I have informed that the city is planning to place the maintenance & Storage yard for the streetcar system and the south east corner of 11th and Grand Ave. is one of proposed area. I think it is really poor judgment that city makes for this vibrant residential and commercial mixed used streets. The proposed site is located in South Park which is one of new great residential, entertainment industry and educational buildings are developed past few years. Young professions, students, families have moved and created great community. However the maintenance yard will strongly against this great environment that has created last few years.

I strongly disagree that the city places a Maintenance Yard for LA's streetcar on the South East corner of 11th and Grand Ave. It will ruin our great community.

Dear Jim,
Re: Streetcars

A couple of thoughts from a (previous) DTLA loft owner/resident,at Spring and 7th..and a member of the LA Conservancy:

Anything that improves public transport in LA, inc,.downtown, making it a desirable method of travelling by all socio-economic groups is a very good and long overdue solution!

a) It'd be rather wonderful if the cars displayed some kind of graphic alluding to the original streetcars..perhaps photographic,.even though these cars will be of a contemporary design, I feel a bridge to the past, a linking continuety of image, is quite important in celebrating (and not forgetting) LA's history.

b) Whilst I have not seen all of the plans, I'd have loved to see planted/decorated medians if at all spatially possible.
Raising funding for such an addition (or any statuary elements etc,.) could be helped by public donations, which are memorialised at a certain financial level.

For example, several years ago, I contributed towards the Larchmont Blvd planted median. All such donors received their names engraved upon the prominently displayed bronze plaque. It makes me feel just a bit more connected to the city....

Thank you for allowing me to provide my input.

Sincerely,

Richard Crowley

Streetcars on Broadway

1 message

Steve Easlon <westernrails.sle@gmail.com> Tue, Feb 5, 2013 at 8:51 PM
To: jim.doty@lacity.org

Jim,

You wanted feedback on the trolley system that is to run on Broadway. My name is Steve Easlon. I wrote the book "The Los Angeles Railway Through The Years" back in the 1970's. Los Angeles had 2 tolley systems. There was the Pacific Electric which was known as the red cars and the Los Angeles Railway which was known as the yellow cars. My book covers the Los Angeles Railway yellow car system which ran on Broadway and many other streets. Let me know if you would like a copy of the book. I know you are planning to use modem light rail trolleys, but I would like to see a different approach. Los Angeles has lost many of the artifacts that made Los Angeles unique. I was very pleased to see Angles Flight put back into service. Los Angeles needs to hang on to historical artifacts like this. If you go to San Francisco, you will see historic Cable Cars and also historic electric trolleys running in the city. They decided to keep many of the old cars running and that gives the city a unique character that attracts people. If you go to San Pedro (Ports O Call), you will see a section of the old Pacific Electric red car trolley system that was recreated. They have 1 authentic red car trolley and 2 replica red car trolleys operating. This is a very popular attraction and they want to expand the system.

Along with the light rail trolleys, I would like to see some original looking trolleys that ran in Los Angeles for decades also operate on the new system. Replica trolleys can be constructed, but I also know where there are original bodies of old Los Angeles Trolleys. They could be rebuilt with new running gear and electronics and would bring much needed history and character back to Los Angeles. As a kid I rode the old trolleys on Broadway and loved them. i can't wait to be able to ride trolleycars on Broadway once again.

Let me know if I can be of help.

Sincerely, Steve Easlon

What would the cost difference, assessment and ridership effect be using the 7th street alignment for a connection to the 7th St Metro Station and new 7th & Figueroa business hotel complex area. Duo directional or double track on the entire route and move the single track from Hill to Broadway for the double track on Broadway? This would reduce the ride time to reach many destinations by half or avoiding the walk from Hill to Broadway. This will also increase the needed capacity.

Los Angeles is not Portland with longer North South blocks and fewer one way streets. Also Portland's destinations, points of interest, business and residential density is more evenly spread out than Los Angeles.

Thanks

Alan

AJ,

I apologize for the lack of response -- I can't find an earlier message from you.

During the Alternatives Analysis, we considered two alternatives (then identified as Alternatives 5 & 6) that would add stops at City Hall, Olvera Street/Union Station and Little Tokyo (+2 more). However, neither of those alternatives was selected (see City Council file 11-0329-S2 via the City Clerk's web page (http://cityclerk.lacity.org/lacityclerkconnect/). It should be noted that the proposed streetcar route will include opportunities to transfer to other modes of public transit that do (or will) serve those other locations. The Locally Preferred Alternative now under consideration by the City does not preclude any future extension.

The outward appearance of the streetcars has not been decided at this time, but certainly a design consistent with the theater district's historic art deco period should be considered.

Jim

To: jim.doty@lacity.org

Hello!

Firstly, I'd like to thank you for your progress with the LA Streetcar. I own a condo on Los Angeles St. and I work at FIDM and I'm so excited about how the streetcar will impact the neighborhood and my property value. One thing I want to request is that the streetcar stays open for at least a half hour after the close of the bars. I believe that this will help the nightlife business downtown and keep the streets lively and safer. I believe that it's more likely that bar/restaurant patrons will use the streetcar more than early morning commuters so if it's between opening early or staying open late, I'd suggest staying open later. Also, I'm hoping that the fare isn't too high. I don't think people would want to pay $1.50 to take a streetcar a few blocks. Perhaps one option is that with each fare purchase, you get some kind of credit to a local business. That way when someone spends money on the streetcar, it encourages people to use the local businesses.

Have an excellent weekend,

Ariana Nussdorf

Hi Jim,

Can I submit my comment here?

I hope that our streetcar can have the same color scheme as the original PE Red Cars with the **RED** and **YELLOW** instead of the green color used in the Streetcar LA renderings.

I have attached an image of a vintage streetcar as an example.

Thank you for your consideration.

The City of Los Angeles' Bureau of Engineering invites you to attend and provide comments at the Scoping Meetings for the Environmental Impact Report (EIR) for the Restoration of Historic Streetcar Service in Downtown LA:

January 23, 2013
10-11am and 6:30-8pm

Caltrans Building
100 S Main St
Conference Room 1A
Los Angeles, CA 90012

All requests for reasonable accommodations and translations in other languages will be provided upon request. Please submit meeting requests 72 hours in advance of the scheduled meeting date via streetcarservice@metro.net, 213.922.3000, or the California Relay Service at 711.

Scoping Period

The scoping period is 30 days: January 3, 2013 – February 1, 2013. You may submit comments by February 1 via mail or email to:

City of Los Angeles
Department of Public Works, BOE
Attn: Jim Doty
1140 S Broadway, Suite 600
Los Angeles, CA 90015-2213

Name / Organization	Agency	Purpose and Need	Alternatives	Aesthetics	Air Quality	Cultural Resources	Geology/Soils	Greenhouse Gas Emissions	Hazards/Hazardous Material	Land Use / Planning	Noise/ Vibration	Public Services	Real Estate	Transportation/Traffic	Utilities/Service Systems	MSF	Other	Comment / Summary
Adelman		X	X					X						X	X		X	This project will reduce mobility while having no effect on transit circulation or revitalization. Adding streetcars to the already congested streets of downtown will only make traffic worse. Streetcars are functionally the same as the buses that replaced them except that streetcars can not maneuver around obstructions such as double parked cars and trucks, accidents, road work or police or fire department activity. Also, streetcars cannot pull over to the curb to let passengers on or off, but instead must stop in traffic lanes, thereby blocking traffic. Finally, streetcars will be just that many more vehicles on the already crowded street. Streetcars will not enhance transit circulation. Downtown is already served by dozens of Metro and Municiple bus lines, many of which follow the same routes through downtown as this proposed streetcar. In addition, the Dash shuttle system serves the same function as the streetcar, with a choices of routes covering most of downtown. Furthermore, downtown is served by the Red and Purple line subways running under the congested streets at five minute headways, providing much faster and convenient service than a streetcar ever could. Finally, by the time the streetcar is running, we will be well under construction on the Regional Connector, an underground extention of the Blue and Expo Lighr rail lines, creating a second subway corridor through downtown. The Construction of a streetcar will not further revitalize downtown. Other cities (such as Portland OR) that built street cars did so on corridors that we lightly trafficed using minor streets to connect downtown to adjacent functionaly obsolete industrial and shoreline areas with no other transit service. This helped facilitate the revitalization of these area with the conversion of vacant buildings to lofts and commercial uses and the construction of new condo towers on former parking lots and one story buildings. The construction of the Metro Blue, Red, and Purple lines into and through downtown is the late 1980s had the same effect here in LA. Lage number of old pre WWII office and industrial buildings along the subway corridor were converted to lofts and more than a dozen new buildings built near the Metro Stations. Furthermore, now that the economy is growing again, the downtown residential boom is resuming with two residential high rises currently under construction and at least two more expected to break ground this year. Similar construction activity is also occuring near Metro Stations in Hollywood and Mid Wilshire. Finally, the streetcar will not enhance tourism. Some of the earliest systems attracted tourists because of the uniqueness of the streetcars and because these citys had few other attractions. Los Angeles on the other hand is a tourist mecca. Everybody already wants to visit LA to see Disneyland, Universal Studios, Hollywood, Venice Beach, Santa Monica, etc. Meanwhile, street cars have become a dime a dozen, so many cities now have them, that nobody has to come to downtown LA just to see and ride a street car, and certainly not one that is stuck in a traffic jam.
Advisory Council on Historic Preservation	Federal					X												No comments regarding the NEPA review at this time. While the documentation proivided indicates that the proposed undertaking may adversely affect historic properties, we have no record of receiving notification of adverse effects from FTA regarding this undertaking as is required under our regulations...Please continue to consult with the California State Historic Preservation Office and other consulting parties to complete the requirements of the Section 106 process.
Alpern		X																The key factor for this project to succeed is to extend the benefits of the Downtown Light Rail Connector and Red/Purple Lines to the rest of Downtown.
Anav			X													X		My name is Jonathan Anav and l live at the Grand Lofts on the comer of 11th and Grand. It was brought to my attention that you are looking to build a maintenance facility on the lot that is our current parking lot. I feel that this is a horrible idea if not for the sale fact that you have million dollar condos right across the street to this lot and of course our building is adjacent to this lot. This will driw property wlues DOWN and hurt the residents that support Downtown LA by buying units and living here. This would be a bad move and it would be much better ser.ed to have this maintenance facility a block or two down where there has been no development.Feel free to contact me at anytime with any questions.
Autry		X																As a ten year resident and stake holder, living and working in the Downtown area, I do support and I do look forward to the RETURN of the Street Cars tothe Downtown area! Thank you for an opportunity to RESOND!
Baptista			X													X		am a owner resident of Grand Lofts at 330 W 11th Street. Thank you in adwnce for your attention to this email. I'm writing to express my whement disapprow.l of the proposed location of the streetcar maintenance facility on the parking lot south of our building. That parking lot property is under an agreement to provide whicle parking for residents of Grand Lofts. Displacing that function would cause sewre undue hardship to our building's residents. While I haw been a strong supporter of the streetcar project, the maintenance facility's proposed location, in the middle of an up and coming downtown neighborhood, will seriously undermine the Mure of retail activity and the local pedestrian network. I want to see the streetcar project go forward. However, please consider an alternate location br the maintenance facility.
Barrett		X	X															Hello Jim. I am in favor of what you are doing with the street car. I feel that having the street car rest stop and repair at 11th Street and Grand is a great idea. If you need further information please ask. Looking forward to the completion of the street car.
Barrett II				X							X							Dear Jim: I live in the EVO Building in South park and I was asked to take a survey to approve or disapprove of the rail yard in my neighborhood, and below is my response.. I would like you to take this into consideration, and if you should have any questions please contact me... I am glad to be a part of downtown Los Angeles and a resident of the City of Los Angeles. RESPONSE to SURVEY GIVEN TO EVO RESIDENSES to Approve or Disapprove of the rail yard on 11th and 12th Street: (For your consideration) I approve of the rail yard in our neighborhood.. Because what I see from what the city is doing they will make it look really nice , compatible with the neighborhood , and I am sure they will consider the noise because we are a residential area. I am sure they will make the rail yard look nicer than our building. The flowers are not maintained in the front of our building (as many parts outside and inside our building are not maintained) and many times it smells like pea outside. So with that how can you ask the residences to have an option of disapproval of this location for the rail yard, I have written Jim Doty the same thing, and will again. I think EVO HOA needs to look at how our building is being maintained before asking us not to approve this location for the rail yard.. The city has a proven record of making things look nice and well maintained throughout the city,, and EVO Board Members and Management cannot maintain and do not keep up our building on the outside and the inside.
Bartholomew																X		As the owner of a condominium in the Grand Lofts at 330 West 11th Street in downtown Los Angeles, I am strongly opposed to locating a maintenance yard at 11th and Grand as shown on pages 6 and 7 ofthe NOP for the Draft Environmental Impact Report for the Restoration of Historic Streetcar SeNce in Downtown Los Angeles. Parking for Grand Lofts residents is located on a part of this location and is part of the wlue of my property. While I support the restoration of street cars in downtown. I do not support a maintenance yard in my back yard.
Bell																X		I am opposed to the proposed location for the maintenance rail yard for the new streetcar system being across the street from my business and home at 1111 South Grand Ave La 90015. Your proposed location would be located in the two perking lots between 11th SI. and 12th SI. on Grand Av lam wry upset about this as it would cause traftic noise pollution in my Residential community and noise for my business. I think it is insensitiw to the community that is imesting in the nNtalization of Downtown. I am voicing my opposition and I will remain committed to seeing this project stopped! If this project is apprmed I will mO\e my business tom DowntO'Nl1 and go back to the westside.

Name / Organization	Agency	Purpose and Need	Alternatives	Aesthetics	Air Quality	Cultural Resources	Geology/Soils	Greenhouse Gas Emissions	Hazards/Hazardous Material	Land Use / Planning	Noise/ Vibration	Public Services	Real Estate	Transportation/Traffic	Utilities/Service Systems	MSF	Other	Comment / Summary
Berke																X		It has come to my attention the City of Los Angeles is entertaining the idea of placing a maintenance rail yard for the new Streetcar system in the parking lot where the Grand Loft residents park. I cannot possibly express how deeply concerned I am about losing this lot for all of the residents in our building. I am one of the owners who has been part of the building since it opened as the Grand Lofts S8\en years ago. This lot was promised as the parking lot location to the occupants back then and has prmen to be the most comenient and secure location. Taking this away would greatly impact the residents in the most incom.enient manner, especially considering the challenged parking situation the City already has. Please consider altematiw sights that don't impact residents who liw in the aty. as 'N8 would hate to giw residents a reason to mO\e to another city. Thank you for your serious consideration regarding this matter and please call me if you haw any questions and/or concerns.
Bisaha		X				X								X				Mr Doty: As I'm sure you're aware, there's a great deal of effort underway to bring back the Broadway theaters. Owners, advocacy groups and city council staff are all involved. No one yet knows how things will turn out, or the purposes that each theater will take on (movies, performing arts, restaurant/entertainment, etc), so it's important not to preclude any options. In that context, the streetcar scoping project should include looking at impacts to possible theater operations. For example, if a theater wants to host a red-carpet function, it would likely involve lots of curbside ingress/egress of VIPs and/or a valet stand. How will streetcar infrastructure and operation work around those needs? Could the streetcar operate while allowing a collection of limousines to drop off a number of dignitaries/celebrities? As another example, some of the houses don't have alley access, so shows have to load from the street. Can streetcar operation coexist with the needs of a production (or a band, or a performer, or...) to load/unload from the street? The streetcar can help revivify the theaters, just as the theaters can generate ridership for the streetcar. The key is to maintain operational flexibility for both. How to do that is a worthy subject for the EIR.
Breger		X	X															I strongly support the proposed route of the streetcar. Although I would personally prefer the 9th Street alternative (I live at the Orpheum), it is a better public policy choice to use the 7th Street route for its proximity to the metro station. Can't wait for this to happen!
Brooks		X																The proposal for street car, is a pretty good deal. Some, probably wonder about noise, and if street where traveling is very adequate. I do not think it should be a problem.
Bytof																X		I am a seven year resident owmer in the Grand Lofts at 330 W 11th St. Our building is located along the 11th St track route, and is also adjacent to the potential South Park maintenance facility location. As part of our Grand Lofts purchase agreement, the current dewloper EVOQ and their predecessor are obligated to pf'0\4de a penn anent parking structure with at least 132 spaces. This structure is four and a half years behind schedule, and we are currently using 1150 S Grand Aw for temporary parking. I support the mission of the Streetcar, but strongly request that the neighborhood be included in the discussion of the maintenance facility as Mil as stops along 11th Street. If South Park is chosen as the location for the maintenance facility, hopefully 'Ne will be able to seize the opportunity to incorporate our parking commitment, neighborhood seNng retail along Grand Awnue, and possibly ewn public park space like tennis courts on the roof. The Streetcar is a unique instance where the neighborhood has chosen to fund an amenity that will benefit the entire city and its \4sitors. As a result, extra e1fort should be made to include the neighborhood in the planning process to insure a truly fantastic result.
California Transportation Commission - Laura	State																X	The California Transportation Commission receiwd the Notice of Preparation of a Draft En\4ronmental Impact Report for the abm.e-mentioned project. Is Mure action by the Commission (i.e a wte of funds, \OI:e to appl'O\e a Route Adoption, and/or a wte to apprme a New Public Road connection) anticipated for this project?
Chao			X													X		I own a unit at Luma facing 11th street. I am wry excited about the streetcar and what it could mean for downtown LA I only haw two comments right now: (1) Please do not put a stop right at the 11th and hope intersection. There was a marathon recently that had its goal line here, and I realized how disrupti\6 the noise can be. Up near Palm restaurant is better (also don't think one stop per block is necessary). (2) I don't think the streetcar maintenance facility belongs next to EII8\6n. That property is prime real estate for more retail and residential. A maintenance yard wouldn't make any sense_ I think it makes more sense between 2nd and 3rd, closer to the gowmment buildings_
Chin																X		Just want to voice my opposition, as a condo owner in South Park, concerning the possibility of putting in the rail maintenance and storage facility on 11th and 12th street. This area becoming more and more heavily residential and to put such a facility in the area will stymie our growth as a neighborhood. Furthermore, with the possibility of noise and other disturbances from the facility, it will significantly decrease our quality of life. Please reconsider the possibility of this action and put the maintenance facility in a more appropriately commercial/industrial area of the city. Thank you for your time.
Cohen																X		I am a re.ooem ofDownlown LA and have been living in the Soulb Parl< area (Luma buikling) ror the past 5 years. I am supportive of the streetcar initiative, but am wriling to express my objection to the proposed 30,500-square-root maintenance filcility site at the soulheast corner of 11th Street and Grand Avenue. I do mt fuel it is the appropriate area ror such a filcility as it woukl severely damaW' the quality oflifi: IDr residents in iliat area due to the excess mise and other potential polhrtanls. It is my hope iliat one of the other 2 proposed sites are eIDsen. Please advise what opfuns residents have to oppose 1hE opfun
Colburn School	Organization										X							I represent the Colburn School which occupies a parcel on Bunker Hill bounded by Olive, 2nd, Grand and GTK Way. The school is an internationally respected music conservatory and performance venue much like Julliard in the east. In addition, our facility is used for recording meaning that sound and vibration is an issue not just to the human ear but also to highly tuned recording equipment. We have been working diligently for the past year and a half with MTA structuring mitigations to eliminate the noise and ground borne vibration the will occur as a result of the Regional Connector tunnel planned along 2nd. We are concerned that noise and vibration of the street car could also impact our facility especially when compounded by that generated by the Regional Connector. As part of your EIR we will expect a detailed study with respect to our operation including acoustic engineering analysis proving that future noise and vibration will not affect our operation in any way. If Colburn School cannot provide an acoustically excellent environment we are out of business.

Name / Organization	Agency	Purpose and Need	Alternatives	Aesthetics	Air Quality	Cultural Resources	Geology/Soils	Greenhouse Gas Emissions	Hazards/Hazardous Material	Land Use / Planning	Noise/ Vibration	Public Services	Real Estate	Transportation/Traffic	Utilities/Service Systems	MSF	Other	Comment / Summary
Cooper			X														X	1) Broadway and Grand seem like the obvious north-south routes for the streetcar to me. But I realize that the elevated street on Grand was probably not built to withstand the weight of a streetcar, and the hill between 4th and 5th might be at too high of an incline for streetcar use. And the routing of Flower, and the dead-ends on Hope and Oliw aren't conduciw to north-south streetcar trallic. But it faels like a waste to h8\e the streetcar run up Hill as well as Broadway. It would haw a much more useful and less-redundant route if it ran north-south on streets that were further away from one another. Are there any other north-south tr&\el'Sals that are possible? Is it technically not feasible to install a streetcar on Grand, or it is it just a matter of too much cost? 2) It seems that Little Tokyo would be an om.ous expansion step in the future. Perhaps Chinatown and Union Station could be added to a route as well. Also, another altematiw route could be built that could run up Figueroa and along 1st street, connecting with the eastern-most and southem-most portions of the track along the current planned route, to better sene the west side of downtown. Will this project be built with the possibility of future expansions in mind or is the current route the entire present-and-Mure scope of the streetcar project?
CPUC	State													X			X	The streetcar project described in the NOP will be subject to a number of rules and regulations involving the Commission. These may include the California Public Utilities Code, Sections 1201 et al, which requires Commission authority to construct rail lines over existing streets. The design criteria of the proposed project must comply with Commission General Orders (GOs) The proposed streetcars would pass through high density commercial and residential areas of the Los Angeles Downtown district on a heavily used roadway network. The potential impacts should be identified, discussed and evaluated for necessary safety improvements and mitigations at each proposed crossing and between crossings along street-running portions of the line. This includes considering traffic circulation and queuing, level of service, interconnection of nearby signalized intersections, emergency service response, pedestrian destinations and circulation patterns with respect to the railroad tracks, and compliance with the Americans with Disabilities Act. In particular, high population density areas near rail tracks typically lead to a high amount of pedestrians and vehicles around the tracks and may result in pedestrian and vehicle conflicts with streetcars. Proper analysis and design should minimize such interactions and mitigate the risks associated with them. Construction of a new public crossing requires authorization from the Commission, through the formal application process in accordance with the Commission’s Rules of Practice and Procedure.
CPUC - Munoz	State																X	The california Public Utilities Commission (Commission) has jurisdiction O\er the safety of highway-rail crossings (crossings) in california. The california Public Utilities Code requires the Commission appl"O\8l for construction or alteration of crossings and grants the Commission exclusiw poYr'9r on design, alteration, and/or closure of crossings in california. The Commission's Rail Crossings Engineering Section (ReES) has receiwci a copy of the Environmenta/Impact Report (EIR) notice for the proposed Historic Streetcar seaping meeting. I am inquiring about the nature of the EIR seaping meeting of January 23rd. Is it of a general nature? Or are specific engineering designs going to be discussed? RCES has already participated in some engineering design meetings with the City of Los Angeles.
Crowley		X															X	Anything that improves public transport in LA, inc,.downtown, making it a desirable method of travelling by all socio-economic groups is a very good and long overdue solution! a) It'd be rather wonderful if the cars displayed some kind of graphic alluding to the original streetcars..perhaps photographic,.even though these cars will be of a contemporary design, I feel a bridge to the past, a linking continuety of image, is quite important in celebrating (and not forgetting) LA's history. b) Whilst I have not seen all of the plans, I'd have loved to see planted/decorated medians if at all spatially possible. Raising funding for such an addition (or any statuary elements etc,.) could be helped by public donations, which are memorialised at a certain financial level.
Curtolo																X		Although this letter is coming from me personally, I would like for you to know that my fellow board members and I have discussed this at length with homeowners, and we are very unhappy with the city's proposal to place maintenance yards on Grand Avenue between 11th and 12th streets and the corner of 11th and Olive. I would also note that I have discussed this with luma's HOA president (corner of Hope & 11th) and hetoo has expressed dissatisfaction. South Park is considered an up and coming section of the broader community, particularly given the city's preeminent attraction, LA Uve. Our community continues to flourish primarily because home-buyers vif!!W South Park as a perfect place to call home. I believe there is great risk in this proposal as it will undoubtedly result in safety concerns for families with small children and pets, creating a greater noise and pollution problem, and ultimately devalue our properties. I would also like to share with you that I attended a couple of the events hosted by city officials promoting the streetcar. Alain, I was very supportive. However, this support came with the understanding that the maintenance yards would be nowhere near our building. In numerous conversations with various officials I brought up the maintenance yards. Their responses always pointed to the other two locations being proposed, and never suggested the ones on Grand and Olive, even after specifically questioning them regarding these lots. I find this very disappointing,. and frankly, a bit disingenuous, bordering on dishonest. I respectfully requestthat you share our community's concern with city officials and do everything you can to find an alternate location that would alleviate us of our concern.
Dahan																X		As a resident of the Grand Lofts, I am writing to express my opposition to placing a maintenance rail yard on our parking lot. I haw been very supportiw of Streetcar, and haw attended s8wral of the awnts promoting the Streetcar. If I was aware of your maintenance rail yard proposal earlier, I 'NOuld haw been initially opposed to the Streetcar as I now h8\e become. I hope your office will reconsider this decision. Our residential community will not support a maintenance rail yard in our neighborhood and by consequence, the Streetcar.
Davis I																X		A rail yard is not something that we want at Grand lofts. Our parking situation at Grand Lofts has been such a disappointment because of the lack of consideration of the residents" My family and I haw been here for 8years and we plan on staying, but Please reconsider this mme and think about all those efl8cted ..
Davis II																X		As a resident at Grand Lo1ts 'Nith 3 kids, I too DO NOT want a rail yard at 11th & grand, I am concerned about the potential health hazards as well as the noise it may cause. Please reconsider this site,
Delrahim		X	X											X				I am a resident owner in the South Park district of Downtown Los Angeles (DTLA). Please consider this as my comment for the Restoration of the Historic Streetcar. The Streetcar in DTLA is the best addition approved by the community since the park on Spring St. My comments pertain specifically towards the two proposed options of having the Streetcar run through 7th St. or 9th St. Both options should be implemented and considered part of the development of the Streetcar tracks. Having it run through 7th St or 9th St only will increase the traffic more than the plan would intend to alleviate, taking into consideration either alternate. 7th St alternate would be more beneficial since it runs along the metro station,thus, implying that the 9th St alternate would be logical, from a traffic standpoint, though the amount of traffic from the 9th St freeway exit would increase. Since there would be a fleet of Streetcars on the road, implementing different schedules (i.e., having only a select number of Streetcars pass through the 7th St route during peek hours of 7-9am & 5-7pm) at busy vs nonbusy times could alleviate traffic on both alternate routes.

Drivas		X	X															My name is Peter Drivas and I reside at 253 South Broadway. Therefore I am one of the most impacted residents as the loft I own is on Broadway and 3rd Street. Many people ask why I don't buy a bike or scooter to get around the neighborhood. Its simple. How can I enjoy the walks around the neighborhood if I am mobile. I have to navigate around traffic and miss all the splendor that downtown offers. The beautiful architecture, the shops, reataurants and the people. Having the trolly allwos one to view the splendor of downtowen and all that itr offes. An added bouns is energy efficianey whcih is iprtna tot al of us. Go trolley!!! The most logical place for a terminal would be Olive and 11th Street as the 5th and Hill space is needed parking or potentially a residential or commercial buidling. As for the area by Hills / Broadway and 2nd, I feel this parcel is to valuable as a future condominum tower or comercial space or combination. I am originally from New York City and I see downtown as the futrue Tribecca equivalent of Manahattan. I envsion Broadway as the hippest street in downtown and liken it to Colorado Avenue in Pasadena. Thank you for allowing me to give you my input.
Easlon																	X	Jim, You wanted feedback on the trolley system that is to run on Broadway. My name is Steve Easlon. I wrote the book "The Los Angeles Railway Through The Years" back in the 1970's. Los Angeles had 2 tolley systems. There was the Pacific Electric which was known as the red cars and the Los Angeles Railway which was known as the yellow cars. My book covers the Los Angeles Railway yellow car system which ran on Broadway and many other streets. Let me know if you would like a copy of the book. I know you are planning to use modern light rail trolleys, but I would like to see a different approach. Los Angeles has lost many of the artifacts that made Los Angeles unique. I was very pleased to see Angles Flight put back into service. Los Angeles needs to hang on to historical artifacts like this. If you go to San Francisco, you will see historic Cable Cars and also historic electric trolleys running in the city. They decided to keep many of the old cars running and that gives the city a unique character that attracts people. If you go to San Pedro (Ports O Call), you will see a section of the old Pacific Electric red car trolley system that was recreated. They have 1 authentic red car trolley and 2 replica red car trolleys operating. This is a very popular attraction and they want to expand the system. Along with the light rail trolleys, I would like to see some original looking trolleys that ran in Los Angeles for decades also operate on the new system. Replica trolleys can be constructed, but I also know where there are original bodies of old Los Angeles Trolleys. They could be rebuilt with new running gear and electronics and would bring much needed history and character back to Los Angeles. As a kid I rode the old trolleys on Broadway and loved them. i can't wait to be able to ride trolleycars on Broadway once again. Let me know if I can be of help.
El Dabe																X		Iam a resident of Grand Lofts located on the comer of 11th and Grand. It is my understanding that you are considering the south east comer of 11th and Grand Awnue as a potential location for the nevi street car rail yard. I am writing to ask you to please consider another location. While I am an ardent supporter and dad yes for the street car i do not think the street car rail yard located next to our building is a good idea. Our building is full of families with children including my 2.5 year old son and we would like to keep the surrounding area as free as we can of any potentia!lft.rture hazards. Also, we currently park our cars in that gated lot and really do not want to lose it as we feel it is safe for us and our families.
EVO	Organization															X		Following this cover letter are the responses and comments to a survey taken this week of our 316 members regarding the possible construction of a rail yard on Grand Ave. at 11th-12th Streets. Ninety-three percent of respondents voted in the negative on this proposed siting.
Fang																X		n has been brought to my attention that the proposed 'historic streetcar' project for downtown Los Angeles is currently evaluating potential sites for theirmtintenance yard and one location under consideration is the south east comer lot on 11th and Qand Ave. orbctterknown as the current pmking lot for<hn.d Loft tenants. First and fo:retmst, I want to cII!press my support of the 'streetcar project. I think it's a great idea and it would be wonderful to have a ImIC efficient and streamline formoftmnsportation throughout the downtown Los Angeles neighborhoods. However. after learning ourparlcing lot was a potential site fortbe IIllintenance yard, I began to have reservations. I will spare you the details of aD the patking changes the Qand Loft owners have had to endure over the years, but the simple truth is that our cUJrent parking amtngemmt is the safest location available to us. It jI '"PITtEd clrecUyto OPT !muda, ,mieh ,JJqm g. to niek.y Hit OUt Wiele. gd eater (Nt JpdJ"n, .. My There is no other location around our building that can offer that sam::: sense of security as we have now with our CUII'CDt parking situation. If that were ta1ren away fromIm, the various individuals and fitmilies that live at Qand Lofts, then I would argue that many of us would consider seeking housing elsewhere were a IIJJIC secured environImnt was available to us. Even with aD the luxury condos, IA live and other establishments near in around Grand lofts/South Park. this area is still undergoing 'change' in many ways. With that COIOOS, car thefts, mlggings, harassment fromhoIOOless people and many other situations where our security tmy be threatened. With that said, I kindly urge you to reconsider the options for the DIlintenance yard location. There DIlst be a different solution that would be satisfactory for all parties involved. Safety firstl
Finkelde																X		We li\e in the Grand Lofts building and heard that there might be plans to build a maintenance facility next to our building. I haw liwd next to such a facility and sure hope that I don't haw to do that again. The noise during the day and night can be unbearable, especially with kids.
Fishel			X														X	What would the cost difference, assessment and ridership effect be using the 7th street alignment for a connection to the 7th St Metro Station and new 7th & Figueroa business hotel complex area. Duo directional or double track on the entire route and move the single track from Hill to Broadway for the double track on Broadway? This would reduce the ride time to reach many destinations by half or avoiding the walk from Hill to Broadway. This will also increase the needed capacity. Los Angeles is not Portland with longer North South blocks and fewer one way streets. Also Portland's destinations, points of interest, business and residential density is more evenly spread out than Los Angeles.
Fried																X		I am writing to you as a resident of South Park regarding the proposed option of using the lots on Grand Awnue between 11th and 12th streets and a comer of 11th and Oliw for the maintenance yards for the n8\IV LA Streetcar. I am also a member of the Ellawn HOA Board of Directors and haw ser.ed on that Board as President, Treasurer and Secretary for 7 years since the building was first new. My comments are personal, although I haw spoken to many residents in my building and we are all in agreement that a maintenance yard in a residential area is highly objectionable. Elle\en, Luma and Ew represent more than 700 housing units and thousands of residents. The lofts across rom Ellewn, which are adjacent to the proposed maintenance yard, represent many more hom8O\Yl"lers. Our neighborhood is full offamilies, including children and pets that \YOuld be harmed rom the noise, dust pollution and general negatiw connotation that a maintenance yard \YOuld bring to our area. I urge you to do awry thing necessary to awid placing this yard across rom our home; doing so can only result in many residents leaving the area and the il'le\4table decline in property \/Blues that a maintenance facility would bring to our neighborhood.

