs. The use of tiering to focus on only those issues identified as requiring further consideration allows an individual EIR to fit into the process of long-term comprehensive planning, and encourages consistency between regional planning and specific project development. The EIR for the 1993 CMP Update is tiered from the EIR for the 1992 CMP and from the EIR for the 1989 Regional Mobility Plan ("RMP"). The CMP is required by law to be consistent with the RMP prepared by the Southern California Association of Governments ("SCAG").

The Authority has evaluated whether the project has the potential to create significant effects which were not examined in the EIR for the 1992 CMP or in the EIR for the RMP. Based on the initial study and the EIR for the Project, the Board finds that, with the exception of the Deficiency Plan addition to the CMP, the changes in the CMP due to the 1993 Update do not alter the environmental analysis or conclusions of the EIR for the 1992 CMP. As a result, with respect to project impacts addressed in the 1992 CMP EIR, the Board finds that the mitigation measures adopted in 1992 (1992 CMP FEIR certified November 18, 1992), which remain in force and are not superseded by these findings, adequately address those impacts. The following sections make findings with regard to potential impacts related to the Deficiency Plan portion of the CMP Update.

2.0 FINDINGS REGARDING POTENTIAL ENVIRONMENTAL EFFECTS THAT CANNOT BE MITIGATED BELOW A LEVEL OF SIGNIFICANCE.

The following sets forth all significant effects of the 1993 CMP update, and with respect to each effect, makes one or more of the findings set forth in the Introduction above, states facts in support of such findings, and, as appropriate, refers to the Statement of Overriding Considerations which is attached hereto.

2.1 Air Quality.

2.1.1 Significant Effect. There is the potential for localized adverse air quality effects including effects from facility construction, realignment of facilities near sensitive land uses, and the creation of "hot spots" near transit centers/stations and/or park-and-ride lots.

Findings. The Board hereby makes findings (1), (2) and (3).

Facts in Support of Findings. The following facts or mitigation measures indicate that although the identified potential environmental effects have been reduced or avoided to the extent feasible, they cannot feasibly be mitigated below a level of significance. The remaining unavoidable effect is acceptable when balanced against the facts set forth in the Statement of Overriding Considerations.

(1) Mitigation Measure 3.3.1 requires the development of the Deficiency Plan tool box in consultation with the Southern California Association of Governments and the South Coast Air Quality Management District in order to assure that air quality goals are addressed. Mitigation Measure 3.3.1 is hereby incorporated by reference.

(2) Further, Mitigation Measures C.1 and C.4 adopted in conjunction with the 1992 CMP will reduce the potential for direct air quality impacts resulting from the selection of capacity enhancement tool box measures.

(3) Since the Deficiency Plan component of the CMP provides a "tool box" structure, allowing jurisdictions within Los Angeles County to select measures most suited to conditions in each jurisdiction, it is not possible to predict the precise programs or projects which will be developed under the Deficiency Plan. As a result, it is infeasible to adopt additional mitigation measures which address project specific impacts related to facilities which will be developed in the future consistent with the CMP.

(4) Potential hot spot impacts will be minimized to the extent that individual jurisdictions pursue Deficiency Plan measures which avoid potential hot spot creation.

(5) It is infeasible to completely avoid the significant effect due to the economic, social and other considerations described in section 5.0 State of Overriding Considerations, incorporated by reference herein.

3.0 POTENTIAL ENVIRONMENTAL EFFECTS WHICH ARE NOT SIGNIFICANT OR WHICH CAN BE MITIGATED BELOW A LEVEL OF SIGNIFICANCE.

The Board has determined that the following potential environmental effects will not be significant for the reasons stated below.

3.1 Transportation.

3.1.1 Potential Effect. The project could involve inconsistency with regional transportation planning.

Findings. The Board hereby makes findings (1) and (2).

Facts in Support of Findings. The following facts or mitigation measures indicate that this potential environmental effect is not significant, or will be mitigated below a level of significance.

(1) California law mandating the CMP requires that the CMP be developed consistent with the regional plan and that the CMP be incorporated into the regional plan. Consistency with the regional transportation plan was evaluated in the EIR for the 1992 CMP, which concluded that there were no significant consistency related impacts. In February 1992 and again in November 1992, SCAG's Executive Committee approved an interim consistency and compatibility finding for the 1992 CMP. In April 1993, based on a recommendation from SCAG's 1246 Committee to the Executive Committee, the interim finding was accepted as a final finding of consistency and compatibility.

(2) As discussed in section 1.3, the provisions of the 1993 CMP Update, with the exception of the Deficiency Plan, do not significantly alter the effects of the project evaluated in the 1992 CMP EIR.

(3) The Deficiency Plan is also designed to work toward implementation of projects and policies which are consistent with regional transportation plan goals.

(4) All modeling analysis which was conducted for purposes of determining the congestion gap and the number of debit points to be mitigated through the CMP Deficiency Plan was based on the MTA county-wide model which was originally obtained from SCAG. The modeling included socio-economic data, highway networks and transit networks consistent with the SCAG regional model. Modeling methodology such as trip generation, assignment and mode choice criteria are also consistent with SCAG modeling methodology.

(5) The modeling analysis associated with capacity enhancing measures under the Deficiency Plan indicates that vehicle miles traveled ("VMT") could increase slightly if jurisdictions within the County choose only the capacity related tool box measures.

(6) The Deficiency Plan will result in the implementation of capacity improvements which are generally in conformance with RMP projects. As a result, the Deficiency Plan is not expected to significantly alter the RMP's analysis of transportation demand.

(7) Since the goal of the CMP is to maintain, rather than improve, mobility, it is possible that even if only capacity enhancing measures are chosen by jurisdictions in the County, no net increase in vehicle miles traveled or vehicle hours traveled will occur.

(8) The Deficiency Plan component of the CMP is designed as a "tool box" of measures available to local jurisdictions. Each local jurisdiction will be able to select among the "tool box" options in forming a congestion mitigation strategy tailored to the needs of the jurisdiction. As a result, it is not possible to predict the precise programs or projects which will be developed under the Deficiency Plan. Such a prediction would be too speculative to support detailed environmental analysis. Therefore it is infeasible to adopt additional mitigation measures which address project-specific impacts related to facilities or programs which will be developed by local jurisdictions under the CMP Deficiency Plan. Such mitigation measures are within the responsibility of the jurisdictions adopting specific "tool box" measures. Further, local jurisdictions will determine the aggregate distribution of the several types of measures available in the "tool box." However, the EIR analyzes two scenarios of "tool box" choices which bracket the possible future actions under the Deficiency Plan. The Authority finds that this is an appropriate method for assessing the effects of the Deficiency Plan and, to the extent feasible, evaluates a "worst-case" level of impacts for the Deficiency Plan as a whole. It is reasonable to anticipate that actual program effects will be in the middle portion of the range indicated by the EIR analysis, as local jurisdictions select a mix of demand reducing and capacity enhancing measures on a county-wide basis.

3.1.2 Potential Effect. The CMP Deficiency Plan could affect the performance of the regional transportation system.

Findings. The Board hereby makes findings (1) and (2).

Facts in Support of Findings. The following facts or mitigation measures indicate that this potential environmental effect is not significant, or will be mitigated below a level of significance.

(1) The county-wide model analysis indicates that the trip reduction emphasis package would result in measurable improvements in the CMP system as well as non-CMP facilities. Improvements generally occur across the board and affect most measures of transportation system effectiveness including the overall amount of vehicle travel, the level of vehicle delay and speeds.

(2) The capacity emphasis package results in increases in VMT and VHT but an overall decrease in delay.

(3) The proposed program would result in between 202 million and 205 million vehicle miles of travel, 7.1 million and 7.3 million vehicle hours of travel and 2.45 million and 2.46 million hours of delay on the regional transportation system compared to 202 million VMT, 7.3 million VHT and 2.52 million hours of delay under year 2010 baseline conditions. Actual program effects are anticipated to be in the middle portion of the range indicated due to the selection of a mix of demand reducing and capacity increasing strategies on a county-wide basis.

