1.3 Transportation System Modeling Approach

While the information in this report focuses mostly on field data, some data were extracted from the regional travel demand model. The modeling approach for the SR 710 EIR/EIS is a combination of the Southern California Association of Governments (SCAG) 2008 Regional Transportation Plan (RTP) regional travel demand model and the Los Angeles Metropolitan Transportation Authority (Metro) model used for Measure R forecasting. The combination of the SCAG and Metro models provides a logical “blended” process for producing the most-accurate highway and transit system demands. The reason for developing this blended model approach was to account for the acknowledged limitations in the SCAG 2008 RTP model, specifically as it applies to transit forecasting in the region. A working group meeting in December 2011, comprised of technical experts from the California Department of Transportation (Caltrans), Metro, SCAG, and the consulting team, arrived at consensus that waiting for the 2012 SCAG RTP model and other approaches would not be viable options.

The agreed-upon application approach consists of a blended approach using the SCAG 2008 RTP model for highway forecasting and the Measure R Metro model for transit forecasting to support the alternatives analysis phase of the SR 710 EIR/EIS.

1.4 Documentation Approach

The travel demand forecasting for the SR 710 EIR/EIS Alternatives Analysis is focused on a full transportation system analysis, and it includes several deliverables. This memorandum is the “Base Conditions Report”. Table 1-1 is a summary of the deliverables, which illustrates how this memorandum fits within the overall structure.

TABLE 1-1
Task 6 Deliverables

Report Title	Original Scope of Work Deliverable(s)	Description	Appendices
Existing Conditions System Performance Report	Baseline Conditions Report	Field data and model results for existing conditions	Field traffic and transit data, plus model output
Forecast Results and Future System Performance Report	System Performance Report	Application of the model for 2035 conditions – no-build and alternatives	Detailed modeling results
Model Methodology Report	Model Methodology Report and Forecast Results Report	Approach for modeling and setup/validation of the models	Forecasting methodology document (December) and detailed validation reports for each mode
Model Results Report	SR 710 Gap Model Results Report	Executive summary of the other reports	Other memorandums not included in other reports

This report consists of two main sections. Section 2 is a summary of the available field data, organized by roadway type (freeway and local streets) and mode (vehicular, truck, transit, and active transportation). Section 3 is a summary of the travel demand model outputs for existing conditions using the 2008 base year from the 2008 SCAG RTP model.

Existing Conditions – Field Data

2.1 System Performance

The Los Angeles metropolitan region is one of the most congested in the United States. The annual *2011 Annual Urban Mobility Report (September 2011)* conducted by the Texas Transportation Institute states that the “Los Angeles-Long Beach-Santa Ana CA” urban area ranks first (worst) in total travel delay, total congestion cost, and travel time index (the ratio of travel time during congested conditions to free flow). The same study also concludes that the Los Angeles metropolitan region ranks third in yearly delay for commuters, excess fuel used per commuter, and overall congestion cost.

The 2012 SCAG RTP discusses many of the challenges that the region must take into consideration for future travel mobility. The primary goal of the 2012 RTP is to increase mobility in the region for residents and visitors. Meeting this goal necessitates addressing challenges related to mobility, air quality, population growth, and a multi-modal transportation system. Some of the challenges that the future SCAG region faces as discussed in the 2012 RTP include the following:

- *Mobility*: “the region wastes 3 million hours each year sitting in traffic. By failing to address our congestion, we have forgone jobs—every 10 percent decrease in congestion can bring an employment increase of about 132,000 jobs.”
- *Air Quality*: “the SCAG region continues to have the worse air quality in the nation, and air pollution still causes thousands of premature deaths every year, as well as other serious adverse health effects. The South Coast Air Quality Management District (AQMD) estimates the monetary cost of air pollution in Southern California to be at least \$14.6 billion annually.”
- *Population Growth*: “The region will add 4 million people by 2035. This growth in population will only exacerbate our region’s existing mobility challenges.”
- *Multi-Modal Transportation System*: “nine out of every ten trips rely either entirely or in part on the highway and arterial systems. The RTDM also estimates 3.6 million vehicles-hours of daily delay, 5.1 million person-hours of daily delay, and 17.3 minutes of daily delay per capita” (2012 SCAG RTP).

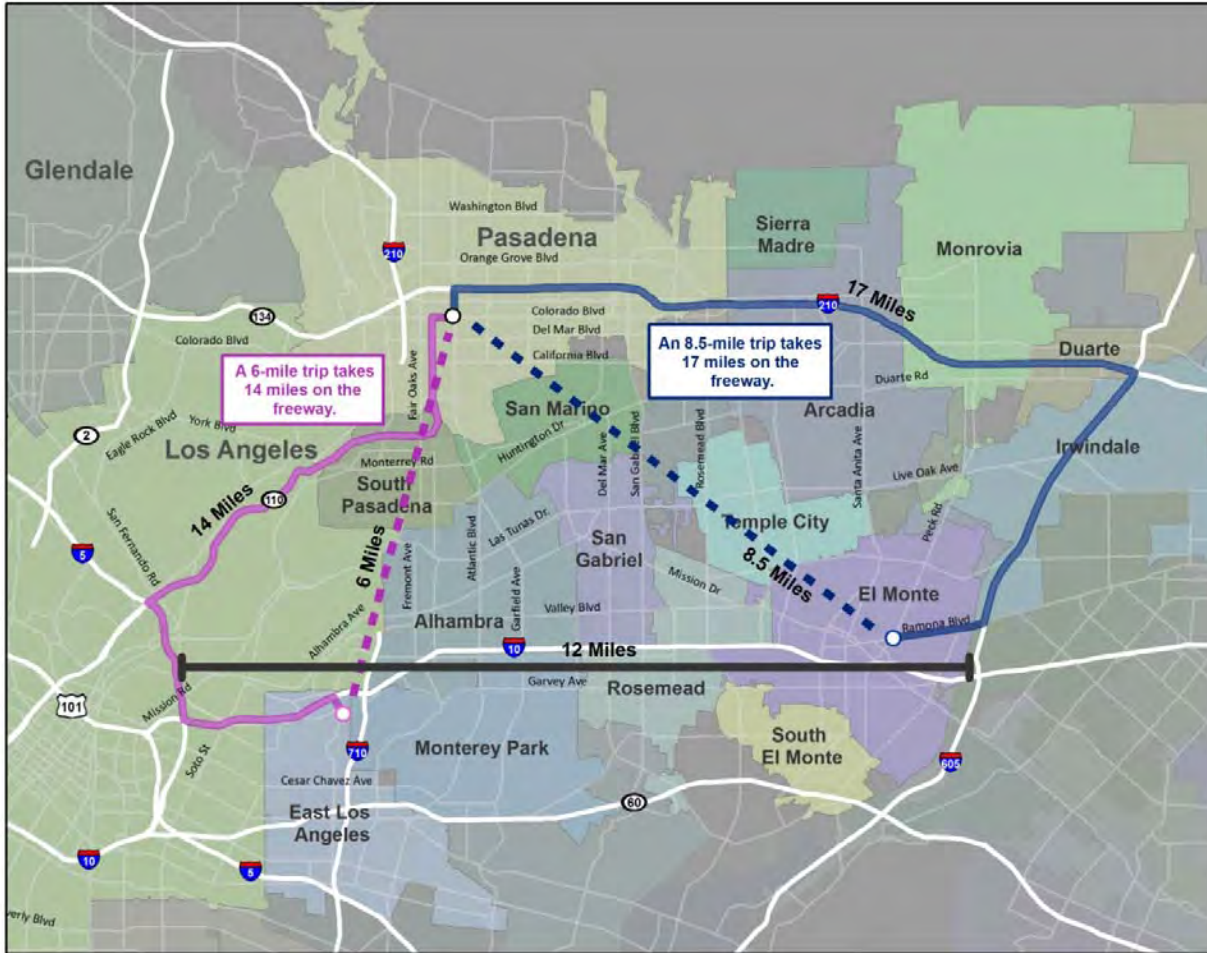

2.2 Freeway Traffic Operations

North-south mobility needs are a key part of the transportation system deficiencies. The existing geography and layout of the freeway system creates a natural lack of true north-south freeway connectivity in Los Angeles County. The freeways in the study area are illustrated in Figure 2-1. Only I-605 connects the system between the beach communities (at I-405) and the mountains (at I-210). The other north-south freeways in the study area are either discontinuous (I-110/SR 110 and I-710/ SR 710) or serve traffic in a northwest-southeast orientation (I-5 and I-405).

The location of the north-south freeways in Los Angeles County is such that there is a 12-mile distance between the north-south connections using I-110/I-5/SR 2 and I-605, requiring out-of-direction travel in the north-south direction for medium to long trips. Both study area trips and regional trips through the study are affected by the necessary out-of-direction freeway travel.

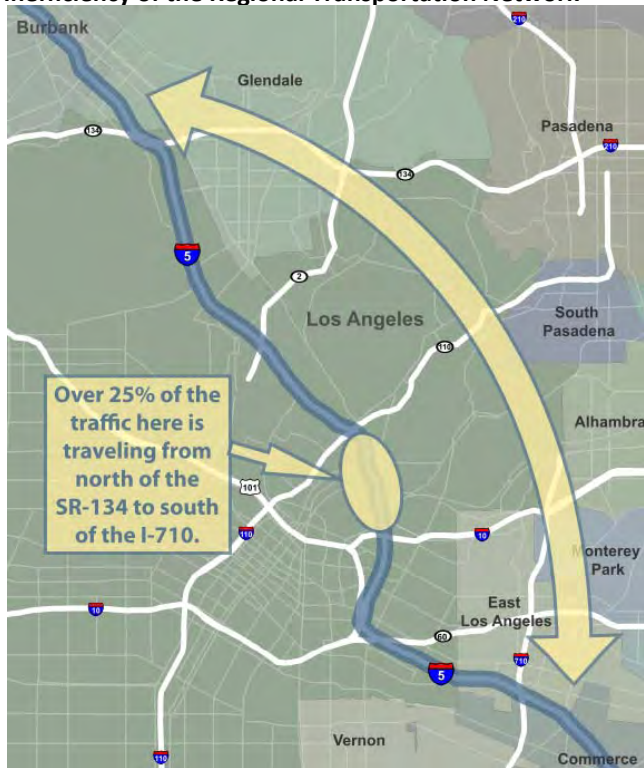

Figure 2-1 highlights trips between two sets of major activity centers (between East Los Angeles and Pasadena and between Pasadena and El Monte). In each case, the freeway travel distance is twice or more the direct distance (“as the crow flies”). The result is that drivers are either using local streets for these trips or spending unnecessary time and distance on the regional freeway network. Making these trips on either local streets or using the out-of-direction freeway system will increase the congestion on these systems.

FIGURE 2-1
 Freeway vs. Direct Travel Distance

The inefficiency of the regional transportation network is illustrated in Figure 2-2. An analysis using the SCAG model shows that over one-quarter of the traffic on I-5 between I-10 and SR 110 does not have an origin or destination between SR 710 and SR 134. The result is that regional and inter-regional traffic is using I-5—one of the most congested freeways in Los Angeles County. This traffic that does not need to be on I-5 to reach its destination contributes to additional system delay and accidents.

FIGURE 2-2
Inefficiency of the Regional Transportation Network

Travel inefficiencies in the region and study area are either the result or cause of transportation system congestion. Congestion can best be seen by looking at the travel speeds on the freeway system in the PM peak hour. Figure 2-3 is a summary of analysis conducted by SCAG for the 2012 RTP and shows that current PM peak period travel speeds on north-south freeways between I-10 and US 101/SR 134/I-210 are less than 15 miles per hour (mph) in many locations.

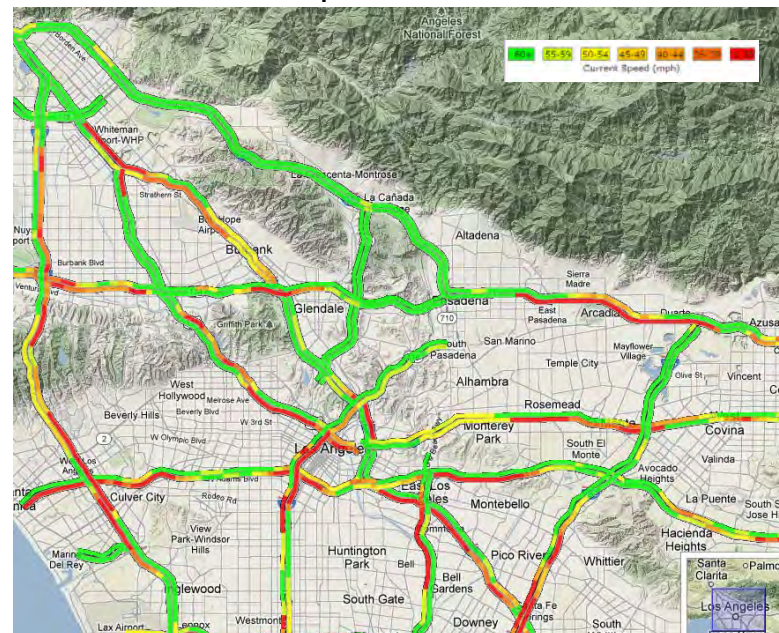

Figure 2-4 is an illustration of the current PM peak hour speeds on freeways in the study area based on data in the Caltrans Performance Measurement System (PeMS). Speeds on I-5 between I-10 and SR 2 are among the slowest in the region. Some of the most-congested freeways in Los Angeles County are located in the area of influence of the SR 710 EIR/EIS study area.

**FIGURE 2-3
SCAG 2012 PM Peak Hour Speeds**

Source: SCAG, 2012 RTP

**FIGURE 2-4
PeMS 2012 PM Peak Hour Speeds**

Source: Caltrans, PeMS

The roads between I-210, I-605, I-10, SR 2, and SR 110 were analyzed with the 2008 RTP travel demand model and compared to the region as whole. Average speeds in the study area are lower than average Los Angeles metropolitan area as summarized in Table 2-1. These lower speeds are in part attributable to the increased congestion due to a lack of sufficient transportation facilities.

TABLE 2-1
Study Area Average Speeds Compared to Los Angeles Metropolitan Area

Facilities in Study Area	Percent Lower Speeds than Los Angeles Metropolitan Area
Freeways	10%
Arterials	13%
Collectors	31%

CH2M HILL calculations, 2012

For a typical weekday PM peak, about half of the 108 miles of freeway network (I-5, SR 110, SR 710, I-10, I-60, and I-210) in the study area is operating at speeds below 50 mph, indicating congestion (CH2M HILL 2012 calculations using data from Google Maps).

Accident rates on the study area freeways are well above the state average based on the Caltrans Traffic Accident Surveillance and Analysis System data (July 1, 2007 through June 30, 2010). In the SCAG region, 1,533 people died and 124,975 were injured in traffic collisions during this time period. The congestion and inefficiency of the freeway system directly contribute to safety deficiencies.

2.2.1 Study Area Freeways

Eight freeways are located in the study area. Descriptions of the study area freeways are provided in this section.

Interstate-5

I-5 is the primary north-south interstate on the West Coast, serving travel from the Canadian border to the Mexican border through Washington, Oregon, and California. In the study area, the alignment of I-5 is from the northwest to the southeast, passing through the City of Los Angeles. The number of lanes varies, as lanes are added and dropped through the system interchanges. There are as few as two lanes in each direction near the East Los Angeles interchange (U.S. Route [US] 101 and I-10) and as many as five general purpose (GP) lanes in each direction in many locations (not including auxiliary lanes).

Interstate-10

I-10 is the primary east-west coast-to-coast interstate of Southern United States, serving travel from California to Florida through Arizona, New Mexico, Texas, Louisiana, Mississippi, and Alabama. In the study area, the alignment of I-10 is from east to west, passing through the urbanized areas of Monterey Park, Alhambra, Rosemead, El Monte, Baldwin Park, and Los Angeles County. The number of lanes varies, as lanes are added and dropped through the system interchanges. There are as few as three GP lanes in each direction near the East Los Angeles interchange (US 101 and I-5) and the I-710/I-10 interchange and as many as six GP lanes in each direction in many locations (not including auxiliary lanes).

Interstate-210

I-210 is an east-west highway joined by SR 210, serving travel from I-5 to I-10 in Redlands, California. In the study area, the alignment of I-210 is from northwest to east, passing through the urbanized areas of Glendale, La Cañada Flintridge, Pasadena, Arcadia, Monrovia, Duarte, Irwindale, and Azusa. The number of lanes varies, as lanes are added and dropped through the system interchanges. There are as few as four GP lanes in each direction north of the SR 134/I-210 interchange and as many as five GP lanes in each direction in many locations (not including auxiliary lanes). There is one high-occupancy vehicle (HOV) lane in each direction of I-210 within the project area.

Interstate-605

I-605 is a north-south freeway in California, serving travel from I-210 to I-405. In the study area, the alignment of I-605 is from north to south, passing through the urbanized areas of Irwindale, Baldwin Park, and Los Angeles County. There are as few as three GP lanes and as many as four GP lanes in each direction in many locations (not including auxiliary lanes). There is one HOV lane in each direction of I-605 south of I-10.

Intersate-710

I-710 is a north-south freeway, serving travel from Long Beach to Alhambra. In the study area, the alignment of I-710 is from north to south, passing through the urbanized areas of Monterey Park and Los Angeles County. The number of lanes varies, as lanes are added and dropped through the system interchanges. There are as few as two GP lanes and as many as four GP lanes in each direction in many locations (not including auxiliary lanes).