Name / Organization	Agency	Purpose and Need	Alternatives	Aesthetics	Air Quality	Cultural Resources	Geology/Soils	Greenhouse Gas Emissions	Hazards/Hazardous Material	Land Use / Planning	Noise/ Vibration	Public Services	Real Estate	Transportation/Traffic	Utilities/Service Systems	MSF	Other	Comment / Summary
Fujita			X															I fully support the downtown streetcar ilea. AIlhough I do rot 1M: in the downtown area, as a frequent visilor to downtown, I would be a riler during major events such as AniIm Expo or the Tha..,! Show. As such, the LocoDy PIelimed AIlernative would be IWCh nme useful to IIll1han if the s1reclcar fuIk>wed the 9th Street al!emative. The LP A would aID link the streetcar wilh Metro RaiJ. at 7th! Metro Center, whi:h IIllkes sense to IIll. Sooner or iarer, the streetcar should be made bi-directional on Broadway or ewn along its entire route. AIlhough this would mt be an issue fur penple ottending a major colIWIllDn center event, I could see how the current one-way route could be discouraging fur SOIlll potential riIers. SOIlllbody who started at Broadway and O\yIq>" would have to make a 1arge lonp to get hack to the starting poinL Ewntually I hope that the streetcar would be successful emugh to extend to IIlllIiple routes, wilh streetcars going to Chinatown or other areas near downtown. I look furward to getting beyond the discusmn and seeing SOIlll tracks laiI.
Gahbauer				X										X				Consider impacts to existing bus routes on the streets that the streetcar would serve, and - more importantly - to consider ways in which bus transit service could be improved as a result...I urge the City and Metro to study the visual impacts asscociated with the project and to strongly consider at least one of several streetcar technologies that would eliminate the need for overhead wites, such as (....), which use various methods of safely embedding the power supply in the ground.
Garcia														X				When preparing the emAronmental clearance documents for the Downtcwm LA Streetcar project, please examine the potential impact it will haw to bus operations. I'm concerned that the project as currently configured will significantly add to the congestion which will slow down bus seNce and whicle mmement in general. I'm particularly concerned about Hill Street since it is one of the most heavily used streets for buses and is schedule to to get ewn more bus lines due to the shrinking the number of southbound tl"8\ellanes on Broadway to one. Considering the City ongoing financial situation, I also concerned as to how it going pay for streetcar operations.
Giles		X												X			X	We're working with Mr. Joseph Hellen (Property Owner) in the hopes of reactivating the Roxie, Cameo & Arcade Theatres (500 block of South Broadway) for entertainment in the very near future, and so we're greatly interested in the ultimate success of the Streetcar program and appreciate this opportunity for comment. We just have a few questions regarding this initial EIR/study and presentation... Given that the Streetcar, while on South Broadway, will travel in the existing, "southbound" lanes of traffic, we're interested in the future placement of the Streetcar stop on the 500 block of South Broadway. Thus, would the stop be "centered", mid-block, or will it be placed at the end of the block as some of the bus stops are? For our design and planning purposes, we're trying to establish how or where our patrons will cross the street once exiting the Streetcar. Additionally, this question may be premature, but will there be advertising opportunities for businesses and even, "incentives" for "local" businesses to advertise on the Streetcar? Notwithstanding the existing local ban, will the Streetcar feature digital signage for advertisers? Lastly, what are or where could we find data on (if any) "safety issues" surrounding the operation of the Streetcar? Does such a system tend to cause more traffic accidents? Are there many individual, physical injuries caused directly by the Streetcar in other cities? We intend to cater to the Downtown,"elderly and aging" community, thus, any and all detail regarding the accident experience for such a system would be greatly appreciated.
Gilles		X																My wife and I live in Los Angeles - Beachwood Canyon. We also have an apartment in Portlahnd in the Nob Hill Area. Portland has excellednt public transportation. Our apartment is within 1 block of the Portland Streetcar line. We can catch the tram and be in the heart of Downtown Portland in about 15 minutes. This line also bisects MAX, the light rail line to PDX. We don't need to drive while in Portland and we can grocery shop, dine and have an adult beverage and get home safely. Los Angeles had the best system in the world. Want to regain the best status? Try the Los Angeles Circular Streetcar in downtown!!!
Grobet		X																Why not have Dash create a rout on the future street car alignment to test the waters on how many people would benefit from this route.
Grossman			X		X						X		X	X		X	X	We have serious concerns regarding the City's option to place a streetcar maintenance and storage facility (the "facility") between Hill and Broadway, just south of Second Street. We reside at the Pan American Lofts (Third and Broadway), which are owner-occupied condominiums on the same block as the proposed site, and we anticipate rail construction will bring both noise and air quality disturbances, including road work, traffic re-routing, dust, etc. – both in front (Broadway) and behind (Hill St.) our residence. Putting the facility on our block means we'll endure construction on three sides – and in the end be forced to endure having the facility beneath the windows of half of our building's owners. Our reading of the Initial Study is that system construction alone will occur during a 14-hour window (7 a.m. to 9 p.m.), plus intersection construction will occur at night. Then, according to the Initial Study, the long-term plan is for streetcar operation on 18- and 22½- hour schedules, guaranteeing increased foot traffic and even more noise. A maintenance/storage facility with streetcars and workers pulling in and out at all hours only exacerbates the continual nuisance. Also, streetcar construction may precede, follow, or be concurrent with the Federal Courthouse construction at Second and Broadway, compounding all these problems. Further, consider that the Pan American must be historically preserved under the Mills Act, and any study of this site must take into account possible damage to our home, including the underground structure. As homeowners, we are also concerned that all of this will degrade our home property values. However, we hope it is already apparent this site is not the ideal location for other reasons. Consider: -- The north end of Broadway is regularly closed to traffic for marches and street fairs – usually from Temple to Seventh. Does it make sense to put the facility where it will be blocked by foot traffic on Broadway? -- The site is near two heavily used tunnels at Second and Third. These are often closed for filming, creating traffic bottlenecks on Hill St., which then causes problems for the 1,300 senior citizen residents of Angelus Plaza, which requires access for families, tour busses and emergency vehicles. Will the facility avoid blocking traffic on Hill St.? -- As mentioned, a federal courthouse will go up at Second and Broadway – a half-block away – bringing its own set of long-term pedestrian, automobile, and security issues. -- This location is between many residential units on Hill and Broadway (not just ours), a hotel, and nearby business, cultural and tourist areas, and the short-term parking lot on the site is used by people attending the courts, Disney Hall, the Music Center, museums, shops in the neighborhood, the historic core, etc. Broadway is being revitalized. It makes much more sense for the facility to be placed further away. -- Between Bunker Hill, the Los Angeles Times, Angels Flight, Grand Central Market, Angelus Plaza, the two parking structures adjacent the Second and the Third Street Tunnels, and Broadway, there already exists a great amount of daily pedestrian and automobile traffic. As

GSA - Matthew Jear	Federal		X	X						X	X			X			X	GSA is in the process of planning and constructing a United States Courthouse on the block bordered on the north by 1st Street; on the south by 2nd Street; on the west by Hill Street; and on the east by Broadway. In response to the City of Los Angeles Notice of Preparation of DEIR/EA and Initial Study for the Restoration of Historic Streetcar Service in Downtown Los Angeles project, dated January 3, 2013, the General Services Administration (GSA) provides the following comments: 1) GSA requests a Threat and Vulnerability Assessment of the streetcar, in relation to the courthouse, to be conducted. The Assessment should be consistent with the Federal Transportation Administration's Public Transportation System Security and Emergency Preparedness Planning Guide. This should be coordinated with the GSA and United States Marshals Service. 2) According to the City's Notice of Preparation and Initial Study, the streetcar routes/tracks will border the courthouse site on 3 sides. In addition, the schedule of completion for the new courthouse mirrors the completion schedule of the streetcar. The close proximity of the streetcar route/tracks and the overlapping completion schedules for both projects, require careful coordination between GSA and the City. Close coordination of construction, including placement of track and stop(s) will need to be undertaken and should be momorialized in a Memorandum of Understanding. This is partially due to the overlapping construction schedules, but also due to mission critical ingress/egress points at the courthouse. 3) GSA requests an acoustic study of the street operations and its impacts to the proposed courthouse to be conducted. There are sensitive receptors within the courthouse that must be carefully considered. 4) While it is understood there are no current plans to extend the streetcar further west, it is likely at some time in the future it could be extended to Union Station and the development of the current phase should consider such expansion. Furthermore, should such expansion occur it would be highly desirable to choose a route that would serve 300NLA and Roybal since there are a number of potential riders between this complex and the courthouse that could be served. 5) It is understood overhead wires will be used to power the street cars. If feasible, new, wireless technology should be used. If not, wires should have a minimal profile and be incapable of concealing devices. Cluttering up the environment with a network of overhead wires is aesthetically less desirable.
Helfand		X																Though I am not a resident of Los Angeles (I live jn Arcadia) I am all for the restoration of Streetcar service in Los Angeles. Having been bom in LA and lived in Hollywood I rode the Pacific Elecbic and LA TL lines almost every day and know how important such transportation is and how much the merchants can benefit from this mode of transportation. Please advise if~u need my assistance ...... .I will be unable to attend the meeting. Morley J. Helfand morleyhelfand@yahoo.com
Hillery																X		Thank you for the opportunity to express my comments regarding the South Park Maintenance Facility Project. am a sewn year resident owner in the Grand Lofts, located at 330 West 11th Street (comer of Grand Awnue and 11th Street). As part of our Grand Lofts purchase agrasment, the current d .... loper EVOQ and their predecessor are obligated to provide a permanent parking structure with at least 132 spaces. We are currently using the parking lot at 1150 S Grand Awnue, which is a potential site for the streetcar maintenance facility. I support the mission of the Streetcar; hClWe\er, I haw ob\tous concerns should 1150 S Grand Awnue seM as the site for the facility.
Hoon																X		I and my belo'o8d dogs of The Grand Lofts do not and will not .... r app",,", of your awful city planners/architects/ignorants to take away our God gr.en rights to parking. You will be ruining many families and precious li",s. Is that how the City of Los Angeles wants to build the newiy bslowd rail project?
Hotchkin		X															X	We have been closely following LA's Streetcar progress and are excited with your progression. In reviewing the Notice of Preparation of a Draft Environmental Impact Report/Environmental Assessment, we noticed that on page two it calls out for the TPSS (traction power substations) and overhead contact system to be high voltage of approximately 600 VDC. Is it your intent to remain at 600 VDC, or will you also be considering 750 VDC? Currently all the modern streetcar systems operating in the US are 750 VDC, so the difference is a significant item of note to United Streetcar, the first US manufacturer of modern streetcars in over 60-years
HuangFu		X	X							X	X		X	X		X	X	I'm currently a homeowner in the building known as Elleven on corner of 11th and Grand Ave. While excited to hear that I will be paying more property tax to support a street car system that I potentially may not be using. I'm also really concern with the potential plan that will route street car through 11th street. I am strongly opposed/concern with the current route proposed through 11th street. 1. 11th street is only a narrow 2 lane street. Olympic, 9th, and 8th street are all wider to handle the additional traffic this project may create 2. The noise level and impact to property value to the homes owners on 11th street. This is personal to me as my windows is facing 11th street. Its already used heavily for emergency vehicle from the firestation during all hours of the day. 3. The proposed maintenance and storage facility currently on Grand and Eleven. This will take significantly already short parking lot availability near homes where guests are visiting. And also yes REDUCE of property value for existing home owners in this area. (would YOU want to live near a train maintenance yard?) In short, i'm opposed to the current route of street car through 11st street and proposed maintenance and storage facility as a resident and someone who is familiar with this area. While we are at it, i will also ask/voice my concern with the current plan 4. Will the one way loop really reduce travel time and is a route that is being used by majority of people? it seems like DASH is sufficient enough to travel between all the points of interst 5. Is streetcar really just a novel idea or a useful transportation tool? does is really move more people with less energy and reduce traffic in the area? 6. Will streetcar create more crime and be used as potential tool for terrorist attack? I'm hoping these questions will be seriously look into and answered. Until then, I'm skeptical of the current plan and is really not looking forward for this plan to be implemented. I have been supporter of DTLA redevelopment for years and purchased my unit in DTLA as a direct result (put my money where my mouth is). I wish the city makes a wise choice for its residence and visitors to create an environment that is positive for continue revitalization of Downtown.
Hui		X				X								X			X	The following are comments based from the public environmental impact hearing for the Downtown LA Streetcar. I am concerned with the effect the planned streetcar will have on the character and atmosphere of the Downtown Los Angeles. Any project in the area must preserve the historic character of the area or it really will not be any kind of 'restoration'; in light of this I believe the train used must be historic instead of the ugly white and green modern car that was on all the pamphlets/webpage. You can reference San Francisco's historic streetcar page for better streetcars http://www.streetcar.org/streetcars/189/. Currently there is a mystique that comes with historical significant and this has resulted in a slew of artsy and small businesses taking root. If a modern streetcar (like those in Seattle) is used the character of the area will be spoiled and set a tone for the developments/shop in the area; which may lead to slower development and dilution of downtown's character. I am also concerned with the length of the streetcar as it will block up traffic on all the turns it makes, not to mention from its frequent stopping on every street. I believe that a smaller streetcar (see the link above) may mitigate the turning issue and may reduce incidents of hitting pedestrians.

Name / Organization	Agency	Purpose and Need	Alternatives	Aesthetics	Air Quality	Cultural Resources	Geology/Soils	Greenhouse Gas Emissions	Hazards/Hazardous Material	Land Use / Planning	Noise/ Vibration	Public Services	Real Estate	Transportation/Traffic	Utilities/Service Systems	MSF	Other	Comment / Summary
Irmler		X											X			X		I support the Downtown Streetcar, but I'm strongly against a Maintenance and Storage Facility on Grand Ave. between 11th and 12th. This will not just be an eyesore, it will greatly depreciate the value of the three residential buildings Evo, Elleven and the building on the corner of 11th and Grand. In addition, it will remove the last big parking lot in this era with the construction of the new apartment buildings on Grand Ave. between 12th and Pico. I hope you are able to use one of the other possible locations for the Maintenance and Storage Facility
Jackson			X	X													X	Are there plans to build the street car so that it can be continued at some point in the future? A link to LIttle Tokyo or Echo Park perhaps? Also, the proposed "street car" car design was horrific! I know it was a concept, but please don't overlook DTLA's famous art deco aesthetic when designing.
Jeff											X					X		Of the three locations designated as potential sites for the Streetcar maintenance yard, regardless of whichever one is actually selected, there is concern regarding the possible high levels of noise so close to residential buildings. It was intimated to me during said meeting, that at this time it has not yet been determined if the majority of the work in the maintenance yard will occur during the day or at night. Either way it would be a disturbance to the nearby residents. I truly believe that noise mitigation efforts should be applied in this regard to properly address these concerns.
Johnson		X																I would look to add my voice to those who would like to see the restoration of a downtown street car. I support the initial downtown streetcar proposal 100%
Johnston																	X	Really Wide sidewalks please!; Consider adding more trees to your sidewalk plans. Never Enough trees downtown!; Minimize poles: Consider combining light poles, street lights poles to hold the wires. Also run wires off building (like in the past); Good info signs at end stop (what is nearby: neighborhoods/blocks); make easy to find (some king of landmark); minimize trash cans/benches=collects trash/messy; the cars itself yellow and green like the past!; minimize advertising on the sides of the cars. Look classy, not a rolling billboard; hopefully will follow portland model especially quick construction/surface methods. Avoid Utility probles with DWP like Expo did.
Joo																X		I really want to make it clear that you will NOT be able to build a maintenance facility on our parking lot.
K+R Design Inc	Organization		X															We believe that the title of the project "Restoration of the Historic Streetcar" is a misnomer. The envisioned streetcar is completely modern and restoration of the historic streetcar is intended. The reason I would like to bring this up is to point out that if no historic restoration is intended, the proposal should be looking at other alternatives which might be cheaper, more efficient, quieter, consume less energy, and have lesser impact on traffic and the environment. We wouldlike to submit to you that one such option is the Personal Rapid Transit (PRT) system. In this matter, I believe that the scope of the EIR only explores alternative routes and does not explore alternative transit technologies. We suggest that alternatives for transit technology such as thePRT be included in the scope of the EIR.
Kawaratani			X											X				I was a city planner for the LA/CRA for 31 years from 1962 to 1993. I worked on all the highrise buildings on Bunker Hill and most of those in the CBD Project, including the convention center and U.S Bank Buildings, and Broadway and Spring Streets. So I am familiar with Downtown Los Angeles. I think the Locally Preferred Alternative route is pretty good in terms of serving the proposed ridership. But I am concerned that it will be a problem on 7th Street because of traffic, many pedestrians, the proposed bikeway,and the length of the street cars. The blocks are also short and the 7th and Figueroa intersection will be a major challenge, especially with all the pedestrians and cars. I guess that is why you have a 9th Street Alternative, but it is terrible, as it doesn't serve the Financial Core area at all. The financial core is along Figueroa Street to Grand Avenue, and 4th Street down to 8th street. The 9th street route will only serve the South Park Area and primarily housing. Visitors don't want to go to housing. 6th Street is one-way east and MUST be your Alternative to 7th Street, not 9th Street. In fact, it should have been the Locally Preferred Alternative. It will provide excellent service to the Financial Core Area, including the Bunker Hill area along 5th Street. You will be missing a big opportunity if you pass on 6th Street. I brought it up before, but it was ignored. This area is the largest office population in Downtown. It will conveniently serve the Bonaventure and Biltmore Hotels and the Central Library. You have the responsibility to at least look at it in the Draft EIR.
Kawaratani			X															I commented eartier that the 9th Street Altematiw is terrible because it bypasses the Financial Core, The much better Altematiw Yt'OUld be 6th Street.
Kay		X		X	X	X					X		X	X			X	This project is unnecessarily duplicative of existing service on the red and purple subway lines, the under construction regional connector light rail line and many bus lines that pass through Downtown. The streetcar project will also subject Downtown to several negative effects in the following areas: 1. Transportation/Traffic - This project will add additional over-sized vehicles to narrow Downtown streets and further worsen already-existing poor traffic conditions. 2. Air quality - The additional traffic created by this project will worsen Downtown air quality because of additional exhaust caused by increased idling of cars in traffic on Downtown streets. 3. Aesthetics/Visual Quality - This project will be built in an area with many historic buildings and the infrastructure required for the streetcar (including the service yard, the power substations and the overhead wiring) will interfere with the views of the historic buildings and will decrease enjoyment of these historic resources. 4. Noise - This project will add additional noise in the project area late in to each night (according to the proposed service schedule). The construction of the project will also add additional noise to the area. 5. Safety - Downtown is already an area with significant pedestrian traffic. Streetcars making turns at intersections will create dangerous conditions for pedestrians. 6. Construction Impacts - The construction will significantly contribute negative impacts of noise, traffic and worsened air quality. 7. Historic resources - The street route will interfere with the future restoration of many historic buildings in Downtown by preventing of the use of space in front of buildings for construction staging that would be necessary for a restoration project. 8. Environmental Justice - This project will further contribute to the gentrification of Downtown and drive out many current low income residents.
KSP																X		I am against the city's proposal to build a maintenance & storage facility at 11th & Grand for the streetcar. This location is in the heart of residential neighborhood and is not an appropriate use of space. I hope our city planners exercise good judgment & common sense and build the facility elsewhere.
KSP II																X		Why build a industrial streetcar garage in thl middle of a residen!ial neighborhood The proposed fucility is directly adjacent 1D densely populared residen!ial1Dwer. The proposed site at 11111 and Grand is also in very chse proximity 1D LA Live, and IIlljor school (FIDM), downtown Ralphs grocery, ~le apar1Jmnt bmlling restaurants & retai1 s1Dres, and thllist goes on. The proposed sites at 11111 and Grand are fully utili2ed as parking hts during events at thl LA Convention Center and Staple Center. Have you furgotren so qui:kly 1hat parking is a limited resource in downtown, especially in thl Sou1h Pad< area, which is directly linked 1D LA Live? I ama registered vorer and a kmg-time resXlent of downtown Los Angeles. AND I AM SO ANGRY TIfAT 111H & GRAND IS BEING CONSIDERED FOR TIIIS PURPOSE.
LADWP Sanitation	Local														X			Based on the project description, we have determined that the project is unrelated to sewer capacity availability and therefore do no have sufficient detail to offer an analysis at this time. However, as you develop your project alignment please ensure that you put in place mitigation measures whenever your project comes near, in contact or interfere with a sew infrastructure to guarantee the continued safe operation of such structures. Should the project description change, please continue to send us information so that we may determine if a sewer assessment is required in the future.
LAFD: Forestry Division	Local					X	X	X	X			X						The statutory responsibilities of the County of Los Angeles Fire Department, Forestry Division include erosion control, watershed management, rare and endangered species, vegetation, fuel modification for Very High Fire Hazard Severity Zones or Fire Zone 4, archeological and cultural resources and the County Oak Tree Ordinance. Potential impacts in these areas should be addressed in the Draft Environmental Impact Report.

Name / Organization	Agency	Purpose and Need	Alternatives	Aesthetics	Air Quality	Cultural Resources	Geology/Soils	Greenhouse Gas Emissions	Hazards/Hazardous Material	Land Use / Planning	Noise/ Vibration	Public Services	Real Estate	Transportation/Traffic	Utilities/Service Systems	MSF	Other	Comment / Summary
LAFD: Health Hazard. Materials	Local											X						The Health Hazardous Materials Division has no objection.
LAFD: Land Development Unit	Local											X						This project is located in close proximity to the jurisdictional area of the Los Angeles County Fire Department. However, this project is unlikely to have an impact that necessitates a comment concerning general requirements from the Land Development Unit of the Los Angeles County Fire Department. Our emphasis is on the availability of sufficient water supplies for firefighting operations and local/regional access issues. However, we review all projects for issues that may have a significant impact on the County of Los Angeles Fire Department. The County of Los Angeles Fire Department, Land Development Unit may also comment on conditions that may be imposed on a project by the Fire Prevention Division, which may create a potentially significant impact to the environment.
LAFD: Planning Division	Local											X						The subject property is entirely within the City of Los Angeles, which is not a part of the emergency response area of the Los Angeles County Fire Department (also known as the Consolidated Fire Protection District of Los Angeles County). Therefore, this project does not appear to have any impact on the emergency responsibilities of this Department.
Lee			X													X	X	I am a resident of the Grand Lofts located at the southeast corner of 11th Street and Grand Avenue and I am concerned about the proposed location of one of the "maintenance and storage facility" areas that is located along 11th Street (see attached PDF). I am certain that other residents in the Grand Lofts as well as neighbors across the street (EVO and Elleven lofts) aren't too thrilled about the proposed location. There are few issues with the proposed location: · As it is currently shown, it includes our building's parking area. Our parking lot is located directly south of our building along Grand Avenue (northern block). What will happen to our parking area? · Along 11th Street, Grand Avenue and immediate vicinity is mostly residential developments as you can see in the attached PDF. It also sees the most amount of pedestrian traffic because of the many residents living in that area. There are commercial/industrial areas with open spaces (used as parking lots currently) east of Olive Street and west of Flower Street that seem to be far more logical place for a maintenance and storage facility. What were the reasons that these areas were not considered? · I think the downtown residents, who are footing the Streetcar bill by paying additional property taxes, should have a say in where the maintenance and storage facilities should or should not be located. When the Streetcar measure was proposed, I do not recall that there was any mention of these maintenance and storage facilities. This is a big deal to the downtown residents and if this information was provided at the time of the ballot, I think many residents might have voted against it. Will there be community workshops or meetings where we can voice our concerns regarding the Project?
Leger																X		am writing to express our concems and opinions in regards to the city considering our residential parking lot, at 11th and Grand, as one of three proposed areas for the maintenance rail yard. 1) Our residential building, Grand Lofts, is across ft"om two other residential buildings here on Grand Awnue in the South Park area. lhese are our homes. We haw families with children and pets in these buildings. A streetcar maintenance rail yard in an area directly next to, and across ft"om residential buildings would increase the noise, traffic, and danger to children and pets that Ihe in these homes. 2) In addition, those of us that enjoy li\Ang downtown do walk and take public transportation whenewr possible, howe\er, we still need to use our cars. Our building does not haw underground parking like some other residential buildings in the area. Because it is adjacent to our building, and fenced, it pl"O\ides a safe area for our families to access their whicles, day and night. We need that parking lot exactly where it is, br the safety and con\enience of our residents. It is the only one we h8\e. For the reasons stated abO\e, and others not listed, my husband and I are among those who do not want our residential parking lot at 11th and Grand to be considered as a location for the streetcar maintenance rail yard.
Libit - Pan American Loft Assoc.	Organization															X		We believe that the Broadway/Hill/2nd street location for the maintenance facility will cause an impact on our immediate downtown neighborhood and careful design consideration or an altemath.e location must be selected for this facility. The city and the streetcar planners should strongly consider the alternate locations (Hill & 5th, 11 & Grand) or propose design solutions that will not harm the gentrification of our area of downtown. The impact that a -maintenance & storage yard- can cause on the pedestrian, residential and urbanist quality of life on Broadway between 2nd & 3rd will be dramatic if done with a heaW hand. These issues can be resol\eCI by using the maintenance facility as a catalyst for smart dewlopment and integrating it into a mixed use project or other wnture that impl"O\eS the civic & cultural life of northern downtown. This facility will haw a negati\e community impact if it is just an open yard with a lifeless concrete building.
Lin		X																Streetcar would be a wonderful transportation in Downtown.
Lin			X													X		strongly fa\or the locally preferrec:l alternati\6. It gi\6S much more 'Nidth to the areas seMKI. The 9th street plan 'Nill seM less Rarea". 2. I do not like the maintenance and storage facilities at 11th St. I believe the 5th St. Maintenance facility makes the most sense based on location. The 2nd/3rd St maintenance facility may also make sense, but I still fa"" the 5th 51. location.
Los Angeles Conservancy	Organization			X		X										X	X	Many streets along the routes of both the locally preferred and 9th Street alternatives historically accommodated streetcars from various lines, and appear to be appropriate for a return of service. Nonetheless, we urge that the design, construction, and operation of the streetcar avoid or minimize adverse impacts to historic resources along the selected route. This includes location of traction power substations (TPSS), overhead systems, and maintenance and storage facilities. If significant impacts on historic resources are anticipated, we ask that preservation alternatives are evaluated in the Draft EIR/EA. In the past, streetcar facilities were integrated into buildings that became part of downtown's urban fabric, such as the Pacific Electric Building and the Subway Terminal Building. The potential locations identified for the new streetcar maintenance and storage facilities are currently vacant sites, which should retain the option for future infill construction to reconnect the streetscape. If new construction is anticipated, we recommend guidelines to ensure appropriate scale and massing with the surrounding context, particularly when adjacent to historic resources or districts. In addition, opportunities may exist to reuse or incorporate remaining elements of the historic streetcar system, such as existing eyehooks for overhead wires on buildings along the route.
Maki																X		Hello: My office is bel<7tN and we haw another place at 11th and Grand across the street. We are opposed to this project. If the city wants to imprme this area, putting a rail yard in it is contrary to that notion. There are other locations south/east of this area. I hope you will consider our strong opposition. Not to mention the emAronmental impacUnoisHbrations-dirl in our residential community. Thank you.
Mendelson				X		X								X			X	Transportation/Traffic - The street car may be unnecessarily redundant with other similar forms of public such as the proposed Regional Connector, Red and Purple lines, and Metro buses 2, 4, 10, 28, 30, 40, 45, 81, 83, 84, 90, 91, 94, 302, 330, 728, 745, and 794. Aesthetics/Visual Quality - This street car's extensive infrastructure (service yard, power substations, and overhead wiring) may further diminish visual quality and enjoyment of the area's architecturally significant buildings. Historic Resources - The route will complicate future historic renovation efforts by limiting the available of construction staging space in front of the buildings. Environmental Justice - Inequity may be experienced by lower income riders if a notably higher fare is charged for the street car compared to other similar public transit options.

Name / Organization	Agency	Purpose and Need	Alternatives	Aesthetics	Air Quality	Cultural Resources	Geology/Soils	Greenhouse Gas Emissions	Hazards/Hazardous Material	Land Use / Planning	Noise/ Vibration	Public Services	Real Estate	Transportation/Traffic	Utilities/Service Systems	MSF	Other	Comment / Summary
METRO	Local																	1} Maximizing Inter-modal Connectivity: The project sponsor should consult LACMTA staff regarding how the project can enhance connectivity with other forms of transit, especially the connections with Union Station; 2} Metro Regional Connector: Construction of the proposed project may coincide with construction of the Metro Regional Connector underground light rail project along 2nd Street. To avoid any potential conflicts during construction and subsequent project operation, the project sponsor should coordinate planning, design, and construction efforts with the Metro Regional Connector Project Team and Design Builder during various planning stages and prior to the start of and during construction; 3} Project Construction Impacts: Several transit corridors with Metro bus service could be impacted by construction ofthe streetcar and its associated maintenance facility. For short term construction activities that may impact Metro bus lines, Metro Bus Operations Control Special Events Coordinator should be contacted at 213-922-4632. Long term construction activities should be coordinated with Metro Service Planning & Scheduling at 213-922-1228. Municipal bus service operators including LADOT may also be impacted and therefore should be included in construction outreach efforts; 4} Operational Impacts: Streetcar service sharing right-of-way with Metro and municipal buses may result in reduced bus operations capacity. Potential disruptions to bus operations should be analyzed in the EIR and appropriate mitigation measures identified in consultation with Metro Service Planning & Scheduling and with other municipal bus operators. Moreover, the agency responsible for operating the streetcar service must also incur the costs associated with implementing the appropriate mitigation measures;
METRO - Carl Ripaldi	Local			X					X	X	X					X	X	1. Within the organization chart for the project presented in you Powerpoint Presentation it would be helpful to identify who in Metro is dealing with the Environmental Clearance in association with the City of LA as well as who the Environmental Consultant is for the project. This contact information is essential. 2. The Initial Study indicated that there are three potential sites for the Storage and Maintenance Yard for the project. You need to explain how much trolley storage is necessary for this project and describe what maintenance operations will occur in the yard. What are the noise and hazardous materials storage issues associated with this yard? Are the sites identified compatible with their surroundings? Are these sites adjacent to commercial and residential complexes? 3. I would suggest that for the figures included in the documents where you chose highlighting for the alignments that a choice is made that will show up on a black and white copy of the study. Not everyone has access to a color printer. That way anyone who chooses to run off a hard copy of the document will be able to see the alignment clearly. 4. Regarding the TPSS requirements for the Project, five or six will be required. Have these been assessed for space availability and possible adjacency problems? For example, are some of these sites next to residential or business complexes? It may be necessary to provide aesthetic enhancements and landscaping to the TPSS plans to make them acceptable to adjacent businesses and residential complexes. This has been done for a number of TPSS sites serving Metro Light Rail lines. 5. The Environmental Studies need to address the presence and alignment of Metro's Regional Connector Project, as well as the projected dates for constrution. Where along the proposed alignment will there be Transfer opportunities for passengers form both the Trolley and Regional Connector lines? Also, what are the expected dates of construction for the Trolley Project versus the Regional Connector Project? Will there be conflicts with utility construction and cut and cover construction of stations for the Regional Connector with the surface construction activities for the Trolley Project?
Miller			X															I see one issue with the route. The top is a mess and unclear what it is trying to accomplish. I'd rather it come down I-lope/Flower for a bit and include the Financial district and Ubrary. The 2nd Street connector could then be canceled, saving billions. The Red line already goes to 7th Street from near Little Tokyo. I understand that the "thin part- of the streetcar route is to allow quick retums to the other side, but the Red Une already plOlAdes this. The -7th St Altematiw" is the correct choice, to connect with the Metro.
Morland		X																Keep up the great opportunity to bring our Downtown together with dignity!
NAHC	State					X												The NAHC advises the Lead Agency to request a Sacred Lands File search of the NAHC if one has not been done for the 'area of potential effect' or APE previously. Early consultation with Native American tribes in your area is the best way to avoid unanticipated discoveries of cultural resources or burial sites once a project is underway. Culturally affiliated tribes and individuals may have knowledge of the religious and cultural significance of the historic properties in the project area (e.g. APE). We strongly urge that you make contact with the list of Native American Contacts on the attached list of Native American contacts, to see if your proposed project might impact Native American cultural resources and to obtain their recommendations concerning the proposed project
Nathie																X		I would h8\e sent this email sooner, but my building just sent an email out today notifying us about the proposed maintenance yards that will be across "tom our building at Ellewn Lofts. 1. How long will these be -maintenance yards- for, and 2. What are local residents supposed to do about parking for themseh.es and their guests? When &\ents are going on at LA Uw those parking lots prcNde us with very necessary additional parking. Being forced to park at farther lots leaw the females in our household wry wlnerable at night time walking to and from their whicles. It's bad enough that the city preys on us with parking tickets, na.v they want to take away our parking lot. Disapprove.
Nesbitt		X	X													X	X	Thank you for the opportunity to respond to subject reports. I have been a Downtown resident since 1984 and have a keen interest in seeing this project brought to fruition. I am impressed with the project so far and feel it is well thought out. The few comments I have are: 1. I'm glad to see a spur running to 1st and Grand Ave. I hope that stays in the final plan. 2. I strongly feel that the 7th Street (LPA) is by far the best route because of the ability to interface with Metro at Figueroa and 7th Streets. 3. The location of the Maintenance and Storage area seems to be a problem since all three sites, and any site along the route, will prevent that area from being developed with residential/commercial applications. I feel that the northern most location bordered by Hill, Broadway, 2nd and 3rd Streets is the best of the three. 4. I have seen no reference as to the design of the streetcar itself other than the current pictures. I hope the selected cars will be of a more interesting design; perhaps unique to L.A. to add some interest.
Netzel																X		My husband and I currently lh .. in the Grand Lolls located at 330 W. 11th. Street. #401. Los Angeles. CA 90015. We lme li .... ng downtown with the nightlife, L.A. Liw, the new restaurants and most importantly many activities that our new daughter who is 3 months will enjoy. We are currently in the process of expanding our loft so that we may liw here comfortably for many years to come. We are here to stay for a wry long time. I-lol.Ye\er, we haw heard that the city is considering putting the maintenance rail yard in our current parking lot on 11th and Grand Awnue. This would definitely hinder our long term plans and be of much incomenience to our current living situation. With children, conwnience and location is key. On that note, while I support the Streetcar, please reconsider the location of the rail yard. I would like to be a resident and owner of Grand Lofts for a wry long time.
Nicholas		X																I am a Downtown LA resident li\4ng in the Historic Old Bank District, I would like to declare my support for the restoration of historic streetcar service in Downtown Los Angeles. Downtown LA is undergoing se-.eral positiw transformations, The addition of an intuitiw transportation system seems fitting with regards to other projects planned for this area, A streetcar will not just make getting around downtown more efficient, but will also add character to the neighborhood. As a small business owner opening up a cafe along the proposed route of the streetcar I lilly support and endorse this project.