(4) The Deficiency Plan component of the CMP is designed as a "tool box" of measures available to local jurisdictions. Each local jurisdiction will be able to select among the "tool box" options in forming a congestion mitigation strategy tailored to the needs of the jurisdiction. As a result, it is not possible to predict the precise programs or projects which will be developed under the Deficiency Plan. Such a prediction would be too speculative to support detailed environmental analysis. Therefore it is infeasible to adopt additional mitigation measures which address project-specific impacts related to facilities or programs which will be developed by local jurisdictions under the CMP Deficiency Plan. Such mitigation measures are within the responsibility of the jurisdictions adopting specific "tool box" measures. Further, local jurisdictions will determine the aggregate distribution of the several types of measures available in the "tool box." However, the EIR analyzes two scenarios of "tool box" choices which bracket the possible future actions under the Deficiency Plan. The Authority finds that this is an appropriate method for assessing the effects of the Deficiency Plan and, to the extent feasible, evaluates a "worst-case" level of impacts for the Deficiency Plan as a whole. It is reasonable to anticipate that actual program effects will be in the middle portion of the range indicated by the EIR analysis, as local jurisdictions select a mix of demand reducing and capacity enhancing measures on a county-wide basis.

3.2 Air Quality.

3.2.1 Potential Effect. The project could lead to regional air quality emissions which contribute to violations of federal and state air quality standards.

Findings. The Board hereby makes findings (1) and (2).

Facts in Support of Findings. The following facts or mitigation measures indicate that this potential environmental effect is not significant, or will be mitigated below a level of significance.

(1) The results of the county-wide traffic model indicate that the proposed program would result in county-wide emissions less than the 2010 baseline of the Air Quality Management Plan.

(2) The trip reduction emphasis scenario results in an approximate 2.5% reduction in air pollutants. In contrast, the increased capacity scenario would result in pollutant levels similar to or approximately 0.1% greater than the AQMP baseline emissions. Based on these results and given the range of mitigation choices the project would provide air quality benefits as compared to baseline conditions.

(3) The Deficiency Plan component of the CMP is designed as a "tool box" of measures available to local jurisdictions. Each local jurisdiction will be able to select among the "tool box" options in forming a congestion mitigation strategy tailored to the needs of the jurisdiction. As a result, it is not possible to predict the precise programs or projects which will be developed under the Deficiency Plan. Such a prediction would be too speculative to support detailed environmental analysis. Therefore it is infeasible to adopt additional mitigation measures which address project-specific impacts related to facilities or programs which will be developed by local jurisdictions under the CMP Deficiency Plan. Such mitigation measures are within the responsibility of the jurisdictions adopting specific "tool box" measures. Further, local jurisdictions will determine the aggregate distribution of the several types of measures available in the "tool box." However, the EIR analyzes two scenarios of "tool box" choices which bracket the possible future actions under the Deficiency Plan. The Authority finds that this is an appropriate method for assessing the effects of the Deficiency Plan and, to the extent feasible, evaluates a "worst-case" level of impacts for the Deficiency Plan as a whole. It is reasonable to anticipate that actual program effects will be in the middle portion of the range indicated by the EIR analysis, as local jurisdictions select a mix of demand reducing and capacity enhancing measures on a county-wide basis.

3.3 Energy.

3.3.1 Potential Effect. The project could result in fuel consumption increases.

Findings. The Board hereby makes findings (1) and (2).

Facts in Support of Findings. The following facts or mitigation measures indicate that this potential environmental effect is not significant, or will be mitigated below a level of significance.

(1) Fuel consumption under the program would be between 7.6 million gallons (under the trip reduction emphasis scenario) and 7.8 million gallons (under the enhanced capacity scenario) compared to 7.7 million gallons without the proposed program. There will not be a significant effect, as actual program effects are anticipated to be in the middle portion of the range, showing little, if any, change from the no project condition.

(2) The Deficiency Plan component of the CMP is designed as a "tool box" of measures available to local jurisdictions. Each local jurisdiction will be able to select among the "tool box" options in forming a congestion mitigation strategy tailored to the needs of the jurisdiction. As a result, it is not possible to predict the precise programs or projects which will be developed under the Deficiency Plan. Such a prediction would be too speculative to support detailed environmental analysis. Therefore it is infeasible to adopt additional mitigation measures which address project-specific impacts related to facilities or programs which will be developed by local jurisdictions under the CMP Deficiency Plan. Such mitigation measures are within the responsibility of the jurisdictions adopting specific "tool box" measures. Further, local jurisdictions will determine the aggregate distribution of the several types of measures available in the "tool box." However, the EIR analyzes two scenarios of "tool box" choices which bracket the possible future actions under the Deficiency Plan. The Authority finds that this is an appropriate method for assessing the effects of the Deficiency Plan and, to the extent feasible, evaluates a "worst-case" level of impacts for the Deficiency Plan as a whole. It is reasonable to anticipate that actual program effects will be in the middle portion of the range indicated by the EIR analysis, as local jurisdictions select a mix of demand reducing and capacity enhancing measures on a county-wide basis.

3.3.2 Potential Effect. The project could increase energy consumption related to alternate traffic modes.

Findings. The Board hereby makes findings (1) and (2).

Facts in Support of Findings. The following facts or mitigation measures indicate that this potential environmental effect is not significant, or will be mitigated below a level of significance.

(1) As local jurisdictions place more emphasis on TDM-intensive measures, energy consumption related to electric power generation for rail transit and commuter rail as well as for electric buses and cars will increase. Additionally, an emphasis on mass transit may also increase diesel fuel consumption by existing bus fleets serving the county. However, such a shift toward high occupancy vehicle modes would increase energy efficiency overall by decreasing energy consumption per person trip.

(2) The Deficiency Plan component of the CMP is designed as a "tool box" of measures available to local jurisdictions. Each local jurisdiction will be able to select among the "tool box" options in forming a congestion mitigation strategy tailored to the needs of the jurisdiction. As a result, it is not possible to predict the precise programs or projects which will be developed under the Deficiency Plan. Such a prediction would be too speculative to support detailed environmental analysis. Therefore it is infeasible to adopt additional mitigation measures which address project-specific impacts related to facilities or programs which will be developed by local jurisdictions under the CMP Deficiency Plan. Such mitigation measures are within the responsibility of the jurisdictions adopting specific "tool box" measures. Further, local jurisdictions will determine the aggregate distribution of the several types of measures available in the "tool box." However, the EIR analyzes two scenarios of "tool box" choices which bracket the possible future actions under the Deficiency Plan. The Authority finds that this is an appropriate method for assessing the effects of the Deficiency Plan and, to the extent feasible, evaluates a "worst-case" level of impacts for the Deficiency Plan as a whole. It is reasonable to anticipate that actual program effects will be in the middle portion of the range indicated by the EIR analysis, as local jurisdictions select a mix of demand reducing and capacity enhancing measures on a county-wide basis.

3.3.3 Potential Effect. The project could result in increases in fuel consumption in and around transit stations or park-and-ride lots due to increased traffic delays and reduced traffic speeds at these centers.

Findings. The Board hereby makes findings (1) and (2).

Facts in Support of Findings. The following facts or mitigation measures indicate that this potential environmental effect is not significant, or will be mitigated below a level of significance.

(1) The increase in fuel consumption at transit stations or park-and-ride lots is not anticipated to have a material effect on the overall beneficial aspects of project with respect to energy consumption. The amount of vehicle miles traveled near such centers would be less than 1% of the total vehicle miles of travel and would not increase estimated fuel consumption above predicted levels.

(2) The Deficiency Plan component of the CMP is designed as a "tool box" of measures available to local jurisdictions. Each local jurisdiction will be able to select among the "tool box" options in forming a congestion mitigation strategy tailored to the needs of the jurisdiction. As a result, it is not possible to predict the precise programs or projects which will be developed under the Deficiency Plan. Such a prediction would be too speculative to support detailed environmental analysis. Therefore it is infeasible to adopt additional mitigation measures which address project-specific impacts related to facilities or programs which will be developed by local jurisdictions under the CMP Deficiency Plan.

Such mitigation measures are within the responsibility of the jurisdictions adopting specific "tool box" measures. Further, local jurisdictions will determine the aggregate distribution of the several types of measures available in the "tool box." However, the EIR analyzes two scenarios of "tool box" choices which bracket the possible future actions under the Deficiency Plan. The Authority finds that this is an appropriate method for assessing the effects of the Deficiency Plan and, to the extent feasible, evaluates a "worst-case" level of impacts for the Deficiency Plan as a whole. It is reasonable to anticipate that actual program effects will be in the middle portion of the range indicated by the EIR analysis, as local jurisdictions select a mix of demand reducing and capacity enhancing measures on a county-wide basis.