State Route 2

SR 2 is a north-south state highway, serving travel from I-10 to SR 138. In the study area, the alignment of SR 2 is from north to south, passing through the urbanized areas of La Canada Flintridge, Glendale, and City of Los Angeles. The number of lanes varies, as lanes are added and dropped through the system interchanges. There are as few as two lanes in each direction near the SR 2/I-5 and as many as five GP lanes in each direction in many locations (not including auxiliary lanes).

State Route 110

SR 110 is a north-south state highway joined by I-110, serving travel from I-210 to I-110. In the study area, the alignment of SR 110 is from north to south, passing through the urbanized areas of Pasadena, South Pasadena, and City of Los Angeles. There are as few as two lanes at the northern portion of SR 110, and as many as three GP lanes in each direction in many locations (not including auxiliary lanes).

State Route 134

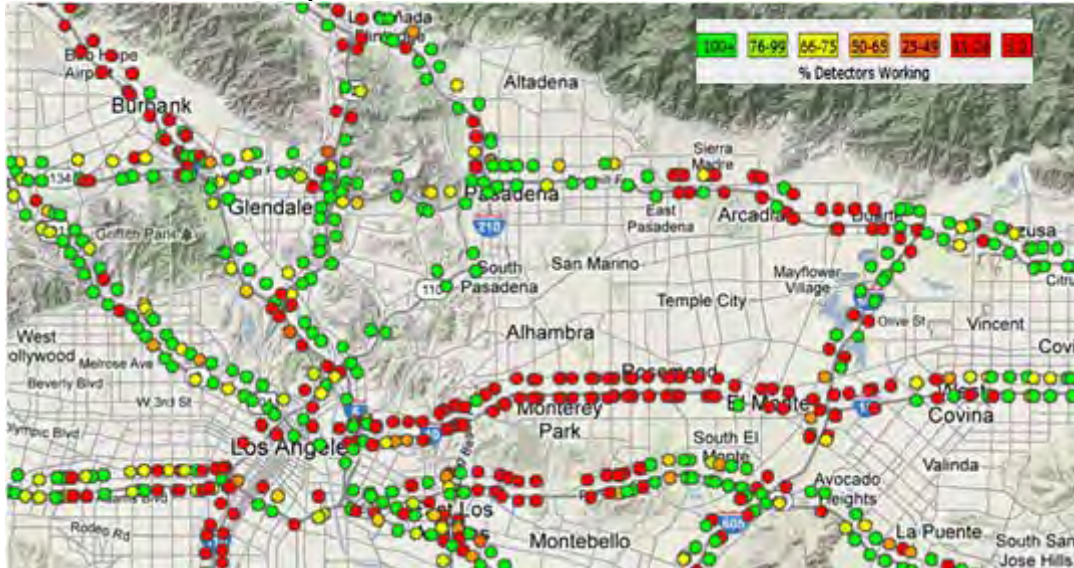

SR 134 is an east-west state highway, serving travel from SR 170 to I-210. In the study area, the alignment of SR 134 is from east to west, passing through the urbanized areas of Los Angeles and Pasadena. There are four GP lanes and one HOV lane in each direction within the project area (not including auxiliary lanes).

2.2.2 Freeway Operations

Data on freeway operations were primarily obtained from PeMS, which provides real-time and historical data on freeway operations. Data include volume, speed, travel time, and incidents. This section is a summary of these data.

While PeMS is a comprehensive database, the data are limited by available detectors. Figure 2-5 is a summary of data from PeMS showing the detector health on all the freeways in the study area. The green and red colors indicate the percentage of working detector stations as of April 18, 2012.

FIGURE 2-5
Detector Health in the Study Area

Source: Caltrans, PeMS

Table 2-2 is a summary of the Average Daily Traffic (ADT) volumes and PM peak hour average speeds of the freeways in the study area.

TABLE 2-2
Study Area Freeway ADT and PM Peak Hour Average Speeds

Freeway (Direction)	Location	ADT (vehicles/day)	PM Peak Hour Average Speed (mph)	
			NB/EB	SB/WB
I-5 (North-South)	Between I-605 and SR 2	227,000 to 286,000	39	43
I-10 (East-West)	Between US 101 and I-605	203,000 to 300,000	N/A	N/A
I-210 (East-West)	Between SR 134/SR 710 and I-605	135,000 to 295,000	38	57
I-605 (North-South)	Between I-5 and I-210	135,000 to 299,000	47	50
I-710 (North-South)	Between I-5 and I-210/SR 134	4,200 to 212,000	59	34
SR 2 (North-South)	Between I-5 and I-210	56,000 to 152,000	62	68
SR 110 (North-South)	Between I-10 and Glenarm Street (Pasadena, CA)	41,000 to 284,000	47	49
SR 134 (East-West)	Between I-5 and I-210/SR 710	96,000 to 234,000	57	64

Source: Caltrans, 2011

Interstate-5

Freeway operations on I-5 were analyzed between I-710 and I-110. Figure 2-6 is an illustration of the volumes, throughout the day, on an 8-mile segment of I-5 between I-710 and I-110. The volumes in Figure 2-6 are based on PeMS data collected in October 2011. During and between the peak hours, volumes on I-5 experiences volumes are greater than 5,500 vehicles per hour (vph) in both directions.

FIGURE 2-6
Volume on I-5 Between I-710 and I-110

Source: Caltrans, PeMS

Figure 2-7 is a summary of the speed variation on I-5 between I-710 and I-110 during the weekday peak hours. The speeds reported in Figure 2-7 are based on PeMS data collected in October 2011. The overall average speed on I-5 is approximately 40 mph. In the AM peak hour, approximately 55 percent of the segment between I-710 and I-110 operates at a speed less than 37 mph in the SB direction. The average speed in the NB direction is 44 mph. In the PM peak hour, approximately 95 percent of the segment between I-710 and I-110 operates at a speed less than 30 mph in the NB direction. Approximately 50 percent of this segment operates at a speed less than 25 mph in the SB direction. Some of the PeMS stations between I-710 and I-10 have speeds less than 20 mph.

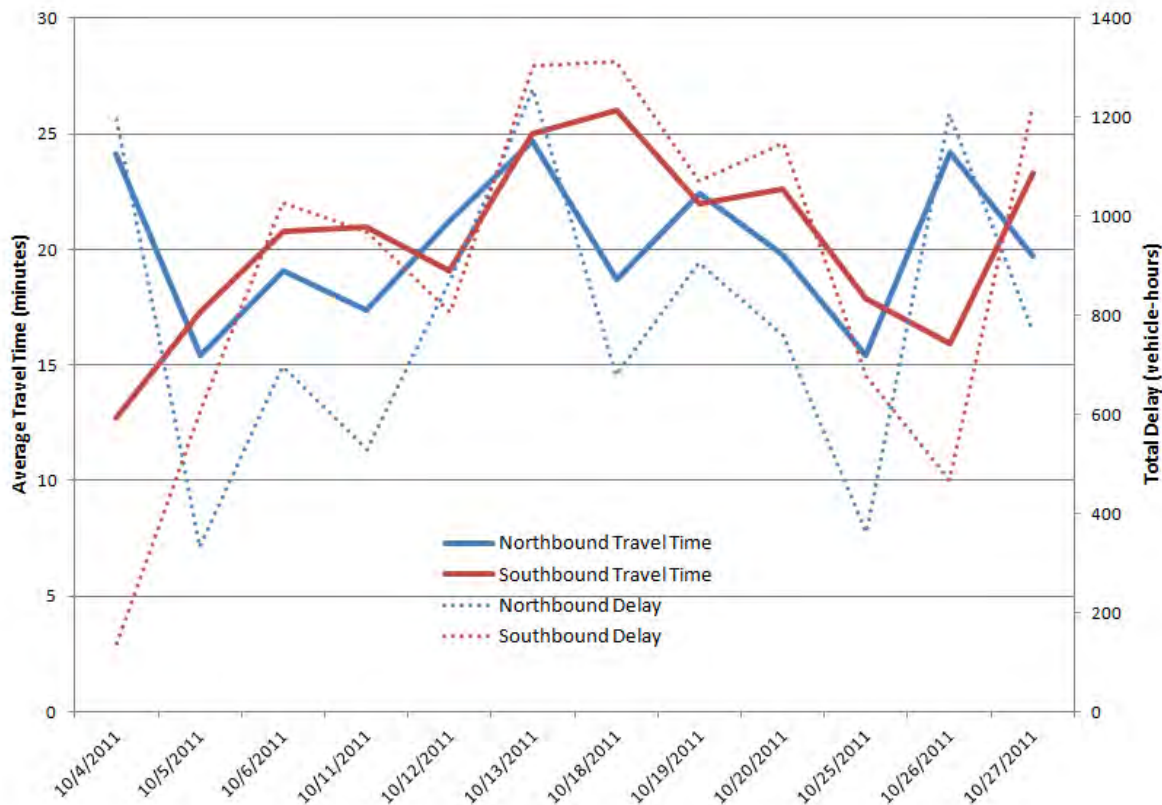

FIGURE 2-7
Speeds on I-5 during Weekday Peak Hours, 8 AM and 5 PM

Source: Caltrans, PeMS

Speeds on I-5 vary from one day to another. The variation in speeds can lead to travel times that can be 60 to 105 percent higher than average on a peak weekday. This increase in travel times can be translated to a total delay that is four to nine times higher than expected, depending on the day. Figure 2-8 illustrates the variation in travel time and delay on I-5 based on PeMS data collected in October 2011.

FIGURE 2-8
I-5 Travel Time and Delay, Tuesday through Thursday

The volumes and speeds on the study area freeways were further analyzed to determine their reliability. Reliability data indicate the expected volumes/speeds and the variability of those volumes/speeds during the peak hours from one day to another based on historical trends. Monday through Friday data were examined for all of 2011, from 8 to 9 AM for morning peak hour and 5 to 6 PM for evening peak hour, to determine reliability.

A simple way to present annual reliability data is to organize it by percentiles. A percentile is the value of a variable below which a certain percent of observations fall. For example, if the 50th percentile of a data set is 40 mph, 50 percent of the observations are less than 40 mph. The range between the 10th and 90th percentiles is a good representation of the entire set of observations because it filters outliers such as upstream and downstream accidents. In addition, the range between the 10th and 90th percentiles illustrates the data variability and draws conclusions about reliability. A relatively small range between the 10th and 90th percentiles indicates that the variability is low and the reliability is high. In contrast, a high range between the 10th and 90th percentiles indicates that the variability is high and the reliability is low.

Figure 2-9 is an illustration of the weekday peak hour traffic volumes at selected locations on I-5. In the SB direction at Fourth Street, I-5 serves 6,000 to 8,000 vph in the AM peak hour and 4,000 to 6,000 vph in the PM peak hour. The range between the 10th and 90th percentiles is 5,000 to 6,000 vph in the PM peak hour and 7,000 to 7,600 vph in the AM peak hour. In the NB direction at Pasadena Avenue, the volumes on I-5 are slightly lower, ranging between 4,000 and 6,000 vph in the AM peak hour and 3,000 to 6,000 vph in the PM peak hour. The range between the 10th and 90th percentiles is approximately 5,100 to 5,600 vph for the AM peak hour and 4,900 to 5,600 PM peak hour. Since these percentiles have relatively close ranges, the data indicate that there is relatively consistent traffic demand throughout the year.

Figure 2-10 is an illustration of the weekday peak hour speeds on the same locations (Pasadena Avenue and Fourth Street) based on PeMS data collected throughout the year in 2011. Speeds in the NB direction are low at Pasadena Avenue (just north of EB I-10) in the PM peak hour. Over half of the data set observations are speeds

less than 30 mph. In the SB direction, over half of the data set observations are speeds less than 30 mph in both AM and PM peak hours. In the SB direction, the range between the 10th and 90th percentiles is 22 to 58 mph in the AM peak hour and 19 to 72 mph in the PM peak hour. In the NB direction, the range between the 10th and 90th percentiles is 53 to 72 mph in the AM peak hour and 22 to 35 mph in the PM peak hour. These data indicate that reduced speeds and related delay on I-5 often vary dramatically from day to day, making travel times unreliable and unpredictable for drivers. Speeds vary more than demand due to effects of congestion, accidents, or incidents such as vehicle breakdowns, weather, and roadway hazards.

FIGURE 2-9
I-5 Traffic Reliability Data – Peak Hour Traffic Volumes

Source: Caltrans, PeMS

FIGURE 2-10
I-5 Traffic Reliability Data – Peak Hour Speeds

Source: Caltrans, PeMS

The unreliability in travel time and speeds on freeways can be attributed to accidents. Speed differentials can cause accidents and speed differentials result from accidents. Figure 2-11 is an illustration of the spatial distribution of accidents on I-5 between I-710 and I-110 from 2009 to 2011. These data are a combination of accidents in both directions ranging in severity from non-injury to fatality. The peak illustrated in Figure 2-11, between WB I-10 and I-110, corresponds to a segment between Fourth Street and Pasadena Avenue that is experiencing high volumes (Figure 2-9), low speeds (Figure 2-10), and a high number of accidents. The accidents that are reported for the I-5 corridor are typically clustered around SR 110, between SR 2 and SR 134, between SR 118 and I-405, and around I-210. On SB I-5, south of I-10, accident rates are three times higher than the state average, resulting in 561 accidents in 2011. There is a high concentration of accidents per mile on I-5 between I-10 and SR 110.

FIGURE 2-11
Accidents on I-5 between I-710 and I-110

Source: Caltrans, PeMS

Interstate-10

As illustrated in Figure 2-5, a low percentage of detectors on I-10 are functioning. As a result, accurate volume and speed data are unavailable, so a detailed freeway operations analysis of I-10 was not conducted. However, the section of I-10 between I-710 and I-605 is generally congested during the peak periods. WB I-10 is more congested in the AM peak period and EB I-10 is more congested in the PM peak period.

Figure 2-12 is an illustration of the spatial distribution of accidents on I-10 between I-710 and I-605 from 2009 to 2011. I-10 has a higher number of yearly accidents in multiple locations compared to other freeways in the study area. Between I-710 and I-605, accidents occur up to 80 percent more frequently than similar facilities. In this 10-mile section of freeway, 2,813 accidents have occurred over the past 3 years. The severity of accidents on WB I-10 between San Gabriel Boulevard and I-710 is 30 to 40 percent higher than the state average.

FIGURE 2-12
Accidents on I-10 between I-710 and I-605

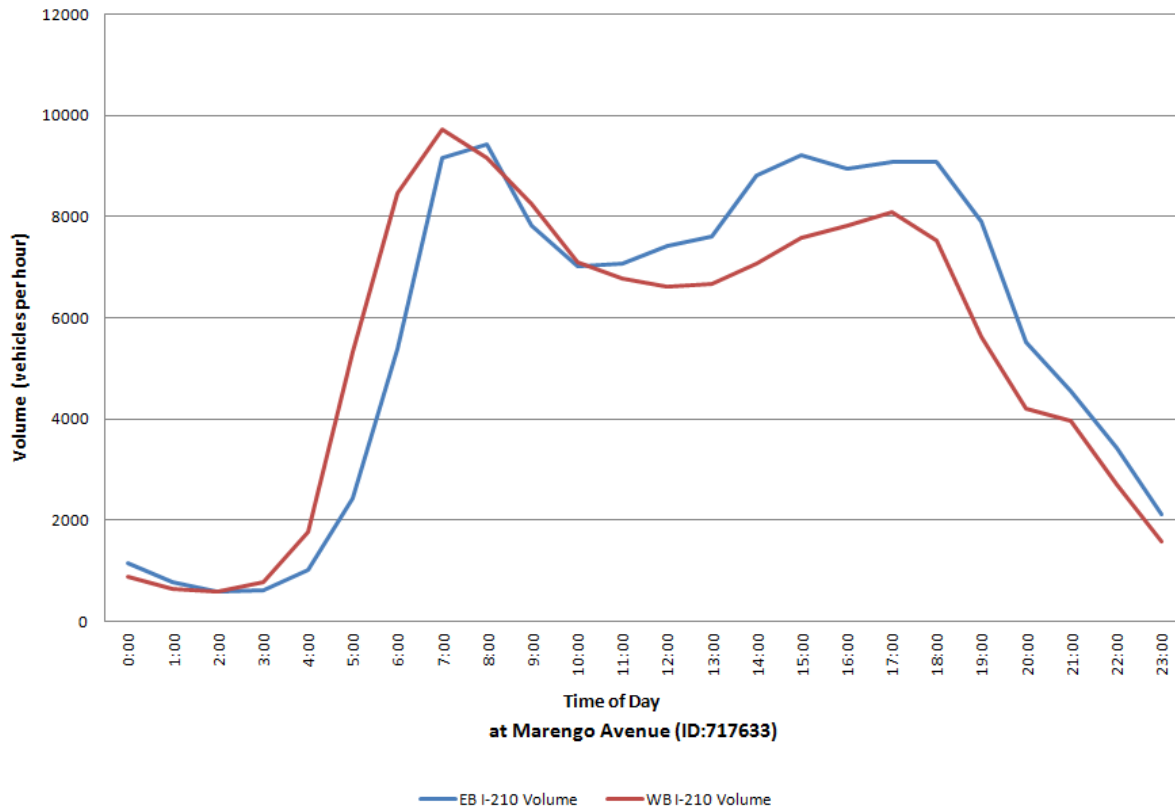

Source: Caltrans, PeMS

Interstate-210

Freeway operations on I-210 were analyzed between SR 134 and I-605. Figure 2-13 is an illustration of the volumes throughout the day at a selected location (Marengo Avenue, PeMS ID#717633). The volumes in Figure 2-13 are based on PeMS data collected in October 2011. During the peak hours, I-210 experiences volumes ranging between 8,000 and 10,000 vph in both directions. During the afternoon and evening hours, EB I-210 volumes are consistently higher than the WB direction.