Name / Organization	Agency	Purpose and Need	Alternatives	Aesthetics	Air Quality	Cultural Resources	Geology/Soils	Greenhouse Gas Emissions	Hazards/Hazardous Material	Land Use / Planning	Noise/ Vibration	Public Services	Real Estate	Transportation/Traffic	Utilities/Service Systems	MSF	Other	Comment / Summary
Norton		X	X											X			X	I find it very problematic that the connection between the financial-hotel core and the Staples-Convention Center area is so awkward. It seems too bad that the necessity to maximize constituency damages the logic of the route. Obviously the preferred route would to use 7th Street for two-way trolley traffic and send southbound trolleys via Flower. In lieu of this, the 9th Street crossing makes better sense--both north- and southbound routes remain in closer proximity this way, easier for visitors to comprehend and, hence, use. The northern "tail" to Moca seems an unnecessary complication; no such extension has been proposed for the southern end to connect with the Convention Center at Pico. I hope the trolleys will look similar to the one shown in the proposal photo. Not only do low-slung trolleys make boarding easier and safer, they are very modern appearing, proclaiming Los Angeles a forward-looking metropolis. Forget cutesy, go sleek. Also the route should be as traffic-free as possible. I doubt whether the plan includes much exclusive right-of-way, but the more that can be obtained, the better. Progressive cities are realizing that closing off street lanes for bicycles, pedestrians and transit--once considered unthinkable because the movement of cars took precedence over everything else--is an increasingly attractive and popular option. This point should never to be forgotten: the purpose is to improve and enhance the movement of PEOPLE, not vehicles.
Nussdorf		X															X	Firstly, I'd like to thank you for your progress with the LA Streetcar. I own a condo on Los Angeles St. and I work at FIDM and I'm so excited about how the streetcar will impact the neighborhood and my property value. One thing I want to request is that the streetcar stays open for at least a half hour after the close of the bars. I believe that this will help the nightlife business downtown and keep the streets lively and safer. I believe that it's more likely that bar/restaurant patrons will use the streetcar more than early morning commuters so if it's between opening early or staying open late, I'd suggest staying open later. Also, I'm hoping that the fare isn't too high. I don't think people would want to pay $1.50 to take a streetcar a few blocks. Perhaps one option is that with each fare purchase, you get some kind of credit to a local business. That way when someone spends money on the streetcar, it encourages people to use the local businesses.
Oie		X	X															This looks great to us and we are looking forward to it. Our family lives at Main and 6th Streets, so even though the city is currently very walkable, it will be great to be able to hop on the Streetcar to get to LA Live, and come home from Ralphs, etc. I like the 7th Street proposal, because that is where so much of the downtown action is (restaurants and stores), but understand, if for traffic reasons, 9th Street is used.
Ong																X		I am writing to clarify the location of the 30,500 square foot rail yard. On the Bureau of Engineering report W.O. E1907459 it states that the site for this rail yard is on the southeast corner of 18t and Grand. Howewr, on the Notice of Preparation of a Draft En~ronmental Impact Report dated January 3. 2013. it states that this rail yard will be at the southeast comer of 11th and Grand. My concern is that the Grand Lofts is on the southeast comer of 11th and Grand and would really low to haw the location clarified. Your preferential attention on this matter will be highly appreciated.
Oseida																X		as a current horm owner and resilent of south park rm opposed to the proposition to place a starnge lBcility near my property, there are other locafun in the area 1hat you can use, 1hii is a prim: housing locafun.
Pan American Lofts	Organization															X		We believe that the Broadway/Hill/2nd street location for the maintenance facility will cause an impact on our immediate downtown neighborhood and careful design consideration or an alternative location must be selected for this facility. The city and the streetcar planners should strongly consider the alternate locations (Hill & 5th, 11 & Grand) or propose design solutions that will not harm the gentrification of our area of downtown. The impact that a "maintenance & storage yard" can cause on the pedestrian, residential and urbanist quality of life on Broadway between 2nd & 3rd will be dramatic if done with a heavy hand. These issues can be resolved by using the maintenance facility as a catalyst for smart development and integrating it into a mixed use project or other venture that improves the civic & cultural life of northern downtown. This facility will have a negative community impact if it is just an open yard with a lifeless concrete building.
Park																X		I protest all plans to construct a Maintenance & Storage Facility for Streetcars at 11th & Grand. This is a \Abrant residential neighborhood and the city is planning to build an industrial maintenance yard adjacent to families, restaurants, and retail stores. As a resident of downtown, I expect our city planners to promote commerce, controlled population growth, and exercise good old fashion common sense, Do not build an industrial maintenance yard next to homes,
Park																X		I recently learned that the city is planning to place the Maintenance & Storage yard for the appl"O\ed streetcar system on the south east corner of 11th and Grand Ave. Yet another example of an extremely poor judgement by the city planners. I am amazed at how a great city like Los Angeles is consistently plagued by bad judgment after another by our esteemed city planners. Proposed site is located directly in South Park, which currently has a \Abrant real estate market and is one of the premier neighborhoods that is driving the revitalization in Downtown Los Angeles. The residents of South Park are the base consumer of the sunounding businesses and amenities, including LA Lhe, and your proposal to make South Park less appealing will have a direct consequence to the local economy. It is reasonable to expect rom our city planners to be ad\ocates in creating a clean and safe en\Aronment for its residences, to promote the local economy. and to improw property 18luas. This proposal will h8\8 a completaly opposita alfact. The proposed site is located in a residential neighborhood occupied by families, students, and young professions. These are the demographics that many sunounding cities are competing to attract and your plan is to create a Maintenance & Storage facility in the heart of the most premier downtown neighborhood. Why? Your plan will have a negative impact on the city's ability to generate income rom property tax, sales tax, business licenses, permits, etc. I am strongly against the thought of utilizing 11th & Grand Ave as a Maintenance Yard for LA's streetcar.
Pastushenko		X	X										X			X		I am a resident of the Evo South building on grand and 12th. I voted for the streetcar and think it will be a wonderful addition to our downtown and first of all thank you for taking a part in this long awaited project. My big concern is the maintenance / service area that is planned directly across the street front our beautiful building . I and some of my fellow residents feel that this site may not be the best place for this. Placing an area such as this in front of two major highly populated residential highrises may just do the opposite of what the streetcar set out to do and bring property values in the neighborhood down due to views at the maintenance area and probable tram traffic and noise excepted with the operation. Although downtown is quickly becoming more and more residential and we realize that finding a place for the service center is a challenge, there are still some options. For instance, there are multiple large lot areas east of grand ave close by, such as at Olympic , at 9th and at 8th that may be better suited for this. Also, there are large lots at northwest corners of olive and Olympic and olive and 9th that would affect the residential communities even less. All in all, there are better options and we ask the city to consider them carefully. Your attention and help is very much appreciated and if there are any questions please do not hesitate to contact me. Also, if you are not the right person to email, would you please let me know who is and / or forward this to them.

Name / Organization	Agency	Purpose and Need	Alternatives	Aesthetics	Air Quality	Cultural Resources	Geology/Soils	Greenshouse Gas Emissions	Hazards/Hazardous Material	Land Use / Planning	Noise/ Vibration	Public Services	Real Estate	Transportation/Traffic	Utilities/Service Systems	MSF	Other	Comment / Summary
Patterson		X		X		X											X	My chief concern is walkability. Downtown LA is located in one of the most temperate environments on earth, yet we model our urban plan as if the pedestrian were of little account. Indeed, so many of the potential benefits of the streetcar refer to the success of the one in Portland, one of the wettest cities in the nation with an annual rainfall average of nearly 40 inches. Yet Portland is also a highly walkable city. Los Angeles is not, and downtown, where people actually do walk, is not providing sufficiently for the increased foot traffic. Furthermore, Broadway is unique. Nearly every building is an architectural treasure. I'm concerned that the focus on mechanized transportation ignores the potential the street has a pedestrian attraction. For nearly 10 years I lived on the 'Rambla de Catalunya' in Barcelona. This thoroughfare is a magnate for locals and tourists, providing a remarkable attraction that benefits local businesses and provides needed public space for an urban center quite nearly as covered in concrete as downtown LA. The famous tree-lined promenade (not to be confused with 'Las Ramblas', it's more prominent sibling) also permits auto traffic in two directions, and though narrow, the corridor actually functions surprisingly well in regards to volume and traffic. The 'High LIne' in New York also succeeds because of walkability. The emphasis on the pedestrian that made that remarkable, transformative thoroughfare happen seems to be regretfully absent from the urban planning of downtown Los Angeles. Jeff Speck, a respected urban planner and author of the informative recent book, 'Walkable City', observes that a streetcar is not always the 'mobility-enhancing, street-enlivening walkability bomb that their promoters would have us believe.' Speck rightly asserts that streetcars are only effective when the routes correspond to other transit networks and, most importantly, that they take people somewhere they can walk. Again, I'm no NIMBY, and I'm a supporter of any type of public transit. But there are major problems in downtown LA for the people who walk here: poorly maintained sidewalks, a lack of walking space for dog owners, autoprivileged thoroughfares, unsightly landscaping (tree planters that even Grozny would discard), poorly designed building frontage, etc. These are problems that no streetcar will solve. Only a concerted effort to consider the pedestrian will improve the livability of this exceptional neighborhood, and the success of the street car. My hope is that this streetcar will indeed promote development along Broadway and generate public revenue that can be invested in the community. But without a concerted effort to consider the walkability of downtown LA, the streetcar, I'm afraid, will merely travel through it.
Pavlish																X		We are emailing to register our STRONG objection to the possibility of choosing to place the maintenance rail yard for Historic Streetcar project in what is currently the parking lot iJr the Grand Lofts. We understand that the restoration of the streetcar makes sense for the economy of DnA. But as a resident here, it becomes clear that there needs to be a balance between the current explosion of grt7tYl:h and construction in this area and a reasonable sense of maintaining the character and bcus of our neighborhoods throughout this process. Grand Lofts is not a lUXUry high-rise with below-ground parking, doonnan, etc ... and as such without our parking lot it would be really difficult to liw here. It would be unfair to penalize the owners and tenants here when you could just as easily locate the rail yard somewhere else that does NOT take BNBy parking specifically attached to a building for the homeowner's and tenant's use. And as you are aware, this area caters to the Staples center, Nokia and LA Liw ... so other parking options are wry minimal most of the time, and non-existent during ewnts. Please rethink this as an option for the maintenance yard!
Perlo													X			X	X	Let me suggest several reasons why a maintenance yard at 11th and Grade would NOT be a wise choice. 1. The yard itself will have some tourist value. It should therefore be located in an area where tourism and trade will be enhanced. A location on Broadway would greatly enhance pedestrian traffic in a commercial area. 2. As a resident of 1111 S. Grand I have seen the value to the City in having residential buildings with greater value so as to provide greater property tax income to the city. A maintenance yard in the heart of South Park would not only discourage additional residential structures but will effect both value and desirability to future residents.. 3.I am also concerned about the message putting a maintenance yard in a burgeoning residential area could discourage future developers and residents from investing in the downtown area. One would have to be concerned that the city might "plop" something down in a an area where people are making botha financial and life style decision. Thank you foor your consideration
Poer																X		As a resident of The Grand Lofts, I am opposed to the proposal of building a rail yard for the Streetcar at the Southeast comer of 11th Street and Grand Ave. This happens to be the parking lot for our residence. After several years of legal issues with the original lot owners, we haw just recently been given our parking lot back. Losing this again would not only be a severe inconvenience, but might likely affect our property wlues. Ha .... ng this lot connected to our structure and secured with a fence and 24-hour guard pl'O\1des us all with added safety and security, as well as immediate access to the building. I have no doubt that the Streetcar will be a positive, beneficial addition to downtown LA. Many residents \01ed for it, myself included. But building the rail yard so close to hundreds of residents who live, work, and relax just steps tNI8y would be monumentally disruptiw. Surely there are options further away from full-time residents? Not to mention the likely chaos and tramc caused during LA Liw and Staples ewnts. Our neighborhood can be thick with heavy traffic, noise pollution and rowdy spactators during these ......rns, both day and night. Heavy construction added to this would further hinder our access to our building. I urge you to reconsider the location of the rail yard so close to South Park residents
Reed	Organization																X	Bart Reed and The Transit Coalition DO NOT want to be sent any registered mail for any and all notices associated with the LA Streetcar project. Bart Reed and The Transit Coalition want to be sent mail only \48 standard postage and we want to be kept on the mailing list
Reynolds	Organization	X																I suggest your group THOROUGHLY review and appreciate this link and the attached. Streetcars are a ridiculously slow and expen.ve transit option for a modern American city. I also suggest your t"9\4ew of all the items on this link for a better altematiw that my firm proposed for dO'Nl'ltown Los Angeles: http://www.prtstrategies.com/connector.html. My firm has also proposed Personal Rapid Transit for the Pacific Electnc Right-of-Way that runs from south LA to central Orange County here.
Rodriguez			X	X														With respect to the segments of the street car along Hill and Broadway that pass by Grand Park, I would suggest a study on the impact this will have. Specifically, there may be a pedestrian safety issue as well as an aesthetic issue as the Street car will further break up the park. A mitigating measure would be the possibility of two wide and landscaped pedestrian bridges that connect the various segments of the park. I ask that the commission please consider the addition of pedestrian bridges in Grand Park as part of the Street Car development.
Rosenthal			X															I support the Locally Preferred Mемative to the Streetcar
Sandler																X		The ownerslresldents of Grand Lofts haw contracts In place for a parking structure to be built on the South East Comer of 11th and Grand Awnue, I am one of the original residents that mowd into Grand Lofts in 2005 and we haw a 50)ear lease for parking on that lot We paid for the space and we want our parking structurel Please click. on the link below to review the Grand Lofts parking documents,

Name / Organization	Agency	Purpose and Need	Alternatives	Aesthetics	Air Quality	Cultural Resources	Geology/Soils	Greenhouse Gas Emissions	Hazards/Hazardous Material	Land Use / Planning	Noise/ Vibration	Public Services	Real Estate	Transportation/Traffic	Utilities/Service Systems	MSF	Other	Comment / Summary
SCAG	State	X												X				SCAG staff has reviewed the Notice of Preparation of a Draft Environmental Impact Report for the Historic Streetcar Service in Downtown Los Angeles Project. The proposed project includes a streetcar system that would run through existing traffic lanes in downtown Los Angeles. As set forth in the attached, SCAG recommends that the EIR include a review and consideration of the goals in the adopted RTP/SCS and that the analyses reflect the most recently adopted growth forecasts. RTP/SCS G1: Align the plan investments and policies with improving regional economic development and competitiveness RTP/SCS G2: Maximize mobility and accessibility for all people and goods in the region RTP/SCS G3: Ensure travel safety and reliability for all people and goods in the region RTP/SCS G4: Preserve and ensure a sustainable regional transportation system RTP/SCS G5: Maximize the productivity of our transportation system RTP/SCS G6: Protect the environment and health for our residents by improving air quality and encouraging active transportation (non-motorized transportation, such as bicycling and walking) RTP/SCS G7: Actively encourage and create incentives for energy efficiency, where possible RTP/SCS G8: Encourage land use and growth patterns that facilitate transit and non-motorized transportation RTP/SCS G9: Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies
SCAQMD	State				X													Air Quality (Summary): The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the project and all air pollutant sources related to the project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, that is, sources that generate or attract vehicular trips should be included in the analysis. In addition to analyzing regional air quality impacts the SCAQMD recommends calculating localized air quality impacts and comparing the results to localized significance thresholds (LSTs). LST's can be used in addition to the recommended regional significance thresholds as a second indication of air quality impacts when preparing a CEQA document. Therefore, when preparing the air quality analysis for the proposed project, it is recommended that the lead agency perform a localized significance analysis by either using the LSTs developed by the SCAQMD or performing dispersion modeling as necessary. In the event that the proposed project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the lead agency perform a mobile source health risk assessment. Guidance for performing a mobile source health risk assessment ("Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis") can be found on the SCAQMD's CEQA web pages Mitigation Measures: In the event that the project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize or eliminate significant adverse air quality impacts.
Shapiro		X												X				As a merchant who has a business on Broadway I am very concerned about how the traffic will be affected during the construction phase of the project and how it will be affected after the project is completed. How will pedestrians access businesses during the construction phase? How many lanes of traffic will be affected? How long will construction take? Once completed, will the lane be utilized for automobiles along with the streetcar? My business is on the west side of the street and my understanding is that the track will be on the west side as the route is southbound on Broadway. The sidewalk in front of my business and indeed most of the block between 5th and 6th is "hollow" below the surface. How will the vibration of the streetcars affect the sidewalk, and indeed, how will it affect the buildings lining the street? I don't know if this is the purview of the EIR, but I don't understand the necessity of the streetcar as the Dash buses could easily duplicate the routes under consideration. Los Angeles previously had streetcars and they were removed many years ago. It seems to me that this project is a waste of precious resources with minimal, if. any, advantage over current buses.
Singh		X		X	X	X					X		X	X		X	X	I strongly oppose the downtown the downtown streetcar project for the following reasons: 1. Transportation/Traffic - This project will add additional over-sized vehicles to narrow Downtown streets and further worsen already-existing poor traffic conditions. 2. Air quality - The additional traffic created by this project will worsen Downtown air quality because of additional exhaust caused by increased idling of cars in traffic on Downtown streets. 3. Aesthetics/Visual Quality - This project will be built in an area with many historic buildings and the infrastructure required for the streetcar (including the service yard, the power substations and the overhead wiring) will interfere with the views of the historic buildings and will decrease enjoyment of these historic resources. 4. Noise - This project will add additional noise in the project area late in to each night (according to the proposed service schedule). 5. Safety - Downtown is already an area with significant pedestrian traffic. Streetcars making turns at intersections will create dangerous conditions for pedestrians. 6. Construction Impacts - The construction will significantly contribute negative impacts of noise, traffic and worsened air quality. 7. Historic resources - The street route will interfere with the future restoration of many historic buildings in Downtown by preventing of the use of space in front of buildings for construction staging. Furthermore, a proposed location of the streetcar storage/operations facility near the corner of 12th / Grand is highly inappropriate. That area is becoming a residential area with an influx of new residents. Such a facility there would disturb the area and would lead to a decline in property values in the Southpark area.
Smith		X											X				X	The Downtown Streetcar Project sounds great and will I believe, have a very positive impact on Downtown for many years to come. Hopefully, with all of the transit that is being built and planned for the region, it will become second nature for many of us to simply "jump on the train". I hope that all of the funds needed for the project is acquired without much handwringing. Further, I have to believe that developers of hotels (we need more for our convention center) are looking closely at this project and will help them to make-up their minds in favor of building downtown! Not to mention more apartments and condo too. Thank you and your staff for all your hard work and let's get this Streetcar built sooner rather than later!
Stangl																X		I am a homeowner at the Grand Lofts and am whemently against this proposition. I purchased my loft in 2007 for nearly 314 of a million dollars. This would be a trawsty and eyesore not to mention the loss of parking for homeowners. What is needed is more wlue added retail and d8\elopment that offers South Park residents comenience. There has to be a better location or altematiw in mind for consideration.
Suyehara I		X	X															Thank you for the informative streetcar scoping meeting. As a downtown homeowner, and an aging babyboomer, I am excited about the proposed streetcar coming to our downtown community. The two proposed routes are of particular interest to me. I encourage the LPA route, Locally Preferred Alternative. I think this route serves more of the needs of the community as well as local businesses. Please include my preference among the public comments regarding this exciting downtown transportation alternative project.
Suyehara II			X															I just wanted to give my vote to the 7th street option. The 9th street option would be great for going to Ralphs market, but I believe, with time, other markets will come downtown making the 9th street option a moot point.

Name / Organization	Agency	Purpose and Need	Alternatives	Aesthetics	Air Quality	Cultural Resources	Geology/Soils	Greenhouse Gas Emissions	Hazards/Hazardous Material	Land Use / Planning	Noise/ Vibration	Public Services	Real Estate	Transportation/Traffic	Utilities/Service Systems	MSF	Other	Comment / Summary
Teigue											X			X		X	X	I'm contacting you because I am a homeowner and resident in the Elleven building on 11th and Grand. We received the information regarding the possible maintenance facility on the SouthEast corner of 11th and Grand and I had some questions and concerns. How would it affect the current parking situation in the neighborhood? Would it take away a parking lot or even two? Would it impact traffic? Would the noise level effect any of us residents? Please let me know if there is anything more I need to know about this as a homeowner, resident and taxpayer.
Thomas Properties Group - Ricci	Organization	X	X															TPG has previously gone on record to oppose the restoration of the Streetcar Service and the Community Facilities District for a number of reasons, including, the lack of a vote on the Communities Facilities District for property owners and the fact that TPG already provides shuttle service to many of the same locations the Streetcar would serve. The concerns of property owners and tenants have not been adequately addressed throughout the process. Therefore, TPG strongly objects to both alternatives for the restoration of the Streetcar Service. Finally, in addition to the above, TPG further objects to the Streetcar Service as a transit connection that is duplicative of existing DASH Routes D and E making it unnecessary (see Exhibit A), The sign ificant impacts that will result are not outweighed by the benefits of the project. The benefits of this project are limited and do not provide an enhancement to the majority of downtown property owners and tenants of the properties with the highest density,
Tooley		X	X															I support the Los Angeles Streetcar 100% and can't wait to ride it - if all goes well. I prefer the LPA alternative as it has the most conections to the Metro Red and Blue lines. Please buld it like yesterday.
Toumasis		X	X											X		X		My wife and I live in the LUMA building on the corner of 11th and Hope St.. While LA Live was still a parking lot and the majority of the new restaurants and bars in the area did not exist, we made a significant investment in the future of downtown. We're excited about all of the new development, including the idea of introducing the streetcar to the area. That being said, I am concerned about the details that are currently being worked out. FIrst, the route of the streetcar on Broadway is fine, however, my issue is having it go down 11th Street towards Staples and LA Live. 11th Street is only two lanes and the only street running West with a direct route to Staples Center and LA Live. Having the streetcar take up one of those lanes will leave only the other lane for auto and bus traffic. During events at Staples Center and LA Live, which is nearly every night of the week especially from October to May (the NBA and NHL season), traffic is already a concern. I don't believe the streetcar will relieve traffic, but rather add to it by limiting the lane for cars to just one. To compound this problem, the main parking entrance and exit for both LUMA and ELEVEN is on 11th Street. That's a combined 400 units in those two buildings where occupants rely on 11th Street as their main thoroughfare to get in and out of their homes. Now, Eleven was the first new LEED construction residential building in downtown and Luma was the 2nd LEED building. The homeowners in both buildings made significant financial investments and took a leap of faith betting that downtown would come out of the recession in the best shape it's been in since the 1940's. Both buildings are in the top 5 most expensive residential buildings downtown.Again, 11th Street is only a two lane street and the primary entrance and exit to both buildings. Adding a streetcar to 11th Street will only cause problems to the homeowners of Luma and Eleven on their morning and evening commutes. I can't help but think it will have an adverse affect on our property prices. Secondly, the location of the streetcar storage and maintenance building seems straightforward. In my humble opinion, it comes down to cost and convenience. I would think the area around Broadway would be the most convenient and quite possibly, the most cost effective. I don't know the details of the specific locations that you're considering, however, I can tell you that South Park is generally more expensive than the Arts District or Historic Core. Whether finding a warehouse to readapt or building from the ground up, the cost per square foot is much cheaper in those areas. The closer you get to LA Live and Staples, the more you're going to pay. South Park is attracting more hotels and residential construction and I can't imagine it makes sense to spend the money just to have a maintenance facility in the area.
Van Stekelenburg																X	X	I am a resident of Grand Lofts, located at 330 w 11th street. Our building has 66 residential units that are located at Grand Lofts, where I have lived for six years. Our parking license is tied to the northern portion of the parking lot bounded by Grand, 12th, our building, and the alleyway running between Olive and Grand. We noticed that this is one of the suggested locations for the maintenance yard for the proposed Streetcar. Can you please tell me what will happen to our parking? We have a license agreement with Merco/Meruelo Maddux or whatever the current ownership entity name is. Our license calls for the construction of a parking garage on this parcel. We are very concerned and confused as to how this can be proposed as a location. Can you provide additional detail and a response as to what the city is suggesting happen to our 66 residential units and their parking??
Velasco																	X	Make sure you get residents who are paying taxes for this free passes. My only comment.
Wentzel			X															I have one COITI'1'lent. I believe 7th Street needs to be double tracked in each direction between Hope and Broadway as indicated on the attached map. This would allow for three routes of this one-way streetcar 1) Full alignrrent loop 2) Top half-loop between Bunker Hill and 7th Street via Broadway/Hill 3) Bottom haW-loop between 7th, 11th, Broadway and Figueroa With this one tiny addition on 7th Street, if there is an accident or errergency that obstructs the streetcar tracks, the other half of the system can continue to win without shutting down the whole system.
Wetzel																X		Jim I am respectfully requesting that you do NOT locate the maintenance rail yard on the comer of 12th and Grand Ave. The South Park District is a neighborhood, not an industrial or light industrial zone. I purchased my home at Ellewn because the South Park District is a residential district a maintenance rail yard is not consistent with a residential district.
Wright		X				X								X				I am a strong supporter of the streetcar. It will be transformational for Broadway. However, I am concerned about the impacts the current Southbound curb alignment will have on the Million Dollar, Los Angeles, State and United Artists Theatres. Along with the streetcar, revitalization of the Broadway theatres is a linchpin for reactivating and attracting new investment to the street. Live entertainment is the best and most economically viable method of making these theatres – and Broadway – entertainment and tourism destinations. On a typical night in the not too distant future, all four theatres may host live events with starting times around 8pm. These events will generate a considerable amount of automobile traffic dropping off patrons at the front doors of these theatres. The same will occur as the shows end. The volume of this traffic will increase dramatically during inclement weather. How will the line-ups of automobiles be managed given the need for clear passage by the streetcar along the shared right of way? It is reasonable to assume that many theatre patrons will use the streetcar for transport to and from the theatres. However, sold out performances at these four theatres will attract up to 7500 patrons, which far exceeds the proposed capacity of the streetcar. When theatregoers from the Orpheum, Tower, Morosco(Globe) are added, there is the potential for an additional 5500 people to be added to the mix. In the past, when the Broadway theatres were consistently drawing more than 13,000 patrons at a time, the two-way center alignment for the streetcars handled the large crowds and also the automobile traffic generated by the theatres. Given the preliminary planning and funds projected to be available for the Broadway streetcar, there may be no other alternative than the less expensive curbside alignment. There may be other methods of mitigating traffic and the needs of the theatres while accommodating the streetcar. Consideration and planning for the likely conditions described above are better addressed now than as an afterthought after the streetcar is operating.
Wu																X		Rail Facility at 11th and Grand?? I'm thinking someone made a clerical error in adding the above location as a possibility?
Yen																	X	hope that our streetcar can have the same color scheme as the original PE Red Cars with the RED and YELLOW instead of the green color used in the Streetcar LA renderings. I have attached an image of a vintage streetcar as an example
Yoon																X		Hello Mr. Doty, How are you? I am one of Grand Loft residents. I got the news regarding Streetcar maintenance rail yard from our Grand loft board.I am supporting street car project and so happy for the project. HOW8\er we recently secured our parking lot and it is essential br our residency. We can't afford to loose the parking lot. Please consider the residents and find the better options.

Name / Organization	Agency	Purpose and Need	Alternatives	Aesthetics	Air Quality	Cultural Resources	Geology/Soils	Greenhouse Gas Emissions	Hazards/Hazardous Material	Land Use / Planning	Noise/ Vibration	Public Services	Real Estate	Transportation/Traffic	Utilities/Service Systems	MSF	Other	Comment / Summary
Yuka-Young																X		I have intmned that the city is planning to place the maintenance & Storage yard for the streetcar system and the south east comer of 11th and Grand Ave. is one of proposed area. I think it is really poor judgment that city makes for this vibrant residential and commercial mixed used streets. The proposed site is located in South Park which is one of new great residential, entertainment industry and educational buildings are dewloped past few' years. Young professions, students, families have moved and created great community. Howe\er the maintenance yard will strongly against this great emAronment that has created last few years. I strongly disagree that the city places a Maintenance Yard for LA's streetcar on the South East comer of 11th and Grand Ave. It willllJin our great community.
Zucker		X	X	X					X		X		X			X		I am opposed to the plan to have the streetcar route going west on 11th. Between Grand and Hope on 11th is the automobile entrance and exit for Luma and Elleven, two large residential buildings. It is already difficult enough to exit the building given the existing traffic on 11th St., The introduction of the streetcar will cause increased accidents given the limited visibility at the exit. In addition the noise and vibration impact is a major concern. It is not only the noise and impact of the streetcar itself, but the noise of the passengers in the evening after visiting bars that will significantly increase the noise level in the neighborhood when many of the residents are trying to sleep. In addition, I am opposed to the possible location of the maintenance yard near 11th and Grand. I am a condo owner in one of the nearby condominiums. There are 4 large residential condominiums containing well over 500 units, and such maintenance facility will be an eyesore impacting the visual quality of the neighborhood, increase noise and vibrations, involve the use of hazardous materials near what has become one of downtown's premier residential locations and thus reduce the residential owners property values, which will also result in a loss of revenue to the city. Please inform me who has been hired to conduct the environmental impact study, and how interested residents can contact them directly so that our concerns can be directly expressed to those responsible for conducting the environmental impactstudy.
Superior Court, Los Angeles County, Henry Hernandez (Received after the comment period)	Local										X						X	Please note, this comment was submitted after official NOP comment period. Comments/Concerns: 1) Loading Dock: The Court periodically receives deliveries of supplies, legal documents, and equipment thru the 1st Street loading dock. Vehicles range in size. Avoid blocking or disrupting entry into the facility. 2) Tree Pruning: Professional arborists should be consulted when topping, pruning, or thinning trees. Tree care should conform to National Standards. 3) Noise: Excessive noises generated by heavy duty machinery, electric saws, gas diesel engines, is not encouraged during work hours. Court trials are heard on a daily basis. 4) Traffic Safety: Monitor construction so traffic does not create hazards for pedestrians. 5) Deep Cleaning: All parts of the building impacted by construction shall be maintained clean and free of debris. Deep cleaning may be required if dust mitigation is unsuccessful. 6) Signage: Clearly identify or post directional signage along the path of pedestrian travel. 7) Employee Safety: Pedestrian accidents should be avoided at all times. Immediately report any hazardous conditions to Facilities Services or ABM. If an employee requires medical attn dial 911.

EXECUTIVE SUMMARY

This technical memorandum describes the construction activities that are anticipated to occur during the course of construction of the Restoration of Historic Streetcar Service in Downtown Los Angeles. The purpose of this document is to provide a general background on typical construction activities and durations of the Project. It should be noted that the approach to construction staging and phasing described herein is general in nature. This approach is intended to establish a baseline for the Environmental Impact Report and to disclose potential construction impacts to the public, including residents and businesses.

1.0 INTRODUCTION

The construction of the Restoration of Historic Streetcar Service in Downtown Los Angeles (the "Project") will entail a number of elements, including construction of guideway and trackwork, paving, streetcar platforms, relocation of parallel utilities in conflict with the trackway, encasement of utilities crossing under the trackway, construction of track drains, and a maintenance and storage facility (MSF). It will also include installation of specialty system work such as traction power substations (TPSS), overhead contact wire, communications, and train/traffic signaling. A set of Advanced Conceptual Engineering Plans (HDR, April 2013) depicts the location and arrangement of these facilities.

This section describes the activities anticipated during construction of this Project.

1.1 REGULATORY FRAMEWORK OF THIS PROJECT

The Project will comply with federal, state, and local regulations. The individual regulations that apply to the construction of this Project will be addressed in the individual technical reports being prepared for the Draft Environmental Impact Report (DEIR). Partial funding would be provided through the Federal Transit Administration (FTA).

The analysis in this document assumes that, unless otherwise stated, the Project would be designed, constructed and operated following all applicable laws, regulations, ordinances and formally adopted City standards.

1.2 INDUSTRY STANDARDS OF THIS PROJECT

The Project will employ conventional construction methods, techniques, and equipment. All Project engineering and construction work will be completed in conformance with the applicable regulations and standards, including but not limited to the following:

- Los Angeles Municipal Code, Chapter VI Public Works and Properties
- Los Angeles Municipal Code, Chapter XI Noise Regulation
- Los Angeles Department of Transportation Traffic Control Handbook and Traffic Manual
- City of Los Angeles Building Code
- City of Los Angeles, Bureau of Engineering Standard Plans, Brown Book, and Design Manuals
- City of Los Angeles Standard Specifications for Public Works Construction (Greenbook)
- Work Area Traffic Control Handbook (WATCH)
- South Coast Air Quality Management District (SCAQMD) Regulations
- California Air Resources Board Requirements
- California Manual on Uniform Traffic Control Devices (MUTCD)
- California Public Utility Commission (CPUC) Regulations
- California Building Code
- Standard Urban Stormwater Mitigation Plan (SUSMP)

- National Pollutant Discharge Elimination System (NPDES)
- Stormwater Pollution Prevention Plan (SWPPP)
- American Railway Engineering and Maintenance of Way Association (AREMA) Standards
- National Electrical Code (NFPA 130)

2.0 PROPOSED CONSTRUCTION ACTIVITIES

2.1 CONSTRUCTION ACTIVITIES COMPLETED BY THIS PROJECT

The various work activities to be performed over an estimated 24 month construction/start-up/testing period would include the following facility and system items:

- Relocation, modification or protection in-place of utilities in conflict with streetcar facilities.
- Construction of the vehicle MSF.
- Installation of temporary traffic control measures.
- Reconfiguration of the existing roadway lanes to accommodate streetcar and traffic movements.
- Construction of surface and subsurface drainage systems, including track drains, and the modifications to existing systems.
- Excavation of the roadway along the alignment to prepare it for trackwork installation.
- Installation of trackwork complete with preparation of track bed, track slab, rail, fasteners, and concrete.
- Construction of TPSS with underground electrical power feeds.
- Installation of traffic signal and streetcar control improvements, and modification of existing traffic signals.
- Installation of overhead contact poles, wires, support brackets, feeder cables, underground conduits, and other components or alternative power distribution systems.
- Construction of streetcar stops using cast-in-place concrete.
- Construction of station stop finishes, such as canopies, benches, signage, trash receptacles, lighting, ticket vending machines, and all other amenities.
- Testing of subsystems and systems.
- Simulated revenue operation test runs and final commissioning of the system.

2.2 CONSTRUCTION ACTIVITIES OF RELATED PROJECTS

It should be noted that there may be construction activity occurring along or near the streetcar alignment that is not part of the Project. These activities include:

- Regional Connector – The Regional Connector Project is a Metro light rail extension between the Little Tokyo/Arts District Station and the 7th St/Metro Center Station, primarily beneath 2nd Street and Flower Street. The project began in 2014 and is expected to end in 2020. Therefore, close coordination and collaboration will be required between the two project teams. Coordination activities would include traffic control measures, construction sequencing, and suggested detour routes. The possibility of shared space for a streetcar TPSS within the Broadway/2nd Street Regional Connector Station area will be further analyzed as a potential TPSS location in the EIR. Construction activity between both projects may also overlap at 2nd Street and Broadway and at 2nd Street and Grand Avenue.

- Broadway Streetscape Master Plan – This project reconfigures Broadway with wider sidewalks and curb extensions at crosswalks and intersections. In 2014, the roadway was narrowed to one lane southbound and two lanes northbound under a "Dress Rehearsal" performed with striping, cones, pavement treatments, and planters. Construction of new curbs and sidewalks will occur as funding is secured and in conjunction with development.

- Figueroa Corridor Streetscape – This project proposes to reconfigure 11th Street and Figueroa Street to widen sidewalks and provide protected bike lanes. To date, 90% draft designs have been developed for the project, and the conceptual streetcar alignment has taken these draft designs into account. Construction is expected to begin in early 2016 and end in late 2016. Close coordination and collaboration will be required between the two project teams due to overlapping facilities.

- City of Los Angeles 2010 Bicycle Plan (Bicycle Plan; 7th Street Segment)– The Bicycle Plan removed one lane of traffic in each direction on 7th Street to provide bicycle lanes in both directions, along with a center turn lane, within the Project's study area. Construction was completed mid-2014.

- Wilshire/Grand Mitigation – Refinements to striping and traffic signal operations are proposed as mitigations to the Wilshire Grand Project, including a "pedestrian scramble" at 7th Street and Figueroa Street. The streetcar Project will incorporate modifications of 7th Street within the segment from Figueroa Street to Hill Street as part of the Wilshire Grand Project's EIR and design engineering.