3.3.4 Potential Effect. The project could result in short term increases of energy consumption due to construction of capital projects.

Findings. The Board hereby makes findings (1) and (2).

Facts in Support of Findings. The following facts or mitigation measures indicate that this potential environmental effect is not significant, or will be mitigated below a level of significance.

(1) Energy consumption related to capital construction projects is not anticipated to result in a need for new energy sources or significantly exceed current and projected usage.

(2) The Deficiency Plan component of the CMP is designed as a "tool box" of measures available to local jurisdictions. Each local jurisdiction will be able to select among the "tool box" options in forming a congestion mitigation strategy tailored to the needs of the jurisdiction. As a result, it is not possible to predict the precise programs or projects which will be developed under the Deficiency Plan. Such a prediction would be too speculative to support detailed environmental analysis. Therefore it is infeasible to adopt additional mitigation measures which address project-specific impacts related to facilities or programs which will be developed by local jurisdictions under the CMP Deficiency Plan. Such mitigation measures are within the responsibility of the jurisdictions adopting specific "tool box" measures. Further, local jurisdictions will determine the aggregate distribution of the several types of measures available in the "tool box." However, the EIR analyzes two scenarios of "tool box" choices which bracket the possible future actions under the Deficiency Plan. The Authority finds that this is an appropriate method for assessing the effects of the Deficiency Plan and, to the extent feasible, evaluates a "worst-case" level of impacts for the Deficiency Plan as a whole. It is reasonable to anticipate that actual program effects will be in the middle portion of the range indicated by the EIR analysis, as local jurisdictions select a mix of demand reducing and capacity enhancing measures on a county-wide basis.

3.4 Land Use.

3.4.1 Potential Effect. The CMP could systematically result in land use patterns substantially different than those anticipated in the Regional Growth Management Plan, or systematically alter land use development patterns.

Findings. The Board hereby makes findings (1) and (2).

Facts in Support of Findings. The following facts or mitigation measures indicate that this potential environmental effect is not significant, or will be mitigated below a level of significance.

- (1) The potential effect on land use patterns will be influenced by the manner in which local jurisdictions fund development of Tool Box measures. In order to evaluate this potential environmental effect, the EIR considers four possible funding scenarios and analyzes the effect of each scenario on land use patterns.
- (2) The "local revenue scenario" calls for local jurisdictions payment for mitigation measures through various local funding sources. No land use effects would result from this approach, as using general funding sources would neither encourage or discourage modification of currently projected land use patterns.
- (3) The "impose direct transportation costs scenario" would focus local jurisdiction mitigation measures on forms of mitigation which could be funded by imposing direct costs on users, such as parking fees. A cost or fee imposed by a local jurisdiction on a particular transportation mode choice or incentive programs for transit use, may affect travel behavior but is unlikely to affect land use patterns.
- (4) The "development charges or fees scenario" provides for the imposition by local jurisdictions of exactions on new development. Although the imposition of exactions in the form of development fees does run the risk of discouraging development, this possibility is unlikely to produce significant land use effects. As a practical matter, jurisdictions likely to impose exactions would be those facing significant development pressure, indicative of strong market support. Under strong market conditions costs will be passed on to tenants and consumers in the form of higher leases or product prices and would not substantially affect land use development patterns. Under weak market conditions the inability to pass through exaction costs could exert some pressure on development to move out of the jurisdiction. The CMP, however, is self regulating in this regard, as jurisdictions facing low development demand would also have low CMP mitigation responsibilities. As a result, even under this scenario, effects on land use patterns would not be significant. Further, while development may be encouraged, in the aggregate, to locate in jurisdictions which do not impose exactions, the structure of the CMP is also self regulating in this

regard. If development is drawn to particular jurisdictions, those jurisdictions will be required to mitigate the congestion impacts of the new development and will therefore need to obtain mitigation funding or act to slow the new development pressure.

(5) The fourth funding scenario addresses local jurisdictions which may elect to provide mitigation by creating "development incentives in the vicinity of transit stations or transportation terminals." The creation of land use development incentives would induce redistribution of development within a jurisdiction, but would be unlikely to capture growth from other jurisdictions. This localized redistribution of development would result in greater densification in transit corridors or transit station areas. This type of change is consistent with the objectives of the Growth Management Plan and would not have a significant effect on market based regional land use patterns.

(6) In general, while CMP related mitigation measures may have localized effects on land use patterns, they are not expected to significantly alter current market trends. The CMP related mitigations are unlikely to provide sufficient incentive for growth to shift away from the patterns predicted by the Growth Management Plan. Regional growth patterns are governed by over-arching market based and geographic trends, which are unlikely to be affected by the relatively small incentives or disincentives associated with CMP deficiency planning.

(7) Neither the TDM intensive nor the capital intensive deficiency plan scenarios will generate a cumulative effect on regional land use patterns. TDM intensive measures focus on travel behavior and do not directly effect land use. Capital improvements likely to be considered under the CMP are not geographically concentrated and are unlikely to extend the County transportation system into less developed areas where they would have a significant effect on development patterns.

(8) Mitigation Measure 3.5.1 requires the Authority to evaluate growth patterns and determine whether CMP Tool Box choices have a significant correlation to changes in land use patterns over a five year period. Mitigation Measure 3.5.1 is hereby incorporated by reference.

(9) The Deficiency Plan component of the CMP is designed as a "tool box" of measures available to local jurisdictions. Each local jurisdiction will be able to select among the "tool box" options in forming a congestion mitigation strategy tailored to the needs of the jurisdiction. As a result, it is not possible to predict the precise programs or projects which will be developed under the Deficiency Plan. Such a prediction would be too speculative to support detailed environmental analysis. Therefore it is infeasible to adopt additional mitigation measures which address project-specific impacts related to facilities or programs which will be developed by local jurisdictions under the CMP Deficiency Plan.

Such mitigation measures are within the responsibility of the jurisdictions adopting specific "tool box" measures. Further, local jurisdictions will determine the aggregate distribution of the several types of measures available in the "tool box." However, the EIR analyzes two scenarios of "tool box" choices which bracket the possible future actions under the Deficiency Plan. The Authority finds that this is an appropriate method for assessing the effects of the Deficiency Plan and, to the extent feasible, evaluates a "worst-case" level of impacts for the Deficiency Plan as a whole. It is reasonable to anticipate that actual program effects will be in the middle portion of the range indicated by the EIR analysis, as local jurisdictions select a mix of demand reducing and capacity enhancing measures on a county-wide basis.

3.5 Public Services.

3.5.1 Potential Effect. The project may have an impact on governmental services if the benefits of compliance with the administrative implementation requirements of the CMP do not outweigh the staff resource costs.

Findings. The Board hereby makes findings (1) and (2).

Facts in Support of Findings. The following facts or mitigation measures indicate that this potential environmental effect is not significant, or will be mitigated below a level of significance.

(1) The 1992 CMP EIR acknowledged the potential for the CMP to result in a diversion of local government personnel and revenues. As mitigation, the 1992 CMP EIR included measures calling for development of a county-wide process for deficiency plan implementation and continued efforts to minimize adverse cost impacts associated with the CMP. The Project's county-wide approach to deficiency mitigation is consistent with the mitigation measures adopted in conjunction with the 1992 CMP.

(2) Although the 1993 CMP will impose additional administrative requirements on local jurisdictions, administrative costs are more than offset by the return on administrative time invested. This return takes the form of both access to formula allocation funds requiring CMP compliance, and the potential administrative efficiencies created by the 1993 CMP. Administrative efficiencies are greatest for local jurisdictions taking a demand reduction approach to deficiency mitigation, due to the ability to coordinate with Transportation Control Measure reporting under the Air Quality Management Plan. However, efficiencies are also created through capacity enhancing approaches to deficiency mitigation. Thus the fiscal and administrative efficiency benefits of compliance outweigh administrative implementation costs. The project would result in the use of additional staff resources, however, the impact is not significant since the benefits of compliance outweigh the costs.