FIGURE 2-13
Volume on I-210 at Marengo Avenue between SR 134 and Lake Avenue

Source: Caltrans, PeMS

Figure 2-14 is a summary of the speed variation on I-210 between SR 134 and I-605 during the weekday peak hours. The speeds reported on Figure 2-14 are based on PeMS data collected in October 2011. In the AM peak hour, speeds range from 20 to 50 mph on WB I-210 between I-605 to the west side of Rosemead Boulevard. In the PM peak hour, EB speeds range from 20 to 40 mph from Rosemead Boulevard to I-605. In the PM peak hour, drivers on EB I-210 experience an average delay of approximately 11.5 minutes due to congestion.

FIGURE 2-14
Speeds on I-210 during Weekday Peak Hours, 8 AM and 5 PM

Source: Caltrans, PeMS

Figure 2-15 is an illustration of the weekday peak hour traffic volumes at selected locations on I-210. In the WB direction at Santa Anita Avenue, I-210 serves 4,000 to 6,500 vph in the AM peak hour and 4,500 to 7,500 vph in the PM peak hour. The range between the 10th and 90th percentiles is 5,000 to 6,200 vph in the AM peak hour and 6,100 to 7,000 vph in the PM peak hour. In the EB direction, I-210 serves 7,000 to 10,000 vph (at Marengo Avenue) in the AM peak hour and 3,500 to 6,500 vph (at Huntington Drive) in the PM peak hour. The range between the 10th and 90th is 8,500 to 9,800 vph in the AM peak hour and 4,500 to 6,300 vph in the PM peak hour. Since the volume percentile ranges are close, the data indicate that there is relatively consistent demand throughout the year.

Figure 2-16 is an illustration of the weekday peak hour speeds on the same locations (Marengo Street, Santa Anita Avenue, and Huntington Drive) based on PeMS data collected throughout the year in 2011. Speeds in the WB direction are low at Marengo Avenue in the AM peak hour. Over half of the data set observations are speeds less than 25 mph. The range between the 10th and 90th percentiles is 18 to 40 mph in the AM peak hour and 35 to 65 mph in the PM peak hour. In the EB direction, over half of the data set observations are speeds less than 25 mph in the PM peak hour. The range between the 10th and 90th percentiles is 60 to 65 mph in the AM peak hour and 15 to 40 mph in the PM peak hour. Except for EB I-210 in the morning peak hours, all the other scenarios have high percentile ranges making the freeway travel times unreliable and unpredictable for drivers.

FIGURE 2-15
I-210 Traffic Reliability Data – Peak Hour Traffic Volumes

Source: Caltrans, PeMS

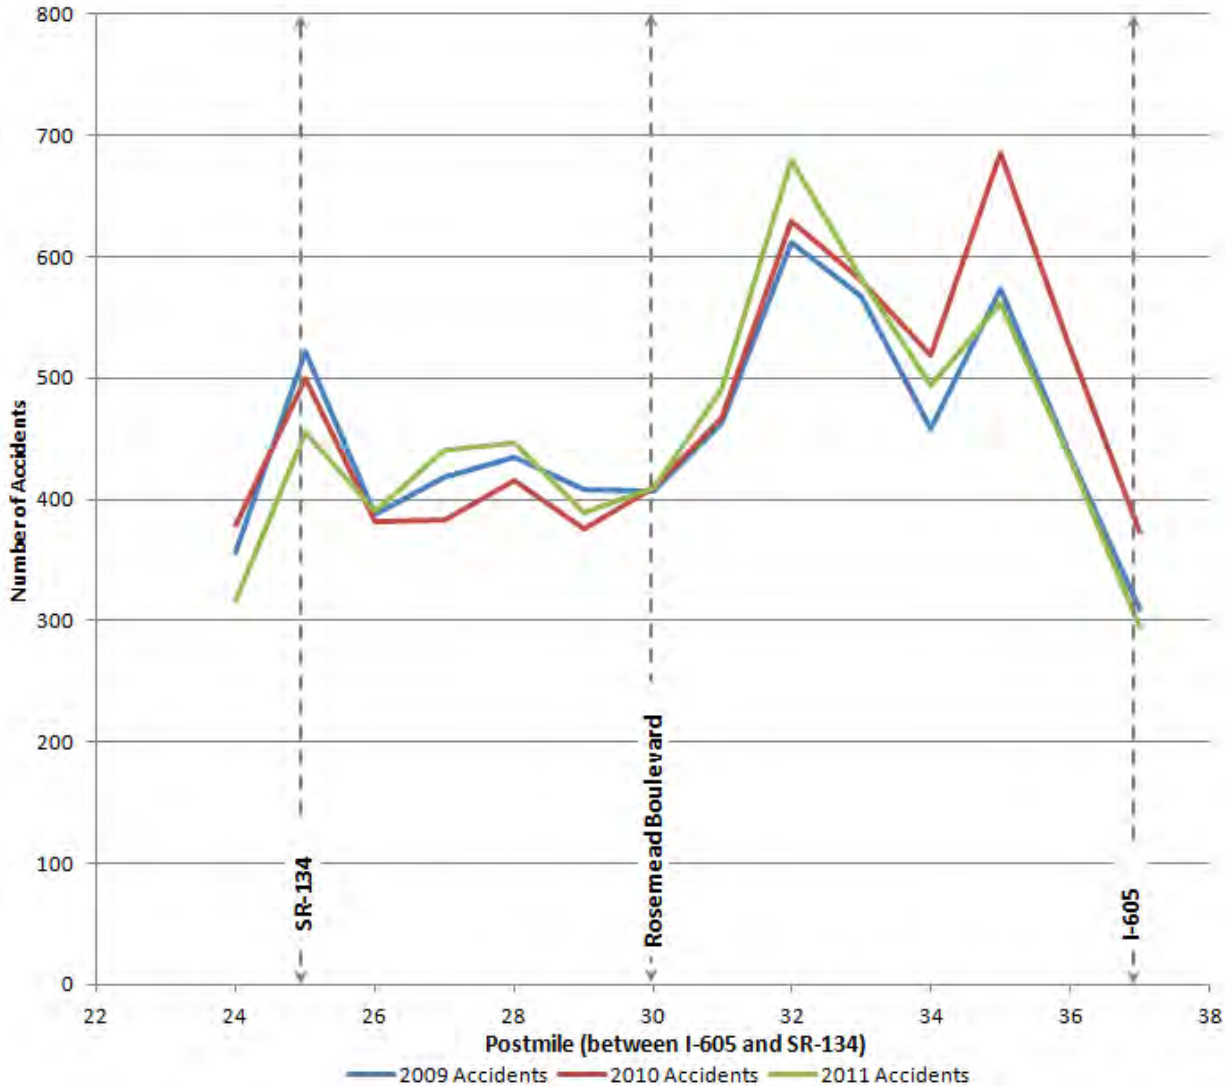

FIGURE 2-16
I-210 Traffic Reliability Data – Peak Hour Speeds

Source: Caltrans, PeMS

Figure 2-17 is an illustration of the spatial distribution of accidents on I-210 between I-605 and SR 134 from 2009 to 2011. These data are a combination of accidents in both directions ranging in severity from non-injury to fatality. Segments to the east of Rosemead Boulevard, where volume is high (Figure 2-15) and speeds are low (Figure 2-16), experience a high number of accidents. Approximately 680 accidents were reported in 2010 and 2011 in segments near Santa Anita Avenue and Huntington Drive.

FIGURE 2-17
Accidents on I-210 between I-605 and SR 134

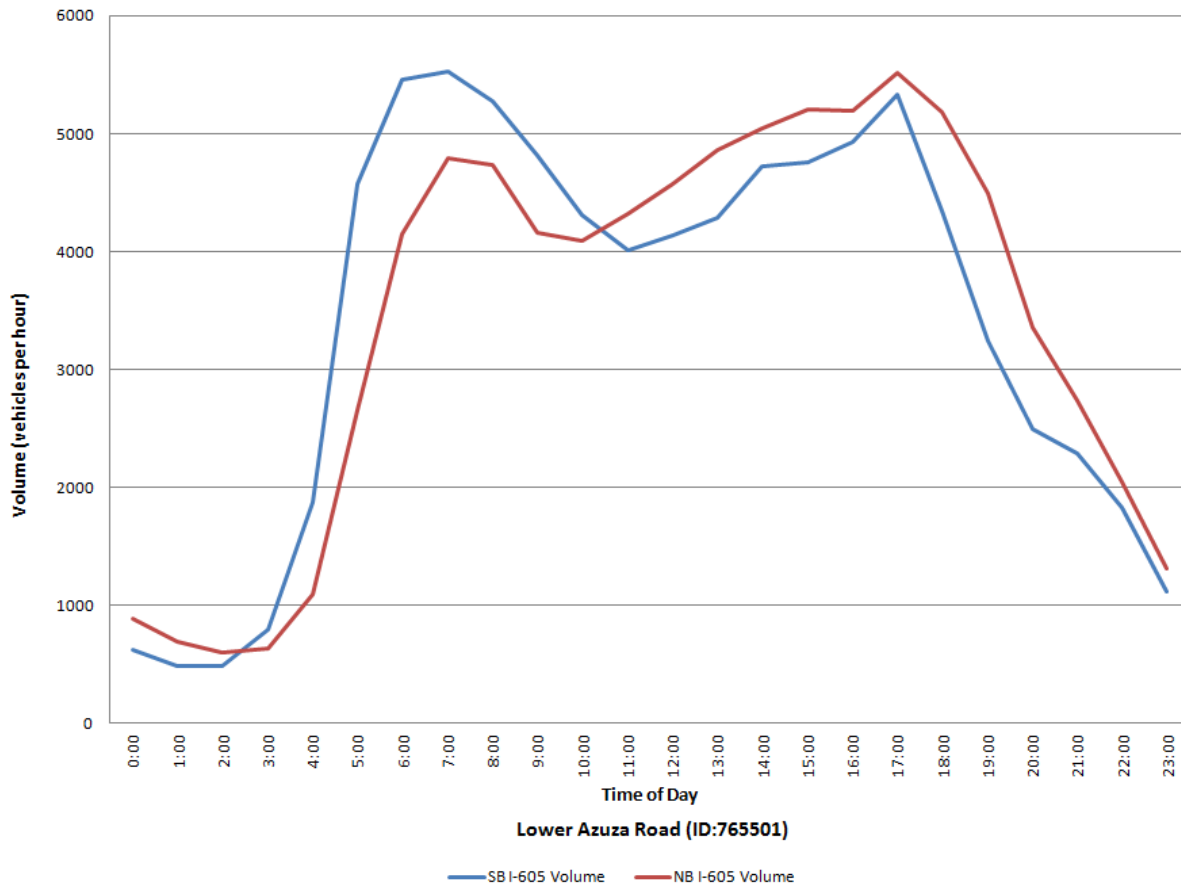

Source: Caltrans, PeMS

Interstate-605

Freeway operations on I-605 were analyzed between I-10 and I-210. Figure 2-18 illustrates the volumes throughout the day at a select location (Lower Azusa Road, PeMS ID#765501). The volumes in Figure 2-18 are based on PeMS data collected in October 2011. During the peak hours, I-605 experiences volumes ranging between 4,000 and 5,500 vph in both directions. During the PM peak, NBI-605 volumes are consistently higher than the SB direction.

FIGURE 2-18
Volume on I-605 at Lower Azuza Road

Source: Caltrans, PeMS

Figure 2-19 is a summary of the speed variation on I-605 between I-10 and I-210 during the weekday peak hours. The speeds reported on Figure 2-19 are based on PeMS data collected in October 2011. The AM and PM peak hour speeds on I-605 are generally above 50 mph in both directions with a few spot exceptions near I-10 and I-210.

FIGURE 2-19
Speeds on I-605 during Weekday Peak Hours, 8 AM and 5 PM

Source: Caltrans, PeMS

Figure 2-20 is an illustration of the weekday peak hour traffic at selected locations on I-605. In the SB direction at Lower Azuza Road, I-605 serves 3,400 to 5,900 vph in the AM peak hour and 4,300 to 5,700 vph in the PM peak hour. The range between the 10th and 90th percentiles is only 5,000 to 5,700 vph in the AM peak hour and 5,100 to 5,500 vph in the PM peak hour. In the NB direction at Valley Boulevard, I-605 serves 3,900 to 5,250 vph in the AM peak hour and 3,300 to 5,600 vph in the PM peak hour. The range between the 10th and 90th percentiles is 4,700 to 5,100 vph in the AM peak hour and 4,700 to 5,300 vph in the PM peak hour. For all scenarios on I-605, the percentile ranges are within 700 vph indicating that the traffic demand is relatively consistent throughout the year.

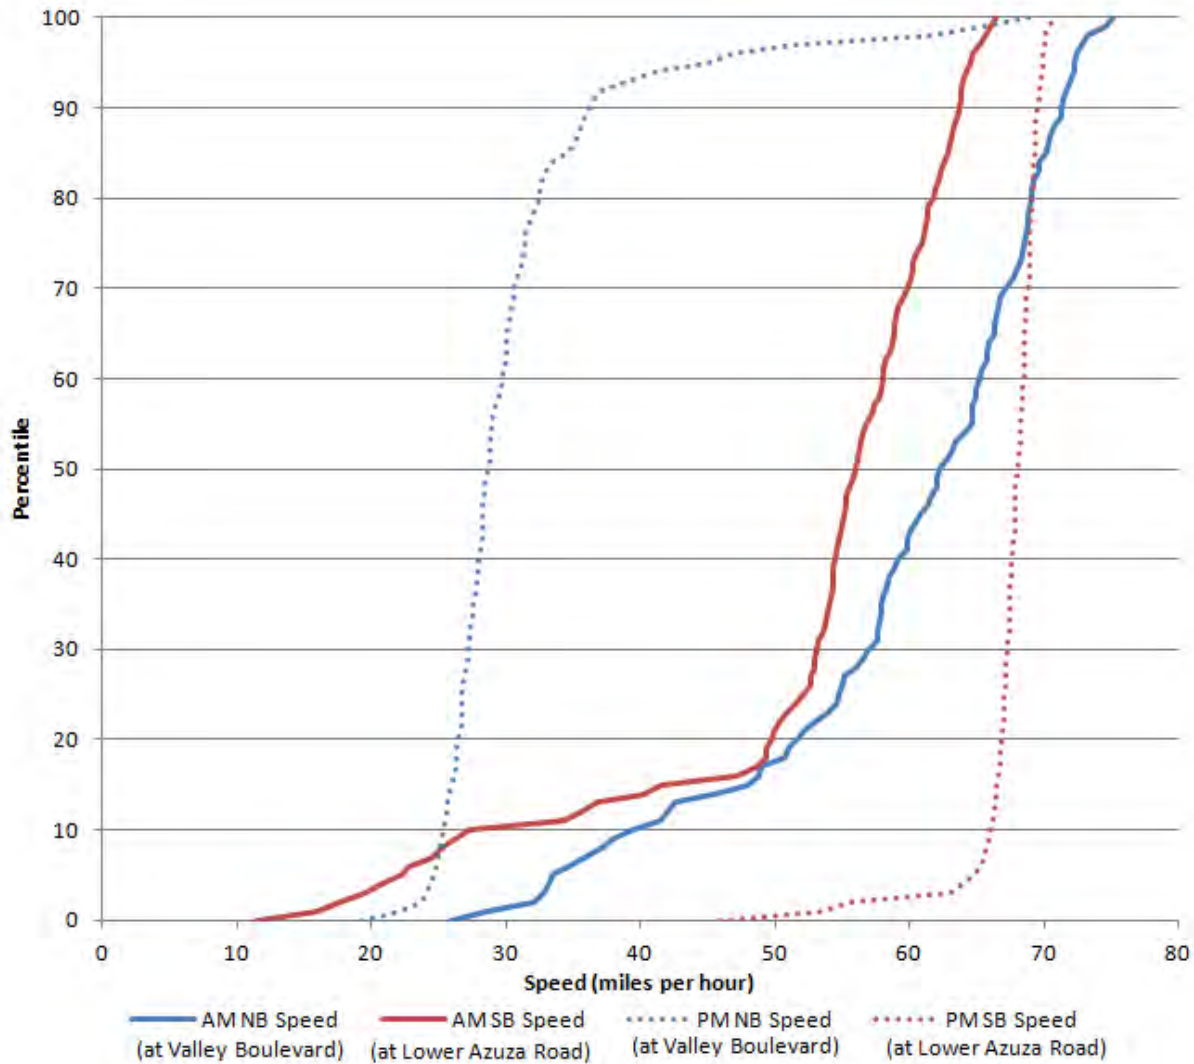

Figure 2-21 is an illustration of the weekday peak hour speeds on the same locations (Lower Azuza Road and Valley Boulevard) based on PeMS data collected throughout the year in 2011. In the SB direction, speeds range from 11 to 68 mph in the AM peak hour and 45 to 70 mph in the PM peak hour. The range between the 10th and 90th percentiles is 40 to 64 mph in the AM peak hour and 66 to 70 mph in the PM peak hour. NB speeds at Valley Boulevard in the PM peak hour are low. Over half of the data set observations are speeds less than 30 mph. The range between the 10th and 90th percentiles is 40 to 72 mph in the AM peak hour and 25 to 35 mph in the PM peak hour. Speeds on I-605 have relatively high variability, so the travel time reliability is often low for drivers in both directions.