- Federal Court House (2nd Street at Broadway) – Construction of a new federal court house is underway on a site adjacent to the streetcar alignment, and it is expected to open in 2016. The streetcar Project's design will take into account site access, physical security measures, and new utility lines.

- There are many other new office, residential, and commercial developments planned within the Project's study area. These will require coordination of construction schedules, site access, construction staging, and traffic control requirements. A complete listing of related projects can be found in the EIR.

3.0 GENERAL CONSTRUCTION SCENARIO

3.1 CONTRACTOR SUPPORT FACILITIES

Construction of the Project will generally be conducted under the direction of a prime contractor with several subcontractors for various specialty trades. The contractor (referred to herein as either the prime or subcontractor) will be required to maintain a field office near the work site. The contractor will also establish a location for the storage and handling of construction materials for the duration of the Project.

3.1.1 Contractor Field Office

The contractor's office will be the administrative and personnel hub of the Project. Project managers, superintendents, and support crewmembers will be frequently joined by agency personnel, City representatives, engineers, plan checkers, City inspectors, technical staff, stakeholders, and public relations staff. The office will typically be open during business hours.

This Project could use portable office trailers or vacant office space in an existing building for this purpose. Each field office requires ample parking for the contractor's staff, agency or owner representatives, and visitors. A project of this size will typically host 20 to 30 vehicles on a full-time basis for the contractor's management team, the agency's construction management team, and other support staff for the office.

3.1.2 Laydown and Storage Area

The contractor will require an area for the laydown and storage of materials, as well as overnight parking of construction equipment. This storage area does not need to be co-located with the field office. If it is not co-located at the field office, there will be contractor's truck traffic between the two contractor locations, especially at the start and end of the work day. The contractor will work with the City's Bureau of Engineering (LABOE), Bureau of Street Services (LABSS), and Department of Transportation (LADOT) to identify and manage operations within the staging area selected by the contractor.

The laydown and storage area will be sized to accommodate the storage of construction materials, including concrete forms, pipes, pipe accessories, concrete vaults, manholes, rail boot, special trackwork, station furnishings, and other materials that may require delivery to the contractor prior to installation. In addition, the storage area will also provide temporary parking for construction vehicles, including bulldozers, backhoes, graders, dump trucks, utility trucks, and cranes.

Ideally, the storage area would be located in close proximity to the work site and offer good access into and exiting the area. Large trucks with trailers will access the storage area, requiring sufficient room for their turning radii. A typical size for a laydown and storage area to accommodate these activities would be approximately three to five acres and preferably rectangular in shape. The contractor will be required to control dust, mud tracking, water, and vegetation debris in and out of the site.

The location of the storage area should be chosen so that its activities do not become a nuisance to adjoining properties and land uses. For the proposed Project, the location will likely be in a generally commercial area with mixed residential and commercial uses. The storage area will be required to abide by all Project and local agency regulations and restrictions regarding noise and light, and shall be easily accessible by police, fire, and emergency services. Four potential laydown and storage areas have been identified as the type of locations that could be chosen for a laydown area. These locations are described below and depicted in Attachment A:

1. Southeast corner of Third Street and Main Street
2. Northeast corner of Third and Spring Street
3. 243 S. Spring Street
4. Grand Avenue to Olive Street, between 8th Street and 9th Street

These sites represent typical areas where a staging area may be sited within the Project vicinity. There are potentially many other locations close to the Project area that may be suitable and have similar characteristics to these four sites. All four of the example sites are currently parking lots adjoining city streets. It should be noted that the actual staging area site will be selected by the contractor at the time of Project construction; the sites referred to above may or may not be available at that time, and therefore should be regarded as examples used for purposes of general impact evaluation.

3.1.3 Work Zone Staging Areas

In general, all materials to be used on the Project will be stored at a laydown and storage area of the type described above. The contractor will not be allowed to store or stage materials within the work zone or jobsite on an overnight basis. Exceptions to this will only occur with prior authorization by LADOT and LABSS and may include large construction elements and materials that would be difficult to move on a daily basis, such as, but not limited to, rail and overhead contact support (OCS) poles.

3.1.4 Rail Storage

Rail will be delivered as straight 80-foot sections, or “sticks”, precurved sections, or as special trackwork units. The 80-foot rail sticks will likely be delivered by rail car to a nearby freight siding. The contractor will arrange the delivery point with the railroad and the freight siding’s owner and operator. From the delivery point, the contractor will load the sticks onto tractor trailers and deliver those loads to a rail storage site, located on or near the work zone. Precurved sections and special trackwork units will likely arrive by tractor-trailer directly from the vendor, and be delivered to the laydown and storage area for storage until installation. Delivery of rail materials typically occurs during the work day, although delivery of these rail materials may occur at night or on weekends with approvals similar to other construction activities.

The purpose of the rail storage site is to facilitate welding of the rail sticks into strings, and to prepare the rail for movement to the installation location. Rail storage sites are typically narrow and long zones set aside for the storage of rail sticks, prior to installation. These rail storage sites typically occupy a space 12 feet wide for the length of a city block. At the rail storage site, individual rail sticks will be welded together into rail “strings.” Rail will be welded into strings using diesel-powered, trailer-mounted machines. The machinery would clean, straighten, prepare, weld, and grind short sections of rail into longer strings.

The lengths of rail strings would vary according to the size of the rail storage site provided; an additional 250 feet would typically be provided to allow room to move the strings. For example, if a rail storage site occupied a 600-foot block, each rail string might be 350 feet in length. This allows the contractor 250 feet of room to weld each string and position it for storage without disturbing the next string to be welded. The contractor will weld the longest string allowable by the space provided, generally up to around 700 feet. Figure 3-1 illustrates a typical rail storage site.

Figure 3-1 Rail Storage Site (Tucson, AZ and Seattle, WA)

Movement of the rail strings to the installation site is accomplished by placing each rail string on steel rollers, and rolling the rail along the street to the installation site. The rail moves at a walking pace (3-4 miles per hour), and requires any traffic crossing its path to be closed. Contractor and police escorts are usually employed for the movement of rail, which typically occurs at times of reduced traffic.

3.2 UTILITY CONSTRUCTION AND OTHER EARLY WORK

The approach to utility construction depends on the type, length, number, and complexity of the utility (or utilities) to be constructed or relocated. Utilities in potential conflict include, but are not limited to, storm drains, sanitary sewers, water, power lines, gas pipelines, electrical duct banks, lighting cables, fiber optic lines, telephone, cable lines, and underground conduits for traffic signals and roadway lighting.

To the extent possible, the streetcar trackway and facilities will be located to avoid or minimize conflicts with existing utilities. In certain instances, existing utilities will be relocated, modified, or protected in place where they are in conflict with or near the trackway or systems elements of the Project. The Project will coordinate relocations, modifications, or protection in place with all utilities in conflict with the streetcar Project, under the terms of each provider's franchise or agreements defining the provisions for such matters.

In addition to relocation, various new utilities will be installed as part of the Project, including electrical duct banks, traffic signal conduits, and electrical service lines. These facilities will likely be installed in the same phase as utility relocation by the Project's contractor and require a similar level of construction activity.

Before utility relocation work, survey and utility-locating personnel will perform research activities of the existing utilities to determine their location, depth, and potentially, condition. This work is performed using a variety of methods – pit excavation, "potholing" using a vacuum extraction truck, ground penetrating radar, opening existing manholes, and closed-camera video recording. All of these methods require temporary traffic control in the vicinity of the work for durations up to several hours. Occasionally during this period of exploration, other underground features are discovered, such as old street rail tracks, tanks, tunnels, unknown live or abandoned conduits, and archaeological items. The likelihood of unknown features increases in a historic downtown area, as many of these items were present before proper records were kept.

Once existing utilities are located, the work to relocate and protect underground utilities can begin. The work activities include excavation of soil to the depth of the existing utility line and installation of a replacement utility in a new location, abandonment of existing pipes, backfill of soil, and reconstruction of pavement or surface improvements above the excavation. This would occur within the street or right-of-way as required. The excavated material will be hauled away to designated haul locations. Section 4 of this memorandum discusses the haul routes in more detail.

Utility relocation is typically the first work item to be performed on a project. Factors that influence utility relocation sequencing include the type, length, and area of the utility relocation, restrictions on service disruptions from the utility agency having jurisdiction, and the availability of the work zone for closure. Once utility relocations have been completed within a segment, trackwork and civil construction will commence, and the utility relocation work crews may move on to the next segment. This method of sequencing typically allows crews to keep utility relocation work ahead of the track work, and keeps construction activity confined to two segments at one time. A description of the typical maintenance of traffic setup is described in Section 4.2 below.

Construction equipment typically required for relocation and restoration of utilities includes excavator/backhoes, trenchers, trucks, cranes, and generator/compressors. Concrete trucks, pavers, rollers, and power compactors are typically required for street restoration.

3.3 TRACK CONSTRUCTION

All tracks and platforms would be located within the public right-of-way (sidewalks and traffic lanes). The majority of the tracks would be located within existing lanes of traffic, within which there would be a mixed-traffic operation. A short segment of the Project along Grand Avenue would operate in an exclusive trackway south of 1st Street in order for the operator to stop the vehicle and switch directions safely.

The construction of a trackway within existing city streets will involve the use of embedded track. Trackwork construction would include demolition of the roadway sections being displaced by the guideway, preparation of the track bed, construction of the supporting track slab, and laying of rails. In most areas, the subgrade will also be prepared and graded. If rebar is designed into the track slab, it will be installed once the grade is prepared. Rail will be pulled into place using the method described above and set to final grade on steel ties and plates. Once the rail is established, concrete will be poured around the rail and rebar to form the concrete trackway.

It may be possible that precast concrete track panel sections be used as a method to increase the rate of trackway production. These may be proposed across intersections and other access points that would benefit from a reduced duration of temporary closure.

Equipment for the excavation of the guideway and installation of the track slab would generally consist of rubber-tired excavators, loaders, graders, small bulldozers, cement trucks, rubber-tired compactors, and water trucks for dust control. Construction vehicles may enter and exit the general traffic lanes, with flaggers, in the areas of construction. Short-duration lane closures, predominantly on one side or the other of the work zone, would be required for delivery of materials and concrete pours. Figure 3-2 illustrates various stages of trackway construction and their work zones.

Figure 3-2 Streetcar Trackwork Construction (Portland, OR)

The installation of special trackwork (e.g., diamond crossings, turnouts) involves the same process for rail installation, as described above, with the additional step of setting the trackwork unit. After the removal of pavement and preparation of the track bed, the special trackwork unit will be transported from the contractor's storage area to the work site and placed into position.

Final leveling and adjustment will occur prior to welding. The unit is then field welded to the running rails at each endpoint. Concrete is then poured to form the track slab under and around the special trackwork unit. This work involves the use of loading trucks and cranes to transport the special trackwork unit, and concrete trucks to finish the trackway.

Construction of station platform foundations, restoration of pavement, and reconstruction of any sidewalks and ramps would begin simultaneously or immediately following the track slab within each segment. Once the track is placed, the pavement is restored, and sidewalks and ramps are reconstructed, the closed roadway lanes can typically reopen to traffic. A more detailed discussion of the maintenance of traffic during track construction can be found below in Section 4.2.

3.4 STREETCAR STOP PLATFORMS

All station stops will be constructed by the Project. Other potentially related projects may be constructed by others, such as planned streetscape improvements, curb extensions, bus stops, or other street amenities that would complement the Project's platforms. These related projects are not a direct component of the streetcar Project.

Platforms will be constructed during track slab and curb construction. The first step involves setting forms, installing underground service utilities, and pouring concrete foundations and curbs. The platform surface, along with ramps and steps connecting the platform to the existing sidewalk would occur next, followed by setting canopies and other platform amenities. Typical equipment for this work includes backhoes, dump trucks, small cranes, and concrete trucks. Figure 3-3 illustrates typical construction of a streetcar stop platform.

Figure 3-3 Streetcar Stop Platform Construction (Portland, OR)

3.5 CIVIL CONSTRUCTION – PAVING, SIDEWALKS, AND RAMPS

Once the track slab has been set, the contractor will focus on restoring pavement adjacent to the trackway and reconstruct sidewalks, driveways, and curbs modified by construction. This activity will take place using the same work zone established for the track installation, and is often the last activity within the work zone prior to opening up the roadway. The work crew will sequence this work following track slab construction. Typical equipment will include forklifts, concrete trucks, rubber tired rollers, dump trucks, and cranes.

3.6 Operating Systems Installation

The operating systems include traction power, an overhead contact system (OCS), communications, and streetcar control (including traffic signals). Traction power would include an estimated five substations spaced relatively evenly throughout the alignment to provide direct current (DC) power for the streetcars.

3.6.1 Traction Power Substation Installation

Each TPSS site consists of a substation, equipment to receive an incoming power supply, conduits, and vehicular access. The TPSS unit is a structure measuring approximately 17 by 11 feet containing electrical and electronic equipment enclosed in a typically rectangular-shaped building, placed on a slab or foundation. A grounding mat, consisting of a grid of copper wires, would be installed below grade underneath the TPSS site and extending five to ten feet beyond the TPSS substation. The grid is necessary to properly ground the TPSS and the OCS feeder cables. Electrical transformers may be required adjacent to the TPSS building to intercept the incoming power feed and transform it to the voltage necessary to power the TPSS.

Construction begins with each site cleared and graded. Underground utility connections would be dug and installed, followed by the grounding mat. The foundation would be poured once the utility connections are completed. The TPSS building would be constructed on the site, per the dimensions necessary to enclose the TPSS equipment. The TPSS equipment will be delivered, installed within the enclosure, and connected to the incoming power supply conduits and outgoing feeder conduits. Fencing or another type of barrier may be installed around the perimeter of the site, and architectural treatments would be applied as feasible. Graders, bobcats, forklifts, flatbed trucks, heavy cranes, and concrete and materials/equipment trucks would be required.

3.6.2 Overhead Contact System Installation

The OCS for the streetcar will consist of overhead copper contact wires supported by span wires or mast arms. Span wires or mast arms are mounted to poles spaced at intervals ranging from 80 to 100 feet. Poles would be about 27 feet tall with contact wire heights typically between 18 to 19 feet throughout the alignment. Construction equipment will include cranes, bucket trucks, and other equipment for installation of the wires from the guideway area. While wires are being strung at cross streets, partial street closures would be anticipated during construction as crews work to complete the wire installation across intersections. Figure 3-4 illustrates typical installation of a streetcar OCS. Note that the trackway and paving are already completed in this photo.

Figure 3-4 Typical OCS Installation (Tucson, AZ)

Systems installation generally follows the completion of track construction. Finishing for platforms usually overlaps with systems work and is completed prior to final testing and pre-revenue operations. Systems installation work is significantly less disruptive to communities as compared to track construction work. Since the work zone is confined within the track area, partial lane closures are anticipated for short segments and will be limited to non-peak hours.

3.7 VEHICLE MAINTENANCE AND STORAGE FACILITY

The vehicle maintenance and storage facility would be constructed sometime from early in the construction process to the midway point of track construction in order to provide the ability to test and store the streetcar vehicles prior to operation. The maintenance and storage facility would be constructed from standard building materials that are durable and resistant to vandalism. A maintenance building for a system of this size would generally be 12,000 to 18,000 square feet and contain tracks inside a garage enclosure for maintenance of the vehicles. The garage would be tall enough to include an overhead crane for moving heavy equipment on and off of the streetcar roofs. The maintenance facility tracks also contain maintenance pits for inspecting and servicing the underbody of the streetcar vehicle. Parts, equipment, and tool storage are located adjacent to the work area.

The construction of the maintenance facility generally follows the same sequencing as for the TPSS. The site would be cleared and graded, and underground utility connections would be installed. Following the underground work and site preparation, the pit and foundation would be installed. Structural walls and heavy industrial equipment (such as shop cranes, etc) would be installed on the foundation. Once the structure is enclosed, the shop would be finished with mechanical and electrical equipment, plumbing, and furnishings. Construction of a storage facility entails placing tracks and turnouts, paving, installation of OCS poles and construction of security fencing and walls. The construction equipment will consist of backhoes, dump trucks, concrete trucks, flatbed trucks, cranes, and lifts.

The maintenance facility is to be located on a land parcel outside the street right-of-way. Construction vehicles will enter and exit the work site during work hours. If the site is large enough, a small Project office and staging area may be located on site. These facilities may also be located nearby at another vacant lot, or kept at the main streetcar staging area.

Construction access to and from the site will be controlled, and the contractor will be responsible for controlling dust, mud tracking, water, and vegetation debris in and out of the work site. Figure 3-5 illustrates typical construction of a maintenance building and the work site around it.

Figure 3-5 Typical Maintenance Building Construction (Tucson, AZ)

4.0 MAINTENANCE OF TRAFFIC

4.1 TEMPORARY STREET AND LANE CLOSURES

Street and lane closures will be necessary during construction of the Project. All traffic control shall be shown on a Traffic Impact Mitigation Plan, prepared by a consultant in coordination with LADOT. This Traffic Impact Mitigation Plan will be submitted to LADOT and the Transportation Construction Traffic Management Committee (TCTMC) for review and approval prior to the start of the construction. The extent and duration of the closures will depend on a number of factors, including the construction contract limits and individual contractors' choices, and will be communicated with and approved by the Project management and public relations team. In general, Project construction activities would typically take place between the hours of 7:00 a.m. and 9:00 p.m. in accordance with LAMC 41.40(a). To expedite construction activities and reduce the duration of associated potential impacts, certain construction activities may occur during peak hours in accordance with Mayor's Executive Directive No. 2 and Bureau of Engineering Special Order No. 001-0406. In addition, construction activities may occur during nighttime, weekends, and holidays with the approval of the Police Commission. The sections below describe the traffic control scenarios for particular Project phases.

4.2 MAINTENANCE OF TRAFFIC DURING UTILITY CONSTRUCTION

As described in Section 3.2 above, utility exploration and construction will occur throughout the Project. At the time of this report, the full extent and duration of utility construction is not known; existing utilities have been mapped and compared with the planned track alignment to determine potential conflicts. The following describes typical traffic control during utility construction.

In general, utility construction will be conducted in a linear manner in street segments along the route. The majority of utility construction will consist of excavating a new trench and installing new pipes, manholes, valves, catch basins, vaults, and other underground facilities alongside existing lines. This type of work will require the closure of one or two lanes (depending on the location), while maintaining one or two lanes of traffic, and sidewalks. The closures will be confined to off-peak daytime periods as much as practicable, and the contractor will be required to install steel plates over all open trenches and open up all lanes to traffic after work hours. Materials and vehicle staging will take place at the contractor's staging area, not on the jobsite. The contractor will establish this traffic control procedure for a workable segment, which would be typically two to three blocks in length. Once the utility is relocated and reconnected into the existing system, the lane closures can be removed.

The possible need to extend street closures for utility work, including night and weekend closures, must be acknowledged at any location along the alignment. There are times when these extended closures are necessary to allow the contractor uninterrupted access to a work zone to complete a relocation and "tie-over" into existing utility lines. Street closures also allow the contractor access during times when the utility and/or street may not be heavily used (i.e. during daylight hours) to perform "tie-overs." These closures may also be required when and if other unanticipated underground features are discovered, as described above in Section 3.2.

Other utility construction scenarios include the relocation and installation of lateral crossing utilities, vaults, valves, and other underground facilities. These scenarios require more specialized traffic control, requiring one or two lane closures while maintaining one or two lanes open to traffic. The open lanes may shift as utility work crosses the street. Larger relocations, such as reconstructing vaults or moving several utility lines in a confined area, may require a larger open pit and work zone. These special scenarios may involve multiple lane closures and will require prior authorization by LABOE and LABSS prior to the work.

4.3 MAINTENANCE OF TRAFFIC DURING TRACK CONSTRUCTION

Generally, track construction along the route will occupy two lanes of traffic – one for the track itself and one for a work zone. The remaining lanes will be open to traffic and the sidewalks will remain open to pedestrians. The work zone will be protected by temporary barriers on the traffic side and pedestrian fencing on the sidewalk side. The number of open lanes depends on the remaining width of the roadway. A minimum of one traffic lane in each direction will be provided, and left or right turn pockets will be provided where room is available. Pedestrian access will remain open along the sidewalk, and temporary ramps and walkways provided by the contractor to maintain ADA accessibility at intersections and crosswalks. Access to businesses will be maintained throughout construction. This can be ensured by leaving at least one business access point open to traffic. For businesses with single access points, access may be maintained through the use of temporary detours, steel plates, and half-closures of driveways. Dedicated bicycle lanes potentially affected by work zones may require temporary detours, and will be disclosed as part of a community outreach program prior to construction in those work zones. Attachment B depicts typical work zone and closure scenarios for a three-block segment, and an intersection, for track construction.

The work zone for track installation will likely span several blocks to accommodate rail installation. Cross streets will remain open to traffic while excavation occurs and the rail is installed. Temporary bridging may be required to restore vehicle and pedestrian access across an excavated area prior to rail installation. During rail installation, a cross street may need to be temporarily closed to traffic as rail is pulled and laid across the intersection. These traffic control restrictions, including the possibility of night-time and/or weekend work, will require prior authorization from LABOE, LADOT, and LABSS. To minimize any disruptions to traffic, mitigation of adverse traffic effects and traffic management and traffic control measures would be implemented, with coordination and involvement from the City before construction would occur.

The maintenance of traffic during special trackwork installation will require a larger closure area at the location of the trackwork. Depending on the type of special trackwork, a typical work zone would close two lanes of traffic for several hours, as the trackwork is positioned, installed, and welded into place. One lane may be reopened after the work shift, but the special trackwork itself would remain closed until the concrete is poured and set around the trackwork unit. The work zone would need to be enlarged again to two closed lanes during the concrete pour.

As discussed in Section 4.2 above, the possibility for multi-day closures, including night and weekend closures, exists at any location along the alignment. A request for an extended closure would be made to LADOT, LABSS, and LABOE for approval prior to the start of any extended work. Extended closures would be used for specific circumstances where it is necessary to allow the contractor uninterrupted access to a work zone, such as during a concrete pour for a segment of track or an area of special trackwork.

Remaining civil work, including paving, curbs, and sidewalk ramps, will require a one-lane or two-lane closure to complete the work. Once asphalt and concrete are set for the trackway, roadway, and sidewalks, the lane closures and traffic control devices can be removed for that segment of work and reopened to vehicle traffic. Each segment of work, comprised of the track and paving activities described above, may take anywhere from two to four weeks to complete, depending on how many blocks are included in the segment and the length of each block.

Attachment C depicts specific traffic control and lane closure scenarios for given segments along the system alignment. These scenarios are meant to describe a typical work zone and lane closure scenario for traffic and pedestrians. Detailed traffic control plans will be prepared during the final engineering design phase as described in Section 4.1 above.

4.4 MAINTENANCE OF TRAFFIC DURING SYSTEMS & OTHER WORK

Following the installation of trackwork, paving, and sidewalks, and the reopening of the roadway to traffic, several follow-up construction activities will occur. The installation of OCS poles, traffic signal poles, streetcar stop canopies and amenities, metering cabinets will occur with small and short-duration traffic control zones. There may be periods of single-lane closures or removal of a parking lane for a few hours for these activities.

When the OCS contact and support wires are strung on the OCS poles, the systems contractor may request a one-lane or two-lane closure to provide a safe work zone in the middle of the roadway. Other streetcar projects have performed this work at night to minimize the disruption of traffic. The duration of each closure for this work varies with the amount of OCS equipment to install; generally this work can be accomplished in one week per block.

4.5 HAUL ROUTES

The excavated material of this Project will need to be removed and hauled away to an off-site location. The method of removing the material for hauling away from the job site is a choice to be made by the contractor; generally this involves dump trucks entering the job site empty and exiting with a full load of excavated material. All haul-away material will be tested for contamination and treated, if necessary. Some imported material may have to be trucked to the site if sufficient material is not available or suitable for use. Table 4-1 describes typical volumes to be hauled away from the job site. Actual volumes of material and specific routes would depend on the final engineering design plans and the approval of the demolition and haul permit by LADOT, LABOE, LABSS, and LA Building and Safety.

Table 4-1 – Excavated Material & Haul Quantities

Item	Quantity	Average Trucks/Day	Number of Trucks*
Project Length	3.8 miles 20,000 feet of track		
Track Excavation	9,885 cubic yards	10-15	659 trucks
Utility Excavation	8,897 cubic yards	10-15	593 trucks
Maintenance Facility Excavation	3,333 cubic yards	10-15	222 trucks
Total			**1474 trucks – low end** **1765 trucks – high end (+20% from low end)**

** Number of large dump trucks with 15 cubic-yard capacity*

The City of Los Angeles Bureau of Sanitation has a process to obtain a Construction and Demolition (C&D) Solid Waste Hauler Permit. This process outlines the restrictions and application process for the removal of construction waste from a jobsite. The contractor would be required to follow these requirements when transporting material to and from the study area. Some of the soil would be stockpiled within the Project limits so that it is available to use if fill material is needed. Excess soil would be hauled to an off-site location, where it may be made available for other Projects requiring fill material. Potential haul routes will be identified based on the location of construction with respect to major streets and freeways, and approved by the Sanitation Department via the application process described above.

VIA	Visual Impact Assessment

Introduction

This report describes the Visual Impact Assessment for the proposed Restoration of Historic Streetcar Service in Downtown Los Angeles (Project). The lead agency for the Project under the California Environmental Quality Act (CEQA) is the City of Los Angeles (City). The City is a joint lead agency with the Federal Transit Administration (FTA) under the National Environmental Policy Act (NEPA). This visual impact assessment (VIA) was prepared in accordance with the thresholds outlined in both the California Environmental Quality Act (CEQA) and the federal National Environmental Policy Act (NEPA) for determining significant impacts/adverse effects. The Environmental Consequences outlined below in Chapter 3 will be subsequently used to satisfy NEPA requirements and to inform the impact determinations made in the proposed Project's Environmental Impact Report (EIR) to comply with CEQA.

Summary

The purpose of this VIA is to document potential visual impacts caused by the proposed Project and propose measures to lessen any detrimental impacts that are identified. Visual impacts are demonstrated by identifying visual resources in the Project area, measuring the amount of change that would occur as a result of the Project, and predicting how the affected public would respond to or perceive those changes. As mentioned, the proposed Project would be subject to both CEQA and NEPA. As such, this VIA was prepared in accordance with the thresholds outlined in both CEQA and NEPA for determining significant impacts/adverse effects.

The proposed Project consists of the construction and operation of a streetcar system in downtown Los Angeles, California along a 3.8-mile loop. The Project alignment would begin at Hill and 1st Street, run along 1st Street, south along Broadway, west along 11th Street, north along Figueroa Street, east along 7th Street or 9th Street, and north along Hill Street back to its beginning at 1st Street. Potential inclusion of a Grand Avenue Extension would also provide an alignment spur west along 1st Street, beginning at Hill Street, and continuing south along Grand Avenue to a stop north of 2nd Street. The primary purposes of the Project are to enhance mobility and transit circulation and support the growth and revitalization of downtown Los Angeles, including its historic districts. By connecting residential and employment hubs, shopping districts, civic resources, cultural institutions, historic landmarks, entertainment venues, and transit services, the Project would increase mobility and accessibility for people who live and work in the downtown area, as well as for visitors.

The build alternatives would not result in substantially adverse effects or significant impacts on visual resources. Visual quality would not be diminished under the build alternatives. Along Broadway and other locations, Project actions, combined with other local design improvement initiatives proposed as part of related projects, are expected to improve visual quality through the implementation of consistent paving, landscaping, and streetscape furniture installations.

Architecturally and historically significant buildings are the primary visual resources in the downtown area. Significant views of historic buildings would not be adversely affected by Project features. The Project improvements would expand existing public transportation facilities on selected local streets by re-establishing an updated and limited version of the extensive streetcar system that once crisscrossed downtown during the first half of the twentieth century. Primary Project components—streetcar platforms, track, and new paving—would be constructed at or near

street level and, consequently, would not obscure views of visual resources. In addition, the overhead streetcar electrification system—or overhead contact system (OCS) would be designed to be consistent with specific downtown design contexts (e.g., Historic Downtown Los Angeles Design Guidelines, Figueroa Corridor Streetscape Project, and Broadway Streetscape Master Plan).

In most instances, installation of the traction power substations (TPSS) would occur on private property, and, in some instances, the TPSS facilities would be located in the public right-of-way. The vehicle maintenance and storage facility (MSF), however, would call for the construction of buildings on private property outside the public right-of-way. Although construction of the vehicle MSF may involve a greater level of temporary disruption to the visual setting than the tracks or platforms for streetcar stops, these proposed buildings and site features would be designed to fit into the surrounding neighborhood in terms of architectural treatment, scale, proportion, materials, texture, and color. Also, through adherence to the pertinent downtown district design guidelines and implementation of the avoidance, minimization, and/or mitigation measures outlined in this report, adverse operational-period effects/impacts on visual resources would be avoided or substantially minimized.

Temporary changes to views as a result of construction-period activities, such as excavation, pouring concrete, paving, streetcar track installation, installing electrification systems, and laydown areas are not considered substantially adverse/significant. Such activities are simply larger-scale expressions of public works activities that have commonly occurred on downtown streets over the years. They also are expected to occur as part of the related design improvement projects downtown, for example, as part of the Figueroa Corridor Streetscape Project and Broadway Streetscape Master Plan (BSMP). Due to its temporary nature, standard best management practices and minimization measures would be sufficient to avoid substantially adverse effects/significant impacts. Impacts would be further reduced because construction would occur sequentially or in a leap-frog manner along affected streets to avoid full street closure (thereby avoiding long areas of continuous visual disruption), and the construction-period activities typically call for construction at or near street level; also, these activities would involve the installation of above-ground aerial elements, such as OCS wires and support poles, platform canopies, and TPSS housings that do not have the potential to cast shadows on shade-sensitive uses nor significantly obscure views of visual resources (e.g., historic buildings).

Chapter 1
Project Description

Introduction

The Project consists of the construction and operation of a streetcar system in downtown Los Angeles, California along a 3.8-mile loop. The Project alignment would run along 1st Street, Broadway, 11th Street, Figueroa Street, alternatively using 7th Street or 9th Street, and Hill Street. An extension to Grand Avenue is also proposed. The project would cover an area composed primarily of commercial land uses with a mix of residential, public, and entertainment land uses. The Project would travel through several neighborhoods or districts within the Central City Community Plan area of the City of Los Angeles: Civic Center, Bunker Hill, Historic Core, Jewelry District, Financial Core, South Park, and Fashion District. This dense urban area is known to be the region's largest employment center and one of the region's largest tourist destinations, and it has a rapidly growing residential population. Streetcar stops would be located approximately every block in the north/south direction and every other block in the east/west direction. Figure 1 depicts the regional location of the Project.

The track and roadway configuration would allow for a mixed flow of vehicles and a fleet of electrically powered streetcars. Power to the streetcar vehicles would be provided by five TPSS and an OCS. An MSF site would be constructed as part of the Project.

The primary purposes of the Project are to enhance mobility and transit circulation and support the growth and revitalization of downtown Los Angeles, including its historic districts. By connecting residential and employment hubs, shopping districts, civic resources, cultural institutions, historic landmarks, entertainment venues, and transit services, the Project would increase mobility and accessibility for people who live and work in the downtown area, as well as for visitors.