(3) The Deficiency Plan component of the CMP is designed as a "tool box" of measures available to local jurisdictions. Each local jurisdiction will be able to select among the "tool box" options in forming a congestion mitigation strategy tailored to the needs of the jurisdiction. As a result, it is not possible to predict the precise programs or projects which will be developed under the Deficiency Plan. Such a prediction would be too speculative to support detailed environmental analysis. Therefore it is infeasible to adopt additional mitigation measures which address project-specific impacts related to facilities or programs which will be developed by local jurisdictions under the CMP Deficiency Plan. Such mitigation measures are within the responsibility of the jurisdictions adopting specific "tool box" measures. Further, local jurisdictions will determine the aggregate distribution of the several types of measures available in the "tool box." However, the EIR analyzes two scenarios of "tool box" choices which bracket the possible future actions under the Deficiency Plan. The Authority finds that this is an appropriate method for assessing the effects of the Deficiency Plan and, to the extent feasible, evaluates a "worst-case" level of impacts for the Deficiency Plan as a whole. It is reasonable to anticipate that actual program effects will be in the middle portion of the range indicated by the EIR analysis, as local jurisdictions select a mix of demand reducing and capacity enhancing measures on a county-wide basis.

3.5.2 Potential Effect. Compliance with the CMP could result in substantial diversion of city fiscal resources away from the provision of other public services.

Findings. The Board hereby makes findings (1) and (2).

Facts in Support of Findings. The following facts or mitigation measures indicate that this potential environmental effect is not significant, or will be mitigated below a level of significance.

(1) The 1992 CMP EIR acknowledged the potential for the CMP to result in a diversion of local government personnel and revenues. As mitigation the 1992 CMP EIR included measures calling for development of a county-wide process for deficiency plan implementation and continued efforts to minimize adverse cost impacts associated with the CMP. The county-wide approach to deficiency mitigation is consistent with the mitigation measures adopted in conjunction with the 1992 CMP.

(2) The degree to which compliance with deficiency plan requirements will result in fiscal impacts to local jurisdictions will depend on the ease of offsetting the mitigation debits from development with mitigation credits. The Tool Box alternatives for mitigation credits provide local jurisdictions with substantial flexibility regarding the choice of deficiency mitigation strategies. Since local jurisdictions have a variety of funding approaches available for deficiency mitigation and the Tool Box deficiency plan approach provides a number of mitigation options, it is anticipated that local jurisdictions will be able

to meet their deficiency mitigation obligations without a significant diversion of funds from other public service areas.

(3) While it is difficult to predict how a particular community may respond with regard to the type of mitigation strategy that may be implemented, it is reasonable to expect that local jurisdictions will choose an approach which is consistent with the jurisdictions' current policies and which results in the least amount of disruption to the community.

(4) Mitigation Measure 3.6.1 requires MTA to continue to work with local jurisdictions to reduce the administrative burdens of carrying out the CMP. Mitigation Measure 3.6.1 is hereby incorporated by reference.

(5) Mitigation Measure 3.6.2 requires MTA to allow local jurisdictions to carry over from year to year surplus credit points accumulated. Mitigation Measure 3.6.2 is hereby incorporated by reference.

(6) Mitigation Measure 3.6.3 requires MTA to investigate adding additional mitigation measures to the Tool Box. Mitigation Measure 3.6.3 is hereby incorporated by reference.

(7) The Deficiency Plan component of the CMP is designed as a "tool box" of measures available to local jurisdictions. Each local jurisdiction will be able to select among the "tool box" options in forming a congestion mitigation strategy tailored to the needs of the jurisdiction. As a result, it is not possible to predict the precise programs or projects which will be developed under the Deficiency Plan. Such a prediction would be too speculative to support detailed environmental analysis. Therefore it is infeasible to adopt additional mitigation measures which address project-specific impacts related to facilities or programs which will be developed by local jurisdictions under the CMP Deficiency Plan. Such mitigation measures are within the responsibility of the jurisdictions adopting specific "tool box" measures. Further, local jurisdictions will determine the aggregate distribution of the several types of measures available in the "tool box." However, the EIR analyzes two scenarios of "tool box" choices which bracket the possible future actions under the Deficiency Plan. The Authority finds that this is an appropriate method for assessing the effects of the Deficiency Plan and, to the extent feasible, evaluates a "worst-case" level of impacts for the Deficiency Plan as a whole. It is reasonable to anticipate that actual program effects will be in the middle portion of the range indicated by the EIR analysis, as local jurisdictions select a mix of demand reducing and capacity enhancing measures on a county-wide basis.

3.6 Growth Inducing Impacts.

3.6.1 Potential Effect. The project could effect regional growth or result in significant redistribution of population and employment within the region.

Findings. The Board hereby makes findings (1) and (2).

Facts in Support of Findings. The following facts or mitigation measures indicate that this potential environmental effect is not significant, or will be mitigated below a level of significance.

(1) As described in section 1.3, the growth inducing impacts of the 1993 CMP update would be essentially the same as those potential effects analyzed in the EIR for the 1992 CMP.

(2) While it is possible that the imposition of development exactions would increase the potential for development to shift to areas where there would be no exactions or other added development costs, it is not likely to be the case under the Deficiency Plan approach. The potential for a jurisdiction to capture development away from another jurisdiction is limited, since the program affects all jurisdictions in the County and because the design of the "tool box" measures and mitigation funding approaches make it unlikely that one jurisdiction will amass a substantial number of surplus mitigation credits which can be used to capture new growth.

(3) It is also unlikely that Deficiency Plan capital improvements would be concentrated in undeveloped portions of the County in a manner inducing growth. The type of capital improvements that are likely to be considered will in most cases be gap closure or retrofit projects on existing facilities that would not extend the County transportation system into undeveloped areas.

(4) The imposition of trip reduction measures under the deficiency plan is unlikely to result in a redistribution of growth within the County attributable to the Project. The trip reduction goal of the 1993 CMP update is less than the trip reduction goal under the Air Quality Management Plan (which incorporates the Growth Management Plan).

(5) The Project is unlikely to result in a redistribution of growth between Los Angeles County and other counties in the region which would be substantially different than the regional policy forecast. Each of the counties in the region is charged with helping to work toward implementation of the Regional Mobility Plan and Growth Management Plan. Additionally, each county is subject to the CMP legislation and must also require deficiency planning by local jurisdictions. Further, other counties are also subject to the trip reduction goals of the Air Quality Management Plan. As a result, there will be little incentive for development patterns to alter across county boundaries in response to the benefits or requirements of the Project.

(6) The project is unlikely to result in a substantial alteration in the markets for office, retail, industrial or housing development. Significant factors continue to exist in the Los Angeles region which encourage a deconcentration of

land use and associated development of land in undeveloped areas. These factors have led to Los Angeles' development as one of the world's first polycentric cities or urban regions. These factors include: (1) the desire to purchase affordable housing leading to development in less developed areas of Los Angeles County and neighboring counties with lower land costs, (2) the desire to avoid the consequences of urban development, including congestion, and (3) Los Angeles' reliance on automobiles as a major form of transportation in the region. Additionally, market forces have resulted in the existing distribution of land uses within the highly developed county. When compared to the power of locational decisions that are based on market forces and quality of life issues, the potential deconcentration or redistributional affect of the Project is minimal, and is not expected to alter development patterns or significantly influence growth.

(7) Deconcentration of urban development patterns can be encouraged by both very good and very bad levels of service on the transportation system. Because the Project is not anticipated to lead to substantial improvements in current levels of service, or associated increases in travel speed which could make housing in outlying areas more attractive it is not likely to further the deconcentration resulting from ease of mobility. Similarly, by maintaining mobility at established levels, the project is unlikely to encourage, beyond current trends, deconcentration related to avoidance of congestion.

(8) The facts in support of finding 3.4.1, regarding land use impacts, are hereby incorporated by reference.

3.7 Cumulative Impacts.

3.7.1 Potential Effect. The project may contribute to the cumulative environmental effects associated with regional growth and transportation projects.

Findings. The Board hereby makes findings (1), (2) and (3).

Facts in Support of Findings. The following facts or mitigation measures indicate that this potential environmental effect is not significant, or will be mitigated below a level of significance.

(1) The CMP is consistent with and would aid achievement of the Regional Mobility Plan and Air Quality Management Plan, the two key components in the region's existing growth strategy. Cumulative development in the region is described in these two regional plans and controlled by the general plans of the 89 local jurisdictions in the County. The environmental effects of the transportation improvements planned for the Los Angeles region to accommodate anticipated growth are analyzed in the EIR for the Regional Mobility Plan.