FIGURE 2-20
I-605 Traffic Reliability Data – Peak Hour Traffic Volumes

Source: Caltrans, PeMS

FIGURE 2-21
I-605 Traffic Reliability Data – Peak Hour Speeds

Source: Caltrans, PeMS

Figure 2-22 is an illustration of the spatial distribution of accidents on I-605 from I-10 to I-210 from 2009 to 2011. There were a high number of accidents on the segments near I-10, where speeds are low and unreliable. From 2009 to 2011, there were 800 to 1,000 accidents near I-10. The concentration of accidents in that location is high compared to other freeways in the study area.

FIGURE 2-22
Accidents on I-605 between I-10 and I-210

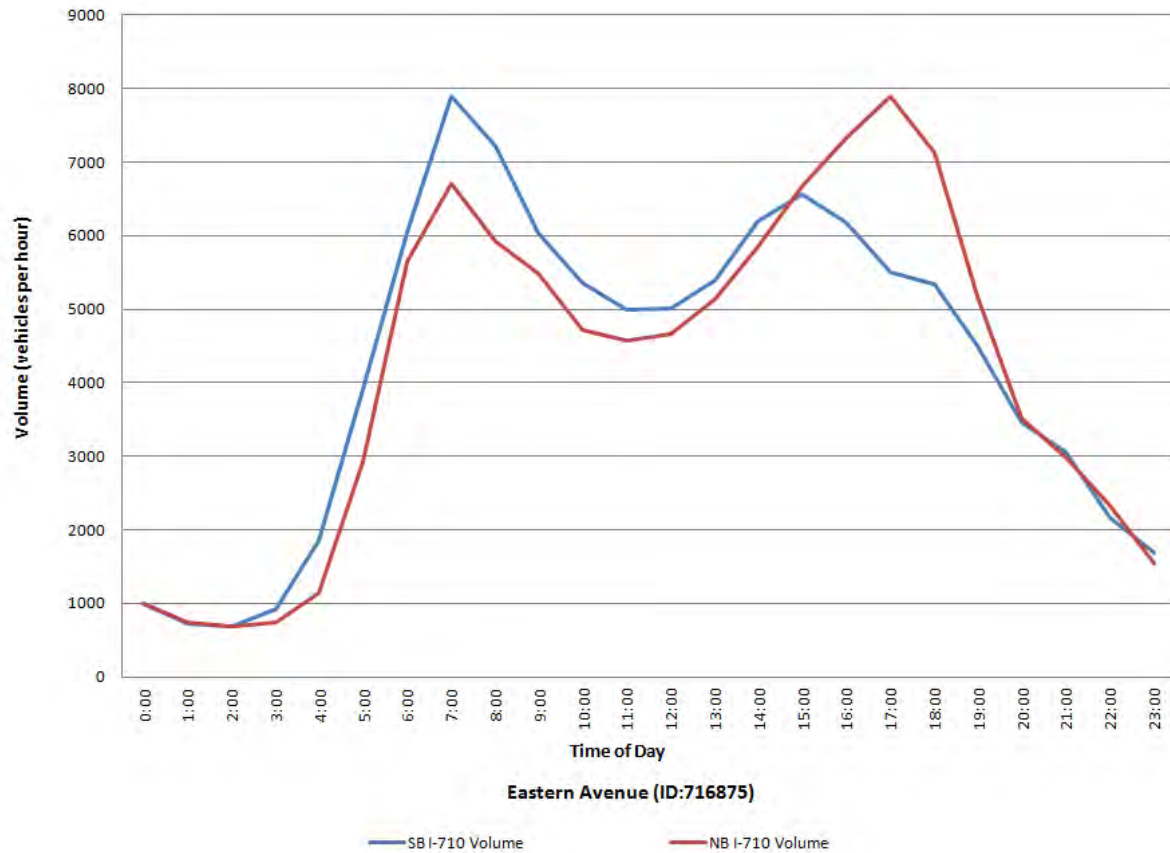

Source: Caltrans, PeMS

Interstate-710

As stated in the *I-710 Major Corridor Study* (Metro, 2005), “the I-710 freeway currently experiences high levels of congestion and emissions during the peak hours, a condition that is exacerbated by heavy truck volumes, design problems, and operational choke points along this 20-mile segment (Port of Los Angeles and Long Beach to SR 60) of the freeway. In addition, trucks and passenger vehicles that use surface streets and arterials as a means to avoid freeway congestion on I-710 contribute to existing traffic and quality of life concerns for the communities that line the I-710 Corridor.”

Due to limited detector availability, freeway operations on I-710 were analyzed in scattered segments between I-5 and the terminus, north of I-10. Figure 2-23 is an illustration of the volumes throughout the day at a select location (Eastern Avenue, PeMS ID#716875). The volumes in Figure 2-23 are based on PeMS data collected in October 2011. During the peak hours, volumes on I-710 peak at approximately 8,000 vph in both directions.

FIGURE 2-23
Volume on I-710 at Eastern Avenue between Whittier Boulevard and SR 60

Source: Caltrans, PeMS

Figure 2-24 is a summary of the speed variation on I-710 between I-5 and I-10 during the weekday peak hours. The speeds reported in Figure 2-24 are based on PeMS data collected in October 2011. In the AM peak hour, there are spot speeds lower than 30 mph as vehicles approach I-5 in the NB direction. In the PM peak hour, speeds on the SB direction are frequently less than 50 mph between SR 60 and I-5 and decrease past I-5 to spot speeds as low as 22 mph.

FIGURE 2-24
Speeds on I-710 during Weekday Peak Hours, 8 AM and 5 PM

Source: Caltrans, PeMS

Figure 2-25 is an illustration of the weekday peak hour traffic volumes at a selected location on I-710. SB at Eastern Avenue, I-710 serves 5,000 to 7,800 vph in the AM peak hour and 4,300 to 6,300 vph in the PM peak hour. The range between the 10th and the 90th percentile is 6,600 to 7,400 in the AM peak hour and 4,700 to 5,800 in the PM peak hour. In the NB direction, I-710 serves 4,200 to 7,800 vph in the AM peak hour and 4,700 to 8,100 in the PM peak hour. The range between the 10th and 90th percentiles is 5,500 to 6,100 vph in the AM peak hour and 6,800 to 7,700 vph in the PM peak hour. The variability in the traffic volumes I-710 serves is generally low.

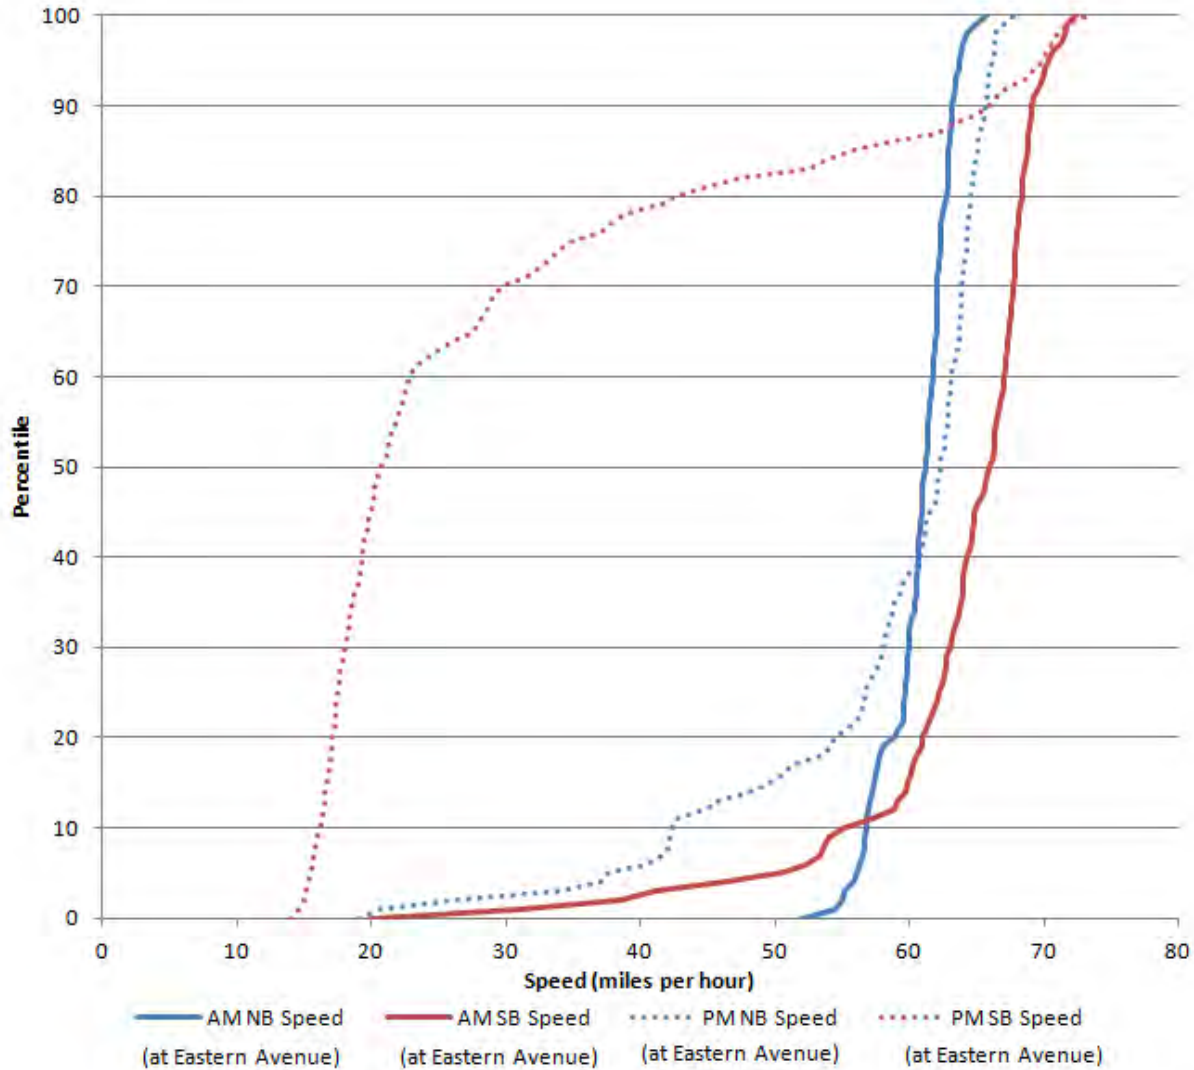

Figure 2-26 is an illustration of the weekday peak hour speeds in the same location (Eastern Avenue) based on PeMS data collected throughout the year in 2011. Speeds in the SB direction are low at Eastern Avenue in the PM peak hour. Half of the data set observations are speeds less than 20 mph. The speeds range from 20 to 72 mph in the AM peak hour and 13 to 73 mph in the PM peak hour. The range between the 10th and 90th percentiles is 55 to 70 vph in the AM peak hour and 16 to 66 mph in the PM peak hour. In the NB direction, speeds range from 52 to 66 mph in the AM peak hour and 19 to 68 mph in the PM peak hour. The range between the 10th and 90th percentiles is 57 to 63 vph in the AM peak hour and 42 to 65 vph in the PM peak hour. Speeds in the SB direction have a high variability in the both AM and PM peak hours, thus making I-710 travel times unreliable and unpredictable for drivers.

FIGURE 2-25
I-710 Traffic Reliability Data – Peak Hour Traffic Volumes

Source: Caltrans, PeMS

FIGURE 2-26
I-710 Traffic Reliability Data – Peak Hour Speeds

Source: Caltrans, PeMS

The *I-710 Major Corridor Study* (Metro, 2005) states that “high traffic volumes, design deficiencies, freeway congestion, and the interaction between cars and trucks in the traffic stream, create potentially unsafe conditions. Field officers of the California Highway Patrol consider I-710 to be one of the worst freeways in the Los Angeles County area with regard to safety.”

Figure 2-24 is an illustration of the spatial distribution of accidents on I-710 between I-60 and the terminus from 2009 to 2011. I-710 experiences an accident rate that is well above the statewide average. On SB I-710 between SR 60 and I-5, accidents occur 80 percent more frequently than similar facilities (102 more accidents on a 1-mile segment of freeway in 3 years).

FIGURE 2-27
Accidents on I-710 between SR 60 and Terminus

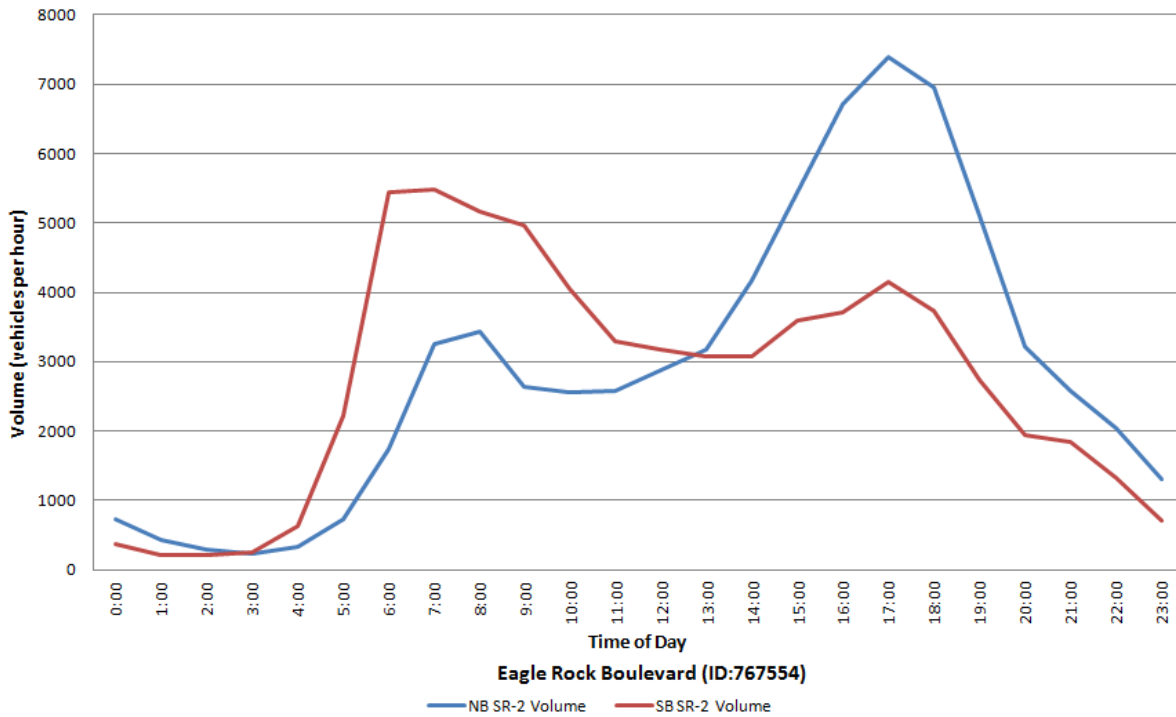

Source: Caltrans, PeMS

State Route 2

Freeway operations in SR 2 were analyzed between I-5 and I-210. Figure 2-28 is an illustration of the volumes throughout the day at a select location (Eagle Rock Boulevard PeMS ID#767554). The volumes in Figure 2-28 are based on PeMS data collected in October 2011. SR 2 experiences heavy volumes going SB in the AM peak hour and NB in the PM peak hour. In the PM peak hour, up to 7,500 vph use SR 2 traveling NB, past Eagle Rock Boulevard.

FIGURE 2-28
Volume on SR 2 at Eagle Rock Boulevard

Source: Caltrans, PeMS

Figure 2-29 is a summary of the speed variation on SR 2 between I-5 and I-210 during weekday peak hours. The speeds reported in Figure 2-29 are based on PeMS data collected in October 2011. The AM peak hour experiences low speeds between SR 134 and I-5 due to the high volume. Speeds are lower than 40 mph in that segment. In the PM peak hour, the NB direction speeds range between 50 and 70 mph.

FIGURE 2-29
Speeds on SR 2 during Weekday Peak Hours, 8 AM and 5 PM

Source: Caltrans, PeMS

Figure 2-30 is an illustration of the weekday peak hour traffic volumes at a select location on SR 2. In the SB direction at San Fernando Road, SR 2 serves 3,900 to 6,500 vph in the AM peak hour and 4,000 to 5,300 vph in the PM peak hour. The range between the 10th and 90th percentiles is 5,100 to 6,200 vph in the AM peak hour and 4,400 to 5,000 vph in the PM peak hour. In the NB direction at San Fernando Road, SR 2 serves 2,200 to 3,400 vph in the AM peak hour and 4,900 to 7,600 in the PM peak hour. The range between the 10th and 90th percentiles is 2,900 to 3,200 vph in the AM peak hour and 6,600 to 7,400 vph in the PM peak hour. The close ranges between these percentiles indicate that there is relatively consistent traffic demand throughout the year.