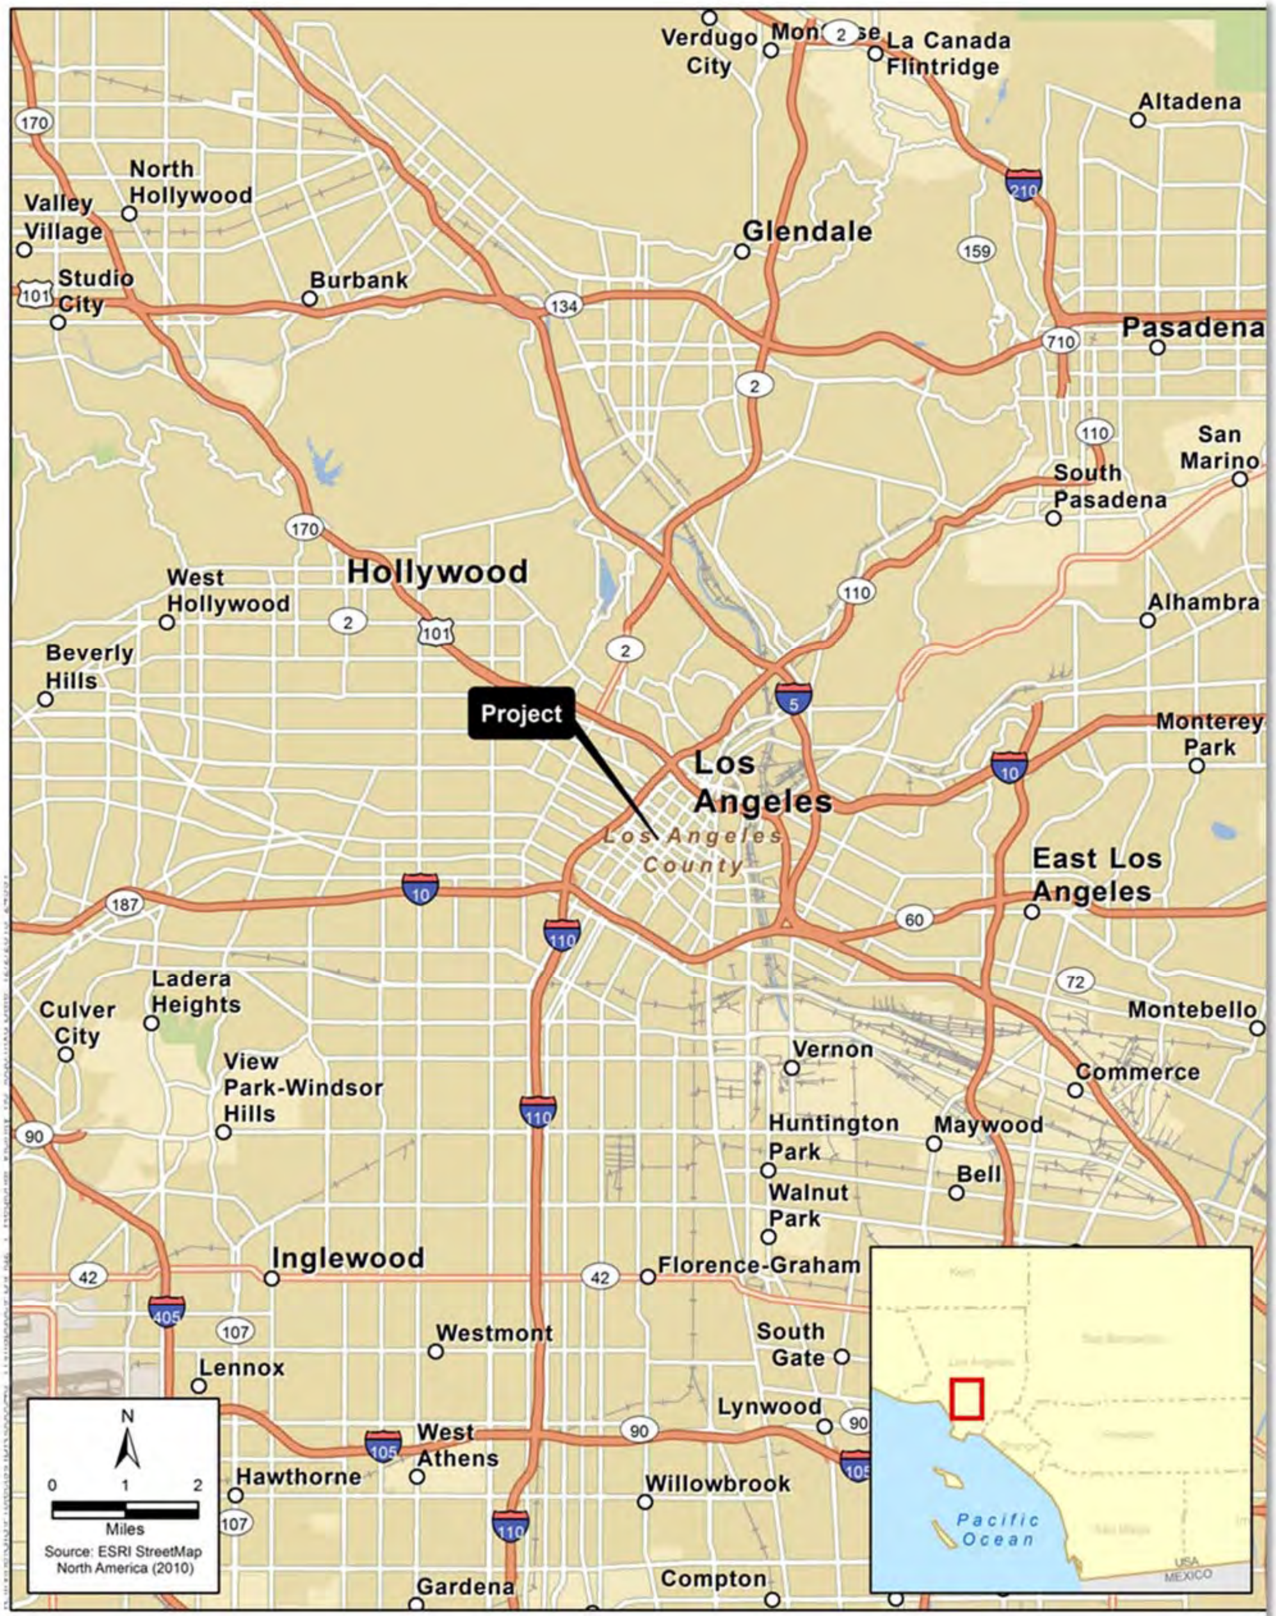
Project Alternatives

Five Project alternatives are being considered. Four build alternatives and a No Project Alternative (Alternative 1) are being studied as part of the EIR and an Environmental Assessment (EA) that are being prepared in compliance with CEQA and NEPA:

- 7th Street with a Grand Avenue Extension (Alternative 2)
- 7th Street without a Grand Avenue Extension (Alternative 3)
- 9th Street with a Grand Avenue Extension (Alternative 4)
- 9th Street without a Grand Avenue Extension (Alternative 5)

These alternatives are described below.

Figure 1. Regional Location Map



Alternative 1: No Project Alternative

The No Project Alternative is required by Section 15126.6(e) of the CEQA Guidelines. The No Project Alternative assumes that the proposed Project would not occur. Existing conditions in the Project study area would remain under this alternative.

7th Street Alternatives

Alternative 2: 7th Street with Grand Avenue Extension

The 7th Street Alternative with the Grand Avenue Extension would construct and implement streetcar service along an alignment that would begin on Grand Avenue just north of 2nd Street adjacent to the Disney Concert Hall, then continue northward until turning east on 1st Street. From 1st Street, the streetcar would turn south on Broadway, traveling to 11th Street where it would turn west and continue on to Figueroa Street. The streetcar would then turn north on Figueroa Street and travel to 7th Street, where it would turn east. From 7th Street, the streetcar would turn north on Hill Street, then continue back to 1st Street, completing the circuit by turning west on 1st Street to return to the streetcar stop on Grand Avenue

Alternative 3: 7th Street without Grand Avenue Extension

This Alternative would construct and implement streetcar service along a one-way loop that would begin at 1st and Hill Streets, run east along 1st Street, south along Broadway, west along 11th Street, north along Figueroa Street, east along 7th Street and north along Hill Street.

9th Street Alternatives

Alternative 4: 9th Street with Grand Avenue Extension

The 9th Street Alternative with the Grand Avenue Extension would follow the same alignment as the 7th Street Alternative with the Grand Avenue Extension, but it would run eastbound on 9th Street between Figueroa Street and Hill Street, rather than 7th Street, and the Project alignment would begin and terminate on Grand Avenue, north of 2nd Street.

Alternative 5: 9th Street without Grand Avenue Extension

This Alternative would follow the same alignment as the 7th Street Alternative without the Grand Avenue Extension, but it would run eastbound on 9th Street between Figueroa Street and Hill Street, rather than 7th Street.

Elements of the Streetcar Alternatives

A brief overview of the elements are common to the build alternatives of the Project are presented below.

Vehicles

A fleet of six electrically powered streetcars is currently estimated to be needed to operate at that frequency. An estimated two additional streetcars would serve as backup vehicles to the operating fleet, for a total estimated fleet size of eight vehicles. Each vehicle would measure approximately 60 to 80 feet long and be approximately 13 feet high. The streetcars would be articulated to make tight turns and have a capacity of approximately 100 passengers. The streetcars would be similar to the modern streetcar models that are currently used in other cities in the United States. The streetcars would be designed with low floors to be compliant with the *Americans with Disabilities Act* (ADA). Operating speeds for the streetcars would be the maximum posted downtown speed limit, which is currently 25 miles per hour (mph) on all streets other than Figueroa Street, between 5th Street and Pico Boulevard, where it is 30 mph. Power for the streetcars would be collected from an overhead catenary wire supported by poles along the streetcar track, or power delivery may be wireless in some segments.

Platforms

The streetcars would make stops at approximately 25 platforms along the alignment; the final number, size and placement of platforms will be determined by engineering design. With varying configurations, the platforms would generally consist of a raised concrete pad measuring approximately 8 feet wide and 70 feet long. Some of the streetcar platforms would be shared by Metro, other regional operators, and LADOT DASH buses. Shared platforms would generally be approximately 120 feet long, though physical constraints on some street segments could limit them to approximately 70 feet long. The maximum curb height would be approximately 8 to 14 inches. Platforms would be located either in the center of the roadway or adjacent to the sidewalk, along the curb. Platforms would transition to match, or nearly match, the floor height of the streetcar vehicles. Platforms would be designed and constructed to connect to the sidewalk in a way that meets ADA access requirements.

The platforms would resemble bus stops, with distinctive signage, and may include amenities such as shelters, benches, signs displaying minutes to train arrival, and kiosks containing information on the route, schedule, and fares. The design and location of the platforms would be consistent with related projects that may construct streetscape elements such as curb extensions, bus stops, or other street amenities along the Project alignment.

Two components of the streetcar support facilities would have physical locations and attributes that are considered individually in this VIA and are described below.

Support Facilities

Two components of the streetcar support facilities would have physical locations and attributes that are considered individually in this VIA and are described below.

Overhead Contact System

There are two potential configurations for the OCS wires, which supply electrical current to the streetcar vehicles. The first configuration would be to support the contact wire with a span wire between two poles perpendicular to the streetcar track. The second configuration would support the contact wire from cantilever arms connected to a single pole. Both of these configurations would use decorative poles consistent with the streetscape along the Project alignment, with the possibility of integrating poles used for street lighting, traffic signals, or traffic signs. OCS suspension at turning locations would be specific to each location, possibly requiring a combination of wire-mounting configurations. OCS poles would be approximately 25 to 30 feet tall and would be typically installed at intervals of about 80 to 120 feet, with added poles at turns. Wire heights above the tracks would typically range between approximately 18 and 19 feet in the public right-of-way.

Traction Power Substations

The streetcars would be powered by an estimated five TPSS units spaced relatively evenly throughout the alignment to provide direct current (DC) power for the streetcars. Each unit would be a durable structure containing electrical and electronic equipment. The TPSS units would most likely measure approximately 17 feet long by 11 feet wide by 11 feet high, although these dimensions could vary. The footprint needed for the TPSS installations could be up to approximately 250 square feet. Each TPSS would typically be located within a parking lot or other suitable off-street location. At one location, at 2nd and Grand Avenue, the currently recommended potential TPSS site may need to occupy space in the public right-of-way.

Maintenance and Storage Facility

The proposed Project would require a Maintenance and Storage Facility (MSF) to provide a location for secure storage of streetcar vehicles when they are not in operation, and regular light maintenance of the vehicles to keep them clean and in good operating condition.

The MSF would be located at one of four potential sites: the southwest corner of 11th Street and Olive Street, the southeast corner of 11th Street and Olive Street, the northwest corner of Hill Street and 5th Street, or the west side of Broadway between 2nd and 3rd Streets. The MSF would consist of an enclosed building and an outdoor area where routine inspections, maintenance work, and light repairs could be performed. The facility would have sufficient storage capacity with paved maintenance aisles, a pit track, overhead crane, paved truck access, staff offices, parts storage areas, and a machine shop. An employee parking area may also be provided. A maintenance building for a system of the size of the proposed Project would generally be 12,000 to 18,000 square feet, approximately two to three stories tall, contain tracks inside a garage enclosure for maintenance of the vehicles, and be constructed to comply with the City's Green Building Code and also meet minimum LEED certification requirements. Streetcars would access the facility from a short segment of track that would be connected to the mainline. A storage area outside of the maintenance facility would provide an area for overnight cleaning and secure storage of streetcar vehicles.

[Figure 2: Proposed Downtown Los Angeles Streetcar Route to be replaced]

Construction Activities

Construction activities associated with the Project would affect portions of Grand Avenue (if the Grand Avenue extension is selected), 1st Street, Broadway, 11th Street, Figueroa Street, 7th Street or 9th Street, and Hill Street, as well as the selected MSF and TPSS sites. Construction activities would include pavement removal, utility relocation, excavation, construction of track drains, installation of concrete track slab and rails, construction of station platforms, installation of special track work units, reconstruction of ramps and sidewalks, paving, and striping. Other activities would include installation of specialty system work, such as traction power, overhead contact wire, communications systems, train/traffic signaling, and OCS pole foundations. The remainder of this section offers a typical description of how the construction process would proceed. It should be noted that the actual construction process and schedule will be determined by the contractor at the time of construction; therefore, the information presented below should be regarded as illustrative of similar typical construction processes.

Construction equipment that may be required for the Project would include backhoes, small cranes, dump trucks, concrete trucks, paving equipment, rail transporters, bulldozers, graders, cranes, compactors, rollers, drill rigs, paving machines, rail welding equipment, concrete mixers, flatbed trucks, dump trucks to haul dirt, rail installation vehicles, and various hand and power tools.

Laydown and storage area(s) for construction would be established near the Project alignment and would be used for storage of equipment and materials. The laydown and storage area(s) could be located within the right-of-way, in parking lots, or on vacant land, and would be used to store equipment and materials. Four potential laydown and storage areas have been currently identified for evaluation: (1) the southeast corner of 3rd Street and Main Street; (2) northeast corner of 3rd Street and Spring Street; (3) 243 Spring Street; and (4) Grand Avenue to Olive Street, between 8th Street and 9th Street. However, these should be regarded as example sites and other locations within the study area may be chosen and become available. All four example locations are currently being used as parking lots adjoining City streets within one block of the Project alignment.

The analysis in this document assumes that, unless otherwise stated, the Project would be designed, constructed, and operated following all applicable laws, regulations, ordinances, and formally adopted City standards, including but not limited to the LAMC, LADOT design standards and special provisions, California Manual on Uniform Traffic Control Devices, and all City bureaus' design manuals, special provisions, and standard plans, including the latest Standard Specification for Public Works Construction (SSPWC or GreenBook), the City of Los Angeles Department of Public Works, Bureau of Engineering (LABOE) BrownBook, the Work Area Traffic Control Handbook, and any requirements imposed by FTA.

Chapter 2
Affected Environment

Regulatory Setting

This section provides an overview of the pertinent federal, state, and local policies governing aesthetics. This VIA was prepared in accordance with the Federal Highway Administration's (FHWA's) *Visual Impact Assessment for Highway Projects* by identifying visual resources in the Project area, measuring the amount of change that would occur as a result of the Project, and predicting how the affected public would respond to or perceive those changes. As mentioned, the proposed Project would be subject to both CEQA and NEPA. As such, this VIA was prepared in accordance with the thresholds outlined in both CEQA and NEPA for determining significant impacts/adverse effects, in addition to the other pertinent federal, state, and local policies governing aesthetics described in this section. The Environmental Consequences outlined below in Chapter 3 will be subsequently used to satisfy NEPA requirements and to inform the impact determinations made in the proposed Project's EIR to comply with CEQA.

Federal

Federal Highway Administration Visual Impact Assessment Guidance

The FHWA's *Visual Impact Assessment for Highway Projects* provides an analytical framework for identifying and assessing qualitative changes to the visual environment that could be introduced as part of a transportation project, regardless of whether the project calls for public transit or highway improvements, parkland improvements, or architectural design interventions. The FHWA guidance is widely used by local, regional, state, and federal planning agencies in California to assess the potential of a project to affect visual quality. It is intended to satisfy the provisions of both NEPA and CEQA as they relate to aesthetic impacts. The process used in the VIA generally follows the guidelines outlined in *Visual Impact Assessment for Highway Projects* (Federal Highway Administration 1988).

National Environmental Policy Act (NEPA)

Although specific significance thresholds or screening criteria are not provided under NEPA or Council on Environmental Quality (CEQ) regulations, in its Declaration of Purpose, NEPA states that it is the responsibility of the federal government to "… assure all Americans safe, healthful, productive, and aesthetically and culturally pleasing surroundings … and to attain the widest range of beneficial uses of the environment without degradation, risk to health or safety, or other undesirable and unintended consequences" (Section 101) (U.S. Government Code [USC], Title42, Section 4331). However, among the 10 types of issues listed in NEPA as important to consider, three touch upon aesthetics indirectly, including the potential to adversely affect the unique character of the affected resource, the potential for controversy, and the potential to violate laws and regulations (Section 1508.27, CEQ: Regulations for Implementing NEPA, Index and Terminology).

State

California Environmental Quality Act (CEQA)

CEQA requires an evaluation of scenic resources when considering project effects on the environment. The evaluation considers site-specific history, context, and area sensitivity, such as whether light and glare, demolition, and new development could potentially change visual character and affect scenic views and natural and human-made visual resources.

Local and Regional

Los Angeles CEQA Thresholds Guide

The *L.A. CEQA Thresholds Guide* (2006) is a guidance document that draws together practical information useful to City staff, project proponents, and the public involved in the environmental review of projects in the City of Los Angeles subject to the CEQA. The document is a reference guide that provides information that can assist in the preparation and review of environmental impact analyses. The *L.A. CEQA Thresholds Guide* provides the following screening criteria for determining significant impacts related to visual/aesthetics:

1. The amount or relative proportion of existing features or elements that substantially contribute to the valued visual character or image of a neighborhood, community, or localized area, which would be removed, altered, or demolished;
2. The amount of natural open space to be graded or developed;
3. The degree to which proposed structures in natural open space areas would be effectively integrated into the aesthetics of the site, through appropriate design, etc.;
4. The degree of contrast between proposed features and existing features that represent the areas valued aesthetic image;
5. The degree to which a proposed zone change would result in buildings that would detract from the existing style or image of the area due to density, height, bulk, setbacks, signage, or other physical elements;
6. The degree to which the project would contribute to the area's aesthetic value;
7. Applicable guidelines and regulations;
8. The nature and quality of recognized or valued views (such as natural topography, settings, man-made or natural features of visual interest, and resources such as mountains or the ocean);
9. Whether the project affects views from a designated scenic highway, corridor, or parkway;
10. The extent of obstruction (e.g., total blockage, partial interruption, or minor diminishment);
11. The extent to which the project affects recognized views available from a length of a public roadway, bike path, or trail, as opposed to a single, fixed vantage point;
12. The change in ambient illumination levels as a result of project sources; and
13. The extent to which project lighting would spill off the project site and effect adjacent light-sensitive areas.

The *L.A. CEQA Thresholds Guide* also provides specific guidance for the evaluation of a project's potential for causing shade/shadow impacts. The key screening criterion is whether a project would include light-blocking structures in excess of 60 feet in height above the ground elevation, and located within a distance of three times the height of the proposed structure from a shadow-sensitive use. If so, the project alternatives would cause a significant impact with respect to shade/shadow sensitive uses if they would:

1. Cast shade on shadow sensitive uses for more than three hours between the hours of 9 a.m. and 3 p.m. Pacific Standard Time (between October and early April), or for more than four hours between the hours of 9 a.m. and 5 a.m. Pacific Daylight Time (between early April and late October).

The Winter Solstice (December 22) and Summer Solstice (June 21) represent the times during the calendar year during which the shade/shadow impacts would be greatest.

Los Angeles Municipal Code (LAMC)

The LAMC sets forth regulations and standards regarding the allowable type, density, height, and design of new development projects. In particular, Chapter 1 of the Code, *General Provisions and Zoning*, provides development standards for the various zoning districts in the City of Los Angeles. In addition, the LAMC also sets forth the following specific regulations regarding lighting:

- Chapter 1, Article 2, Section 12.21 General Provisions, paragraph A, Section 5, Park (k) restricts light spill onto adjacent properties and provides minimum luminance levels for safety within and around parking facilities.
- Chapter 1, Article 7, Section 17.08 C states that plans for street lighting shall be submitted to and approved by the Bureau of Street Lighting for subdivision maps.

Citywide General Plan Framework Element

As it relates to the evaluation of aesthetics and views, the General Plan Framework's Urban Form and Neighborhood Design Chapter establishes a goal of creating a livable city for existing and future residents with interconnected, diverse neighborhoods (Goal 5A). Also within the General Plan Framework, the Open Space and Conservation chapter calls for the use of open space to enhance community and neighborhood character (Objective 6.2). The policies in this chapter recognize that there are communities where open space and recreational resources are currently in short supply and, therefore, suggests that pedestrian-oriented streets and small parks, where feasible, might serve as important resources for meeting the open space and recreation needs of residents (Policy 6.2.1).

Applicable objectives from the Urban Form and Neighborhood Design chapter and the Open Space and Conservation chapter address such issues as pedestrian activity and orientation, transitions in building height, landscaping and landscape buffers, ground floor uses, sidewalks and other streetscape elements, and open space.

Furthermore, the General Plan's Mobility Element, also known as the *Mobility Plan 2035*, provides a roadmap for achieving a transportation system that balances the needs of all road users. As an update to the City's General Plan Transportation Element (last adopted in 1999), *Mobility Plan 2035* incorporates "Complete Streets" principles and lays the policy foundation for how future generations of Angelenos interact with their streets. Complete Streets aims to provide safe and efficient transportation for pedestrians, bicyclists, transit riders, and car/truck drivers. Mobility Plan 2035 prioritizes the implementation of various actions (funding and staff permitting) and the Complete Street Manual describes and identifies implementation procedures for the City's expanded Street Standards and Guidelines. The manual includes information on the roadway, intersections, pedestrian crossings, sidewalks, bus stops, and other placemaking elements. The 2010 Bicycle Plan was integrated into the Complete Street Manual so technical design information for all modes is in one document.

Central City Community Plan

The Central City Community Plan is part of the 2009 *Los Angeles General Plan Framework.* As part of the City of Los Angeles General Plan, the Central City Community Plan, among other purposes, guides development within the Project area aimed at creating a healthful and pleasant environment. Chapter III, *Land Use Policies and Programs*, serves as the land use element of the General Plan for the downtown area. It includes a number of objectives and policies that address the visual aspects of new development. Chapter V, *Urban Design*, of the Community Plan acknowledges that the design of the buildings in the downtown area has not adequately addressed the planning concepts of well-designed streets, squares, and parks that are essential for a pedestrian-friendly city. The Community Plan provides broad urban design objectives for each district in the Community Plan area. It provides urban design objectives for the revitalization of Broadway as a regional-scale, nighttime entertainment district that promotes the preservation and reuse of its rare collection of historic theaters in the downtown area.

City of Los Angeles Walkability Checklist

The 2008 Walkability Checklist for Entitlement Review was developed by the City Planning Department's Urban Design Studio to encourage City planning staff, project proponents, and community stakeholders to pursue high quality urban design that provides enhanced pedestrian movement, access, comfort, and safety, both in the public right-of-way and on private properties. It specifies urban design guidelines that are generally applicable to all projects requiring discretionary approval for new construction. The Walkability Checklist consists of objectives, goals, and implementation strategies regarding various design elements that are intended to improve the pedestrian environment, protect neighborhood character, and promote high quality urban form. Such topics as sidewalks, crosswalks/street crossings, on-street parking, utilities, building orientation, off-street parking and driveways, onsite landscaping, building façades, and building signage and lighting are addressed and should be considered in the design of a project.

Citywide Design Guidelines

The 2011 Citywide Design Guidelines were adopted by the City Planning Commission for use in reviewing applications for commercial, multi-family, mixed use, and industrial projects. The Commercial Guidelines, dated May 2011, serve to implement the 10 Urban Design Principles, a part of the Framework Element. The first two principles deal with mobility and transit access in the public right-of-way. These principles, listed below, are a statement of the City's vision for the future of Los Angeles, providing guidance for new development and encouraging projects to complement existing urban form in order to enhance the built environment in Los Angeles. The 10 Principles of Urban Design listed in the Citywide Design Guidelines are as follows:

1. Develop inviting and accessible transit areas.

2. Reinforce walkability, bikeability, and wellbeing.
3. Nurture neighborhood character.
4. Bridge the past and the future.
5. Produce great green streets.
6. Generate public open space.
7. Stimulate sustainability and innovation in our city.
8. Improve equity and opportunity.
9. Emphasize early integration, simple processes, and maintainable solutions.
10. Ensure connections.

The Commercial Citywide Design Guidelines also set forth six objectives that are applicable to the Project:

Objective 1: Consider neighborhood context and linkages in building and site design.

Objective 2: Employ high quality architecture to define the character of commercial districts.

Objective 3: Augment the streetscape environment with pedestrian amenities.

Objective 4: Minimize the appearance of driveways and parking areas.

Objective 5: Include open space to create opportunities for public gathering.

Objective 6: Improve the streetscape by reducing visual clutter.

Downtown Design Guide

With the exception of the Historic Downtown District, which is governed by the *Historic Downtown Los Angeles Design Guidelines* (2002), the *Downtown Design Guide* (DDG) (City of Los Angeles 2009) provides guidelines for all of downtown. Its overarching goal is to create a better and more livable downtown, in part by promoting sustainable development with a focus on walkability and the formation of great streets, neighborhoods, and districts offering good connections to transit. Implemented by the City's Planning, Transportation, and Public Works departments, the DDG is tailored to protect and enhance the character of downtown's streetscapes, while respecting the contributions to those streetscapes made by historically significant districts and buildings (namely, massing, scale, and design context). Outside the Historic Downtown District, DDG guidance has primacy with respect to other potentially conflicting downtown design policies. It is intended for application in conjunction with the City's new street standards and emphasizes mobility alternatives to the automobile.

The DDG contains 11 topic areas: sidewalks and setbacks, ground floor treatment, parking access, massing and streetwall, onsite open space, architectural detail, streetscape improvements, signage, sustainable design, public art, and civic and cultural life.

Historic Downtown Los Angeles Design Guidelines

The purpose of the *Historic Downtown Los Angeles Design Guidelines* (2002) (HDLADG) is to aid downtown business improvement districts (BIDs), the Los Angeles Conservancy, government agencies, building owners, developers, and architects in implementing effective preservation and adaptive reuse projects that protect, highlight, and promote downtown's historic character. Based on the Secretary of the Interior's Standards for the Treatment of Historic Properties, the HDLADG apply to properties located along portions of Main, Spring, Broadway, and Hill Streets, loosely between 3rd Street on the north and 9th Street on the south. This district contains a significant concentration of historic office buildings, department store buildings, and the largest collection of movie palaces (i.e., early twentieth-century cinemas of elegant architectural design that emulated the theaters and opera houses of large European cities) anywhere in the United States—possibly anywhere in the world. It also contains a significant collection of buildings with architectural terra cotta cladding.

Although focused almost entirely on building design, retrofit, maintenance, appropriate building addition design and integration, and signage design, HDLADG guidance is premised on the eventual reintroduction of streetcars and/or trolley lines in the Historic Downtown neighborhood.

Broadway Streetscape Master Plan

The BSMP provides a vision for design improvements along Broadway, a menu of design tools and streetscapes, and other design criteria germane to design within individual street blocks. It presents eight overarching design principles intended to:

- Keep new streetscape elements simple, with clean lines and materials;
- Avoid historic recreations;
- Preserve views to key historic buildings;
- Promote clear pedestrian connections;
- Enhance the perception of public safety;
- Promote environmentally responsible design;
- Stimulate private investment; and
- Create a sense of timelessness through the use of flexible and/or modular construction premised on serving current and future needs.

The BSMP also prioritizes pedestrian and public transit circulation over the private auto. Under its provisions, street curb extensions, crosswalk and street paving, transit stop locations, and all signage (including wayfinding and informational signage) require review by the City Planning Department. Such approval was granted by the Planning Commission during early 2013. Under the BSMP, LADOT also reviews all street right-of-way changes to median strips, crosswalks, bus stop locations, directional and informational signage, bicycle facilities, and any changes to the standard LADOT menu of hardware, colors, and materials.

The BSMP calls for several additional major design interventions along Broadway that would be implemented separately from the Project. These include a reduction of automobile traffic lanes from four to two, installation of tree and understory landscaping, street furniture and kiosks, additional street lighting, paving, and wayfinding signage.

Although there are numerous non-historic replacement streetlight poles along Broadway, the surviving so-called "Broadway Rose" streetlight bases, while not considered historic elements, are considered worthy of retention as part of the streetscape proposed under the BSMP. These bases and historic terrazzo sidewalk installations, historic sidewalk vault lights, basement vault hatch doors, flagpole holders, and utility and ventilation covers are itemized in the BSMP, and are considered character-defining historic fabric.

City of Los Angeles Tree Preservation Ordinance

City Ordinance number 177404 (2006), as amended, regulates the removal of Southern California native tree species commonly found in the City of Los Angeles when those trees measure four inches or more in cumulative diameter, or four and one - half feet above the ground level at the base of the tree. Protected tree species include: nearly all indigenous oak trees of the genus Quercus; Black Walnut (Juglans californica); California Sycamore (Platanus racemosa), and California Bay trees (Umbellularia californica). Removal or relocation of protected trees requires a permit from the Board of Public Works. Removal or relocation are defined as "any act that will cause a protected tree to die, including but not limited to acts that inflict damage upon the root system or other part of the tree by fire, application of toxic substances, operation of equipment or machinery, or by changing the natural grade of land by excavation or filling the drip line area around the trunk." A protected tree report must be submitted to the Board of Public Works to apply for a tree removal permit.

City of Los Angeles Tree Preservation Policy

The City of Los Angeles Department of Recreation and Parks established the Tree Preservation Policy as a regulatory tool to provide additional protections to urban forest trees within parks beyond the protections regulated by the City of Los Angeles Tree Preservation Ordinance. In addition to the trees protected by the Tree Preservation Ordinance, the Tree Preservation Policy regulates protection of Heritage, Special Habitat Value, and Common Park trees. The definitions of each are included below:

- Heritage trees are individual trees of any size or species that are specifically designated as heritage because of their historical, commemorative, or horticultural significance. Before a Heritage tree is pruned, damaged, relocated, or removed, recommendations from Department of Recreation Parks staff arborists must be obtained. The Forestry Arborist makes a recommendation to the General Manager of Recreation and Parks for removal. The General Manager or designee must make the final approval before the tree(s) can be removed.
- Special Habitat Value trees include three of the tree species covered under the City of Los Angeles Tree Preservation Ordinance, including California Black Walnut (*Juglans californica*), California Sycamore (*Platanus racemosa*) and California Bay (*Umbellaria californica*), as well as other shrubs and trees, such as Toyon (*Heteromeles arbutifolia*), Hollyleaf Cherry (*Prunus ilicifolia*), Catalina Cherry (*Prunus lyonii*), Fremont Cottonwood (*Populus fremontii*), and at least four species of willow (*Salix sp.*). Before a Special Habitat Value tree is pruned, damaged, relocated, or removed, recommendations from Department of Recreation Parks staff arborists must be obtained. The Forestry Arborist makes a recommendation to the General Manager for removal. The General Manager or designee must make the final approval before the tree(s) can be removed.
- Common Park Trees provide aesthetic, sentimental, economical, and environmental value. Every tree in the city of Los Angeles' parks is recognized as a valuable asset and must be protected.
- Department of Public Works policy on trees and landscaping within the public right-of-way. Any mature trees removed would have to be replaced on a 2 for 1 basis.

Physical Setting

Overall Visual Character

As defined in the DDG, the Project alignment falls within, or borders, six contiguous design districts. These include Civic Center, Civic Center South, Bunker Hill, Historic Downtown, South Park, and Financial Core. In its alignment along Figueroa Street, between 11th Street and Olympic Boulevard, the Project also borders the Los Angeles Sports and Entertainment District (LASED)/Convention Center design district. Although office uses with ground-floor retail predominate, the setting is a densely developed urban area containing a range of land uses and building types and supports a growing residential population.

The Civic Center/Civic Center South are located in the northern part of downtown Los Angeles, bordering Bunker Hill, Little Tokyo, Chinatown, and the Historic Core of Downtown. The Civic Center and Civic Center South design districts extend south from the Hollywood Freeway (US-101) to a staggered boundary along 1st and 2nd Streets, terminating at Alameda Street on the east and the Harbor Freeway (I-110) on the west. These districts have a large concentration of government employees and are home to Union Station, Walt Disney Concert Hall, the Dorothy Chandler Pavilion, the Mark Taper Forum, and the Ahmanson Theater.

Bunker Hill is located in the northern and central parts of downtown Los Angeles, bounded by 1st Street to the north, Hill Street to the east, and the I-110 freeway to the west, sharing its southern border with the Financial Core. This area has music and art centers, office buildings and living spaces, and is home to the Bunker Hill Steps and Los Angeles Central Public Library.

The Financial Core, like Bunker Hill, is bounded on its west by the I-110 freeway and shares central Downtown with the Center City/Historic Core. This area is the corporate center for downtown Los Angeles and has skyscrapers, office buildings, hotels, banks, law firms, and real estate companies, amongst other related services.

South Park is bounded by the I-10 freeway to the south, Main Street to the east and shares its borders with the Financial Core and LASED/Convention Center. South Park, like the LASED/Convention Center districts, attracts visitors for sports and entertainment events, meeting facilities, conventions, and trade shows.

The DDG defines the Historic Downtown design district as being bounded by Hill Street on the west, 1st Street on the north, Los Angeles Street on the east, and 11th Street on the south. The streets of Historic downtown Los Angeles include two nationally registered historic districts: the Broadway Theater District, which includes the remnants of 12 theaters within 7 blocks, and the Old Spring Street Financial District. Several photographs are included as Appendices to help contextualize the analysis of Environmental Consequences presented in Chapter 3 and to give the reader a sense of the visual quality and character throughout the Project corridor.

In visual terms, 2nd Street east of Broadway serves as a clear demarcation line between the grouping of large-scaled federal, state, and local government office and civic buildings that occupy entire city blocks and feature landscaped grounds with park-like attributes—such as expanses of lawn, landscaped parterres (level space occupied by an ornamental arrangement of flower beds) and fountains to the north (e.g., County Administrative/Courts complex)—and more typical zero-front-setback office buildings with ground-floor retail uses on smaller, more typical urban commercial lots located to the south in Historic Downtown (Appendix A, Photos 2 and 3).

The cultural institutions comprising the Music Center—including Disney Concert Hall (to the south, across 1st Street)—are part of a large campus located between Grand Avenue and Hope Street (on the east and west, respectively) and Temple and 2nd Streets (on the north and south, respectively). This civic cultural complex includes four theaters/auditoriums housing theatrical, concert, and opera productions; restaurants; and a partially below-ground parking garage. Adjoining Disney Hall on the south, between 2nd and 3rd Streets on Grand Avenue, and within the Bunker Hill design district, are the Colburn School of Performing Arts, Museum of Contemporary Art (MOCA), the Broad (a new, public museum of contemporary art), and high-rise apartment buildings (Appendix A, Photo 1).

Along Broadway and portions of Hill Street, large department store and retail uses housed in early twentieth-century buildings, as well as historic movie theaters, are the dominant uses, with newer but intermittent residential uses occurring above the ground-floor levels (Appendix A, Photos 4 through 6). Along 7th and Figueroa Streets, large office buildings are dominant, with ground-floor restaurants and retail uses (Appendix A, Photos 9 through 12). Large retail centers and hotels occur on 7th Street at Figueroa (FIGat7th; Wilshire Grand Redevelopment Project), and at 7th and Flower Streets (The Bloc). By contrast, along 11th Street, in the South Park design district there is a blend of light industrial, office, and loft residential uses housed in a range of contemporary and early-twentieth century buildings ranging in height from low-rise (1- and 3-story) to tall (10-story or more), with large surface parking lots occasionally separating the uses (Appendix A, Photo 7).

The Central City Community Plan classifies a majority of the land within the Project alignment as commercial; significantly smaller portions of the land area are designated for residential multiple family and public facilities uses.

Land Forms

In topographic terms, downtown occurs on an alluvial outwash of the main channel of the Los Angeles River in the northeastern portion of the Los Angeles Basin. It is also defined by the Elysian Hills on the western and northwestern edges of downtown. One prominent feature associated with the Elysian Hills is Bunker Hill—an area that loosely extends east from the Harbor Freeway to Hill Street, north of 5th Street. Due to its geomorphology as an alluvial outwash, as well as the presence of the Elysian Hills and Bunker Hill, the topography within the Civic Center slopes downward in a southeasterly direction towards the Los Angeles River and Interstate 10. From its highest elevation adjoining Temple Street and Grand Avenue, at 391 feet above mean sea level (msl), the terrain drops approximately 50 feet between Grand Avenue and Spring/Temple Streets to 339 feet above msl. East of Los Angeles Street, and extending south to Broadway and 5th Street, the terrain appears to be essentially flat to casual observers, at approximately 260 to 267 feet above msl.