(2) Mitigation measures adopted in conjunction with regional plans, including the Regional Mobility Plan, the Growth Management Plan and the Air Quality Management Plan have addressed the full range of feasible mitigation measures to minimize potentially significant cumulative effects of transportation

and growth development in the region.

(3) Because the CMP is required to be consistent with the Regional Mobility Plan, and fit within the framework of regional growth and transportation planning, the CMP will not contribute to cumulative impacts beyond those analyzed in the EIR for the RMP.

(4) The Deficiency Plan component of the CMP is designed as a "tool box" of measures available to local jurisdictions. Each local jurisdiction will be able to select among the "tool box" options in forming a congestion mitigation strategy tailored to the needs of the jurisdiction. As a result, it is not possible to predict the precise programs or projects which will be developed under the Deficiency Plan. Such a prediction would be too speculative to support detailed environmental analysis. Therefore it is infeasible to adopt additional mitigation measures which address project-specific impacts related to facilities or programs which will be developed by local jurisdictions under the CMP Deficiency Plan. Such mitigation measures are within the responsibility of the jurisdictions adopting specific "tool box" measures. Further, local jurisdictions will determine the aggregate distribution of the several types of measures available in the "tool box." However, the EIR analyzes two scenarios of "tool box" choices which bracket the possible future actions under the Deficiency Plan. The Authority finds that this is an appropriate method for assessing the effects of the Deficiency Plan and, to the extent feasible, evaluates a "worst-case" level of impacts for the Deficiency Plan as a whole. It is reasonable to anticipate that actual program effects will be in the middle portion of the range indicated by the EIR analysis, as local jurisdictions select a mix of demand reducing and capacity enhancing measures on a county-wide basis.

4.0 FINDINGS REGARDING ALTERNATIVES.

4.1 Scope of the Alternatives Analysis.

Environmental documentation for the project, including development and review of alternatives, has taken place in the context of development of the Regional Mobility Plan and the 1992 CMP. Environmental review for the project has been carried out as a tiered process designed to focus environmental analysis on those issues ripe for decision at each point in the planning process. Following from the Regional Mobility Plan and the 1992 CMP, the current project is constrained by the decisions made at earlier points in the planning process. As a result, the range of alternatives considered with respect to the Project has been limited to those alternatives which are consistent with alternatives selected in the Regional Mobility Plan and the 1992 CMP.

The Regional Mobility Plan EIR analyzed five alternatives to the selected project. The CMP is required to be consistent with the RMP. The EIR for the 1992 CMP contained an analysis of four alternatives. The project alternatives evaluated were designed to be consistent with the adopted Regional Mobility Plan alternative, assessing a reasonable range of alternative CMP programs within the constraints of the adopted RMP.

Similarly, the alternatives evaluated for the 1993 CMP address a reasonable range of alternatives which are consistent with the program adopted as the 1992 CMP. Specifically, the alternatives analysis focuses on alternatives to the proposed Deficiency Plan strategy, the portion of the 1993 CMP with the potential for significant environmental effects.

4.2 Overview of Standards for Determining a Reasonable Range of Alternatives.

CEQA requires that EIRs examine feasible mitigation measures and feasible alternatives to a proposed project. A critical element of an EIR is the selection of which alternatives warrant detailed review in the document.

In any environmental review, the lead agency must determine the range of alternatives to be examined. As the California Supreme Court has found, "both the California and the federal courts have . . . declared that the 'statutory requirements for consideration of alternatives must be judged against the rule of reason.'" The court further noted that "these statutory and judicial concepts are carried forward in the [CEQA] Guidelines":

[An EIR] must describe a range of reasonable alternatives to the project or the location of the project, which could feasibly attain the basic objectives of the project, and evaluate the comparative merits of the alternatives. (CEQA Guidelines, § 15126, subd. (d).)

It is important to note that the range of alternatives is defined by those alternatives "which could feasibly attain the basic objectives of the project" (Emphasis added.) Accordingly, in determining the scope of the alternatives analysis and of the reasonable range of alternatives, the alternatives analysis in the EIR was framed by the project objectives and purposes identified for the Project in the course of its planning history and in relation to the regional planning framework provided by the RMP and the adopted 1992 CMP.

Not only must a range of alternatives reflect those alternatives capable of attaining the basic objectives of the project, but the alternatives must also comprise actions that can feasibly be implemented. Recently, the California Supreme Court has noted that "in determining the nature and scope of alternatives to be examined in an EIR, local agencies shall be guided by the doctrine of feasibility." As defined in CEQA, the term "feasibility" involves an assessment of whether the mitigation measures and alternatives are "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, social and technological factors." The feasibility of alternatives to the Project is limited both by the existing regional planning framework for transportation set forth in the RMP, and by the program adopted as the 1992 CMP.

4.3 Deficiency Plan Alternatives.

4.3.1 No-Project Alternative (No Deficiency Plan Addition).

Under this alternative, no deficiency plan component would be added to the CMP and the MTA would not review and approve any deficiency plans generated by local jurisdictions. The existing adopted CMP would remain in place. The lack of a deficiency plan mechanism would result in local jurisdictions losing their Section 2105 monies, losing their ability to compete for state funding through the State Transportation Improvement Program (STIP), and the loss of federal funds linked to compliance with the CMP. The net result would be no change in the existing transportation system. None of the programmed improvements would be built. This alternative would have the same impacts as the No-Project (Existing System) Alternative discussed in the 1992 CMP EIR.

The No Project Alternative is infeasible, or not environmentally preferable for the following reasons:

- (1) Transportation - On a systemwide basis, this alternative would result in 10,911,636 vehicle hours of travel (VHT), 5,661,786 hours of delay, and 218,389,015 vehicle miles of travel (VMT) in the region, compared to 7,945,118 VHT, 2,467,030 hours of delay, and 205,154,425 VMT under the worst case (Countywide use of only capacity enhancement Tool Box strategies) for the proposed deficiency plan approach.

(2) Air Quality - Under this alternative air quality emissions would be substantially higher than with the proposed project. Year 2010 emissions are estimated at 707 tons per day (tpd) of Carbon Monoxide (CO), 38 tpd of Ozone (ROC), 87 tpd of Nitrogen Dioxide (NOX), 22 tpd of Sulfur Dioxide (SOX), and 38 tpd of particulates (PM10) compared to 597 of CO, 38 tpd of ROC, 88 tpd of NOX, 20 tpd of SOX, and 36 tpd of PM10 under the worst case scenario (Countywide use of only capacity enhancement Tool Box strategies) for the proposed deficiency plan approach.

(3) Energy - Fuel consumption due to VMT in the County would be significantly greater under this alternative than under the proposed deficiency plan approach, 8.3 million gallons per day, compared to 7.8 million gallons per day under the worst case (Countywide use of only capacity enhancement Tool Box strategies) for the proposed deficiency plan approach.

(4) Land Use - Under this alternative, the transportation system would not be improved to accommodate anticipated growth. This would have a significant effect on future land use. It can be expected that land use would be displaced from congestion core parts of the County to areas of the County where the transportation system still had existing capacity. In addition, growth would be displaced to other adjacent counties which were still making the transportation improvements included in the RMP. Both the displacement within the County and the displacement to other counties would result in additional urban sprawl, which would in turn have an indirect impact on air quality not anticipated in the model runs which are the basis of the air emission figures cited above.

(5) Public Services - The loss of funding for transportation improvements would likely result in local jurisdictions using additional general fund revenues for maintenance of the transportation system. This would have a significant impact on public service provision. Increased congestion on the regional network would increase emergency vehicle response times, which would be a significant impact under this alternative.

(6) This alternative would not comply with the requirements of the CMP statute since there would be no deficiency plan component incorporated in the CMP by the time deficiencies are identified on the CMP network. This alternative would fail to fulfill the aims of the CMP legislation and would be inconsistent with the RMP.

4.3.2 No-Countywide Deficiency Plan Alternative.

Under this alternative no uniform Countywide approach to deficiency planning would be adopted. Instead, the CMP Update would specify the general content of deficiency plans, and local jurisdictions would be left to develop their plans individually. Local jurisdictions would also be responsible for determining the degree to which mitigations result in an improvement in deficiency conditions. Plans would then be submitted to the MTA for review and approval.