Figure 2-31 is an illustration of the weekday peak hour speeds on the same location (San Fernando Road) based on PeMS data collected throughout year 2011. In the AM peak hour, the SB direction experiences low speeds. Over half of the data set observations are speeds less than 30 mph. The speeds range from 22 to 68 mph in the AM peak hour and 46 to 72 mph in the PM peak hour. The range between the 10th and 90th percentiles is 27 to 48 mph in the AM peak hour and 63 to 70 mph in the PM peak hour. In the NB direction, the speeds range from 61 to 72 mph in the AM peak hour and 21 to 70 mph in the PM peak hour. The range between the 10th and 90th percentiles is 67 to 71 mph in the AM peak hour and 51 to 68 mph in the PM peak hour. With the exception of SB travel in the AM peak hour, SR 2 has low speed variability and high reliability for drivers.

FIGURE 2-30
SR 2 Traffic Reliability Data – Peak Hour Traffic Volumes

Source: Caltrans, PeMS

FIGURE 2-31
SR 2 Traffic Reliability Data – Peak Hour Speeds

Source: Caltrans, PeMS

On WB SR 2 between Eagle Rock Boulevard and San Fernando Road, accidents occur 25 percent more frequently than similar facilities (18 more accidents on a 1-mile segment of freeway in 3 years). The accident spatial distribution data for SR 2 were not available on PeMS.

State Route 110

Freeway operations in SR 110 were analyzed between I-5 and the terminus, just south of I-210 in Pasadena. Figure 2-32 is an illustration of the volumes throughout the day at a select location (Avenue 43 PeMS ID#767750). The volumes in Figure 2-32 are based on PeMS data collected in October 2011. For most of the day, the NB traffic is much higher than SB as vehicles exit the downtown area. During the PM peak hour, NB traffic increases to approximately 7,000 vph.

FIGURE 2-32
Volume on SR 110 at Avenue 43

Source: Caltrans, PeMS

Figure 2-33 is a summary of the speed variation on SR 2 between I-5 and the terminus during weekday peak hours. The speeds on Figure 2-33 are based on PeMS data collected in October 2011. In the AM peak hour, vehicles making their way toward downtown experience low speeds close to I-5. The average speeds in this segment are frequently less than 30 mph and they decrease to less than 15 mph in some locations. NB vehicles exiting the downtown area experience speeds between 35 and 55 mph as they approach I-5.

FIGURE 2-33
Speeds on SR 110 during Weekday Peak Hours, 8 AM and 5 PM

Source: Caltrans, PeMS

Figure 2-34 is an illustration of the weekday peak hour traffic volumes at a select location on SR 110. In the SB direction (north of I-5), SR 110 serves 900 to 4,100 vph in the AM peak hour and 1,100 to 2,600 vph in the PM peak hour. The range between the 10th and 90th percentiles is 1,700 to 3,900 vph in the AM peak hour and 2,000 to 2,500 vph in the PM peak hour. In the NB direction (south of the I-5 interchange), SR 110 serves 2,800 to 4,100 vph in the AM peak hour and 5,100 to 7,200 in the PM peak hour. The range between the 10th and 90th percentiles is 3,500 to 3,900 vph in the AM peak hour and 6,300 to 6,900 vph in the PM peak hour. The close ranges between these percentiles indicate that there is consistent traffic demand throughout the year.

Figure 2-35 is an illustration of the weekday peak hour speeds on the same locations (north and south of I-5) based on PeMS data collected throughout year 2011. In the AM peak hour, the SB direction experiences low speeds. Over half of the data set observations are speeds less than 30 mph. The speeds range from 5 to 76 mph in the AM peak hour and 12 to 75 mph in the PM peak hour. The range between the 10th and 90th percentiles is 8 to 68 mph in the AM peak hour and 61 to 75 mph in the PM peak hour. In the NB direction, the speeds range from 43 to 62 mph in the AM peak hour and 27 to 49 mph in the PM peak hour. The range between the 10th and 90th percentiles is 57 to 60 mph in the AM peak hour and 36 to 48 mph in the PM peak hour. SR 110 has poor reliability in the SB direction, making conditions unpredictable for drivers.

FIGURE 2-34
SR 110 Traffic Reliability Data – Peak Hour Traffic Volumes

Source: Caltrans, PeMS

FIGURE 2-35
 SR 110 Traffic Reliability Data – Peak Hour Speeds

Source: Caltrans, PeMS

Figure 2-36 is an illustration of the spatial distribution of accidents on I-110 between I-5 and the terminus from 2009 to 2011. On SR 110 north of I-5, accident rates are up to 156 percent above the state average. This equates to 168 more accidents over a 3-year period. In the 3 years, the location north of I-5 experienced the highest number of accidents, ranging from 600 to 730, than any other location in the study segment.

FIGURE 2-36
Accidents on SR 110 between I-5 and Terminus

Source: Caltrans, PeMS

State Route 134

Freeway operations on SR 134 were analyzed between I-5 and the I-210/SR 710 interchange. Figure 2-37 is an illustration of the volumes throughout the day at a selected location (Brand Boulevard, PeMS ID#717583). The volumes in Figure 2-37 are based on PeMS data collected for October 2011. During the AM peak hours, SR 134 experiences peaks of 6,300 vph (in the EB direction) and 7,200 vph (in the WB direction). In the PM peak hours, the EB freeway serves 7,800 vph.

FIGURE 2-37
Volume on SR 134 at Brand Boulevard

Source: Caltrans, PeMS

Figure 2-38 is an illustration of the speed variation on I-5 between I-5 and I-210/SR 710 interchange during weekday peak hours. The speeds reported in Figure 2-38 are based on PeMS data collected in October 2011. In the AM peak hour, speeds in the WB direction range between 40 and 50 mph in segments between SR 2 and I-5. In the PM peak hour, speeds in EB direction are less than 30 mph near I-5.

FIGURE 2-38
Speeds on SR 134 during Weekday Peak Hours, 8 AM and 5 PM

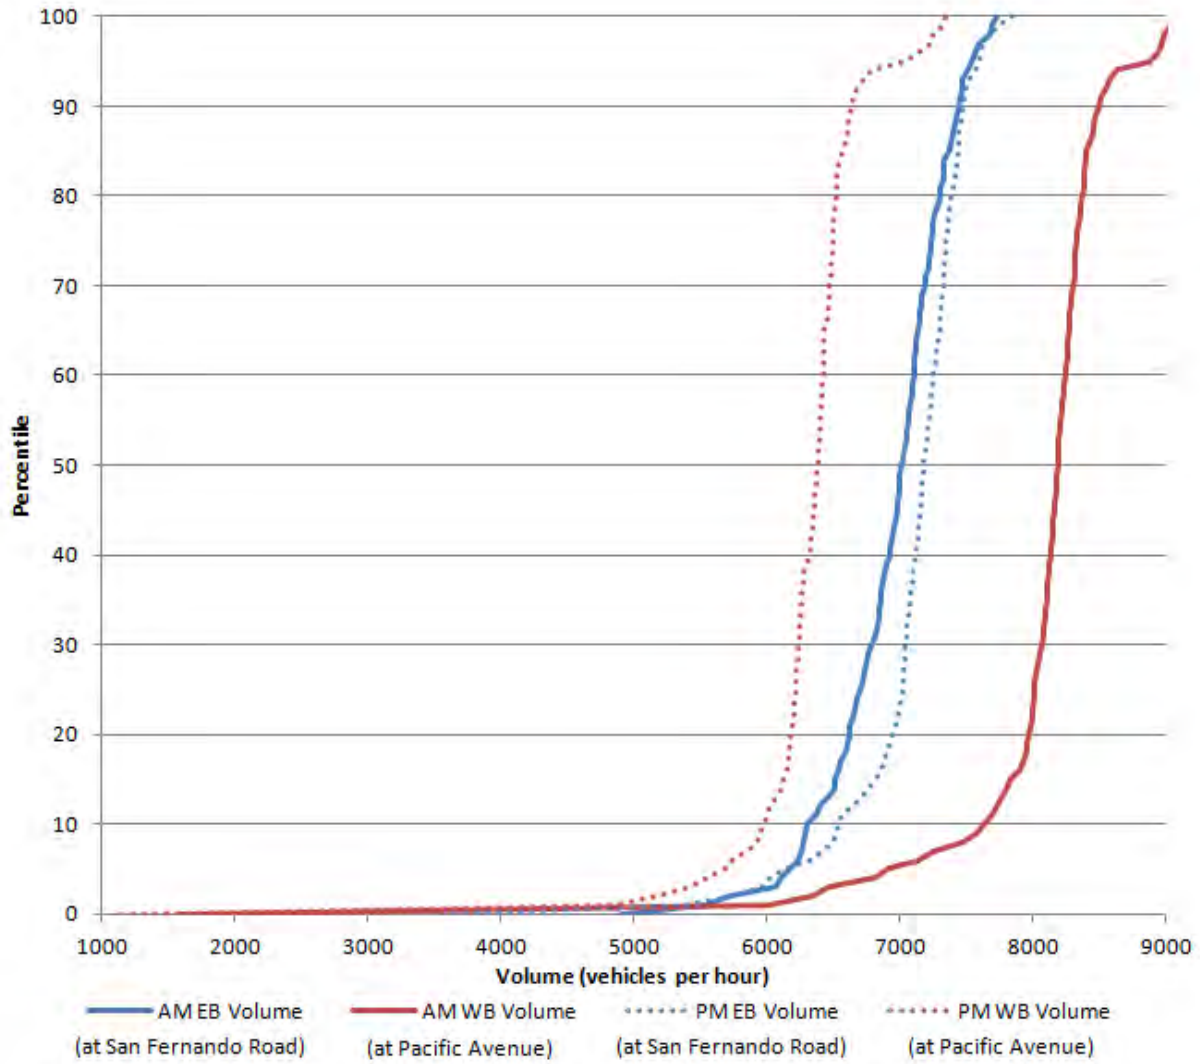

Source: Caltrans, PeMS

Figure 2-39 is an illustration of the weekday peak hour traffic volumes at selected locations on SR 134. In the EB direction at San Fernando Road, SR 134 serves 4,900 to 7,800 vph in the AM peak hour and 3,500 to 7,900 vph in the PM peak hour. The range between the 10th and 90th percentiles is 6,300 to 7,500 vph in the AM peak hour and 6,500 to 7,500 vph in the PM peak hour. In the WB direction at Pacific Avenue, SR 134 serves 1,500 to 9,000 vph in the AM peak hour and 1,100 to 7,400 vph in the PM peak hour. The range between the 10th and 90th percentiles is 7,600 to 8,500 vph in the AM peak hour and 6,000 to 6,600 vph in the PM peak hour.

Figure 2-40 is an illustration of the weekday peak hour speeds on the same locations (San Fernando Road and Pacific Avenue) based on PeMS data collected throughout the year in 2011. In the EB direction, speeds range from 20 to 76 mph in the AM peak hour and 12 to 69 mph in the PM peak hour. The range between the 10th and 90th percentiles is 60 to 70 mph in the AM peak hour and 47 to 60 mph in the PM peak hour. In the WB direction, speeds range from 21 to 66 mph in the AM peak hour and 23 to 70 mph in the PM peak hour. The range between the 10th and 90th percentiles is 34 to 68 mph in the AM peak hour and 47 to 65 mph in the PM peak hour. The speed differential results in relatively low travel time reliability on SR 134, particularly for the AM peak hour in the WB direction.

FIGURE 2-39
 SR 134 Traffic Reliability Data – Peak Hour Traffic Volumes

2.3 Arterial and Surface Street Operations

When a great deal of congestion occurs on the freeway system, the local street system also has congestion from trips that are trying to avoid the freeways. The north-south freeway congestion in Los Angeles County results in local streets with high delays throughout the study area. These delays are generally experienced as intersection delays caused by local arterial demands exceeding capacity. Congestion is particularly pronounced in the cities of Alhambra, San Gabriel, South Pasadena, and Pasadena. Impacts include oversaturated (congested) intersections with queues that affect local access and deliveries, travel time, emergency services, safety, and overall quality of life. Both operational (existing conditions) and travel demand modeling (future) data show a large amount of congestion on arterial streets in the study area.

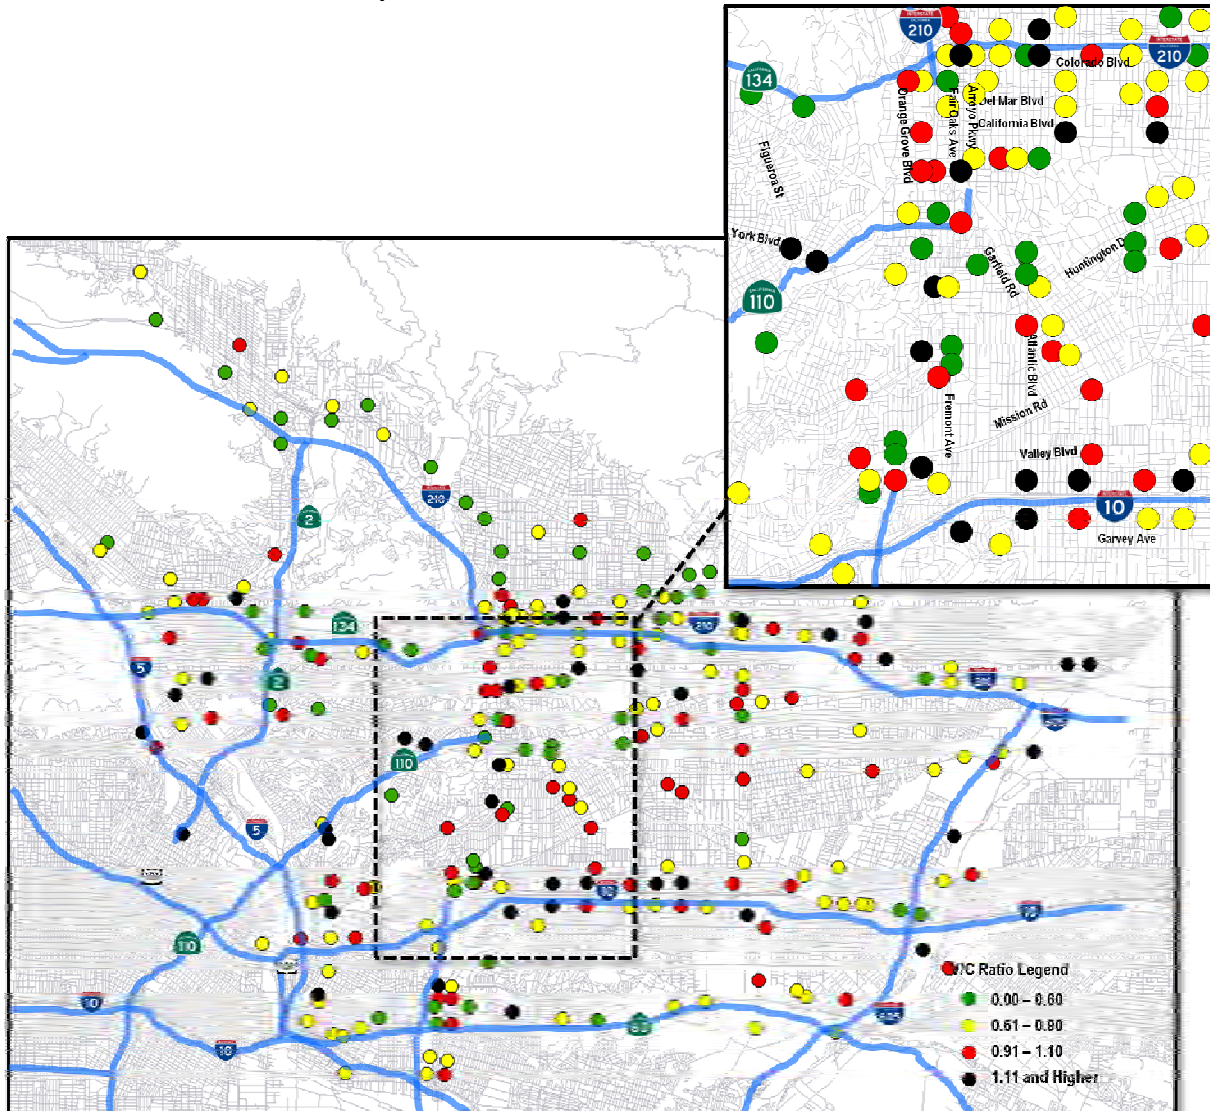

Drivers wishing to travel from the SR 710 endpoints in Alhambra and Pasadena must travel on local streets through the cities of Alhambra, South Pasadena, and San Gabriel. Drivers traveling NB on SR 710 north of I-10 exit the freeway at its terminus and travel EB on Valley Boulevard. From Valley Boulevard, traffic moves north through on major arterials (typically Fremont Avenue, Atlantic Boulevard, and Garfield Avenue). The volume of traffic that uses these local routes far exceeds the available capacity, resulting in congestion.

To better understand the local congestion and travel patterns, Caltrans conducted an extensive traffic counts program in 2010. Daily traffic volumes were collected at 259 arterial locations in a defined area, roughly bounded by SR 60 on the south, I-210 on the north, I-5 on the west, and I-605 on the east. Raw traffic counts are provided in Appendix B. The counts include traffic volumes by direction in 15-minute periods for 3 days at each location. Using these data, assessments of the peak hour (AM and PM) and daily volume/capacity (V/C) ratios were made. Daily capacity is a planning-level estimate of the practical daily volume that can be served without congestion. Both peak hour and daily capacity values were estimated by considering factors including the number of through and turn lanes, whether the roadway is divided, whether there are dedicated turn lanes, and the density of signals. At the 259 arterial locations, the capacity ranged from 1,037 to 5,065 vph, and 10,728 to 52,259 vehicles per day (vpd).