Broadway Theatre and Commercial Historic District

A portion of Broadway, loosely bounded by 3rd Street on the north and 9th Street on the south, is listed on the National Register of Historic Places (NRHP) as part of the Broadway Theatre and Commercial Historic District. The historic district, which includes properties on both the east and west sides of the street, was listed on the NRHP in 1979, with a subsequent boundary expansion in 2001. It comprises some 60 contributing and 38 non-contributing resources, as well as non-building objects, such as surviving sidewalk elements (e.g., terrazzo in front of some theaters and store fronts and sidewalk vault lights) (Chattel Architecture, Planning and Preservation 2010:1).

In addition to the Broadway Theatre and Commercial Historic District, there are numerous other properties within Historic Downtown and elsewhere within downtown, which have been deemed eligible for, or that have been listed, on the California Register of Historical Resources (CRHR) and/or the NRHP, both individually and as part of historic district groupings. Other properties also have received official historic landmark recognition as City of Los Angeles Historic-Cultural Monuments (HCMs). Because historic resources are often visual resources for the purposes of CEQA and NEPA, those properties, as well as other character-defining, non-building features within the historic district, such as terrazzo sidewalk displays and the bases of historic streetlights, should be considered visual resources. Among the more architecturally noteworthy historic resources adjoining the Project alignment outside the Broadway Theatre and Commercial Historic District are the Herald-Examiner Building (1111 South Broadway), the Fine Arts Building (811 West 7th Street), the Music Center (135 North Grand Avenue), and the County Hall of Administration and Stanley Mosk Courthouse campus (1st to Temple Streets, between Hill Street and Grand Avenue).

Figueroa Corridor Streetscape Project

The Figueroa Corridor Streetscape Project calls for a series of design elements along Figueroa, extending between Martin Luther King Jr. Boulevard and West 7th Street and along 11th Street between Figueroa and Broadway. Goals include providing infrastructure to support new housing development; implementing the City of Los Angeles 2010 Bicycle Master Plan; creating a distinctive paving and landscape palette along Figueroa and West 11th Streets; clearer marking of and design enhancement of public transit stops; establishing landscaped medians; planting new sidewalk trees; creating park-like environments at event destinations, such as LASED; adding sidewalk lighting; and providing unique public art opportunities (often at public transit stops).

Specific design interventions include creating protected bike lanes (separated from vehicle traffic by curbs) connected to local bikeways along Martin Luther King Jr. Boulevard, Jefferson Boulevard, and 11th and 7th Streets; reducing vehicle traffic lanes from six to four, and retaining existing curbs, gutters, and most sidewalks along Figueroa Street; and installing retrofitted LED streetlights. Bikeway improvements along 7th Street that will be implemented as part of the City of Los Angeles 2010 Bicycle Master Plan will interface with, and supplement, the bikeway components proposed as part of the Figueroa Corridor Streetscape Project.

.

Chapter 3
Environmental Consequences

Assessment Methodology

The process used for the analysis presented in this section generally follows the guidelines outlined in the *Visual Impact Assessment for Highway Projects* (FHWA 1988), which are considered an industry standard for evaluating the visual implications of highway, railroad, and a wide range of non-transportation–related projects. As mentioned, the general methodological approach involves identifying visual resources in the Project area, measuring the amount of change that would occur as a result of the Project, and predicting how the affected public would respond to or perceive those changes. Visual resources of the Project setting are defined and identified by assessing the visual character and visual quality throughout the Project corridor. Resource change is assessed by evaluating the visual character and the visual quality of the visual resources that comprise the Project corridor before and after the construction of the proposed Project. The resource change assessment incorporates the anticipated viewer response, based on the potentially affected viewer groups and their relative exposure and sensitivity.

The basic components of the FHWA methodology are as follows:

- Define the project setting and viewshed;
- Identify key views for visual assessment;
- Assess existing visual resources and viewer response;
- Depict the visual appearance of project alternatives;
- Assess changes to visual resources and predict viewer response to those changes;
- Assess the visual impacts of project alternatives; and
- Propose methods to mitigate adverse visual impacts.

Consistent with FHWA guidance, the following steps have been taken:

- The visual environment and existing landscape characteristics within the Project alignment have been defined and documented. The visual environment has been evaluated for both the existing condition and the future planned condition.
- Applicable planning documents (e.g., general plans, planning and zoning codes, etc.) have been reviewed for pertinent policy and guidance information.
- Major viewer groups have been identified, and anticipated viewer responses have been documented.
- Typical views for the visual assessment have been identified, based on the actual and anticipated responses of representative viewers.
- Review of the Project description and conceptual design plans took place, and the type and degree of visual changes expected to result in the visual resources study area have been documented.
- Design recommendations for specific Project features and locations were reviewed to enhance the visual environment for stationary and transient viewers.
- Appropriate mitigation measures have been identified.

A number of variables affect the degree of visibility, visual contrast, and the ultimate impact of a project. Such variables include the scale and size of facilities, distances and viewing angles, color and texture, and the influences of adjacent scenery or land uses. Even where visible, viewer response and sensitivity vary depending on viewer attitudes and expectations. There is a range in the level of viewer sensitivity among motorists and commuters, and in adjacent cultural/recreational, commercial and office areas, and residential areas. The last group, residential viewers, is generally considered to have the highest potential for sensitivity, while the first several viewer groups generally possess low levels of sensitivity. It should be noted that viewer activities can either encourage a viewer to observe the surrounding area more closely (e.g., driving for pleasure) or discourage close observation (e.g., employees in work environments, drivers commuting in heavy traffic). All of these viewer elements are considered when evaluating expected viewer response.

Evaluative Framework

The analysis in this visual impact assessment has been shaped by both FHWA and CEQA guidelines, because the CEQA guidelines incorporate topics that are not explicitly referenced by NEPA or the FHWA guidelines. These include the introduction of substantial light or glare, and impacts on scenic vistas, historic buildings, and natural resources along scenic highways. The *City of Los Angeles CEQA Thresholds Guide* (2006) was also employed as part of the evaluative framework for this analysis. The *Thresholds Guide* identifies additional factors to consider when determining the significance of impacts with respect to aesthetics, including view obstruction, nighttime illumination, and shade and shadow impacts.

The FHWA guidelines' evaluative framework defines the visual setting in terms of landscape units and/or key views. The key view approach is often adopted for railroad and highway improvement projects proposed in a densely urbanized and developed setting. Due to the densely built-up character of the *viewshed* and the constrained sight lines from one portion of the study area to other portions, this assessment uses a key view approach in lieu of the landscape unit approach.

A *viewshed* comprises all the surface areas visible from an observer's viewpoint. The limits of a viewshed are defined as the visual limits of the views from the Project and build alternatives. The viewshed also accounts for the locations of viewers likely to be affected by visual changes brought about by the Project.

Within the evaluative framework, changes in the quality and character of visual resources in the viewshed are assessed with respect to viewer response, as discussed in the following sections.

Quality and Character of Visual Resources

Visual Character

The *visual character* of a view is described by the topography, land uses, scale, form, and natural resources depicted in the view. The assessment of the visual character is intended to be descriptive rather than evaluative, and is based on defined attributes, such as physical traits—including form, color, line, and texture (pattern elements)—as well as pattern character traits—the dominance, scale, and diversity or continuity of visual elements.

Visual Quality

Visual quality refers to the aesthetics of a view. Determining the quality of a view can be subjective because it is based in part on the viewer's values and notions about what constitutes a quality setting. In an effort to establish a more objective framework, this assessment applies the evaluative criteria (i.e., vividness, intactness, and unity) and qualitative rankings (low, medium, and high) presented in the FHWA guidelines. This method should correlate with public judgments of visual quality well enough to predict those judgments. This approach to evaluating visual quality can also help identify specific methods for mitigating each adverse impact that may occur as a result of a project. The three criteria for evaluating visual quality can be defined as follows:

- *Vividness* is the visual power or memorability of landscape components as they combine in distinctive visual patterns.
- *Intactness* is the visual integrity of the natural and human-built landscape and its freedom from encroaching elements. It can be present in well-kept urban and rural landscapes, as well as in natural settings.
- *Unity* is the visual coherence and compositional harmony of the landscape considered as a whole. It frequently attests to the careful design of individual human-made components in the landscape.

As a general rule, views of high quality are found to have topographic relief, a variety of vegetation, rich colors, impressive scenery, and unique natural and/or built features. In addition to their use as descriptors, vividness, unity, and intactness are used more objectively as part of a rating system to assess a landscape's visual quality. Visual quality is evaluated using the following equation, provided in the FHWA guidelines:

$$\text{Visual Quality} = \frac{\text{Vividness + Intactness + Unity}}{3}$$

Utilizing a rating scale from 0 through 7, with 0 representing very low visual quality and 7 representing very high visual quality, high visual quality is equivalent to visual quality rating numbers 5.5 through 7. In contrast with the descriptors of high visual quality described above, views of medium quality may have interesting but minor landforms, some variety in vegetation and color, and/or moderate scenery (equivalent to visual quality rating numbers 3.5 through 5.4). Views of low quality have uninteresting features, little variety in vegetation and color, uninteresting scenery, and/or common elements (equivalent to visual quality rating numbers 0 through 3.4).

Viewer Response

Viewer response is composed of two elements: viewer sensitivity and viewer exposure. These elements combine to form a method of predicting how the public might react to visual changes brought about by a development project.

Viewer exposure is typically assessed by measuring the number of viewers exposed to the resource change, type of viewer activity, duration of their view, speed at which the viewer moves, and position of the viewer. High viewer exposure heightens the importance of early consideration of design, art, and architecture and their roles in managing the visual resource effects of a project. Because objects in the foreground have more detail, views from nearby locations are more detailed compared to objects that are indistinguishable in the distance. Viewers would experience visibility of a proposed project to varying degrees in a particular viewshed, depending on distance or other intervening structures or obstacles.

Viewer sensitivity is defined both as the viewer's concern for scenic quality and the viewer's response to change in the visual resources that make up the view. Local values and goals may confer visual significance on landscape components and areas that would otherwise appear unexceptional in a visual resource analysis. The sensitivity of viewers in their perception of visual quality, as well as their sensitivity to changes in visual quality, varies based on familiarity with the view, as well as their sense of ownership of the view, and the nature of their activity while receiving the view. In turn, these considerations determine how much attention the receptor focuses on the view.

Residential viewers typically have a high sensitivity to visual quality and changes in visual quality because of their familiarity with the view over a period of time, investment in the area, and sense of ownership of the view. In a way, the view from residences represents a visual extension of residents' property, and noticeable changes in this view can result in strong positive or negative reactions. Other viewers, with exceptions, usually have a low or average sensitivity to visual quality or change. These include people on the local roadway system, such as commuting motorists and pedestrians. If they are traveling simply to get from one place to another for work reasons or while doing errands, their sensitivity would normally be average. However, when motorists are traveling for pleasure, it is likely that they would be somewhat more sensitive to their surroundings. The level of sensitivity increases based upon the level of familiarity the person has with the visual setting and the viewer's concern for scenic quality (e.g., downtown residents who regularly walk downtown).

Key Views

Because it is not feasible to analyze all the potential views of the Project, it is necessary to select a number of key viewpoints that would most clearly display the visual effects of the Project at representative locations along its alignment. Key views also represent the primary viewer groups that would potentially be affected by the Project.

For purposes of this analysis, a view is considered key if at least one of the following circumstances applies:

- Visual resources are present, regardless of the quality of the view. The sensitivity of the affected viewer group is moderate or high, and the duration of the view is long-term.
- The quality of the view is moderate or high, regardless of whether visual resources are present. The sensitivity of the viewer group is moderate or high, and the duration of the view is long-term.
- The view is distinct, clear, and unobstructed from the street to adjacent businesses and is viewed regularly by a large number of commuters. In this case, the viewer sensitivity is moderate, and the view is long-term.

Key observation points (KOPs) identify key views that document the visual character and quality of the corridor in highly representative ways, or from the perspective of sensitive viewers (e.g., residents). The analysis identified seven such specific views that could be altered to some degree by the Project.

These KOPs document key views at the following vantages:

- KOP 1: Grand Avenue, near 2nd Street, looking north to 1st Street. Iconic Disney Concert Hall is in the foreground of the view on the left. The view documents the streetcar terminus adjoining key downtown cultural institutions, including the Music Center, Disney Hall, Colburn School of Performing Arts, MOCA, and the Broad.
- KOP 2: Broadway between 5th and 6th Streets, looking north, documents a representative section of this heavily traveled retail shopping street framed by historic commercial buildings and a noteworthy collection of historic movie theaters. Broadway draws large numbers of pedestrians.
- KOP 3: Figueroa Street, looking north to Olympic Boulevard, documents the streetscape adjoining the LASED and defined north of Olympic Boulevard by highly varied architectural design. Figueroa Street is a highly trafficked thoroughfare and is familiar to many LASED and downtown visitors and commuting motorists.
- KOP 4: West 7th Street at Flower Street, looking east, documents a representative section of the street framed by historic commercial buildings of comparable height that form a strongly defined streetwall. West 7th Street marks the southern boundary of the Financial District and is a major transit transfer location for Metro trains and buses, as well as DASH. It features large numbers of pedestrians.
- KOP 5: Hill Street at 6th Street, looking north. Pershing Square, a well-known downtown visual landmark, appears as a vivid visual element at middle ground, framed by tall buildings of highly varied design.
- KOP 6: West 11th Street at Broadway, looking west. The Herald-Examiner Building, which is an architectural and historic landmark, appears in the foreground portion of the view on the left.
- KOP 7: West 11th Street between Hope and Flower Streets, looking west. The view documents the dense cluster of high-rise residential development that exists along this segment of 11th Street east of the LASED.

Appendix A includes 14 photos used in this assessment to document the visual setting. The photos in Appendix A show representative views along the Project corridor by the location and direction of view, and supplement the seven KOP photos in this chapter.

Table 1 presents the visual quality ratings at the seven KOPs.

Table 1. Existing Visual Quality at Key Observation Points along the Project Alignment Using the FHWA Evaluation Criteria of Vividness, Intactness, and Unity

Key Observation Points	Vividness	Intactness	Unity	Average (V+I+U/3)	Visual Quality Rating
KOP 1	7	5	4	5.3	Moderately High
KOP 2	5	4	5	4.7	Moderately High
KOP 3	5	4	3	4.0	Moderate
KOP 4	5	5	5	5.0	Moderately High
KOP 5	5	4	3	4.0	Moderate
KOP 6	5	4	3	4.0	Moderate
KOP 7	5	5	3	4.3	Moderate

Impacts are characterized by their potential levels of significance. Generally, a reduction in the visual quality ratings from one degree of significance to another is considered a significant visual impact.

- *Low*—Minor adverse change to the existing visual resource, with low viewer response to change in the visual environment. Unlikely to require mitigation.
- *Moderate-Low*—Minor adverse change to the existing visual resource, with low viewer response to change in the visual environment. May or may not require mitigation.
- *Moderate*—Moderate adverse change to the visual resource with moderate viewer response. Impact can be mitigated within 5 years using conventional practices.
- *Moderate-High*—Moderate adverse visual resource change with high viewer response or high adverse visual resource change with moderate viewer response. Extraordinary mitigation practices may be required. Landscape treatment required will generally take longer than 5 years to mitigate.
- *High*—High level of adverse change to the resource or a high level of viewer response to visual change such that architectural design and landscape treatment cannot mitigate the impacts. Viewer response level is high. An alternative Project design may be required to avoid highly adverse impacts.

Viewer sensitivity or concern is based on the visibility of resources in the landscape, the proximity of viewers to the visual resource, the relative elevation of viewers to the visual resource, the frequency and duration of views, the number of viewers, and the types and expectations of individuals and viewer groups (Figure 3).

Figure 3. Visual Impact Assessment Process (per FHWA Guidance)

Table 2 provides a reference for determining levels of visual impact by combining resource change and viewer response.

Table 2. Visual Impact Ratings Using Viewer Response and Resource Change (per FHWA Guidance)

	Viewer Response (VR)				
Resource Change (RC)	**Low (L)**	**Moderate-Low (ML)**	**Moderate (M)**	**Moderate-High (MH)**	**High (H)**
Low (L)	L	ML	ML	M	M
Moderate-Low (ML)	ML	ML	M	M	MH
Moderate (M)	ML	M	M	MH	MH
Moderate-High (MH)	M	M	MH	MH	H
High (H)	M	MH	MH	H	H

Source: California Department of Transportation Landscape Architecture Division 2015.

The criteria for identifying the importance of views are related in part to the position of the viewer relative to the resource. An area of the landscape that is visible from a particular location (e.g., views to a park or a visual landmark) or series of points (e.g., views along a street) is defined as a *viewshed*. To identify the importance of views of a resource, a viewshed may be broken into distance zones of foreground, middle ground, and backdrop. Generally, the closer a resource is to the viewer, the more dominant it is and the greater its importance to the viewer. Although distance zones in viewsheds may vary among different geographic regions or types of terrain, a commonly used set of criteria developed by the U.S. Department of Agriculture Forest Service (1995) identifies the foreground distance zones as being within the first 0.25 to 0.5 mile from the viewer. However, within downtown Los Angeles, views are often highly constrained by densely placed tall buildings. In order to more appropriately define the distance zones, foreground distances are defined as being within 500 feet from the viewer, with the middle ground zone extending from the foreground zone to 0.5 mile from the viewer. The backdrop zone is defined as extending from the middle ground zone to the limits of sightlines. Within the densely developed context of downtown, sightlines typically extend 1.0 mile. Beyond that distance, most human-made design features, as well as mature trees, become indistinct in visual terms, and only especially large, tall buildings and landforms such as the local hills and mountains can be clearly seen.

Visual sensitivity also depends on the number and type of viewers and the frequency and duration of views. Generally, visual sensitivity increases with an increase in total number of viewers, frequency of viewing (e.g., daily or seasonally), and duration of views (i.e., how long a scene is viewed). Also, visual sensitivity is higher for views seen by people driving for pleasure (e.g., sightseers); people engaging in recreational activities such as running, biking, or walking; and homeowners (see Table 3).

Table 3. Viewer Sensitivity and View Duration at All Key Observation Points along the Project Alignment Using the FHWA Evaluation Criteria

Viewing Group	Viewer Sensitivity	View Duration
Commuting Motorists	Low	Short-term
Motorists Driving for Pleasure/Sightseers	Moderate	Long-term
Businesses/Workplace Employees	Moderate	Long-term
Pedestrians	Moderate to High	Long-term
Residents	High	Long-term

Thresholds of Significance

This section lists the thresholds used to conclude whether an impact has the potential to be substantial. Because evaluating visual impacts is inherently subjective, federal and professional standards of visual assessment methodology have been used to determine potential impacts on aesthetic values of the study area.

Determining Significance under NEPA

NEPA criteria for determining significance are listed in Code of Federal Regulations Title 40, Section 1508.27, but are considered broader and less stringent than CEQA criteria, described below. Furthermore, the CEQA criteria incorporate NEPA standards. For these reasons, identification of impacts as significant under CEQA is treated herein as sufficient for identifying effects considered substantial under NEPA. Mitigation measures set forth to minimize CEQA significant impacts are presumed also to mitigate adverse effects under NEPA. These assumptions are made only for the purpose of identifying the magnitude of particular impacts.

Determining Significance under City of Los Angeles Guidelines

The *City of Los Angeles CEQA Thresholds Guide* (2006) identifies the following factors to consider when determining the significance of impacts under CEQA with respect to aesthetics, view obstruction, shading, and nighttime illumination:

1. The amount or relative proportion of existing features or elements that substantially contribute to the valued visual character or image of a neighborhood, community, or localized area, which would be removed, altered, or demolished.
2. The amount of natural open space to be graded or developed.
3. The degree to which proposed structures in natural open space areas would be effectively integrated into the aesthetics of the site, through appropriate design, etc.
4. The degree of contrast between proposed features and existing features that represent the area's valued aesthetic image.
5. The degree to which a proposed zone change would result in buildings that would detract from the existing style or image of the area due to density, height, bulk, setbacks, signage, or other physical elements.
6. The degree to which the project would contribute to the area's aesthetic value.
7. Applicable guidelines and regulations.
8. The nature and quality of recognized or valued views (such as natural topography, settings, human-made or natural features of visual interest, and resources such as mountains or the ocean).
9. Whether the project affects views from a designated scenic highway, corridor, or parkway.
10. The extent of obstruction (e.g., total blockage, partial interruption, or minor diminishment).
11. The extent to which the project affects recognized views available from a length of a public roadway, bike path, or trail, as opposed to a single, fixed vantage point.

12. The change in ambient illumination levels as a result of project sources.
13. The extent to which project lighting would spill off the project site and affect adjacent light-sensitive areas.
14. Whether shadow-sensitive uses would be shaded by project-related structures for more than 3 hours between 9 a.m. and 3 p.m. Pacific Standard Time (between late October and early April), or for more than 4 hours between 9 a.m. and 5 p.m. Pacific Daylight Time (between early April and late October).

Construction-Period Effects

No Project Alternative (Alternative 1)

Under the No Project Alternative, no new construction or building would take place within the Project area, aside from projects that are currently under construction or funded and approved for construction and operation. As a result, no new visual elements would be introduced and no construction-period effects would occur under this alternative.

7th Street with a Grand Avenue Extension (Alternative 2)

Under Alternative 2, construction of the Project would be expected to occur over a 24-month period. Construction would occur in a manner that would help to maintain circulation along affected roadways as much as possible, and construction activities may partially overlap during the course of the 24-month overall construction period. All Project engineering and construction would be completed in conformance with applicable City, state, and federal regulations and standards, including, but not limited to, the Los Angeles Municipal Code Noise Ordinance Section 112.05, *LADOT Traffic Control Handbook and Traffic Manual*, California Public Utilities Commission Regulations, California Building Code, American Railway Engineering and Maintenance of Way Association Standards, and national stormwater pollution discharge regulations.

Construction-period effects/impacts would include below-ground utility relocation and protection activities along Project alignment streets, as well as related trenching, possible soil remediation, and the installation of barricading and street circulation-related detours. In order to avoid the complete shutdown of traffic, or the constriction of traffic along substantial portions of the corridor at one time, these activities would occur either sequentially or on a leap-frog basis. Additionally, as a result of project construction, some mature trees, as well as younger trees (with trunk diameters of 5 inches or less) may have the potential to be trimmed or removed. City policy requires all tree removals be replaced on a 2:1 basis for street trees and 4:1 basis for protected private property trees. Replacement trees would be placed as near their original locations as possible. Alternative methods and options to removal, such as trimming, would be explored prior to considering potential tree removal. The removal of trees may slightly alter the visual character along the proposed alignment. The project's compliance with the City of Los Angeles Tree Preservation Ordinance and Tree Preservation Policy would ensure that any trees slated for removal would be planted at or near their original locations at 2:1 or 4:1 ratios. As a result, no long-term, significant effects/impacts related to trees are expected.

Construction-period effects/impacts also would include excavation in Project alignment streets, the installation of new drainage systems, the pouring of concrete for station platforms, and the installation of new sidewalk paving where curbs are proposed for extension, as well as paving to match existing road surfaces. These activities would necessitate the narrowing or closing of segments of alignment streets. Intersection construction associated with this component of the construction process would potentially take place during either daytime or nighttime hours.

If construction occurs during nighttime hours, in addition to reducing traffic impacts, nighttime construction would also typically serve to further minimize visual effects because potentially far fewer visually sensitive viewers, such as pedestrians who are shopping or visiting downtown for business purposes, would be present along some portions of the alignment. In other segments of the alignment adjoining residential uses, views of visual resources would typically be accessible but far less discernible to sensitive viewing groups at night, because the dark reduces the ability of the human eye to capture much of the detail found in outdoor objects. With the exception of nighttime skyline views across the downtown—views that draw their power from nighttime lighting against dark silhouetted buildings—most ordinary views that can be acquired during daylight hours would be far less detailed and vivid at nighttime. Thus, construction activities undertaken during the evening hours, and on a temporary basis, featuring limited lighting that is directed on site and shielded from adjoining properties, are expected to be less than significant in the way they potentially affect visual resources (e.g., views of architectural or historical resources). Notwithstanding, in those areas where nighttime entertainment venues are clustered, such as along portions of Broadway and Figueroa Street adjoining the LASED, temporary visual impacts during the construction period could be greater at night as a result of the Project.

Station platform construction would take place at more than one point during the construction period. In order to minimize the effect/impact, construction would occur on either a leap-frog or sequential basis to avoid closing large segments of affected streets in the alignment simultaneously.

Construction may occur during daytime or nighttime hours. In general, Project construction activities would typically take place between the hours of 7 a.m. and 9 p.m. in accordance with LAMC 41.40(a). In addition, to expedite construction activities and reduce the duration of associated potential impacts, certain construction activities may occur during peak hours in accordance with Mayor's Executive Directive No. 2 and Bureau of Engineering Special Order No. 001-0406. In addition, construction activities may occur during nighttime, weekends, and holidays with the approval of the City's Police Commission.

The OCS, TPSS, streetcar control and communication systems, related traffic signal improvements, ventilation testing activities, and OCS pole installation would occur during the construction period. Installation and testing of the wiring for TPSS buildings and communication systems would also continue. Construction of these elements would generally take place during non-peak hours to minimize the effect/impact.

Further testing of streetcar operational systems and training streetcar system personnel would occur as the Project nears completion. With a focus on training and the testing of systems already in place, such activities would result in negligible effects/impacts on visual resources.

Related logistical support activities would include establishing a staging area for the laydown and storage of construction materials—including concrete forms, pipes, pipe accessories, concrete vaults, manholes, and station furnishings—and for overnight parking of construction equipment. Such staging areas would range in size and would be located adjacent to other compatible industrial or commercial land uses or on large surface parking lots to the extent practicable. Potential locations under consideration include between Grand Avenue and Olive Street between 8th and 9th Streets (a large surface parking lot), and between Grand Avenue and Olive Street between 12th and 11th Streets (a large surface parking lot with some adjacent light industrial uses as well as nearby residential uses). Actual laydown area locations will be determined prior to initiating construction.

The active construction areas are primarily within street rights-of-way and would have construction signs and barricades to delineate the work zone.

In order to minimize views of stockpiled materials and idle construction equipment at the MSF and in staging areas, and to reduce visual clutter and disorder, Project construction staging areas would be enclosed or screened from view at the street level with appropriate screening materials. The contractor would provide daily visual inspections to ensure the immediate surroundings of construction staging areas are free from construction-related clutter and to maintain the areas in a clean and orderly manner throughout the construction period.

Utility relocation and protection would likely be one of the first work tasks to be performed on the Project. To the extent possible, the Project's streetcar trackway would be located to avoid or minimize conflict with existing utilities. In certain cases, however, existing utilities would be relocated, modified, or protected in place, including, but not limited to, storm drains, sanitary sewers, water and power lines, gas pipelines, electrical duct banks, lighting cables, fiber optic cables, telephone cable lines, and underground conduits for traffic signals and roadway lighting. Once utility relocations and/or protection have been completed within a segment, trackwork would commence.

Track construction within the existing street would call for the use of embedded track. Trackway construction would include the demolition of the roadway section to accommodate the guideway, preparation of the track bed, construction of the supporting track slab, and the laying of rails. In most areas, the sub-grade would be prepared and graded. If rebar is designed into the track slab, it would be installed once the grade is prepared. Rail would then be pulled into place and set to final grade on steel ties and plates. Once the rail is established, concrete would be poured around the rail and rebar to form the concrete trackway.

Establishment of the staging area, utility relocation, and track construction activities would be of temporary duration and would be governed by City, state, and federal regulations and standards designed to minimize their potential to affect adjacent sensitive uses in significantly adverse ways.

7th Street without a Grand Avenue Extension (Alternative 3)

Under Alternative 3, projected related construction-period effects would be similar to those outlined above under Alternative 2. Since Alternative 3 does not include the proposed Grand Avenue extension, disruptions to visual resources would be reduced slightly as this alternative does not include construction activities south of 1st Street along Grand Avenue (between 1st and 2nd Street[s]) or west of Hill Street along 1st Street.

9th Street with a Grand Avenue Extension (Alternative 4)

Under Alternative 4, the same construction-period actions would occur as under Alternative 2, with the alignment including a 9th Street route segment in lieu of a route along 7th Street. The actions would occur over the same overall 24-month construction period, with similar overlapping construction-related actions, and would primarily call for work at and below street level, with little potential to disrupt views of visual resources. Work in the affected streets would take place either sequentially or on a leap-frog basis, and would occur during either daytime or nighttime hours. In addition, some construction activities may occur during nighttime, weekends, and holidays with the approval of the City's Police Commission to both expedite the construction process and to help minimize the effect/impact.

Due to the presence of fewer early twentieth-century buildings along the 9th Street alignment, the porous streetwall, and the presence of large surface parking lots, the potential for temporary minor disruptions of sight lines to visual resources would be reduced slightly compared to Alternatives 2 and 3. To ensure that the Project features are built with sensitivity to the visual environment, Alternative 4 would employ the same avoidance, minimization, and/or mitigation measures as are proposed under Alternative 2.

9th Street without a Grand Avenue Extension (Alternative 5)

Under Alternative 5, projected related construction-period effects would be similar to those outlined above under Alternative 4. Since Alternative 5 does not include the proposed Grand Avenue extension, disruptions to visual resources would be reduced slightly as this alternative does not include construction activities south of 1st Street along Grand Avenue (between 1st and 2nd Street[s]) or west of Hill Street along 1st Street.

Traction Power Substations

As mentioned, the proposed streetcar would be powered by an estimated five TPSS units spaced relatively evenly throughout the alignment and would measure approximately 17 feet long by 11 feet wide by 11 feet high, or of sufficient size to house the TPSS equipment. Each would be placed at a parking lot, placing structures on private property outside the public right-of-way (except for one). As with the other proposed Project elements, in order to avoid the constriction of traffic along substantial portions of the corridor at one time, construction activities would occur either sequentially or on a leap-frog basis. In general, Project construction activities would typically take place between the hours of 7 a.m. and 9 p.m., with the potential for nighttime construction. Project construction staging areas would be enclosed or screened from view at the street level with appropriate screening materials, to the extent practicable.

Substations could be prefabricated in metal boxes or built in place in a small building. The substations would be relatively small in size and given an architectural design treatment that would be compatible with adjacent architecturally/historically significant buildings. Through adherence to pertinent downtown design guidelines and the proposed avoidance, minimization, and/or mitigation measures, adverse effects/impacts on visual resources would be avoided or substantially minimized. Thus, given the relative size of the TPSS units, their proposed location(s), and the temporary nature of construction activities, construction-period effects/impacts associated with the TPSS would be less than significant.

Maintenance and Storage Facilities

Construction of a maintenance and storage facility would require the establishment of a staging area and other construction activities that would be of temporary duration and would be governed by City, state, and federal regulations and standards designed to minimize their potential to affect adjacent sensitive uses in significantly adverse ways, such as the enclosure and/or screening of Project construction staging areas. Construction of the MSF may involve a greater level of disruption on a temporary basis than the tracks or platforms for streetcar stops (e.g., excavation; soil remediation, if necessary; street closures; construction staging areas; traffic control; utility issues), though it would be designed to fit into and complement the surrounding buildings and neighborhood. Larger scale expressions of public works activities have commonly occurred along downtown streets over the years and are expected to be a part of the related downtown improvement projects, including the Figueroa Corridor Streetscape Project and BSMP.

Though temporary visual disruptions are expected, contractors would use best management practices to further reduce and/or avoid significant aesthetics impacts during construction. Construction contractors would use appropriate screening (i.e. temporary fencing with opaque materials) to buffer views of construction equipment as well as materials and soil in construction staging areas. Site managers would conduct regular site inspections to ensure that staging areas are clean and orderly, to the extent practicable, and that construction debris is removed from public rights of way and adjacent properties/roadways. In compliance with the Los Angeles Municipal Code, any graffiti would be removed from the construction site and staging areas within 24 hours, where possible. Through the implementation of best management practices associated with general construction and adherence to pertinent downtown design guidelines (such as the Historic Downtown Los Angeles Guidelines and Downtown Design Guide and other applicable regulations, including but not limited to, the Los Angeles Municipal Code, *LADOT Traffic Control Handbook and Traffic Manual* and California Building Code) to ensure the proposed project elements would conform to their unique visual environments, adverse construction-period effects/impacts on visual resources would be avoided or substantially minimized. Moreover, since temporary changes to views as a result of construction-period activities are not considered adverse/significant, effects/impacts on visual resources as a result of construction would not be adverse/significant.

Operational-Period Effects

Visual Effect/Impact at KOP 1: Grand Avenue at 2nd Street

Existing Condition

The streetwall, which refers to one of the long side boundaries of a street formed by its buildings, hedges, and other visual elements, is porous at this key view and is characterized by architecturally distinguished buildings that are spatially separate from one another, as well as a blend of vertical and horizontal line elements (see Figure 4). The view is vivid due to the varied architectural expression and contrasting vertical, horizontal, and curvilinear line elements. Due to its highly animated, sculptural form, Disney Concert Hall is the key visual resource in the view, with the County Hall of Administration and Stanley Mosk Courthouse campus and the Music Center forming architectural backdrop elements in the middle ground portion of the view. Directly across Grand Avenue to the south is a large parking structure on sloping terrain. The change in topography, along with continuous screening fencing (along Grand Avenue) planted with vines, serves to obscure views of this structure along Grand Avenue.

The view is also relatively free of obtrusive elements, such as business signage and clutter on building façades; traffic signage and signal equipment also is minimally evident. The roadway and sidewalk paving are dominant in the view, in terms of line, color, and texture, and add a strong element of unity. Off-white coloration seen on middle ground buildings, the silver color of Disney Concert Hall, and the gray color of the road pavement and sidewalks are dominant, and, along with street trees and other landscape elements outside the public right-of-way, further unify the view.

No Project Alternative (Alternative 1)

Resource Change under the Project

Under the No Project Alternative, no new construction or building would take place within the Project area, aside from projects that are currently under construction or funded and approved for construction and operation. As a result, no new visual elements would be introduced and no resource change would occur under this alternative.

Viewer Response

Under the No Project Alternative, no new construction or building would take place within the Project area, aside from projects that are currently under construction or funded and approved for construction and operation. As a result, no new visual elements would be introduced and there would be no viewer response.