The No-Countywide Deficiency Plan Alternative is infeasible, or not environmentally preferable, for the following reasons:

(1) Under this alternative, local jurisdictions would be held responsible for mitigating any deficiencies identified on portions of the network within their jurisdiction, regardless of the degree to which they contributed to the creation of the deficiency, since no method for sharing responsibility for deficiency creation would be in place. Jurisdictions on portions of the network serving as key connectors between portions of the County would be unfairly burdened with the responsibility for mitigating deficiencies on these segments. Imposition of additional TDM requirements within the impacted jurisdiction may have little impact on curing a deficiency, since the deficiency may be largely the result of trips originating and terminating in other jurisdictions. This would mean that deficiency mitigation would primarily take the form of capacity enhancements, which generally have less environmental benefit than trip reduction approaches. Local jurisdictions on heavily traveled portions of the network would thus have the burden of major capital improvements.

(2) Transportation - This alternative would not encourage the degree of additional TDM activities encouraged by the Project, and it would place a greater responsibility for the funding of capacity enhancing mitigations on jurisdictions containing heavily traveled portions of the network which act as regional connectors. This approach would increase the probability that identified deficiencies would not be mitigated, which would have a significant impact on the maintenance and improvement of the transportation system, as well as the consistency of the CMP with the RMP.

(3) Air Quality - It is anticipated that air quality emissions would be somewhere between the levels identified for the Baseline Scenario and the levels identified for the capacity enhancement scenario for the proposed program. Air quality emissions would, therefore, be higher than under the Project.

(4) Energy - Similarly, it is anticipated that energy use would be somewhere between the levels identified for the Baseline Scenario and the levels identified for the capacity enhancement scenario for the Project. Energy use would thus be greater than under the Project.

(5) Land Use - Under this alternative, it is anticipated that unmitigated deficiencies may occur on portions of the network which serve as major County connectors and that the jurisdictions containing these portions of the network would have disproportionately high mitigation costs, which would effect their ability to mitigate deficiencies, as well as the likelihood they would enact deficiency mitigation related fees or exactions. Since the urban core portions of the County are the portions containing the majority of these segments of the network, this alternative may result in additional urban deconcentration as potential growth responds to either the additional congestion which could occur

under this alternative, or the higher mitigation costs in core areas which might occur under this alternative.

(6) Public Services - Under this alternative, jurisdictions containing portions of the network which serve as major regional connectors would have higher mitigation costs and less ability to mitigate deficiencies through TDM and land use controls than under the proposed program, thus their mitigation costs would be higher. This could result in public service provision impacts. Unmitigated deficiencies would result in increases in the response times of emergency vehicles, which would be a significant public service impact. In addition, the lack of deficiency plan development assistance under this alternative could increase local jurisdictional staff resources used for plan development substantially.

(7) This alternative does not meet the MTA's deficiency plan goals and objectives regarding provision of a Countywide approach, minimization of administrative costs, consistency among jurisdictions, sensitivity to the economy or jobs, or promotion of inter-jurisdictional mitigation.

4.3.3 Countywide Fee Alternative.

Under this alternative, a Countywide traffic impact fee would be imposed on new development. It would be established based on a nexus study which would establish the casual connection between the creation of deficiencies on the network and development activity. The fee would be used to fund capacity enhancements on the regional network.

The Countywide Fee Alternative is infeasible, or not environmentally preferable, for the following reasons:

(1) Transportation - This alternative would have similar transportation system benefits as the capacity enhancement scenario discussed for the proposed program. Therefore, the benefits would be somewhat less than under the proposed program, which is likely to result in a combined use of demand reduction and capacity enhancement strategies, on a Countywide basis.

(2) Air Quality - This alternative would have similar air quality benefits as the capacity enhancement scenario discussed for the proposed program. Therefore, the benefits would be somewhat less than under the proposed program, which is likely to result in a combined use of demand reduction and capacity enhancement strategies, on a Countywide basis.

(3) Energy - This alternative would have similar energy benefits as the capacity enhancement scenario discussed for the proposed program. Therefore, the benefits would be somewhat less than under the proposed program, which is likely to result in a combined use of demand reduction and capacity enhancement strategies, on a Countywide basis.

(4) Land Use - The countywide fee would be imposed Countywide. It is possible that this would make development less attractive in areas with weak markets, than in areas with strong markets, but it is difficult to ascertain without conducting special land use impact related studies for this alternative, whether or not it would result in a systematic displacement of land uses. Any development inhibiting impacts of this alternative are likely to be greater than under the proposed program, which allows flexibility in the degree to which mitigations are funded with public or private resources.

(5) This alternative does not provide the deficiency mitigation and funding flexibility of the proposed program, and sensitivity to the economy or jobs, or the transit-enhancing land use effects.

4.3.4 Monitoring Based Approach Alternative.

Under this alternative, the MTA would not provide a mitigation Tool Box. Instead, each local jurisdiction would select their own mitigation measures, monitor their effectiveness, and get credit based on the demonstrated effectiveness of their mitigation measures.

Local jurisdictions would still be responsible for calculating and mitigating the effects of development within their boundaries. The impacts of new development activity would still be calculated according to formulas prepared by the MTA staff and used countywide. However, rather than using the standardized list of options for mitigation credits, where the benefits have been prequantified by the MTA staff, each local jurisdiction would implement its own measures and, through monitoring, determine their effectiveness in reducing the impacts of new development. The monitoring results would be submitted to the MTA for their evaluation. This alternative would add a strong element of uncertainty to the process of compliance with the CMP.

The Monitoring Based Approach Alternative would be infeasible, or not environmentally preferable, for the following reasons:

(1) Transportation - Because jurisdictions could tend to select mitigation options where the benefits could be easily monitored and ascertained, there would be a concentration of certain capital improvements, traffic system management improvements and those demand management options that are easily quantified. Land use measures and those demand management measures that reduce or shorten the long term need for trips would be harder to monitor or quantify and would tend to be selected less frequently. As a result, this alternative is likely to result in selection of more capacity enhancing measures than the proposed project.

(2) Air Quality - Because the selection of mitigation measures would be skewed towards capacity enhancement measures, this alternative could have similar air quality effects as the capacity enhancement scenario discussed for the

proposed program. Therefore, the air quality benefits would be somewhat less than under the proposed program, which would result in selection of a mix of demand reduction and capacity enhancement measures.

(3) Energy - Because the selection of mitigation measures would be skewed towards capacity enhancement measures, this alternative would have a similar energy use effect as the capacity enhancement scenario discussed for the proposed program. Therefore, the energy benefits would be somewhat less than under the proposed program, which would result in selection of a mix of demand reduction and capacity enhancement measures.

(4) Land Use - While this alternative would continue the flexibility of allowing jurisdictions to choose their mitigation strategies, the short term difficulty in quantifying or monitoring the benefits of transit facilities could decrease the attractiveness of these types of mitigation strategies. This alternative could, therefore, provide less incentives for local jurisdictions to consider the siting of new development in close proximity to transit facilities.

(5) Public Services - This alternative would place substantially more responsibility on local jurisdictions. The monitoring based approach would eliminate the element of certainty that exists in the Tool Box approach, and the reporting process would be substantially lengthened. In addition, jurisdictions would have to select appropriate monitoring strategies and conduct their monitoring on a regular basis. After implementation and monitoring a strategy, local staffs might find that it did not produce the anticipated results; they would then have to select and implement additional strategies to mitigate their development credits. This alternative would also make the mitigation process much more subjective, requiring additional staff time from the local jurisdiction as well as from the MTA staff. The larger burden on both staffs could result in increased administrative costs for the local jurisdiction and the MTA and result in less allocated and discretionary funds available for project implementation.

(6) This alternative does not meet the MTA's goals and objectives regarding transit enhancing land use, effectiveness and flexibility of actions, sensitivity to the economy and jobs, and consistency and fairness among communities and developments.

4.3.5 Modified Tool Box - Hot Spot Reducing Approach Alternative.

Under this alternative, those Tool Box measures which are likely to result in air quality hot spots would be eliminated from the Tool Box. Strategies targeted for removal would include: land use strategies which result in an intensification of land use; rideshare support facilities such as passenger loading areas for carpools; capital improvements such as park and ride lots, transit and goods movement facilities, High Occupancy Vehicle (HOV) lanes and general use highway lanes; and some transportation systems management improvements, such as some intersection modifications.