The V/C ratios were evaluated to assess the extent of congestion on local streets. A high V/C ratio indicates congestion and queuing. For the daily V/C ratio calculation, a high V/C ratio suggests that there may be multiple hours during the day when there is congestion.

A map of the local arterial congestion is provided in Figure 2-42. In each of the peak periods and for the daily calculation, approximately 20 percent of the segments have a high V/C ratio (defined as greater than 0.95). Approximately one-third (87 of 259) of the segments had a high V/C ratio in at least one of the three analysis periods.

FIGURE 2-42
Local Street V/C Ratios in the Study Area

Source: CH2M HILL calculation, using Caltrans data

A more-thorough review of the local arterial congestion indicates specific patterns in the following data:

- The average daily V/C ratio (weighted by volume) for the north-south segments is 16 percent higher than the V/C ratio for the east-west segments (0.91 to 0.78).
- The most-congested segments are in the north-south direction. For example, four of the top five segments (highest V/C ratio) in the AM peak period are north-south streets.
- More congestion occurs in the central part of the study area, defined as the area between SR 2/I-5 (west) I-210 (north), I-10 (south), and San Gabriel Boulevard (east). In the AM peak, 25 percent of these segments are congested (V/C ratio greater than 0.95), as compared to only 16 percent for the segments further east and west.
- V/C ratios are highest in the core study area (the cities of Alhambra, South Pasadena, and Pasadena). For example, in the AM peak, the weighted average V/C ratio in the core study area is 0.90, compared to 0.84 in the rest of the central study area and 0.79 in the entire area.

Other data, including the following, provide insights on specific streets:

- Fremont Avenue in Alhambra exceeds its daily capacity, indicating that the roadway is congested for many hours each weekday. Figure 2-43 is a summary based on 2005 data. This graphic indicates that weekday traffic

volumes (the blue bars) are higher than practical capacity (the dotted line to the right) north of Valley Boulevard. Even the weekend volumes (the red bars) exceed capacity between Valley Boulevard and Mission Road. The dotted line to the left is the desirable traffic volume, where traffic delays are acceptable. All weekday and weekend locations north of Valley Boulevard exceed this value. Figure 2-44 is a similar summary based on 2010 weekday data at other locations. Again, multiple segments at Fremont Avenue exceed capacity.

- Fremont Avenue from Valley Boulevard to Columbia Street, and Valley Boulevard from SR 710 to Fremont Avenue are identified as “interim Congestion Management Program (CMP)” routes until a decision is made regarding SR 710. As interim CMP routes, these local arterials are expected to carry a greater percentage of regional vehicle trips.

FIGURE 2-43
Fremont Avenue Volumes Compared to Capacity (2005)

FIGURE 2-44
Fremont Avenue Volumes Compared to Capacity (2010)

- Monitoring conducted for the CMP (1991 to 2011) has found the intersections of Fremont Avenue/Valley Boulevard and Fremont Avenue/Huntington Drive to be at or near capacity (Figure 2-45). The Fremont Avenue/Huntington Drive intersection has operated above capacity for several years. The Fremont Avenue/Valley Boulevard intersection is near that threshold. The improvement between 2003 and 2005 at that intersection was the result of a major widening project.

FIGURE 2-45
Fremont Avenue PM Peak Hour Intersection V/C

- Rosemead Boulevard, Walnut Grove Avenue, San Gabriel Boulevard, and Del Mar Avenue are the major north-south roadways within the City of Rosemead. All four major north-south roads provide connections to I-10. Valley Boulevard, Garvey Avenue, Graves Avenue, and Rush Street are the major east-west roadways within the City of Rosemead. These arterials often act as parallel relief to the freeways during peak commute periods of the day (AM and PM peak periods), providing alternative travel routes to destinations throughout the San Gabriel Valley. Most of the roadway segments and major intersections in Rosemead, north of I-10, are projected to operate at Level of Service (LOS) E or F in 2025. Figure 2-46 is an illustration of the projected intersection operations in the City of Rosemead in 2025 (City of Rosemead General Plan, 2010).

City of Rosemead
 General Plan Update

February 2010

- During peak periods, congestion on freeways in the study area leads to congestion on the surrounding arterial system as drivers exit the freeway in search of a faster route to their destination. This leads to a congested arterial system in the cities in the study area. Figure 2-47 is a screen shot taken from Google Maps on a typical weekday in the PM peak period. As shown in the screen shot, speeds on the freeways and arterials are yellow or red (green = greater than 50 mph, yellow = 25 to 50 mph, and red = less than 25 mph). The highest concentration of red and yellow is in the north-south corridor between the SR 710 endpoints.

FIGURE 2-47
Traffic Operations, Typical Weekday PM Peak Period

Source: <http://maps.google.com> accessed February 2012

2.4 Trucks

Congestion and delay not only affect the everyday lives of commuters in the study area, they also have a significant impact on goods movement. The *Multi-County Goods Movement Action Plan* (Wilbur Smith Associates, Inc., 2008) notes that “goods rely substantially on trucking to connect warehouses, distribution facilities, intermodal facilities, and other businesses. For the most part, these facilities and businesses operate during daytime hours, though some operate during the night, too. Daytime operations cause conflicts between everyday commuter traffic and truck traffic. This conflict also creates a perception that goods movement is the sole contributor to congestion and delays. However, the bulk of truck traffic does not occur during the traditional morning and early evening peak commute hours. Approximately two thirds of truck travel occurs during the off-peak hours. Therefore, the issue of congestion and delays on the highway system cannot be fully addressed without including strategies to reduce the impact of commuter traffic as well as goods movement.”

Figure 2-48 is an illustration of existing truck data (traffic volumes and percent of overall traffic) on the study area freeways. These are available truck data from Caltrans (<http://www.dot.ca.gov/hq/traffops/saferesr/traffdata/>). Truck percentages are highest (yellow) on SR 60, I-210, and I-605. Most freeways have daily truck percentages less than 5 percent.

Figure 2-49 is a compilation of data collected by Caltrans (daily) and the peak period data collected from the field. Peak period data from the field are provided in Appendix C. The AM and PM peak truck percentages are generally lower than the daily percentages. Truck percentages on the surface streets (shown in blue) average around 1 percent.

FIGURE 2-48
Existing Truck Data in the Study Area (2010)