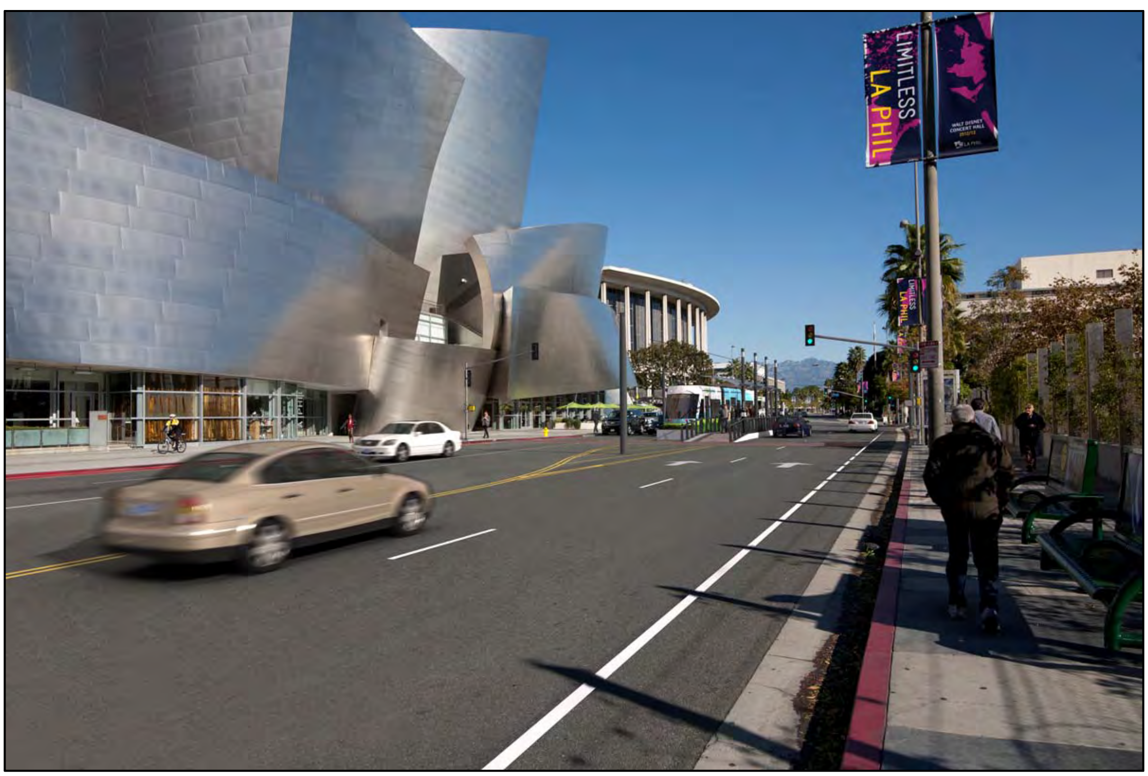
7th Street with a Grand Avenue Extension (Alternative 2)

Resource Change under the Project

As is shown in Figures 4 and 4A, installation of tracks and new paving along the track path, construction of a concrete station platform in the center of Grand Avenue, with metal railings and platform light standards and signage, as well as the OCS system, read as extensions of current public transit features such as bus stops and would be minimally noticeable. A more noticeable element

Figure 4 (KOP 1). View along Grand Avenue at 2nd Street, Looking North

Figure 4A (KOP 1). Simulated View along Grand Avenue, North of 2nd Street



would be a concrete plinth, or possibly a concrete planter, that is likely to be placed at the end of the track to prevent trains from accidentally running off the end of the track. The exact design of such a feature, however, is as yet undetermined. Furthermore, trees have the potential to be removed along the project alignment. As mentioned in the discussion of construction-related effects/impacts, in compliance with the City of Los Angeles Tree Preservation Ordinance and Tree Preservation Policy, any trees slated for removal would be planted at or near their original locations at 2:1 or 4:1 ratios. As a result, no long-term significant visual effects/impacts related to trees are expected.

OCS electrical wiring would include several components. Consistent with other segments of the alignment, there are two potential configurations for the OCS wires. The first configuration would be to support the contact wire with a span wire between two poles perpendicular to the streetcar track. The second configuration would support the contact wire from cantilever arms connected to a single pole. Both of these configurations would use decorative poles consistent with the streetscape along the Project alignment, with the possibility of integrating poles used for street lighting, traffic signals, or traffic signs. As discussed in Chapter 2, OCS poles would be approximately 25 to 30 feet tall and are typically installed at intervals of about 80 to 120 feet, with added poles at turns. Wire heights above the tracks would typically range between approximately 18 and 19 feet in the public right-of-way. Unique to this location as the streetcar terminus, a high-tension contact wire with a down-guy, or some form of diagonal termination—along with support poles—would be installed.

Tables 4 through 6 document the changes in visual quality under the Project.

Viewer Response

The Project does not include development of natural open space and would be integrated into its design setting with a very minor degree of contrast. No designated scenic corridors occur in the viewshed, and the Project's degree of view obstruction would be very low given that most of its features would be at, or slightly above, street level, and they are not opaque. In addition, aerial components such as catenary poles and OCS wires would be minimally apparent and would not block informal views. Streetcar-related platforms and platform shelters would not be of sufficient scale or bulk that they would cast shadows of sufficient size to affect shade-sensitive uses. Nor would these features significantly alter ambient illumination levels or result in spill light impacts on surrounding uses. The streetcar trains would be lighted in a manner that would minimize the potential for spill light effects and would not generate more nighttime light on the streets than existing downtown buses generate.

The Project would occur within the viewshed of Disney Concert Hall. Although no officially recognized scenic views occur in this setting, views of the building are considered important due to its design quality. Notwithstanding placement of the station stop adjacent to the iconic Disney Concert Hall, because the Project features proposed within the public right-of-way would read as extensions of the street and of the downtown public transit system, visual quality would remain moderate, and viewer response is expected to be minimal.

7th Street without a Grand Avenue Extension (Alternative 3)

Resource Change under the Project

Under Alternative 3, the Grand Avenue Extension is not included as a part of the proposed Project alignment. Therefore, under this alterative, proposed changes associated with the Project would not occur within KOP 1. As a result, no new visual elements would be introduced and no resource change would occur.

Viewer Response

Again, under this alterative, proposed changes associated with the Project would not occur within KOP 1. As a result, no new visual elements would be introduced and no viewer response would occur.

9th Street with a Grand Avenue Extension (Alternative 4)

Resource Change under the Project

Under Alternative 4, proposed changes associated with the Project would be similar to those described above under Alternative 2. The Project would occur within the viewshed of Disney Concert Hall. Although no officially recognized scenic views occur in this setting, views of the building are considered important due to its design quality. Notwithstanding placement of the station stop adjacent to the iconic Disney Concert Hall, because the Project features proposed within the public right-of-way would read as extensions of the street and of the downtown public transit system and though visual quality would decrease slightly, it would remain moderate.

Viewer Response

Again, under this alternative, proposed changes associated with the Project would be similar to those described above under Alternative 2. Viewer response is expected to be minimal.

9th Street without a Grand Avenue Extension (Alternative 5)

Resource Change under the Project

As with Alternative 3, the Grand Avenue Extension is not included as a part of the proposed Project alignment under Alternative 5. Therefore, under this alternative, proposed changes associated with the Project would not occur within KOP 1. As a result, no new visual elements would be introduced and no resource change would occur.

Viewer Response

Again, under this alternative, proposed changes associated with the Project would not occur within KOP 1. As a result, no new visual elements would be introduced and no viewer response would occur.

Traction Power Substations

Resource Change under the Project

As mentioned, the proposed streetcar would be powered by an estimated five TPSS units spaced relatively evenly throughout the alignment and would measure approximately 17 feet long by 11 feet wide by 11 feet high, or of sufficient size to house the TPSS equipment. One of the proposed TPSS locations is within the public ROW on the southeast corner of the Grand Avenue and 2nd Street intersection. Large areas are available where a TPSS could be placed without interfering with loading docks or parking structure entrances. Another alternative is to place the TPSS at the northeast corner of Grand Avenue and 2nd Street, which would place the TPSS below street elevation, hidden behind an existing landscaped fence. From KOP 1, TPSS siting locations at these sites would be very difficult to detect.

As mentioned, the substations would be relatively small in size and given an architectural design treatment that would be compatible with adjacent buildings and neighborhood character. Their design, through adherence to pertinent downtown design guidelines (i.e. HDLADG and DDG and other applicable regulations such as the *Los Angeles Municipal Code, Section 62.08*, would minimize their presence in visual terms. As a result, adverse effects/impacts on visual resources due to the TPSS would be avoided or substantially minimized and resource change would be low.

Viewer Response

Under this alternative, viewer response associated with the Project would be similar to Alternative 2. Viewer response is expected to be minimal.

Maintenance and Storage Facilities

Resource Change under the Project

The proposed MSF siting locations occur outside the viewsheds within KOP 1. As a result, no new visual elements would be introduced and no resource change would occur.

Viewer Response

Again, as mentioned, construction of an MSF would not occur within KOP 1. As a result, no new visual elements would be introduced and no viewer response would occur.

Visual Effect/Impact at KOP 2: Broadway between 5th and 6th Streets, Looking North

Existing Condition

The streetwall on both sides of Broadway is unbroken, framing both south- and north-facing views down the street at this vantage point (see Figure 5).[1] The rectilinear forms of the buildings and the consistent, classically inspired architectural language, architectural cladding materials, and coloration (e.g., tan, gray, off-white) create strong visual interest (vividness) as well as strong visual unity. However, the large quantity of business signs and conflicting sign treatments, placements, colors and patterns, combined with traffic signal lighting, diminishes the intactness of the view. The gray roadway and sidewalk paving are dominant in terms of line, color, and texture, and add a strong element of unity to the view.

No Project Alternative (Alternative 1)

Resource Change under the Project

Under the No Project Alternative, no new construction or building would take place within the Project area, aside from projects that are currently under construction or funded and approved for construction and operation. As a result, no new visual elements would be introduced and no resource change would occur under this alternative.

Viewer Response

Under the No Project Alternative, no new construction or building would take place within the Project area, aside from projects that are currently under construction or funded and approved for

[1] Note that the existing view of Broadway depicted in Figure 7 does not include the approved BSMP project improvements.

construction and operation. As a result, no new visual elements would be introduced and there would be no viewer response.

Build Alternatives

From KOP 2, Alternatives 2 through 5 would include the same proposed project elements. As a result, the build alternatives would result in similar visual impacts. Thus, they are analyzed conjointly below.

Resource Change under the Project

As shown in Figures 5 and 5A, Project features include installation of tracks, new paving along the track path, and new accent paving that would be consistent in its gray coloration with the existing sidewalks. Slight changes to the simulated view along Broadway, as shown in Figure 5A, could occur, depending on the final alternative selection. For the purposes of this VIA, the simulation, as presented, best represents the potential visual changes that could occur under the proposed project's build alternatives. The bulk of design changes in this viewshed would not be made as part of the Project, but rather, as part of the BSMP—a related project in visual terms; only the streetcar-specific elements, such as the streetcar platforms, are part of the Project. BSMP improvements would include widening the sidewalks along Broadway and adding station shelters for waiting passengers. These shelters would incorporate benches and wayfinding signage beneath translucent roofs into single structures with very limited elements that have the potential to obscure views. Reconfiguring the sidewalks along the west side of Broadway, installing street furniture, and adding landscaping in above-ground planters and trees in wells protected by black metal grates are also proposed as part of the related BSMP, scheduled for implementation prior to the Project. As mentioned, trees have the potential to be removed along the project alignment. In compliance with the City of Los Angeles Tree Preservation Ordinance and Tree Preservation Policy, any trees slated for removal would be planted at or near their original locations at 2:1 or 4:1 ratios. As a result, no long-term significant visual effects/impacts related to trees are expected.

As part of the Project, OCS electrical wiring would be included. There are two potential configurations for the OCS wires, which supply electrical current to the streetcar vehicles. The first configuration would be to support the contact wire with a span wire between two poles perpendicular to the streetcar track. The second configuration would support the contact wire from cantilever arms connected to a single pole. Both of these configurations would use decorative poles consistent with the streetscape along the Project alignment, with the possibility of integrating poles used for street lighting, traffic signals, or traffic signs. OCS suspension at turning locations would be more specialized and specific to each location, possibly requiring a combination of wire-mounting configurations. Despite the extensive nature of the design interventions along Broadway proposed as part of the Project and BSMP, these combined elements would read as extensions of current public transit features and would add visually unifying elements to the view. The change in visual quality would be noticeable but would seem appropriate in scale and in keeping with the historic design character of Broadway. Tables 4 through 6 document the change in visual quality under the Project. Visual quality would remain moderately high.

Viewer Response

The Project does not include development of natural open space and would be integrated into its design setting with a very minor degree of contrast. No designated scenic corridors occur in the viewshed, and the Project's degree of view obstruction would be very low given that most of its features would be at, or slightly above, street level, small in mass, and generally non-opaque. In addition, aerial components such as catenary poles and OCS wires would be minimally apparent and would not block informal views. Streetcar-related platforms and platform shelters would not be of sufficient scale or bulk to cast shadows of sufficient size to affect shade-sensitive uses. Nor would these features significantly alter ambient illumination levels or result in spill light impacts on surrounding uses. The streetcar trains would be lighted in a manner that would minimize the potential for spill light effects and would not generate more nighttime light on the streets than existing downtown buses.

The Project would occur within the Broadway Theatre and Commercial Historic District. Although no officially recognized scenic views occur in this setting, views along Broadway are considered important due to the concentration of architectural/historical resources. However, because the Project features within the public right-of-way read as extensions of the street and of the downtown public transit system and would seem appropriate to the setting in scale and design terms, viewer response is expected to be moderate and positive, for both sensitive viewers (e.g., sightseers and other viewers traveling for pleasure) and less-sensitive viewers.

Figure 5 (KOP 2). View along Broadway, between 5th and 6th Streets, Looking North

Figure 5A (KOP 2). Simulated View along Broadway, between 5th and 6th Streets

Traction Power Substations

Resource Change under the Project

As mentioned, the proposed streetcar would be powered by an estimated five TPSS units spaced relatively evenly throughout the alignment and would measure approximately 17 feet long by 11 feet wide by 11 feet high, or of sufficient size to house the TPSS equipment. One of the proposed TPSS locations is on 208 S. Broadway, as the Regional Connector Station lot is currently being designed and the potential for a TPSS therein is being assessed by Metro and property owner to determine feasibility and capacity. A nearby alternative, on 229 S. Broadway, is also being considered. The 229 S. Broadway site is a parking lot on the west side of the street that has the possibility of serving both the Broadway and Hill Street alignments. From KOP 2, TPSS at these sites would be very difficult to detect.

As mentioned, the substations would be relatively small in size and given an architectural design treatment that would be compatible with adjacent buildings and neighborhood character. Their design, through adherence to pertinent downtown design guidelines (i.e. HDLADG and DDG) and other applicable regulations such as the Los Angeles Municipal Code, would minimize their presence in visual terms. As a result, adverse effects/impacts on visual resources under this alternative would be avoided or substantially minimized and resource change would be low.

Viewer Response

Under this alternative, viewer response associated with the Project would be low.

Maintenance and Storage Facilities

Broadway and 2nd Street

Resource Change under the Project

As mentioned, under Option A, the MSF would be located on the west side of Broadway between 2nd and 3rd Street(s) and would consist of an enclosed building and an outdoor area where routine inspections, maintenance work and light repairs could be performed. From KOP 2, this MSF siting location would be very difficult to detect. The proposed location is in an existing parking lot between 2nd and 3rd Streets and Broadway and Hill Streets, and would abut La Catedral De Los Angeles Wedding Chapel, Guadalupe Wedding Chapel, the Office of Child Care and several other institutional and retail-oriented establishments such as the Max Electronics Center, the Learning Rights Law Center, and Civic Center Studios, among others. The area around the site is in a built up urban environment and contains a variety of land uses, including residential. South of 3rd Street are popular attractions such the Grand Central Market and the Bradbury Building. The MSF facility would replace the existing parking lot and, in accordance with the Downtown Design Guidelines, would provide a continuous landscaped parkway next to the curb and would line the property with an attractive façade (no chain link or barbed wire) [City of Los Angeles, 2009]. Therefore, it would improve the quality of the surrounding viewshed and, as a public facility amongst a mix of land uses, would not disrupt the visual character of the project area. Since the MSF site would be two or three stories high, due to the existing variety of building sizes and architectural elements, the scale and size of the proposed MSF would not substantially alter or degrade existing views. Any nighttime lighting necessary for the operation of the MSF would be directed on site to minimize spill effects and reduce potential visual impacts related to nighttime illumination. Due to the highly urbanized nature of the proposed site, its surrounding land uses, and the varying size of the neighboring buildings, high-rises and residences, the potential addition of nighttime lighting to the two or three story facility, which would replace an existing parking lot, would not introduce a substantial amount of light when compared to existing conditions. Similarly, due to its relative size, the MSF facility would not compromise views to and/or from neighboring facilities along 2nd, 3rd, Broadway, and Hill Streets. Thus, MSF Option A would not degrade the visual character of the area, degrade open space elements, create an unacceptable degree of contrast, or compromise the nature and quality of key views within the project area. Rather, with its landscaped parkway and attractive façade, it would improve visual quality in the surrounding area.

Furthermore, the MSF would be designed to fit into and complement the surrounding buildings and neighborhood. Through adherence to pertinent downtown design guidelines (i.e. HDLADG and DDG) and other applicable regulations such as the Los Angeles Municipal Code, and California Building Code, adverse effects/impacts on visual resources would be avoided or substantially minimized. Thus, the change in visual quality would be noticeable, but would seem appropriate in scale and in keeping with the historic design character of Broadway. Tables 4 through 6 document the change in visual quality under the Project. Visual quality would remain moderately high.

Viewer Response

As mentioned, the MSF would be integrated into its design setting with a very minor degree of contrast. No designated scenic corridors occur in the viewshed, and the option's degree of view obstruction would be very low. In addition, the MSF would not block informal views. Although no officially recognized scenic views occur in this setting, views along Broadway are considered important due to the concentration of architectural/historical resources. However, because the MSF features would adhere to pertinent downtown design guidelines and other applicable regulations, they would seem appropriate to the setting in scale and design terms. Viewer response would be minimal.

Other Locations

Resource Change under the Project

Under the remaining proposed MSF siting locations at Hill & 5th Street, 11th & Olive Street (East), and 11th & Olive (West), the MSF would be constructed outside the viewsheds within KOP 2. As a result, no new visual elements would be introduced and no resource change would occur under those options.

Viewer Response

Again, under these options, construction of the MSF would not occur within KOP 2. As a result, no new visual elements would be introduced and no viewer response would occur.

Visual Effect/Impact at KOP 3: Figueroa Street, Approaching Olympic Boulevard, Looking North

Existing Condition

Dramatic and highly varied architectural forms, with divergent architectural cladding, textures, and coloration characterize this view (see Figure 6).[2] Many of the buildings are high-rise structures, producing a series of individuated vertical line elements in the view that are moderately powerful in visual terms, and vivid. The verticality is contrasted at the first floor–level of the buildings by rectilinear architectural features that are more horizontal in alignment than vertical. Also, due to their curvilinear form, evergreen color, and texture, the street trees (*Ficus* spp.) are a noteworthy visual element of secondary importance that contrasts with the pronounced verticality of the architectural forms. The horizon serves as the focal point in the backdrop of the view.

The streetwall on both sides of Figueroa Street is porous, only partially framing views down the street at this vantage point. The gaps between buildings, and the highly varied architectural design and heights of the buildings, create moderate visual interest (vividness) while conveying only a moderately low degree of visual unity (due to the highly varied architectural detail, color, building placements, and heights). The gray roadway and sidewalk paving is dominant in the view in terms of line, color, and texture, and offers both a contrasting and visually unifying element.

The view is largely free of distracting, cluttering elements, such as traffic light/signage, and building signage is subdued and fitted to the architectural forms of the buildings, thereby conveying a moderate degree of intactness.

No Project Alternative (Alternative 1)

Resource Change under the Project

Under the No Project Alternative, no new construction or building would take place within the Project area, aside from projects that are currently under construction or funded and approved for construction and operation. As a result, no new visual elements would be introduced and no resource change would occur under this alternative.

Viewer Response

Under the No Project Alternative, no new construction or building would take place within the Project area, aside from projects that are currently under construction or funded and approved for construction and operation. As a result, no new visual elements would be introduced and there would be no viewer response.

[2] Note that the existing view along Figueroa Street shown in Figure 8 does not depict the proposed Figueroa Corridor project improvements.

7th Street with a Grand Avenue Extension (Alternative 2)

Resource Change under the Project

Design changes in this viewshed would include those made as part of the Project as well as those of the Figueroa Corridor Streetscape Project—a related project in visual terms. Figueroa Corridor Streetscape Project improvements would include a bikeway (already in place and delineated with striping), landscaping, and some reconfiguration of driving lanes. As shown in Figures 6 and 6A, installation of tracks and new paving along the track path, accompanied by street restriping to demarcate the shared bus, motor vehicle, and streetcar right-of-way, bikeway, and reconfigured drive lanes, would read as extensions of the street and current public transit features, such as bus stops, and would add visually unifying elements to the view. OCS electrical wiring would include several components, based on which of the two potential configurations is selected. Both of these configurations would use decorative poles consistent with the streetscape along the Project alignment, with the possibility of integrating poles used for street lighting, traffic signals, or traffic signs. Furthermore, trees have the potential to be removed along the project alignment. As mentioned in the discussion of construction-related effects/impacts, in compliance with the City of Los Angeles Tree Preservation Ordinance and Tree Preservation Policy, any trees slated for removal would be planted at or near their original locations at 2:1 or 4:1 ratios. As a result, no long-term significant visual effects/impacts related to trees are expected. The change as a result of the Project and the related Figueroa Corridor Streetscape Project, whether considered separately or together, would be slightly noticeable on this wide, heavily trafficked thoroughfare and would introduce nominal changes to its design setting. Visual quality would remain moderate. As mentioned, Tables 4 through 6 document the changes in visual quality under the Project.

Viewer Response

The Project does not include the development of natural open space and would be integrated into its design setting with a very minor degree of contrast. No designated scenic corridors occur in the viewshed, and the Project's degree of view obstruction would be very low given that most of its features would be at, or slightly above, street level, small in mass, and generally non-opaque. In addition, aerial components such as catenary poles and OCS wires would be minimally apparent and would not block informal views. Streetcar-related platforms and platform shelters would not be of sufficient scale or bulk to cast shadows of sufficient size to affect shade-sensitive uses. Nor would

Figure 6 (KOP 3). View along Figueroa Street at Olympic Boulevard, Looking North

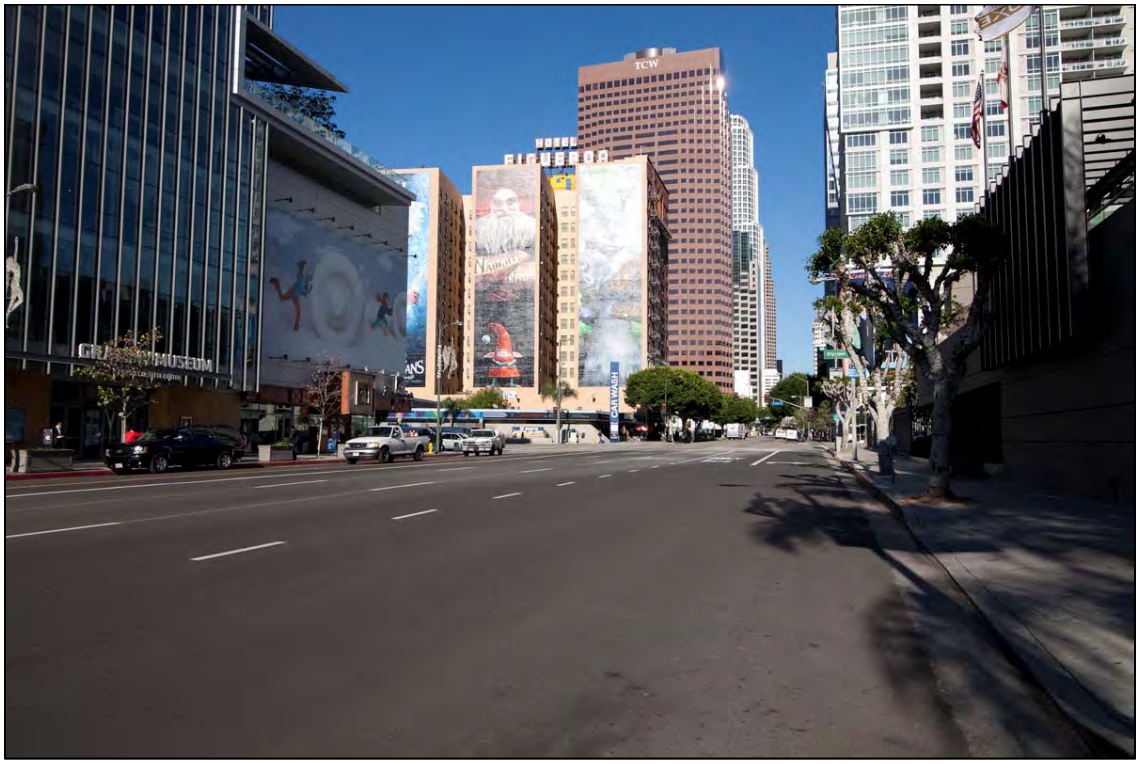

Figure 6A (KOP 3). Simulated View, North along Figueroa Street at Olympic Boulevard

these features significantly alter ambient illumination levels or result in spill light impacts on surrounding uses. The streetcar trains would designed and lighted in a manner that would minimize the potential for spill light effects and would not generate more nighttime light on the streets than existing downtown buses.

The Project would occur as part of a heavily trafficked thoroughfare and in a design setting where no officially recognized scenic views or noteworthy informal views are present. Moreover, because the Project features proposed within the public right-of-way would read as extensions of the street and of the downtown public transit elements and would seem appropriate to the setting in scale and design terms, viewer response is expected to be minimal.

7th Street without a Grand Avenue Extension (Alternative 3)

Resource Change under the Project

Under Alternative 3, proposed changes associated with the Project would be the same as those described above under Alternative 2. The change as a result of the Project under this alternative would be slightly noticeable on a wide, heavily trafficked thoroughfare and would introduce nominal changes to its design setting. Visual quality would remain moderate.

Viewer Response

Again, under this alternative, proposed changes associated with the Project would be similar to those described above under Alternative 2. The Project would occur in a design setting where no officially recognized scenic views or noteworthy informal views are present. Because the Project features proposed within the public right-of-way would read as extensions of the street and of the downtown public transit elements and would seem appropriate to the setting in scale and design terms, viewer response is expected to be minimal.

9th Street with a Grand Avenue Extension (Alternative 4)

Resource Change under the Project

Under Alternative 4, proposed changes associated with the Project would be similar to those described above under Alternative 2. However, under this alternative, impacts would be slightly less, as changes throughout the Project alignment would begin at 9th Street. Therefore, the foreground depicted in KOP 3, between Olympic Boulevard and 9th Street, would remain unchanged. Thus, the changes as a result of the Project under this alternative would also be slightly noticeable on a wide, heavily trafficked thoroughfare and would introduce nominal changes to its design setting. Visual quality would remain moderate.

Viewer Response

Again, under this alternative, proposed changes associated with the Project would be similar to those described above under Alternative 2, though slightly less. The Project would occur in a design setting where no officially recognized scenic views or noteworthy informal views are present. Since much of KOP 3 would remain unchanged and because the Project features proposed within the public right-of-way would read as extensions of the street and of the downtown public transit elements and would seem appropriate to the setting in scale and design terms, viewer response is expected to be minimal.

9th Street without a Grand Avenue Extension (Alternative 5)

Resource Change under the Project

Under Alternative 5, proposed changes associated with the Project would be the same as those described above under Alternative 4. The change as a result of the Project under this alternative would be slightly noticeable on a wide, heavily trafficked thoroughfare and would introduce nominal changes to its design setting. Visual quality would remain moderate.

Viewer Response

Again, under this alternative, proposed changes associated with the Project would be the same as those described above under Alternative 4. The Project would occur in a design setting where no officially recognized scenic views or noteworthy informal views are present. Because the Project features proposed within the public right-of-way would read as extensions of the street and of the downtown public transit elements and would seem appropriate to the setting in scale and design terms, viewer response is expected to be minimal.

Traction Power Substations

Resource Change under the Project

As mentioned, the proposed streetcar would be powered by an estimated five TPSS units spaced relatively evenly throughout the alignment and would measure approximately 17 feet long by 11 feet wide by 11 feet high, or of sufficient size to house the TPSS equipment. One of the proposed TPSS locations is on 928 Figueroa Street, which is on Figueroa Street, south of 9th Street, in a small parking lot. From KOP 3, this TPSS siting location would be very difficult to detect. As mentioned, the substations would be relatively small in size and given an architectural design treatment that would be compatible with adjacent buildings and neighborhood character. Their design, through adherence to pertinent downtown design guidelines (i.e. HDLADG and DDG) and other applicable regulations such as the Los Angeles Municipal Code, would minimize their presence in visual terms. As a result, adverse effects/impacts on visual resources due to the TPSS would be avoided or substantially minimized and resource change would be low.

Viewer Response

Under this alternative, viewer response associated with the Project would be low.

Maintenance and Storage Facilities

Resource Change under the Project

The proposed MSF siting locations occur outside the viewsheds within KOP 3. As a result, no new visual elements would be introduced and no resource change would occur.

Viewer Response

Again, as mentioned, construction of an MSF would not occur within KOP 3. As a result, no new visual elements would be introduced and no viewer response would occur.

Visual Effect/Impact at KOP 4: West 7th Street, Approaching Flower Street, Looking East

Existing Condition

The streetwall on both sides of 7th Street is unbroken, framing both west- and east-facing views down the street at this vantage point (see Figure 7). The rectilinear forms of the buildings and the consistent, classically inspired architectural language, architectural cladding materials, and coloration (e.g., tan, gray, brown) create strong visual interest (vividness) as well as strong compositional unity. With its horizontal line pattern, texture, and gray coloration, the roadway and sidewalk paving serve to strongly focus the view and provide one element of contrast to the dominant vertical line components conveyed by the architectural forms. Also, due to their curvilinear form, evergreen color, and texture, the *Ficus* street trees are a noteworthy visual element of secondary importance that contrasts with the dominant rectilinear character of the architectural forms.

The view is largely free of distracting, cluttering elements, such as traffic light/signage, and building signage is subdued and fitted to the architectural forms of the buildings, thereby conveying a moderately high degree of intactness. The view is dynamic due to the balance of unifying design elements, subtly differentiated design features, and the moderately strong tree canopy.

No Project Alternative (Alternative 1)

Resource Change under the Project

Under the No Project Alternative, no new construction or building would take place within the Project area, aside from projects that are currently under construction or funded and approved for construction and operation. As a result, no new visual elements would be introduced and no resource change would occur under this alternative.

Viewer Response

Under the No Project Alternative, no new construction or building would take place within the Project area, aside from projects that are currently under construction or funded and approved for construction and operation. As a result, no new visual elements would be introduced and there would be no viewer response.

7th Street with a Grand Avenue Extension (Alternative 2)

Resource Change under the Project

Design changes in this viewshed would include those made as part of the Project, as well as those of the City of Los Angeles 2010 Bicycle Master Plan, the primary improvements of which would be the delineation of a bikeway (created through restriping) and the reconfiguration of driving lanes. The Project would include paving along the streetcar track path, restriping, and installation of an OCS electrical wiring support system. As shown in Figures 7 and 7A, installation of tracks and new paving along the track path, accompanied by street restriping to demarcate the shared bus, motor vehicle, and streetcar lane, bikeway, and reconfigured drive lanes, would read as extensions of the street and of current public transit features, such as bus stops, that exist within the public right-of-way, and would add visually unifying elements to the view. The change would be slightly noticeable on this heavily trafficked thoroughfare and would introduce nominal changes to its design setting, including station platforms, railings, and OCS electrical wiring, which could include two potential configurations, both of which would use decorative poles consistent with the streetscape along the Project alignment, with the possibility of integrating poles used for street lighting, traffic signals, or traffic signs. Furthermore, trees have the potential to be removed along the project alignment. As mentioned in the discussion of construction-related effects/impacts, in compliance with the City of Los Angeles Tree Preservation Ordinance and Tree Preservation Policy, any trees slated for removal would be planted at or near their original locations at 2:1 or 4:1 ratios. As a result, no long-term significant visual effects/impacts related to trees are expected. Visual quality would remain moderate. Tables 4 through 6 document the changes in visual quality under the Project.

Viewer Response

The Project does not include the development of natural open space and would be integrated into its design setting with a very minor degree of contrast. No designated scenic corridors occur in the viewshed, and the Project's degree of view obstruction would be very low given that most of its

Figure 7 (KOP 4). View along 7th Street at Flower Street, Looking East

Figure 7A (KOP 4). Simulated View, 7th Street at Flower Street, Looking East

features would be at, or slightly above, street level, small in mass, and generally non-opaque. In addition, aerial components such as catenary poles and OCS wires would be minimally apparent and would not block informal views. Streetcar-related platforms and platform shelters would not be of sufficient scale or bulk to cast shadows of sufficient size to affect shade-sensitive uses. Nor would these features significantly alter ambient illumination levels or result in spill light impacts on surrounding uses. The streetcar trains would be lighted in a manner that would minimize the potential for spill light effects and would not generate more nighttime light on the streets than the existing downtown bus fleet.

The Project would occur within a viewshed characterized by a large concentration of architectural/historical resources marked by a strongly defined streetwall that possesses a moderately high level of visual quality. Although no officially recognized scenic views occur in this setting, views along 7th Street are considered important due to the concentration of architectural/historical resources. However, because the Project features proposed within the public right-of-way read as extensions of the street and of extant downtown roadway and public transit elements, and would seem appropriate to the setting in scale and design terms, viewer response is expected to be minimal.

7th Street without a Grand Avenue Extension (Alternative 3)

Resource Change under the Project

Under Alternative 3, proposed changes associated with the Project would be the same as those described above under Alternative 2. The changes would be slightly noticeable on this heavily trafficked thoroughfare and would introduce nominal changes to its design setting, including station platforms, railings, and OCS electrical wiring as well as guide wires that could be suspended from solitary catenary poles, potentially incorporating decorative streetlights consistent with the streetscape along 7th Street. Visual quality would remain moderate. As mentioned, Tables 4 through 6 document the changes in visual quality under the Project.

Viewer Response

Again, under this alternative, proposed changes associated with the Project would be similar to those described above under Alternative 2. The Project would occur in a design setting where no officially recognized scenic views or noteworthy informal views are present. Because the Project features proposed within the public right-of-way would read as extensions of the street and of the downtown public transit elements and would seem appropriate to the setting in scale and design terms, viewer response is expected to be minimal.

9th Street with a Grand Avenue Extension (Alternative 4)

Resource Change under the Project

Under Alternative 4, proposed changes associated with the Project would not occur within KOP 4 as the alignment would occur along 9th Street rather than 7th Street. As a result, no new visual elements would be introduced under this alternative and no resource change would occur.

Viewer Response

Again, under this alterative, proposed changes associated with the Project would not occur within KOP 4. As a result, no new visual elements would be introduced and no viewer response would occur.