The Modified Tool Box Alternative is infeasible, or not environmentally preferable, for the following reasons:

(1) Transportation - Classes of project's included in the RMP would be precluded from nomination for STIP funding under this alternative. The prohibition on projects which create air quality hot spots would, therefore, be inconsistent with the RMP. This would invalidate the CMP and could, under a worst case scenario, result in the same effect as the No-Project Alternative.

(2) Air Quality - As long as sufficient strategies remain in the Tool Box to allow local jurisdictions to meet their mitigation obligations, air quality impacts should be similar on a regional level as under the proposed program. This alternative would reduce or eliminate the hot spot impacts identified for the proposed program.

However, elimination of all hot spot producing mitigations is likely to constrain the choices available to jurisdictions such that impacts would be somewhere between those of the proposed program and the No-Project Alternative. If this alternative is found inconsistent with the RMP, the effect could be the same as the No-Project Alternative.

(3) Energy - As long as sufficient strategies remain in the Tool Box to allow local jurisdictions to meet their mitigation obligations, energy impacts should be similar on a regional level as under the proposed program. However, elimination of all hot spot producing mitigations is likely to constrain the choices available to jurisdictions such that impacts would be somewhere between those of the proposed program and the No-Project alternative. If this alternative is found inconsistent with the RMP, the effect could be the same as the No-Project Alternative.

(4) Land Use - Land use effects would generally be similar as those under the proposed program as long as deficiency mitigation occurred. Otherwise, land use effects would be similar to the No-Project Alternative.

(5) Public Services - This alternative would provide local jurisdictions with fewer Tool Box measures and thus less flexibility in meeting deficiency mitigation targets. Less flexibility could result in greater staff resources needed for deficiency planning and greater use of fiscal resources. Local jurisdictions would be limited in the projects they could nominate for the STIP. If this alternative is found inconsistent with the RMP, local jurisdictions could lose their Section 2105 funding, their ability to compete for state funding through the STIP, and all federal funds that are linked to compliance with the CMP.

(6) This alternative would provide less flexibility of action than under the proposed program. It may be difficult to achieve the MTA's goals and objectives regarding the promotion of transit enhancing land uses, and this alternative may not be found consistent with the RMP. Given the number of strategies which could produce hot spots, this alternative is unlikely to meet the CMP statute's requirement to measurably improve congestion and air quality.

5.0 STATEMENT OF OVERRIDING CONSIDERATIONS.

The CMP EIR indicates that if the CMP is adopted, certain significant impacts may be unavoidable. Additionally, the CMP EIR acknowledges that potential environmental effects related to specific projects developed pursuant to the CMP may occur, although the specific projects and significant environmental effects related to those projects are currently too speculative to evaluate. If the benefits of a proposed project outweigh the unavoidable adverse environmental effects, the adverse effects may be considered "acceptable." The Board finds that the unavoidable significant effects described in section 2 are acceptable, and alternatives with less significant environmental effects are not preferable, as described in section 4 due to the following overriding considerations.

5.1 Economic Effect of a Balanced Transportation System.

The CMP will contribute to a balanced transportation system in the County. The existence of a balanced and efficient regional transportation system is necessary to the development and maintenance of a healthy economic climate. The California Legislature, in adopting the CMP statute, found that "although California's economy is critically dependent upon transportation, its current transportation system relies primarily upon a street and highway system designed to accommodate far fewer vehicles than are currently using the system. . . . The lack of an integrated system and the increase in the number of vehicles are causing traffic congestion that each day results in 400,000 hours lost in traffic, 200 tons of pollutants released into the air and three million one hundred thousand dollars (\$3,100,000) added costs to the motoring public." The Legislature declared its intention that to develop California's economy to its fullest potential federal, state and local agencies should join with transit districts, business, private and environmental interests to develop and implement comprehensive strategies to meet transportation needs.

5.2 Consistency with Comprehensive Regional Transportation Planning.

As described in detail in the CMP EIR, and the RMP and RMP EIR, region wide transportation planning has focused on the development of a balanced system of capital improvements, balance between jobs and housing, and transportation demand management and transportation systems management measures. This regional approach is necessary to address the tremendous transportation needs of Los Angeles County and the Southern California region. In adopting the CMP statute, the California Legislature found that California's transportation system is characterized by fragmented planning, both among jurisdictions involved and among the available means of transport, and further found that to keep California moving, all methods and means of transport between major destinations must be coordinated to connect vital economic and population centers.

The CMP is designed to provide an essential coordinating mechanism within Los Angeles County and to provide planning linkages with other counties to assure an integrated transportation system. To assure consistency and integration between levels of transportation planning, the CMP is consistent with the provisions of the RMP, as required by the CMP statute.

5.3 Emergency Access and Evacuation.

The effect of the CMP in maintaining regional mobility and maintaining or improving Levels of Service on the highway network, will be essential to maintaining access for emergency services to all portions of the County. In the event of an emergency, such as an earthquake, it is vital that the transportation system have sufficient capacity and potential alternative routes and modes to handle large volumes of evacuation traffic in a short period of time. The importance of alternative routes was highlighted after the recent earthquake in the San Francisco Bay area when parallel systems and modes were able to provide emergency access and evacuation capacity when some major highway systems had been damaged. The CMP will maintain or improve access to emergency sites for law enforcement, fire and medical vehicles.

5.4 Environmental Superiority.

Alternative 5, the Hot Spot reducing approach will have a reduced impact on air quality with respect to creation of hot spots than the Project. However, regional air quality impacts may be greater if the alternative is found inconsistent with the RMP. Further, by providing fewer Tool Box measures, this alternative would make it more difficult for local jurisdictions to meet their deficiency mitigation obligations resulting in greater public service impacts than the proposed project. If this alternative is found to be inconsistent with the RMP, it is clearly inferior to the project with respect to environmental effects, as well as failing to meet the RMP consistency requirement of the CMP statute. Even in the event that the hot spot reducing approach is determined to be consistent with the RMP, it is not clearly superior to the proposed Project.

The other alternatives are clearly inferior to the proposed 1993 CMP Update deficiency plan approach. Alternative 1, the No-Project Alternative, would have negative transportation, air quality, energy, land use, and public service impacts. Alternative 2, the No-Countywide Deficiency Plan Approach Alternative, would have less air quality and energy benefits than the proposed program and it could have negative transportation, land use, and public service impacts. Alternative 3, the Countywide Fee Alternative, would have less transportation, air quality, and energy benefits than the proposed program, and could have land use impacts. Public service effects may be less than under the proposed program, however, Alternative 4, the Monitoring Based Approach Alternative, would have less transportation, air quality, and energy benefits than the proposed program. It would encourage less densification around transit stations and it would result in significant public service impacts.

APPENDIX H

**NOVEMBER 17, 1993 STAFF REPORT
TO THE LOS ANGELES COUNTY METROPOLITAN TRANSPORTATION
AUTHORITY BOARD
REGARDING ADOPTION OF THE CONGESTION MANAGEMENT
PROGRAM
AND CERTIFICATION OF THE FINAL ENVIRONMENTAL IMPACT
REPORT
FOR THE 1993 CMP UPDATE**

Los Angeles County

October 25, 1993

TO: PLANNING AND PROGRAMMING COMMITTEE
THROUGH: FRANKLIN E. WHITE
FROM: JUDITH A. WILSON *JW*
SUBJECT: CERTIFICATION OF CMP ENVIRONMENTAL IMPACT
REPORT AND ADOPTION OF 1993 CONGESTION
MANAGEMENT PROGRAM

RECOMMENDATIONS

Based upon comment received at the public hearing of November 17, 1993, the Board of Directors is requested to:

1. Certify that the MTA Board has independently reviewed the EIR for the 1993 Congestion Management Program and that it conforms to California Environmental Quality Act (CEQA) requirements and that the report reflects the Board's independent judgment.
 - Adopt the Statement of Findings and Overriding Considerations (Attachment A).
 - Adopt the Mitigation Monitoring Plan and the mitigation measures described therein (Attachment B).
 - Direct staff to file a Notice of Determination.
2. Adopt the 1993 Congestion Management Program (Attachment D).