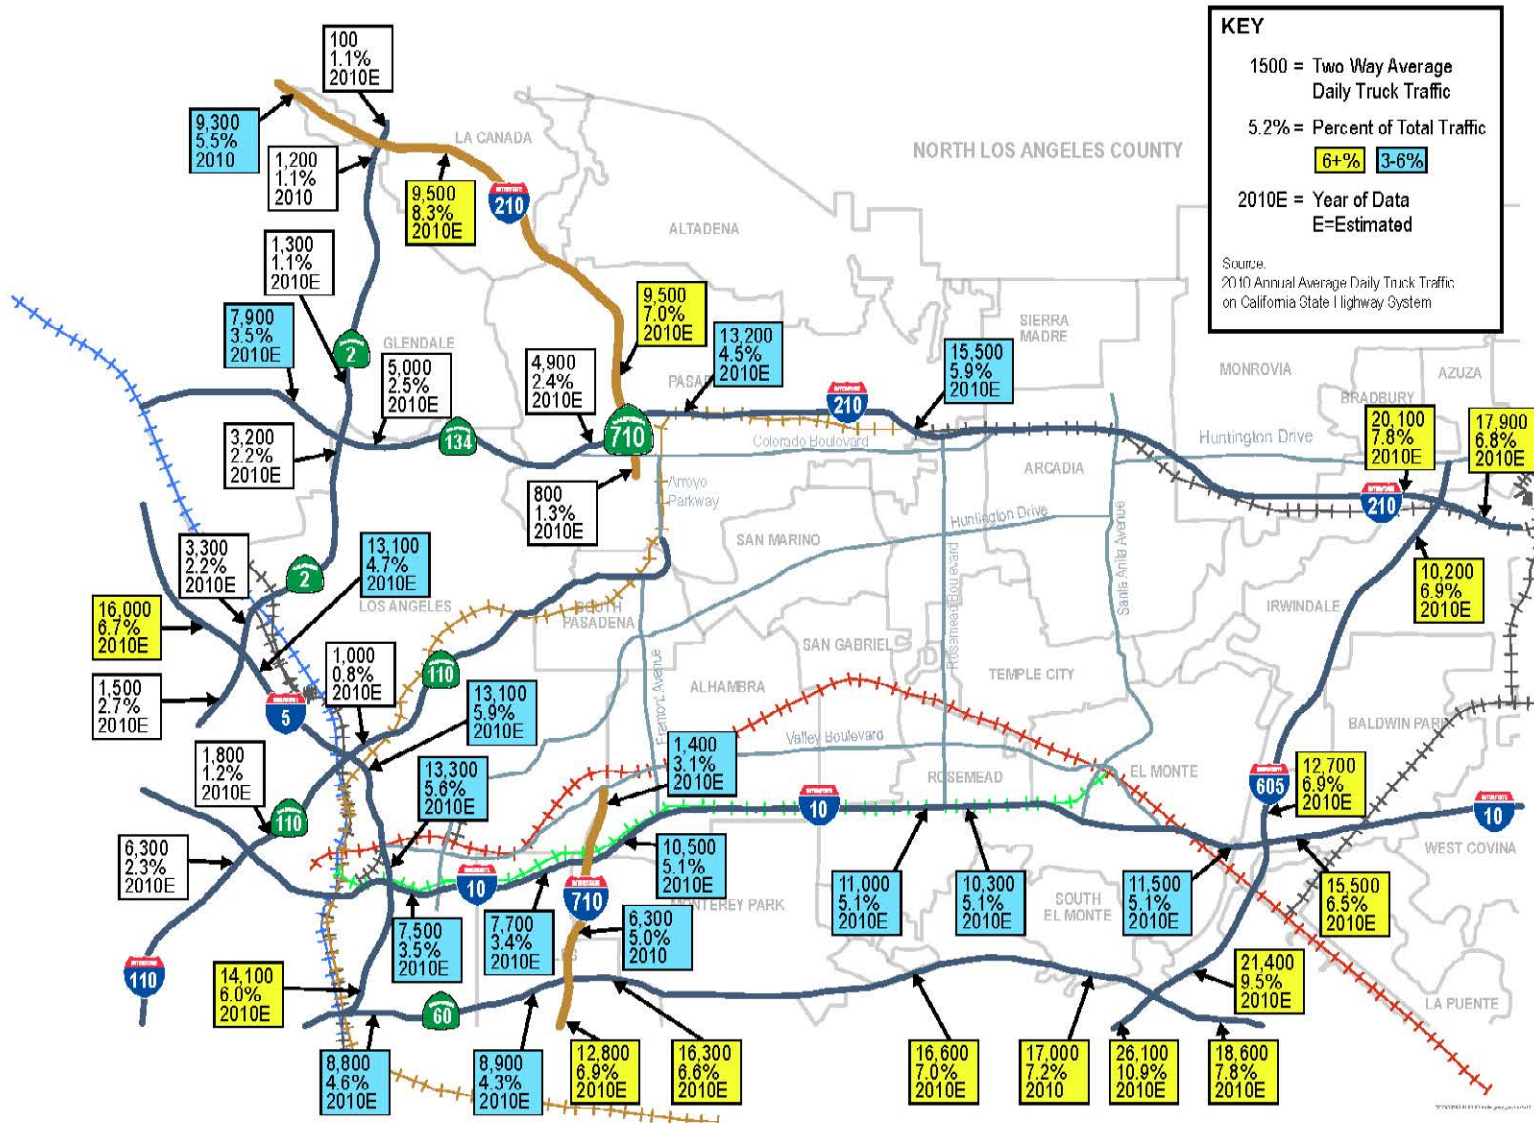

FIGURE 2-49
Study Area Truck Data Summary

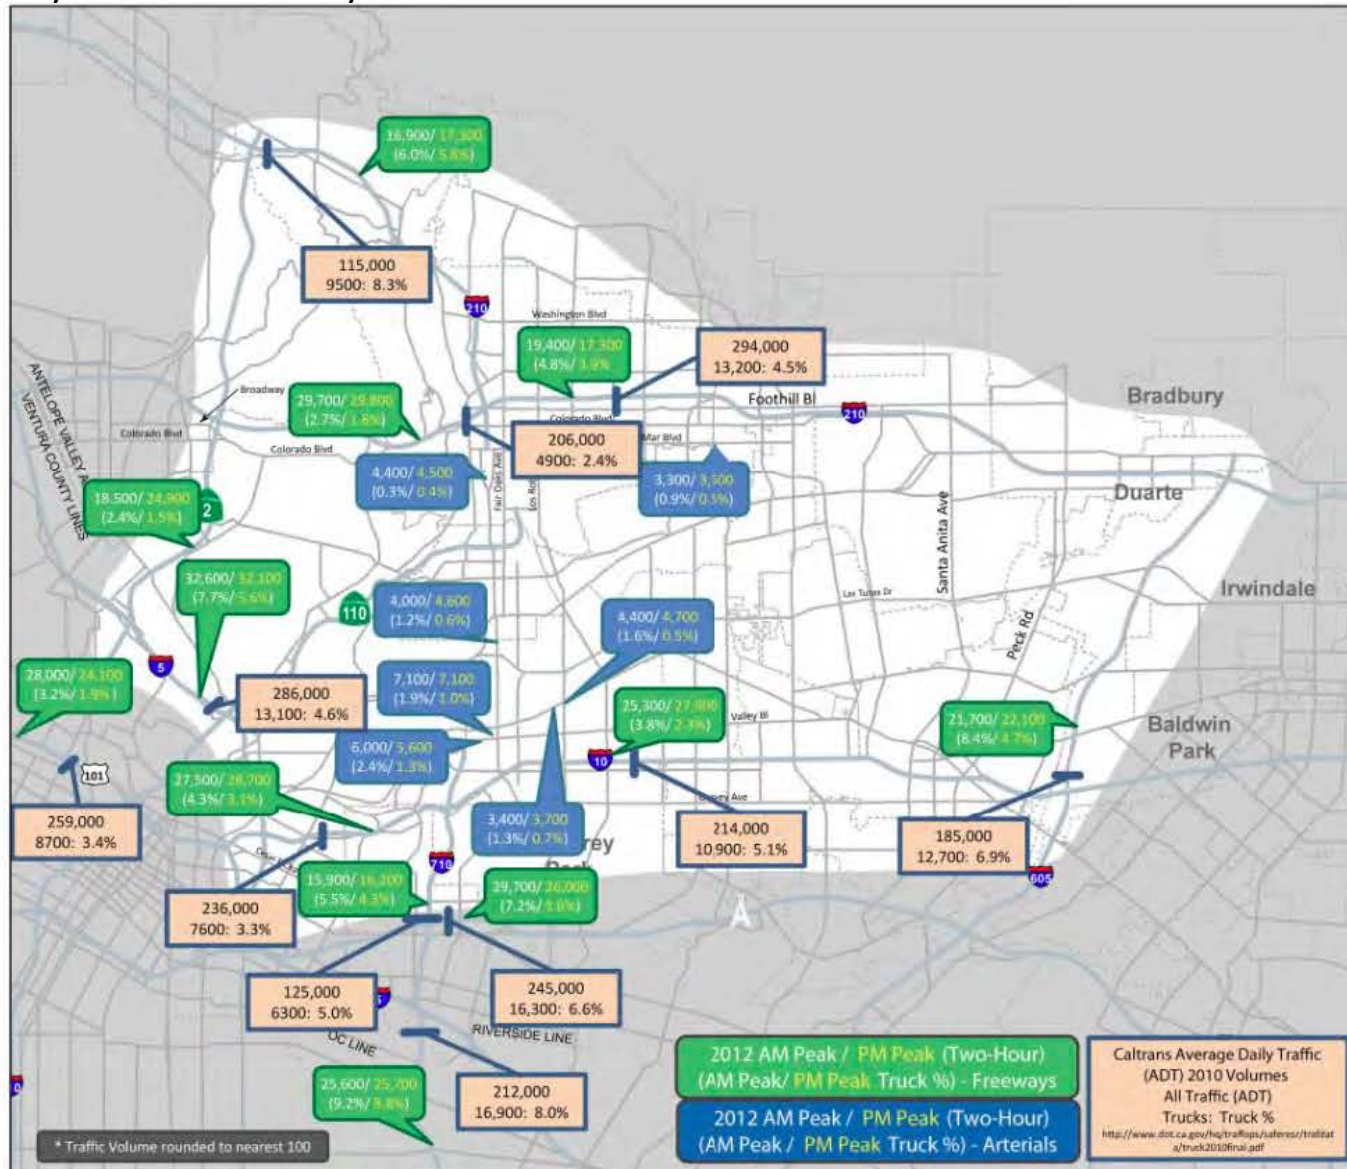

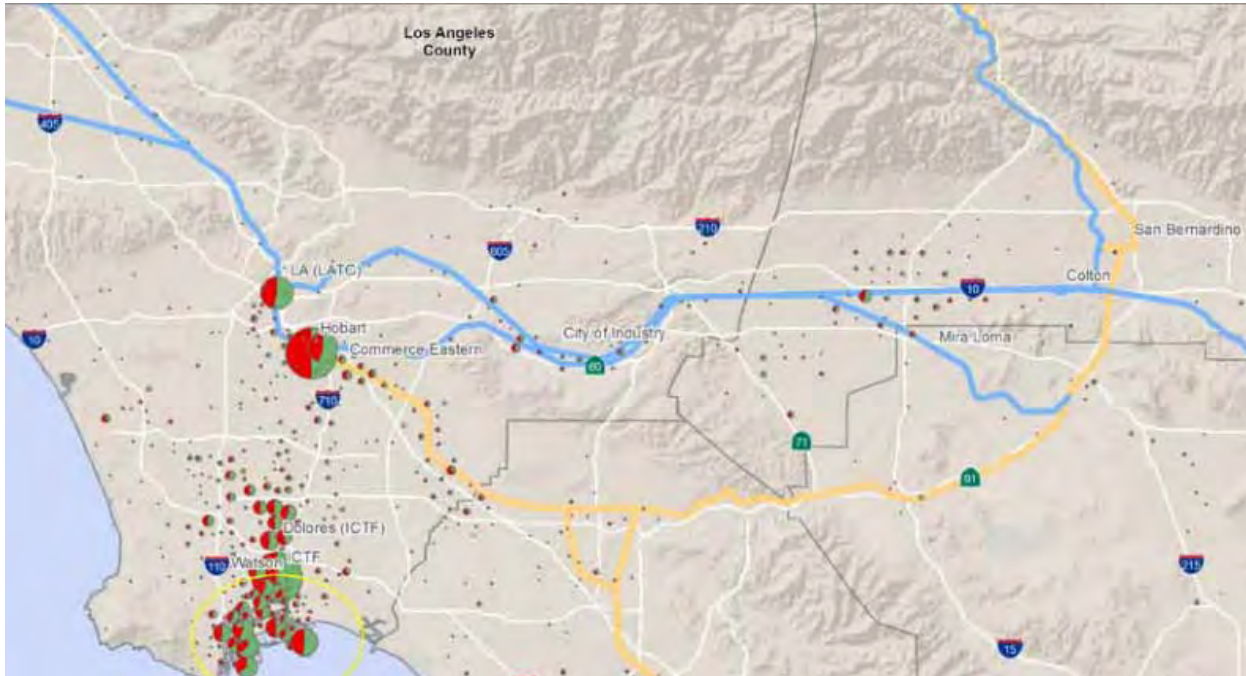

Figure 2-50 is an illustration of the auto/truck composition on SR 710/I-710 between SR 1 and I-10. While trucks have a significant operational effect on the south part of I-710 (toward the Ports of Long Beach and Los Angeles), they do not appear to be a major cause of congestion in the study area. Currently, I-710 has very high truck volumes to the south, but truck volumes fall off sharply at SR 91 and decrease continuously to the north (Caltrans 2010 traffic counts).

FIGURE 2-50
Traffic Composition on SR 710 in 2010

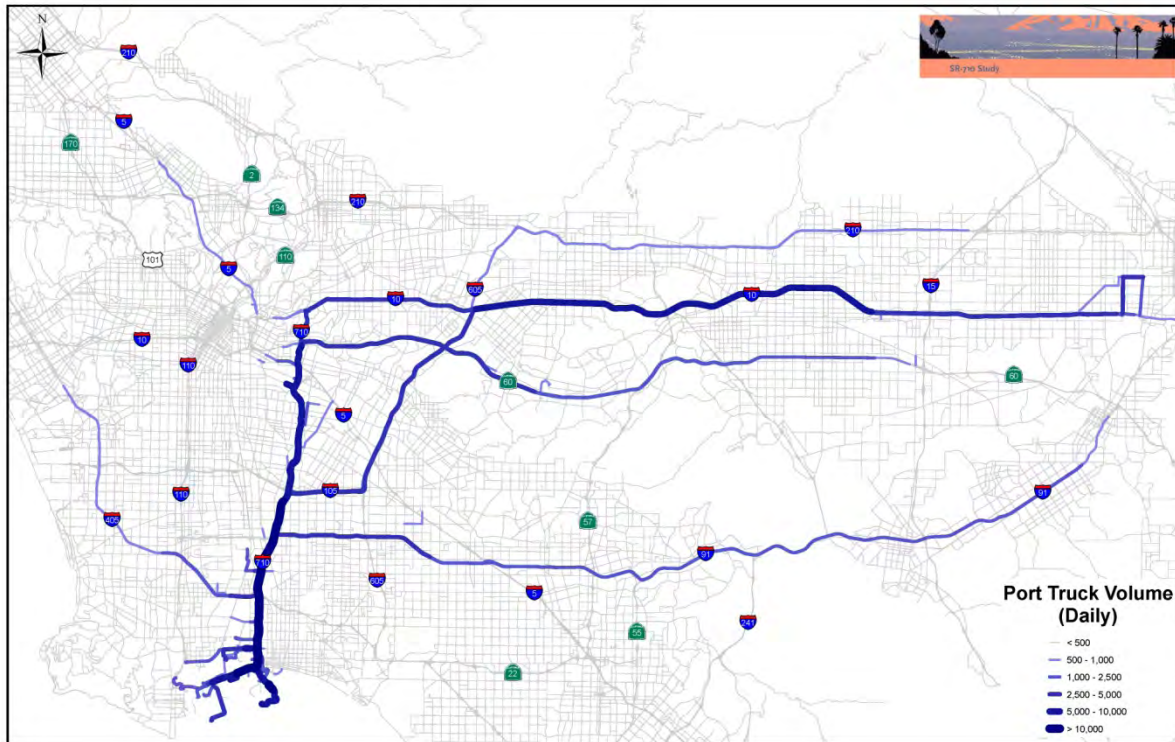

Port trucks are a minor factor in the study area. Across the region, Port trucks constitute less than 4 percent of truck trips regionwide, and less than 8 percent in Los Angeles County. Most of the truck destinations from the Port are south and east of the study area (see Figure 2-51). Less than 15 percent of the truck trips in the six-county SCAG region leave Southern California (SCAG Draft 2012 RTP).

FIGURE 2-51
Truck Destinations from the Port

The SCAG model was used to get a better visual understanding of the port truck distribution in the region. The analysis looked at all of the truck trips which use I-710 at a location south of Pacific Coast Highway in Long Beach. The map below shows the routes of truck trips that pass this point on I-710. Figure 2-52 illustrates that most of the longer San Pedro port truck trips use the freeways to/from the east, with almost no port traffic destined to the north and west (CH2M Hill analysis using 2008 RTP 2035 No Build model, provided by SCAG in the SCAG 08R35a3_bl_rev2 scenario for land use and networks).

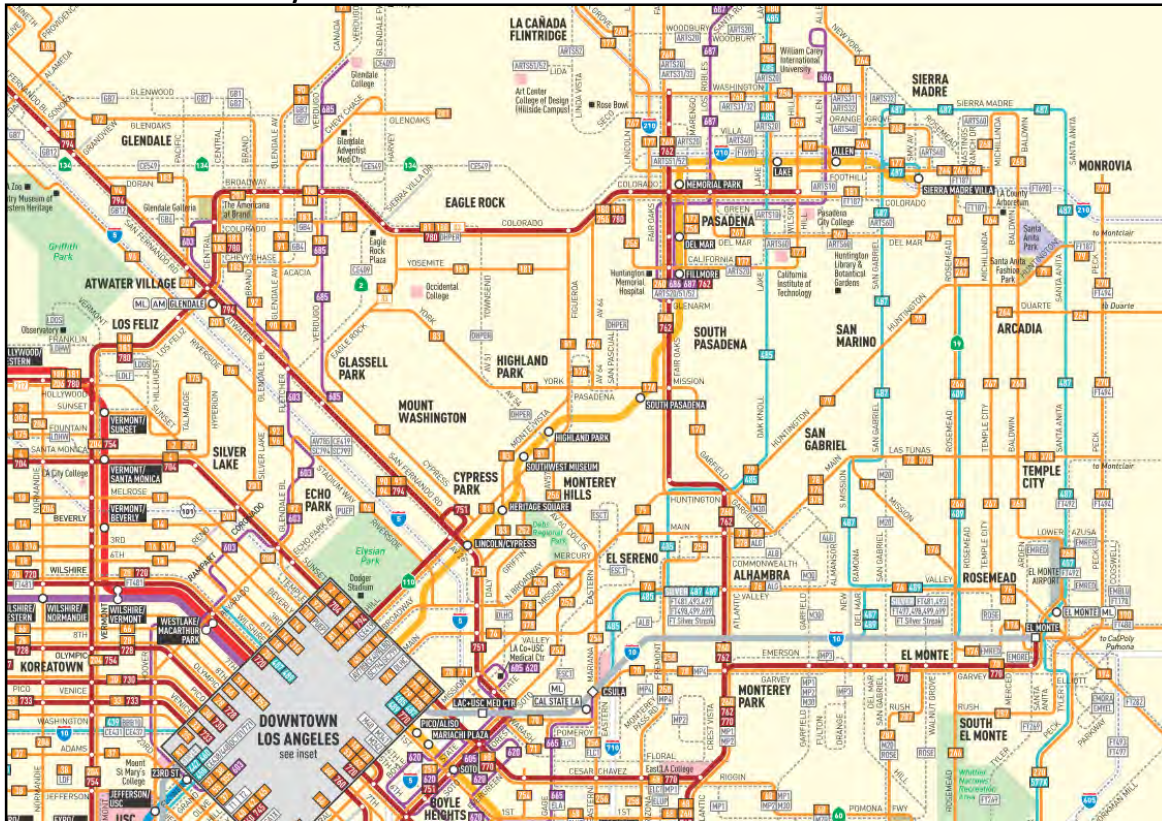

FIGURE 2-52
Port Truck Trip Origins and Destinations

2.4.1 Transit Operations

The SR 710 study area is served by 16 local transit agencies, with both bus and rail services, including Metro Bus and Rail, Metrolink, Arcadia Transit, Alhambra Transit, Baldwin Park, Duarte Transit, El Sol East LA Shuttle, El Monte Transit, Foothill Transit, Glendale Beeline, Los Angeles Department of Transportation (LADOT), Monrovia Transit, Monterey Park Spirit Bus Lines, Pasadena Area Rapid Transit System (ARTS), Rosemead Explorer, and South Pasadena Gold Link. Service types provided include rapid, express, limited, commuter rail, and local lines. The agencies operate more than 100 local and express bus routes, as well as a light-rail service, Metro Gold Line, which connects Pasadena to downtown Los Angeles. The study area is also served by heavy-rail Metrolink, connecting Pasadena to downtown Los Angeles, as well as other regional destinations such as San Diego and Santa Barbara. Figure 2-53 is an illustration of the transit routes in the study area and Table 2-3 is a summary of the transit service in the study area.

Source: State Route 710 Gap Closure Transit Profile Study 2011, Cambridge Systematic, Inc.

Note: Where very few routes are provided, the name of the route is indicated rather than grouping further by type.

Figure 2-54 is a summary of Metro’s bus service boardings at each bus stop throughout the study area. Metro has over 106,000 existing average daily bus boardings throughout the study area. The El Monte Station has the highest number of boardings in the study area. In general, east-west bus routes have higher volumes of bus boardings than do north-south routes.

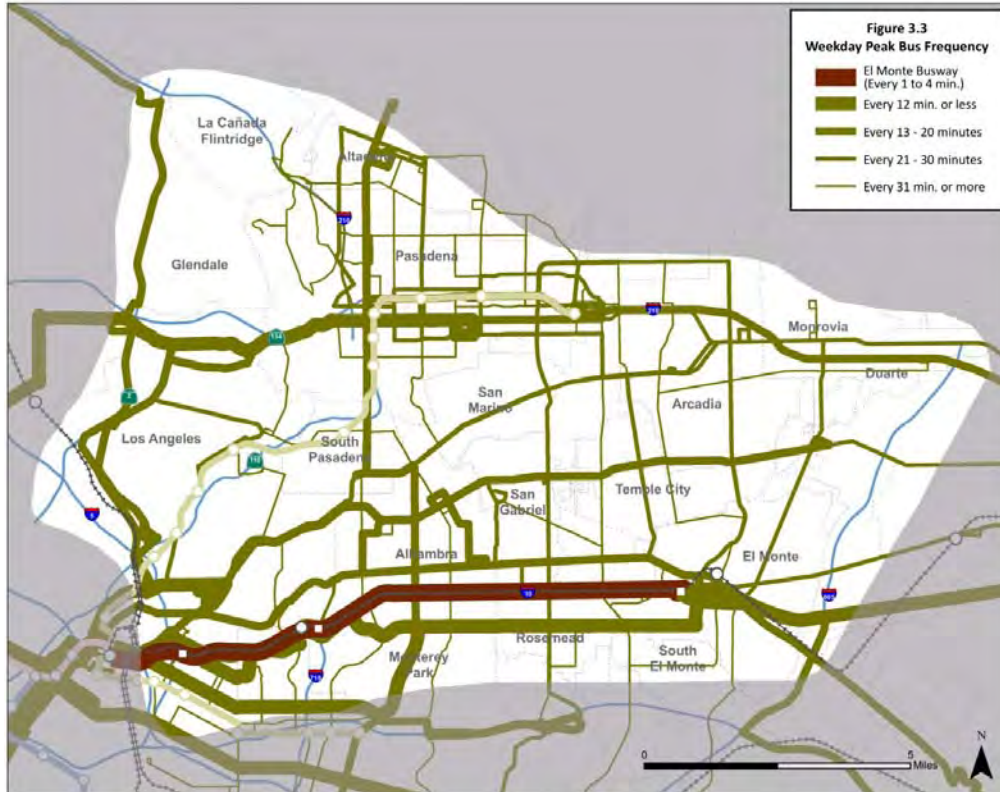

FIGURE 2-54
Existing Metro Bus Boardings

Source: Metro and Cambridge Systematics, 2011

Figure 2-55 is an illustration of the peak hour bus frequency for major bus transit corridors in the study area. Frequencies are generally higher along east-west routes than north-south routes. The El Monte Busway provides the highest frequency of service, with one- to four-minute headways in the peak hours. There are no north-south transit corridors east of Atlantic Boulevard with service frequency more often than every 20 minutes.

FIGURE 2-54
Existing Peak Bus Frequency

2.4.2 Active Transportation

Active transportation refers to transportation such as walking or using a bicycle, tricycle, velomobile, wheelchair, scooter, skates, skateboard, push scooter, trailer, hand cart, shopping car, or similar electrical devices. According to the 2012 SCAG RTP, “Active transportation modes (e.g., bicycling and walking) are essential and increasingly important modes of transportation. These non-motorized modes are low-cost, do not emit greenhouse gases, and help reduce roadway congestion, and increase health and the quality of life. As the region works toward reducing congestion and air pollution, walking and bicycling will become more essential to meet the future needs of our residents. National Household Travel Survey (NHTS) data indicate that approximately 21 percent of all trips in the region in 2009 were conducted by walking (19 percent) or bicycling (2 percent), representing an approximately 75 percent increase from the 12 percent active transportation mode share in 2000 (Figure 2-56). The 2009 NHTS data also showed that there was an 11 percent decrease in driving, from 84 to 75 percent. More active transportation has placed a greater focus on the preservation, maintenance, and expansion of active transportation infrastructure. As the population in the SCAG region grows and matures, and as parts of the region move toward denser, mixed-use, and transit-oriented development, the demand for and use of active transportation will increase.”

FIGURE 2-56
Mode of Travel for Total Trips (2009)

Source: National Household Travel Survey, 2009

2.4.2.1 Bicycle Facilities

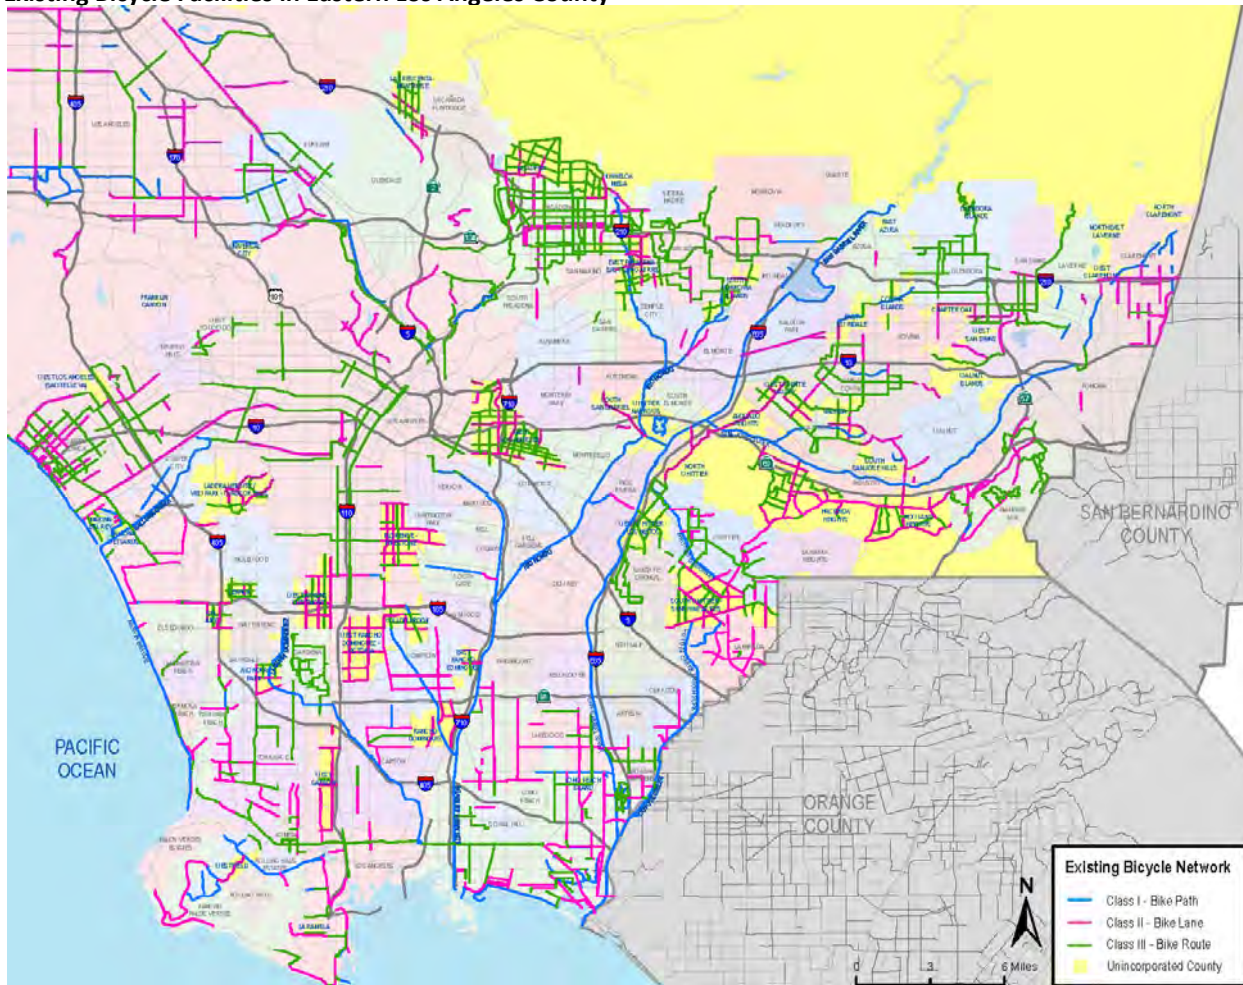

Transportation Demand Management (TDM) programs and projects play an important role in making efficient use of the transportation system. TDM generally refers to policies and programs that increase the use of HOVs (transit, carpooling, and vanpooling), bicycling and walking, shortening trips, and avoiding trips altogether (teleworking). Metro's commitment to TDM is reflected in the development of master plans for bicycle facilities within the nine subregions of Los Angeles County. The Metro Bicycle Transportation Strategic Plan, developed by Metro in 2005, establishes regional bicycle planning policies and provides tools that can be used by local agencies in creating their own bicycle plans. The Strategic Plan has contributed to the development of bicycle plans throughout Los Angeles County, including the 2012 County of Los Angeles Bicycle Master Plan.

Following are three classes of bicycle facilities throughout the study area:

- Class I bike paths consist of a paved path within an exclusive right-of-way.
- Class II bike lanes consist of signed and striped lanes within a street right-of-way.
- Class III bike routes are preferred routes on existing streets identified by signs only.

Figure 2-57 provides an overview of existing bicycle facilities in the eastern portion of the County (this area includes the study area for the SR 710 EIR/EIS).

FIGURE 2-57
Existing Bicycle Facilities in Eastern Los Angeles County

Source: 2012 County of Los Angeles Bicycle Master Plan

2.4.3 Pedestrian Facilities

All agencies in the study area consider the needs of non-motorized travelers (including pedestrians, bicyclists, and persons with disabilities) in all programming, planning, maintenance, construction, operations, and project development activities and products. The roadway network throughout the study area provides facilities for pedestrians to travel via sidewalks, pedestrian paths, crosswalks at intersections (signalized and unsignalized), mid-block crosswalks, and pedestrian overcrossings over several freeways in the study area.

As stated in the *Caltrans Pedestrian and Bicycle Facilities in California Technical Reference* (Alta Planning and Design, 2005), “As population and vehicle miles traveled continue to grow, transportation planners, engineers, and policy makers are looking to non-motorized transportation, often in combination with transit, to relieve some of the pressure on the framework of the traditional transportation system. Good walking and bicycle facilities extend the reach of transit systems, provide mobility options, improve accessibility for all persons, and help encourage people to have active lifestyles.”

Travel Demand Model

3.1 Travel Demand Model Overview

SCAG is responsible for maintaining the travel demand model for the Southern California region. The model, most-recently developed using the TransCAD platform, is regularly updated. The most recent update was completed as part of the 2012 RTP. Other agencies and consultants also use the SCAG model. For example, Metro has developed a transit-focused version of the 2008 RTP model that they use to evaluate transit projects and programs.

The model approach for the SR 710 EIR/EIS consists of a blended model comprising the 2008 RTP regional model developed and maintained by SCAG and the Metro transit model used for Measure R forecasting. Both models have similar inputs and processes but have different forecasting approaches and select model inputs. The biggest differences in the models are that the Metro model uses trip tables derived from the 2000 Census Transportation Planning Package (CTPP) for Home-Based Work (HBW) transit travel and have a different mode choice model. The blended modeling approach will allow the Metro model to forecast transit trips in the SR 710 corridor while retaining the strength of the SCAG model for highway trips.

The blended model approach leads to a two-step validation process. The first step validates the highway and transit models independently. The second step combines the models following the blended approach to ensure that steps used to improve validation of one model did not adversely affect the other. Because the impact of blending the models did adversely impact the individual validations, additional remediation efforts were not required.

This section provides a brief summary of the travel demand model outputs for highway and transit modeling as it pertains to the validation of the models for the SR 710 EIR/EIS.

3.2 2008 Highway Modeling Outputs

The regional travel demand model outputs can be used to calculate performance of the existing system. The performance measures that show the most-relevant information are related to distance and time.

3.2.1 Travel Time

Travel time in the study area is calculated using peak highway skims from the travel demand model. Figure 3-1 shows nine origin-destination (O-D) pairs, obtained using travel model peak travel time. The travel time data between these O-D pairs is summarized in Table 3-1.

FIGURE 3-1
Travel Time between O-D Pairs

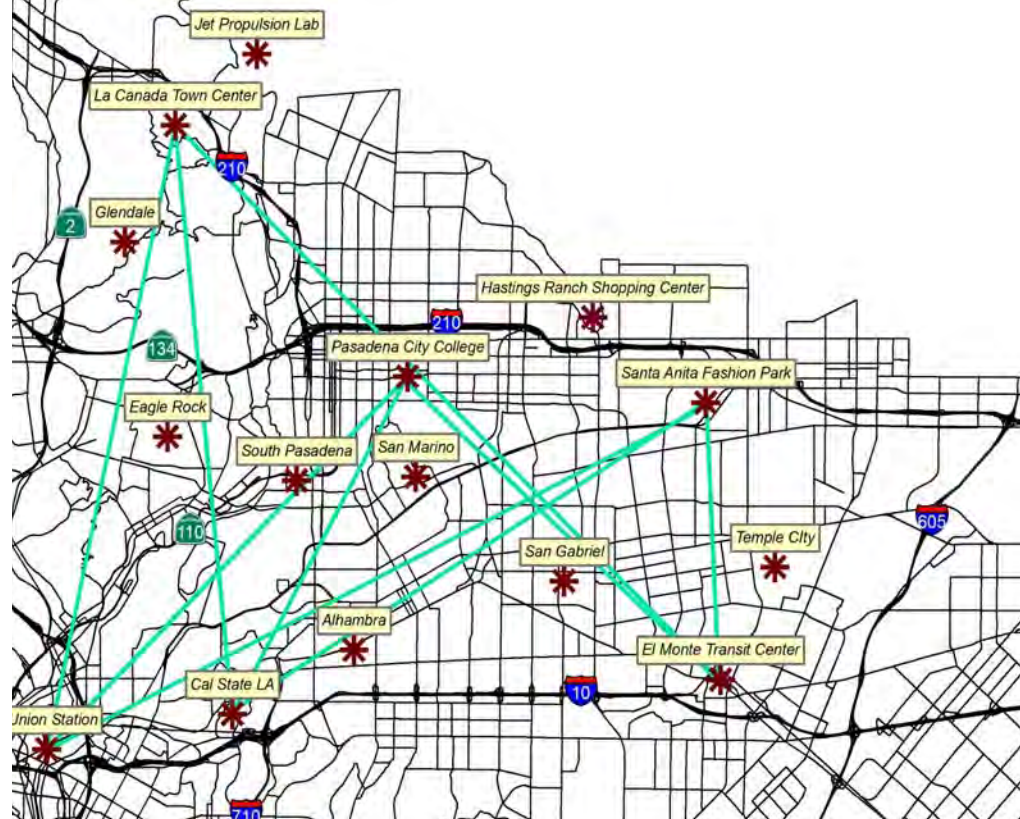

TABLE 3-1
Peak Period Travel Time (minutes)

Origin	Destination	Drive Alone	Shared Ride 2	Shared Ride 3+
Union Station	La Canada Town Center	29	29	29
Union Station	Pasadena City College	24	24	24
Union Station	Santa Anita Fashion Park	31	31	31
Cal State LA	La Canada Town Center	27	27	27
Cal State LA	Pasadena City College	20	20	20
Cal State LA	Santa Anita Fashion Park	23	23	23
El Monte Transit Center	La Canada Town Center	33	31	31
El Monte Transit Center	Pasadena City College	20	20	20
El Monte Transit Center	Santa Anita Fashion Park	11	11	11

3.2.2 Vehicular Travel

Vehicle miles traveled (VMT), vehicle hours traveled (VHT), and vehicle hours of delay (VHD) are all calculated using the travel model outputs for multiple time periods throughout the day. Table 3-2 shows the total vehicle travel in the study area by time of day.

TABLE 3-2
Total Vehicle Travel

Units	AM Peak Period 6 AM to 9 AM	Midday Period 9 AM to 3 PM	PM Peak Period 3 PM to 7 PM	Nighttime Period 7 PM to 6 AM	Total Daily
VMT	3,952,519	6,642,376	5,546,100	3,802,218	19,943,213
VHT	126,221	194,423	180,682	85,503	586,829

*Note: Travel statistics do not include travel on centroids or local roads that are not included in the model.

Figures 3-2 through 3-3 are summaries of the total VMT and VHT in the study area by each roadway functional classification. The majority of travel in the study area occurs on freeways.

FIGURE 3-2
Vehicle Miles Traveled by Time Period and Functional Classification

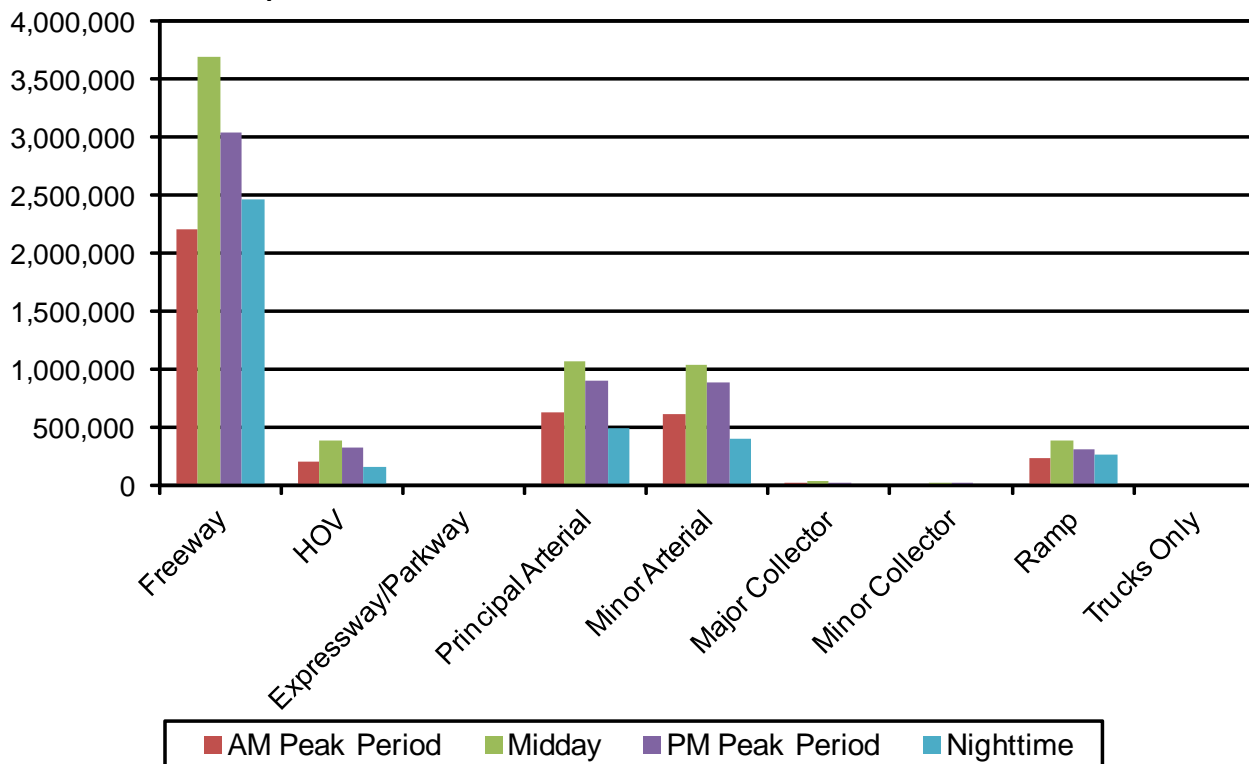

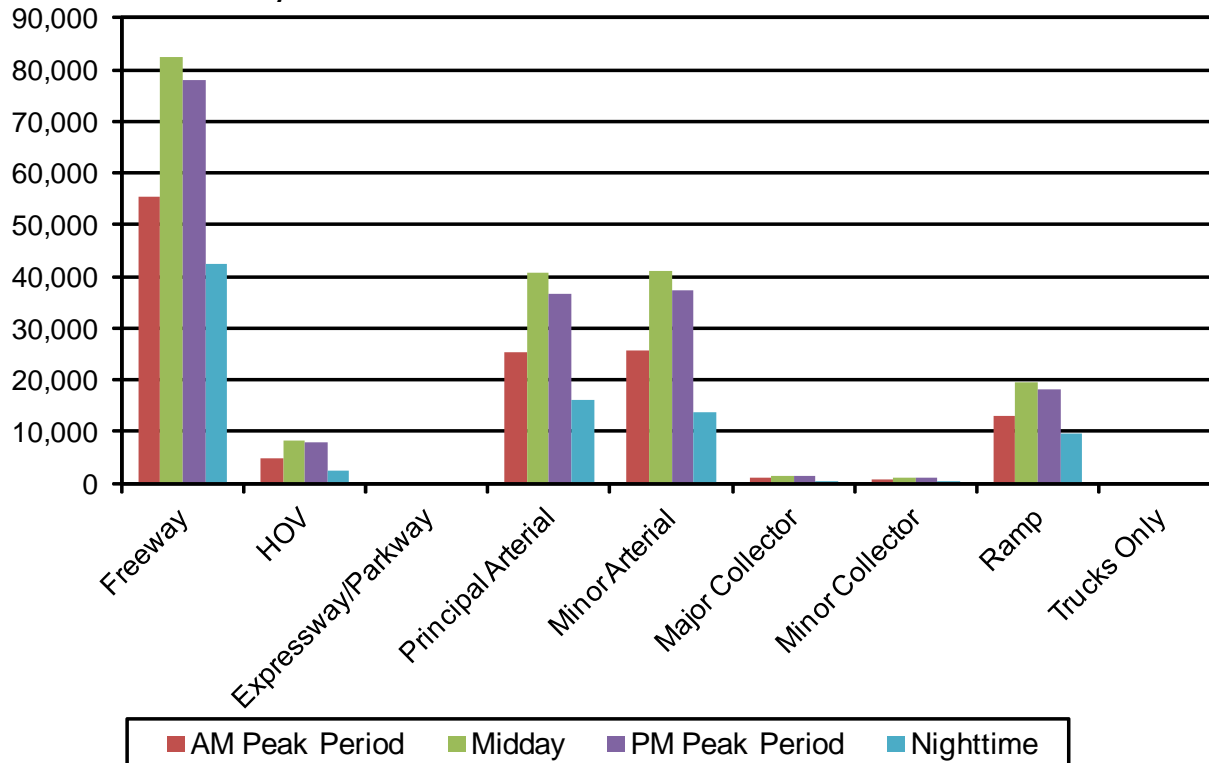

FIGURE 3-3
Vehicle Hours Traveled by Time Period and Functional Classification

3.2.3 Congestion

Roadway congestion in the study area is calculated using a V/C ratio using travel demand model outputs. Roadway congestion on freeways, arterials, and collectors is summarized in Tables 3-3 through 3-5. A V/C ratio that is greater than 1.0 shows a facility that has a higher demand than available capacity.

3.2.4 2006 Transit Modeling Outputs

Table 3-6 shows 2006 modeled and 2012 observed transit linked trips in the study area for the following transit sub-modes in the Metro model:

- Local Bus
- Express Bus
- Commuter Rail
- Urban Rail
- Transitway
- Rapid Bus

TABLE 3-3
Summary of Congestion on Freeways in Study Area