ALTERNATIVES CONSIDERED

The 1993 CMP and Deficiency Plan are mandated by state statute. The CMP update is the result of an extensive process of consultation with local jurisdictions, the private sector and environmental interests. The CMP Policy Advisory Committee (PAC) has guided the development of this document to devise a program consistent with State statute while responsive to the needs of Los Angeles County.

IMPACT ON BUDGET AND OBJECTIVES

The 1993 CMP and Deficiency Plan has been developed in accordance with the adopted FY 93-94 budget. The Countywide Deficiency Plan will encourage local

jurisdictions to mitigate regional congestion due to growth using strategies that complement regional improvements and enhance countywide mobility. The technical work completed by MTA through the Countywide Deficiency Plan also eliminates the need for site-level analysis and represents a significant cost savings to local jurisdictions.

BACKGROUND

A complete review of the 1993 Congestion Management Program was presented to the MTA Board in October. The following sections summarize key refinements to the program over the last month and findings of the CMP Environmental Impact Report. The resulting proposed 1993 CMP is provided as Attachment D, and incorporates the October 20, 1993 recommendations of the CMP Policy Advisory Committee.

1. THE 1993 CONGESTION MANAGEMENT PROGRAM

The first CMP for Los Angeles County was adopted in November 1992. Linking transportation, land use and air quality decisions, the CMP is designed to address regional congestion in a comprehensive manner. The first year CMP consisted of core program elements required under statute: a designated highway system with level of service (LOS) standards, transit analysis, transportation demand management, land use analysis, a capital improvement program, and a countywide transportation model.

The 1993 CMP will add the Countywide Deficiency Plan, as well as update a number of elements which were included in the 1992 CMP. State statute requires the CMP to be updated by December 1, 1993 and biennially thereafter.

Development of the Countywide Deficiency Plan has been underway since early 1992, in consultation with local jurisdictions throughout the county, other agencies involved in transportation, private sector and environmental groups, and other interested parties. A Draft 1993 CMP including the Deficiency Plan was circulated for public comment in July 1993. In response to comments received and further program refinement, a Final Draft 1993 CMP was recirculated in October.

Statute requires that local jurisdictions prepare Deficiency Plans when portions of the CMP highway system deteriorate to LOS F or worsen within LOS F. The purpose of the Deficiency Plan is to implement strategies that either fully mitigate congestion or alternatively, provide measurable improvement to congestion and air quality. In order to implement this requirement in a fair and

effective manner and based on broad support, the Countywide Deficiency Plan has been developed.

In essence, the Countywide Deficiency Plan requires all local jurisdictions to annually determine their "contribution" to regional traffic congestion as growth occurs. Local jurisdictions are then responsible for implementing mitigation strategies that commensurably benefit the CMP system. The Plan provides a simple point system for assessing the impact of growth as well as the benefit of selections from a "toolbox" of mitigation strategies. The Plan provides local flexibility for selecting strategies and encourages multi-jurisdictional and city-wide programs and projects.

In response to seventeen letters received on the July Draft CMP and continued consultation with advisory groups, the document was revised as highlighted in the Final Draft (Attachment D). These changes generally added clarification, additional information, and technical refinements of various parts of the program.

The Final Draft CMP was then presented to the CMP Policy Advisory Committee (PAC) on October 20th. After discussing two outstanding technical issues, the PAC recommended that the MTA Board adopt the 1993 CMP as revised regarding credit definitions for land use strategies along transit corridors and non-CMP system highway improvements. These revisions do not alter the analysis or conclusions of the environmental impact report, discussed below.

In addition to development of the Countywide Deficiency Plan, smooth implementation of the program by local jurisdictions will require that MTA provide technical support throughout the phase-in period. MTA staff will assist local jurisdictions in fulfilling their CMP responsibilities by providing ongoing consultation and support to local jurisdictions, with particular emphasis on workshops and one-on-one assistance prior to the May 1, 1994 reporting deadline. As the CMP is an evolving process, MTA staff will also continue to refine the program as experience is gained with implementation and such refinements will be incorporated into the 1995 CMP update.

2. THE 1993 CONGESTION MANAGEMENT PROGRAM ENVIRONMENTAL IMPACT REPORT (EIR)

The Draft EIR analyzed the potential of the 1993 CMP to create significant environmental impacts which were not analyzed in the EIR for the 1992 CMP, from which the 1993 CMP EIR was tiered. The Draft EIR also analyzed alternatives to the proposed CMP deficiency

plan approach and recommended a set of measures to mitigate any potentially significant adverse impacts. The Draft EIR concludes that there may be significant localized adverse air quality effects including the creation of "hot spots" near transit centers/stations and/or park-and-ride-lots. These would be highly localized impacts of otherwise beneficial improvements. With implementation of the recommended mitigation measures, no other significant direct or indirect program level adverse impacts would result from the 1993 CMP.

Attachments E details actions taken to comply with CEQA requirements, as related to the EIR.

The MTA Board, as the lead agency under the California Environmental Quality Act (CEQA), is required to identify and make findings with regard to each significant impact of the proposed project, prior to approving and adopting the project. A description of the effects of the project and the proposed mitigation measures and findings with regards to the effects are summarized in Attachment A, Statement of Findings and Overriding Considerations.

The MTA Board is also required to adopt a Mitigation Monitoring Plan. Attachment D describes each mitigation measure, the agency responsible for implementation, and monitoring responsibility and reporting requirements.

Upon certification of the EIR and adoption of the project, staff will file the required Notice of Determination with the Los Angeles County Clerk and the Governor's Office of Planning and Research.

ATTACHMENTS A THROUGH D
Available Under Separate Cover

ATTACHMENT E

Compliance with CEQA requirements, as related to the EIR for the 1993 CMP, was met in the following ways:

May 21 Notice of Preparation released

Filed with County Clerk and State of California; copies distributed to: all local jurisdictions; all MTA Board members and Alternates; all CMP Policy Advisory Committee and Technical Forum members; regional, state and federal agencies; other interested individuals/organizations.

June 22 Scoping Session conducted

July 24 Draft EIR released

Notice of Availability (NOA) published in LA Times; EIR and NOA/NOC filed with County Clerk and State of California; copies distributed to: all local jurisdictions; all MTA Board members and Alternates; all CMP Policy Advisory Committee and Technical Forum members; regional, state and federal agencies; all Notice of Preparation responders; other interested individuals/organizations.

August 24/25 Public EIR Workshops conducted

October 13 Notice of Availability (NOA) for EIR Response to Comments and notice of public hearing for CMP adoption/EIR certification published in LA Times.

October 15 NOA filed with County Clerk and State of California. Response to Comments on Draft EIR released (Attachment C). Copies distributed to: all local jurisdictions; all MTA Board members and Alternates; all CMP Policy Advisory Committee and Technical Forum members; regional, state and federal agencies; all Draft EIR responders; other interested individuals/organizations.

PLANNING AND PROGRAMMING COMMITTEE RECOMMENDATION

The Committee concurred with the staff recommendation to:

- a. Certify that the EIR for the 1993 Congestion Management Program reflects the Board's independent judgment and that it conforms to California Environmental Quality Act (CEQA) requirements.
- b. Adopt the Statement of Findings and Overriding Considerations;
- c. Adopt the Mitigation Monitoring Plan and the mitigation measures described therein;
- d. Direct staff to file a Notice of Determination;
- e. Adopt the 1993 Congestion Management Program.
- f. Approve CMP Policy Advisory Committee recommendations.

COMMITTEE RECOMMENDATIONS

CONGESTION MANAGEMENT PROGRAM

POLICY ADVISORY COMMITTEE

October 20, 1993

The Congestion Management Program (CMP) Policy Advisory Committee (PAC) took the following actions at their meeting on October 20, 1993:

1. The PAC recommends that the Deficiency Plan definition of a "transit corridor" for land use strategies be revised to include headways of 10 minutes or less in the PM peak.
2. The PAC recommends that the Deficiency Plan credit for improvements on non-CMP arterials retain simple credit factors, based on congestion alleviated from the CMP highway system. The PAC recommends that staff conduct additional technical analysis to develop the credit factors and provide a recommendation to the MTA Board within 90 days.
3. The PAC recommends that the MTA Board adopt the 1993 Congestion Management Program for Los Angeles County.