9th Street without a Grand Avenue Extension (Alternative 5)

Resource Change under the Project

As in Alternative 4, proposed changes associated with the Project would not occur within KOP 4 under this alternative as the alignment would occur along 9th Street rather than 7th Street. As a result, no new visual elements would be introduced and no resource change would occur.

Viewer Response

Again, under this alternative, proposed changes associated with the Project would not occur within KOP 4. As a result, no new visual elements would be introduced and no viewer response would occur.

Traction Power Substations

Resource Change under the Project

The TPSS would be constructed outside the viewsheds within KOP 4. As a result, no new visual elements would be introduced and no resource change would occur due to the TPSS.

Viewer Response

TPSS would not be constructed within KOP 4. As a result, no new visual elements would be introduced and no viewer response would occur.

Maintenance and Storage Facilities

Resource Change under the Project

The proposed MSF siting locations occur outside the viewsheds within KOP 4. As a result, no new visual elements would be introduced and no resource change would occur.

Viewer Response

Again, as mentioned, construction of an MSF would not occur within KOP 4. As a result, no new visual elements would be introduced and no viewer response would occur.

Visual Effect/Impact at KOP 5: Hill Street, Approaching West 6th Street, Looking North

Existing Condition

The visual elements that make up the view are highly varied in terms of building architectural design, height, and exterior cladding materials (e.g., glass skin, brick, concrete, terra cotta). Vertical line elements are dominant, and the degree of contrast, due to differentiation in size, placement, and architectural design detail, is high (Figure 8). The streetwall on both sides of Hill Street is porous, only partially framing north- and south-facing views down the street at this vantage. Because of the moderately dense clustering of trees and understory landscaping along the west side of Hill Street, Pershing Square, with its curvilinear form, evergreen color, and texture, provides a significant and vibrant contrasting component to the strongly individualized building forms. The rectilinear forms of the buildings and the non-continuous, classically inspired architectural language, architectural cladding materials, and differentiation in coloration (e.g., tan, brown, gray, green-blue, off-white) create moderate visual interest (vividness) as well as moderately low visual unity. The gray roadway and sidewalk paving are dominant in the view in terms of line, color, and texture and add a strong element of unity.

The view is relatively free of distracting, cluttering elements, such as traffic lights/signage. Building signage is subdued and fitted to the architectural forms of the buildings, thereby conveying a moderately high degree of intactness.

No Project Alternative (Alternative 1)

Resource Change under the Project

Under the No Project Alternative, no new construction or building would take place within the Project area, aside from projects that are currently under construction or funded and approved for construction and operation. As a result, no new visual elements would be introduced and no resource change would occur under this alternative.

Viewer Response

Under the No Project Alternative, no new construction or building would take place within the Project area, aside from projects that are currently under construction or funded and approved for construction and operation. As a result, no new visual elements would be introduced and there would be no viewer response.

Build Alternatives

From KOP 5, Alternatives 2 through 5 would include the same proposed project elements. As a result, the build alternatives would result in similar visual impacts. Thus, they are analyzed conjointly below.

Resource Change under the Project

As is shown in Figures 8 and 8A, the installation of tracks and new paving along the track path, accompanied by street restriping to demarcate the shared streetcar/bus/motor vehicle lane and reconfigured drive lanes, would read as an extension of current public transit features, such as bus stops, that occur within the existing public right-of-way. OCS electrical wiring would include several components, based on which of the two potential configurations is selected. Both of these configurations would use decorative poles consistent with the streetscape along Hill Street, with the possibility of integrating poles used for street lighting, traffic signals, or traffic signs. Furthermore, trees have the potential to be removed along the project alignment. As mentioned in the discussion of construction-related effects/impacts, in compliance with the City of Los Angeles Tree Preservation Ordinance and Tree Preservation Policy, any trees slated for removal would be planted at or near their original locations at 2:1 or 4:1 ratios. As a result, no long-term significant visual effects/impacts related to trees are expected. The change would be slightly noticeable on this thoroughfare and would introduce nominal changes to a design setting, which possesses only moderate visual quality. Table 4 documents the change in visual quality under the Project.

Viewer Response

The Project does not include the development of natural open space. It would be integrated into its design setting, with only a minor degree of contrast. No designated scenic corridors occur in the viewshed. The Project's degree of view obstruction would be very low given that most of its features would be at street level or slightly above, small in terms of mass, and generally non-opaque. In addition, aerial components such as catenary poles and OCS wires would be minimally apparent and would not block informal views. Streetcar platforms and shelters would not cast shadows that would affect shade-sensitive uses, nor would these features significantly alter ambient illumination

Figure 8 (KOP 5). View along Hill Street at 6th Street, Looking North

Figure 8A (KOP 5). Simulated View, Hill Street at 6th Street, Looking North

levels or result in impacts on surrounding uses related to spill light. The streetcar trains would be lighted in a manner that would minimize the potential for spill light. They would not generate more nighttime light than existing downtown buses.

The Project would occur in a setting that is characterized by a mix of both new, non-historic buildings and older architectural/historical resources, including Pershing Square, the visual centerpiece. Although no officially recognized scenic views occur in this setting, views to and from Pershing Square is considered important because of its role as a key downtown park and its design as landscaped open space. However, because Project features would read as extensions of the street and extant downtown public transit elements and seem appropriate in terms of scale and design to their setting adjoining Pershing Square, viewer response is expected to be minimal.

Traction Power Substations

Resource Change under the Project

As mentioned, the proposed streetcar would be powered by an estimated five TPSS units spaced relatively evenly throughout the alignment and would measure approximately 17 feet long by 11 feet wide by 11 feet high, or of sufficient size to house the TPSS equipment. One of the proposed TPSS locations is on 431 Hill Street, which is located west of Hill Street between 4th and 5th Streets. Alternatively, a TPSS may be sited at 628 S. Hill Street. Currently, there is a privately owned small parking lot on the east side of Hill Street, south of 6th Street. There is also a small jewelry store on the site. In the case that this site is selected, the TPSS would be built behind the store, which would prevent the unit from being an obstruction. From KOP 5, these TPSS siting locations would be very difficult to detect. As mentioned, the substations would be relatively small in size and given an architectural design treatment that would be compatible with adjacent buildings and neighborhood character. Their design, through adherence to pertinent downtown design guidelines (i.e. HDLADG and DDG) and other applicable regulations such as the Los Angeles Municipal Code, would minimize their presence in visual terms. As a result, adverse effects/impacts on visual resources due to the TPSS would be avoided or substantially minimized and resource change would be low.

Viewer Response

Under this alternative, viewer response associated with the Project would be low.

Maintenance and Storage Facilities

MSF Option: Broadway and 2nd Street

Resource Change under the Project

As mentioned, one potential siting location for the MSF is on the east side of Broadway between 2nd and 3rd Street(s) and would consist of an enclosed building and an outdoor area where routine inspections, maintenance work and light repairs could be performed. From KOP 5, this MSF siting location would be very difficult to detect. The MSF would be designed to fit into and complement the surrounding buildings and neighborhood. Since the MSF site would be two or three stories high, due to the existing variety of building sizes and architectural elements, the scale and size of the proposed MSF would not substantially alter or degrade existing views. Any nighttime lighting necessary for the operation of the MSF would be directed on site to minimize spill effects and reduce potential visual impacts related to nighttime illumination. Due to the highly urbanized nature of the proposed site, its surrounding land uses, and the varying size of the neighboring buildings, high-rises and residences, the potential addition of nighttime lighting to the two or three story facility, which would replace an existing parking lot, would not introduce a substantial amount of light when compared to existing conditions. Through adherence to pertinent downtown design guidelines (i.e. HDLADG and DDG) and other applicable regulations such as the Los Angeles Municipal Code and California Building Code, adverse effects/impacts on visual resources would be avoided or substantially minimized. Thus, the change in visual quality would be noticeable, but would seem appropriate in scale and in keeping with the scale and setting surrounding the site. Tables 4 through 6 document the change in visual quality under the Project. Visual quality would remain moderate.

Viewer Response

As mentioned, the MSF would be integrated into its design setting with a very minor degree of contrast. No designated scenic corridors occur in the viewshed, and the option's degree of view obstruction would be very low. In addition, the MSF would not block informal views. Due to its relative size, the MSF facility would not compromise views to and/or from neighboring facilities along 2nd, 3rd, Broadway, and Hill Streets. Although no officially recognized scenic views occur in this setting, views to and from Pershing Square are considered important because of its role as a key downtown park and its design as landscaped open space. However, because the MSF features would adhere to pertinent downtown design guidelines (i.e. HDLADG and DDG) and other applicable regulations, they would seem appropriate to the setting in terms of scale and design. Viewer response is expected to be minimal.

MSF Option: Hill Street and 5th Street

Resource Change under the Project

As mentioned, another potential siting location for the MSF is on the northwest corner of Hill Street and 5th Street and, like the other MSF options, would consist of an enclosed building and an outdoor area where routine inspections, maintenance work and light repairs could be performed. From KOP 5, this MSF siting location would be difficult to detect. The proposed location is in an existing parking lot between 4th and 5th Streets and Hill and Olive Streets, and would abut Metro 417 Apartments. The area around the site is in a built up urban environment and contains a variety of land uses, including residences, restaurants, retail outlets, offices and hotels. Being situated closer to Los Angeles's Central Business District, the proposed site is in proximity of various skyscrapers and high-rise buildings that are afforded views of the lot, such as the Southern California Gas Company building and the Millennium Biltmore Hotel, amongst others. Pershing Square is one block southwest, between 5th and 6th Streets and Hill and Olive Streets. Under Option B, the proposed changes associated with operation of the MSF facility would be similar to those described above under Option A. The MSF facility would replace an existing parking lot and, in accordance with the Downtown Design Guidelines, would provide a continuous landscaped parkway next to the curb and would line the property with an attractive façade (no chain link or barbed wire) (City of Los Angeles, 2009). Therefore, it would improve the quality of the surrounding viewshed and, as a public facility amongst a mix of land uses, would not disrupt the visual character of the project area. Since the MSF site would be two or three stories high, due to the existing variety of building sizes and architectural elements, particularly skyscrapers, high-rises and other tall buildings in the Central Business District, the scale and size of the proposed MSF would not substantially alter or degrade existing views. Any nighttime lighting necessary for the operation of the MSF would be directed on site to minimize spill effects and reduce potential visual impacts related to nighttime illumination. Due to the highly urbanized nature of the proposed site, its surrounding land uses, and the varying size of the neighboring buildings in the Central Business District, the potential addition of nighttime lighting to the two or three story facility, which would replace an existing parking lot, would not introduce a substantial amount of light when compared to existing conditions. Nor would it compromise views to and/or from neighboring facilities along 4th, 5th, Hill, and Olive Streets. Residents at Metro 417 Apartments would be able to see the MSF, though, these residents would be accustomed to dynamic, urban cityscape views, would not substantially change the visual setting for these viewer groups. Thus, this MSF option would not degrade the visual character of the area, degrade open space elements, create an unacceptable degree of contrast, or compromise the nature and quality of key views within the project area. Rather, in compliance with DDG, its landscaped parkway and attractive façade would help improve visual quality in the surrounding area.

Furthermore, the MSF would be designed to fit into and complement the surrounding buildings and neighborhood. Through adherence to pertinent downtown design guidelines (i.e. HDLADG and DDG) and other applicable regulations such as the Los Angeles Municipal Code, and California Building Code, adverse effects/impacts on visual resources would be avoided or substantially minimized. Thus, the change in visual quality would be noticeable, but would seem appropriate in scale and in keeping with the scale and setting surrounding Pershing Square. Tables 4 through 6 document the change in visual quality under the Project. Visual quality would remain moderate.

Viewer Response

As mentioned, the MSF would be integrated into its design setting with a very minor degree of contrast. No designated scenic corridors occur in the viewshed, and the option's degree of view obstruction would be very low. In addition, the MSF would not block informal views. Although no officially recognized scenic views occur in this setting, views to and from Pershing Square are considered important because of its role as a key downtown park and its design as landscaped open space. However, because the MSF features would adhere to pertinent downtown design guidelines and other applicable regulations, they would seem appropriate to the setting in terms of scale and design to their setting adjoining Pershing Square. Viewer response is expected to be minimal.

Other Locations

Resource Change under the Project

If placed at either 11th & Olive Street (East) or 11th & Olive Street (West), the MSF would be constructed outside the viewsheds within KOP 5. As a result, no new visual elements would be introduced and no resource change would occur under these options.

Viewer Response

Again, under these option, construction of the MSF would not occur within KOP 5. As a result, no new visual elements would be introduced and no viewer response would occur.

Visual Effect/Impact at KOP 6: 11th Street at Broadway, Looking West

Existing Condition

The streetscape at this location is characterized by highly varied architectural forms, with divergent building heights, architectural cladding, textures, and coloration (see Figure 9).[3] Because of the presence of large high-rise buildings in the mid-frame and far-off portions of the view—including the 54-story portion of the Ritz Carlton and Residences complex and the Elleven Lofts and Luma South condominium buildings (19 stories and 13 stories, respectively)—the dominant line pattern in the view is vertical. However, the low-rise buildings in the foreground, along with the road pavement, provide a contrasting horizontal line pattern of secondary importance. These contrasting vertical and horizontal line elements in the view are only moderately powerful and vivid, with the architectural elements within the LASED—roughly 0.5 mile to the west—forming the backdrop to the view.

In the foreground, framing the view on the left, is the Herald-Examiner building, an architectural/historical landmark and an important visual resource along both Broadway and 11th Street. Among the distinctive Mission Revival features of the Herald-Examiner building are its yellow, blue, and white ceramic-clad domes; mission-style tiled roof; arched openings; and decorative metal balcony railings.

Although they form a discontinuous line along 11th Street, the yew (*Podocarpus macrophyllus*) street trees are a noteworthy visual element of secondary importance. Their curvilinear form, evergreen color, and texture contrast with the architectural forms.

A range of colors can be seen in this view. These include the pale pink-beige color of the Herald-Examiner building, off-white and beige coloration of some of the mid-frame buildings, the light gray-blue of the high-rise Ritz Carlton and Residences complex, and a range of brown shades, from light to dark. The green color of the street trees and the gray asphalt paving provide contrast.

The streetwall on both sides of 11th Street is porous, only partially framing views down the street from this vantage. The gaps between the buildings provide views of asphalt-paved surface parking lots. Considered together with the highly varied architectural design and the heights of the buildings, these elements create moderate visual interest (vividness) while conveying only a moderately low degree of visual unity (due to the highly varied architectural detail, color, building placements, and heights).

The view has a few distracting, cluttering elements, such as billboards and traffic lights or signage. Building signage is generally subdued and fitted to the architectural forms of the buildings, giving the view a moderate degree of intactness.

No Project Alternative (Alternative 1)

Resource Change under the Project

Under the No Project Alternative, no new construction or building would take place within the Project area, aside from projects that are currently under construction or funded and approved for

[3] Please note that the view along 11th Street shown in Figure 11 does not depict the proposed Figueroa Corridor Streetscape Project improvements.

construction and operation. As a result, no new visual elements would be introduced and no resource change would occur under this alternative.

Viewer Response

Under the No Project Alternative, no new construction or building would take place within the Project area, aside from projects that are currently under construction or funded and approved for construction and operation. As a result, no new visual elements would be introduced and there would be no viewer response.

7th Street with a Grand Avenue Extension (Alternative 2)

Resource Change under the Project

Design changes in this viewshed would include those made as part of the Project and those that would be part of the Figueroa Corridor Streetscape Project—a related project in visual terms. The Project would reconfigure driving lanes, and the Figueroa Corridor Streetscape Project would provide a bikeway along 11th Street, groundcover parkway landscaping, and supplemental street trees. As is shown in Figures 9 and 9A, planting a large number of new trees with a dense and consistent placement would add a visually unifying element to the view. The tracks and new paving along the track path, accompanied by street restriping to demarcate the shared motor vehicle lane/streetcar right-of-way and the bikeway, would read as an extension of the street. These would also be visually unifying elements.

Because this vantage depicts the streetcar at a location where it would turn from one street to another, the OCS electrical wiring would several components, based on which of the two potential configurations is selected. Both of these configurations would use decorative poles consistent with the streetscape along 11th Street and Broadway, with the possibility of integrating poles used for street lighting, traffic signals, or traffic signs. Furthermore, trees have the potential to be removed along the project alignment. As mentioned in the discussion of construction-related effects/impacts, in compliance with the City of Los Angeles Tree Preservation Ordinance and Tree Preservation Policy, any trees slated for removal would be planted at or near their original locations at 2:1 or 4:1 ratios. As a result, no long-term significant visual effects/impacts related to trees are expected. The change as a result of the Project and the related Figueroa Corridor Streetscape Project, whether considered separately or together, would clearly be noticeable, particularly along 11th Street, which is a fairly narrow thoroughfare. The large number of OCS-related guy wires associated with the train where it would turn the corner would also be noticeable. Nonetheless, the degree of change, in terms of scale and design, would seem appropriate in relation to the setting. Features proposed as part of the Figueroa Corridor Streetscape Project, such as additional street trees and continuous parkway groundcover planting, would add greater visual cohesion and potentially enhance intactness. Visual quality would remain moderate. Table 4 documents the change in visual quality under the Project.

Figure 9 (KOP 6). View along 11th Street at Broadway, Looking West

Figure 9A (KOP 6). Simulated View, 11th Street at Broadway, Looking West

Viewer Response

The Project does not include the development of natural open space. It would be integrated into its design setting with a very minor degree of contrast. No designated scenic corridors occur in the viewshed, and the Project's degree of view obstruction would be very low given that most of its features would be at street level or slightly above street level, small in terms of mass, and generally non-opaque. In addition, aerial components such as catenary poles and OCS wires would be minimally apparent and would not block informal views. Streetcar platforms and shelters would not cast shadows that would affect shade-sensitive uses, nor would these features significantly alter ambient illumination levels or result in impacts on surrounding uses related to spill light. The streetcar trains would be lighted in a manner that would minimize the potential for spill light. They would not generate more nighttime light than existing downtown buses.

The Herald-Examiner building is the key architectural/historical resource in the viewshed. The Ritz Carlton serves as a visual landmark and focal point in the backdrop of the view. No officially recognized scenic views or noteworthy informal views are present within the design setting.

Viewer response is expected to be minimal because Project features would read as extensions of the street as well as extant downtown public transit elements and seem appropriate to the setting in terms of scale and design. The OCS wires at this location would be more noticeable than they would be at other locations along the alignment; however, the degree of change in the view would still be quite minor. Outside of the intersection of 11th Street and Broadway, no views of architectural resources, such as the Herald-Examiner building, would be impaired. In addition, Figueroa Corridor Streetscape Project landscape features (e.g., supplemental street trees and parkway groundcover plantings) would add a degree of visual cohesiveness to the view.

7th Street without a Grand Avenue Extension (Alternative 3)

Resource Change under the Project

Under Alternative 3, proposed changes associated with the Project would be similar to those described above under Alternative 2. The proposed changes as a result of the Project under this alternative, such as the OCS electrical wiring and related support elements, would be noticeable. Nonetheless, the degree of change, in terms of scale and design, would seem appropriate in relation to the setting. Visual quality would remain moderate.

Viewer Response

Again, under this alternative, proposed changes associated with the Project would be similar to those described above under Alternative 2. No officially recognized scenic views or noteworthy informal views are present within the design setting, though, the Herald-Examiner building is the key architectural/historical resource in the viewshed. The Ritz Carlton also serves as a visual landmark and focal point in the backdrop of the view. The Project's degree of view obstruction would be very low given that most of its features would be at street level or slightly above street level, small in terms of mass, and generally non-opaque. Aerial components such as catenary poles and OCS wires would be minimally apparent and would not block informal views. Viewer response is expected to be minimal because Project features would read as extensions of the street as well as extant downtown public transit elements and seem appropriate to the setting in terms of scale and design. The OCS wires at this location would be more noticeable than they would be at other locations along the alignment; however, the degree of change in the view would still be quite minor.

9th Street with a Grand Avenue Extension (Alternative 4)

Resource Change under the Project

Under Alternative 4, proposed changes associated with the Project would be similar to those described above under Alternative 2. The proposed changes as a result of the Project under this alternative would be noticeable, however, the degree of change, in terms of scale and design, would seem appropriate in relation to the setting. Visual quality would remain moderate.

Viewer Response

Again, under this alternative, proposed changes associated with the Project would be similar to those described above under Alternative 2. Viewer response is expected to be minimal because Project features would read as extensions of the street as well as extant downtown public transit elements and seem appropriate to the setting in terms of scale and design.

9th Street without a Grand Avenue Extension (Alternative 5)

Resource Change under the Project

Under Alternative 5, proposed changes associated with the Project would be similar to those described above under Alternative 2. The proposed changes as a result of the Project under this alternative would be noticeable, however, the degree of change, in terms of scale and design, would seem appropriate in relation to the setting. Visual quality would remain moderate.

Viewer Response

Again, under this alternative, proposed changes associated with the Project would be similar to those described above under Alternative 2. Viewer response is expected to be minimal because Project features would read as extensions of the street as well as extant downtown public transit elements and seem appropriate to the setting in terms of scale and design.

Traction Power Substations

Resource Change under the Project

The TPSS would be constructed outside the viewsheds within KOP 6. As a result, no new visual elements would be introduced and no resource change would occur under this option.

Viewer Response

Construction of the TPSS would not occur within KOP 6. As a result, no new visual elements would be introduced and no viewer response would occur due to the TPSS.

Maintenance and Storage Facilities

MSF Option: 11th Street and Olive Street (East)

Resource Change under the Project

As mentioned, a potential location for the MSF is on the southeast corner of 11th Street and Olive Street and would consist of an enclosed building and an outdoor area where routine inspections, maintenance work and light repairs could be performed. From KOP 6, this MSF siting location would be very difficult to detect. The proposed location would house the MSF in an existing parking lot between 11th and 12th Streets and Olive and Grand Streets, which would abut two parcels, which contain various entities, including a restaurant (facing Olive Street, away from the proposed MSF site) and an insurance broker. The area around the site is in a built up urban environment and contains a variety of land uses. The Herald-Examiner building is an architectural/historical landmark and an important visual resource along both Broadway and 11th Streets. The MSF facility would replace an existing parking lot and, in accordance with the Downtown Design Guidelines, would provide a continuous landscaped parkway next to the curb and would line the property with an attractive façade (no chain link or barbed wire) (City of Los Angeles, 2009). Therefore, it would improve the quality of the surrounding viewshed and, as a public facility amongst a mix of land uses, would not disrupt the visual character of the project area. Since the MSF site would be two or three stories high, due to the existing variety of building sizes and architectural elements, particularly skyscrapers, high-rises and other tall buildings, the scale and size of the proposed MSF would not substantially alter or degrade existing views. Any nighttime lighting necessary for the operation of the MSF would be directed on site to minimize spill effects and reduce potential visual impacts related to nighttime illumination. Due to the highly urbanized nature of the proposed site, its surrounding land uses, and the varying size of the neighboring buildings, high-rises and residences, the potential addition of nighttime lighting to the two or three story facility, which would replace an existing parking lot, would not introduce a substantial amount of light when compared to existing conditions. Similarly, due to its relative size, the MSF facility would not compromise views to and/or from neighboring facilities along 11th, 12th, Olive, and Grand Streets or to and/or from the Herald-Examiner building.

Furthermore, the MSF would be designed to fit into and complement the surrounding buildings and neighborhood. Through adherence to pertinent downtown design guidelines (i.e. HDLADG and DDG) and other applicable regulations such as the Los Angeles Municipal Code, and California Building Code, adverse effects/impacts on visual resources would be avoided or substantially minimized. Thus, the change in visual quality would be noticeable, but would seem appropriate in scale and in keeping with the scale and setting along 11th Street. Tables 4 through 6 document the change in visual quality under the Project. Visual quality would remain moderate.

Viewer Response

As mentioned, the MSF would be integrated into its design setting with a very minor degree of contrast. No designated scenic corridors or officially recognized scenic views occur in this setting, though, the Herald-Examiner building is the key architectural/historical resource and the Ritz Carlton also serves as a visual landmark and focal point. The degree of view obstruction under this option would generally be very low, and the MSF would not block informal views. Because the MSF features would adhere to pertinent downtown design guidelines (i.e. HDLADG and DDG) and other applicable regulations, they would be appropriate to the setting in terms of scale and design to their setting along 11th Street. Viewer response is expected to be minimal.

MSF Option: 11th Street and Olive Street (West)

Resource Change under the Project

As mentioned, a potential siting location for the MSF would be located on the southwest corner of 11th Street and Olive Street and, like the other MSF options, would consist of an enclosed building and an outdoor area where routine inspections, maintenance work and light repairs could be performed. From KOP 6, this MSF siting location would be very difficult to detect. The MSF facility would replace an existing parking lot and, in accordance with the Downtown Design Guidelines, would provide a continuous landscaped parkway next to the curb and would line the property with an attractive façade (no chain link or barbed wire) (City of Los Angeles, 2009). Therefore, it would improve the quality of the surrounding viewshed and, as a public facility amongst a mix of land uses, would not disrupt the visual character of the project area. Since the MSF site would be two or three stories high, due to the existing variety of building sizes and architectural elements, particularly skyscrapers, high-rises and other tall buildings, the scale and size of the proposed MSF would not substantially alter or degrade existing views. Any nighttime lighting necessary for the operation of the MSF would be directed on site to minimize spill effects and reduce potential visual impacts related to nighttime illumination. Due to the highly urbanized nature of the proposed site, its surrounding land uses, and the varying size of the neighboring buildings, high-rises and residences, the potential addition of nighttime lighting to the two or three story facility, which would replace an existing parking lot, would not introduce a substantial amount of light when compared to existing conditions. Similarly, due to its relative size, the MSF facility would not compromise views to and/or from neighboring facilities along 11th, 12th, Olive, and Grand Streets or to and/or from the Herald-Examiner building. Thus, this MSF siting location would not degrade the visual character of the area, degrade open space elements, create an unacceptable degree of contrast, or compromise the nature and quality of key views within the project area. Rather, with its landscaped parkway and attractive façade, it would improve visual quality in the surrounding area.

Furthermore, the MSF would be designed to fit into and complement the surrounding buildings and neighborhood; therefore, the final design would vary depending on the site selection. Through adherence to pertinent downtown design guidelines (i.e. HDLADG and DDG) and other applicable regulations such as the Los Angeles Municipal Code, and California Building Code, adverse effects/impacts on visual resources would be avoided or substantially minimized. Thus, the change in visual quality would be noticeable, but would seem appropriate in scale and in keeping with the scale and setting along 11th Street. Tables 4 through 6 document the change in visual quality under the Project. Visual quality would remain moderate.

Viewer Response

As mentioned, the MSF would be integrated into its design setting with a very minor degree of contrast. No designated scenic corridors or officially recognized scenic views occur in this setting, though, the Herald-Examiner building is the key architectural/historical resource and the Ritz Carlton also serves as a visual landmark and focal point. The degree of view obstruction under this option would generally be very low, and the MSF would not block informal views. Because the MSF features would adhere to pertinent downtown design guidelines (i.e. HDLADG and DDG) and other applicable regulations, they would be appropriate to the setting in terms of scale and design to their setting along 11th Street. Viewer response is expected to be minimal.

Other Locations

Resource Change under the Project

Under the remaining proposed MSF siting locations at Broadway & 2nd Street and Hill & 5th Street, the MSF would be constructed outside the viewsheds within KOP 6. As a result, no new visual elements would be introduced and no resource change would occur under those options.

Viewer Response

Again, under these options, construction of the MSF would not occur within KOP 6. As a result, no new visual elements would be introduced and no viewer response would occur.

Visual Effect/Impact at KOP 7: 11th Street at Grand Avenue, Looking West

Existing Condition

The streetscape at this location is characterized by varied architectural forms, including a range of building heights, architectural cladding, textures, and coloration (see Figure 10).[4] The dominant line pattern in the view is vertical because of the presence of large high-rise buildings in the foreground and mid-frame portions of the view—including the 54-story portion of the Ritz Carlton and Residences complex in mid-frame (right) and the Elleven Lofts and Luma South condominium buildings (19 stories and 13 stories, respectively) in the foreground (left). Medium-rise buildings, such as the Desmond's warehouse, occur in the foreground (right) and at mid-frame (left and right). Combined with the road pavement, these elements provide a contrasting horizontal line pattern of secondary importance. The contrasting vertical and horizontal line elements in the view are moderately powerful and vivid, with the architectural elements within the LASED forming the backdrop to the view.

Although they are non-uniform in their placement and shape, the yew street trees and the taller, more broadly silhouetted Tipu (*Tipuana tipu*) trees along 11th Street are noteworthy visual elements of secondary importance; their curvilinear form, evergreen color, and texture contrast with the architectural forms.

There is little continuity in the range of colors seen in this view. Colors include the pale gray/beige-pink tone of the Elleven condominiums buildings, the brown-gray color of the adjoining Luma South Building, the beige and brown brick coloration of some of the mid-frame buildings, and the light gray-blue of the high-rise Ritz Carlton and Residences complex. The green color of the street trees, as well as the gray asphalt paving, provides some limited contrast in terms of form, coloration, and texture.

The streetwall on both sides of 11th Street is porous because of the varying building heights and at least one surface parking lot. It only partially frames views down the street at this vantage. Considered together with the highly varied architectural design and heights of the buildings, the

[4] Please note that the view along 11th Street shown in Figure 12 does not depict the proposed Figueroa Corridor Streetscape Project improvements.

elements combine to evoke only moderate visual interest (vividness). They convey only a moderately low degree of visual unity because the highly varied architectural detail, color, building placements, and heights diminish the sense of cohesiveness.

The view has only a few distracting, cluttering elements, such as traffic lights and signage, including temporary street construction signage. Building signage is generally subdued and fitted to the architectural forms of the buildings, giving the view a moderate degree of intactness.

No Project Alternative (Alternative 1)

Resource Change under the Project

Under the No Project Alternative, no new construction or building would take place within the Project area, aside from projects that are currently under construction or funded and approved for construction and operation. As a result, no new visual elements would be introduced and no resource change would occur under this alternative.

Viewer Response

Under the No Project Alternative, no new construction or building would take place within the Project area, aside from projects that are currently under construction or funded and approved for construction and operation. As a result, no new visual elements would be introduced and there would be no viewer response.

Build Alternatives

From KOP 7, Alternatives 2 through 5 would include the same proposed project elements. As a result, the build alternatives would result in similar visual impacts. Thus, they are analyzed conjointly below.

Resource Change under the Project

Design changes in this viewshed would include those made as part of the Project and those that would be part of the Figueroa Corridor Streetscape Project—a related project in visual terms. The Figueroa Corridor Streetscape Project would provide a bikeway along 11th Street, groundcover parkway landscaping, and supplemental street trees. As is shown in Figures 10 and 10A, planting a large number of new trees with a dense and consistent placement would add a visually unifying element to the view. Trees have the potential to be removed along the project alignment as a result of the proposed build alternatives. As mentioned in the discussion of construction-related effects/impacts, in compliance with the City of Los Angeles Tree Preservation Ordinance and Tree Preservation Policy, any trees slated for removal would be planted at or near their original locations at 2:1 or 4:1 ratios. As a result, no long-term significant visual effects/impacts related to trees are expected. Additionally, the proposed Project would provide tracks and new paving along the track path, accompanied by street restriping to demarcate the shared motor vehicle lane/streetcar right-of-way and the bikeway, which would read as an extension of the street.

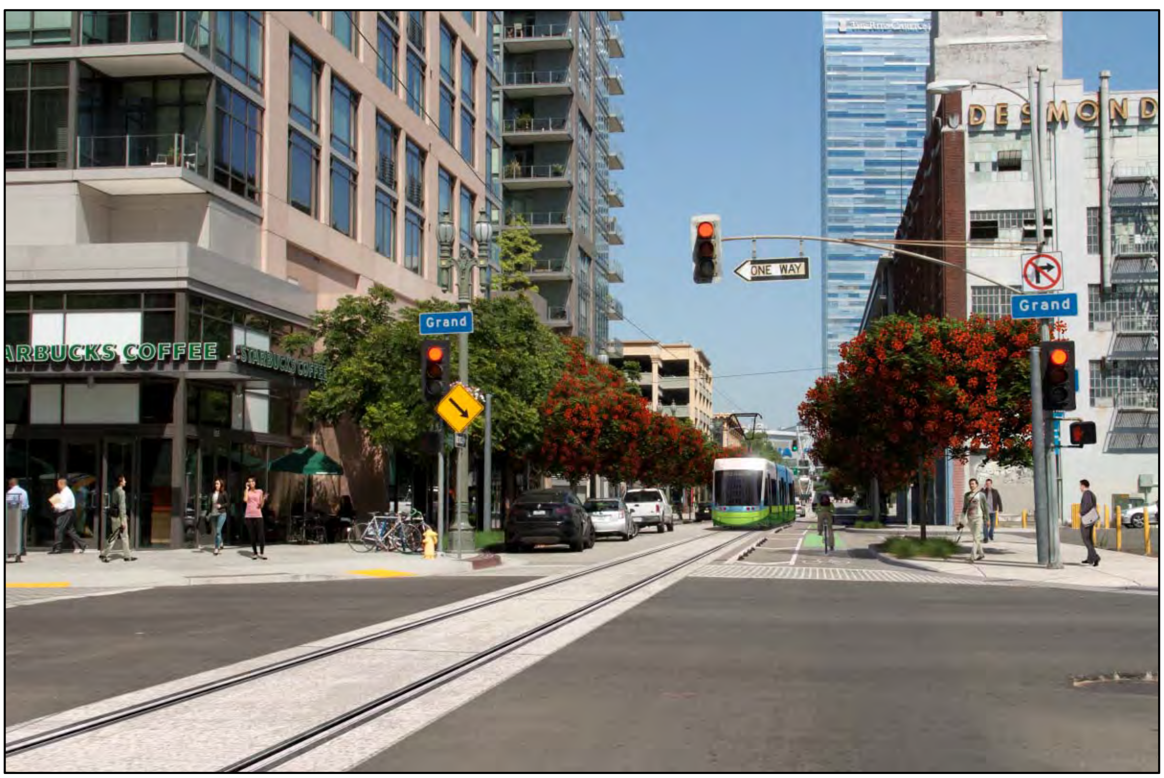
The change as a result of the Project and the related Figueroa Corridor Streetscape Project, whether considered separately or together, would clearly be noticeable, particularly along 11th Street, which is a fairly narrow thoroughfare. Nonetheless, the degree of change, in terms of scale and design, would seem appropriate in relation to the setting. Also, features proposed as part of the Figueroa Corridor Streetscape Project, such as additional street trees and continuous parkway groundcover planting, could enhance intactness—one of the measures of visual quality—by adding greater visual cohesion. Visual quality, however, would remain moderate. Table 4 documents the change in visual quality under the Project.

Viewer Response

The Project does not include the development of natural open space. It would be integrated into its design setting with a very minor degree of contrast. No designated scenic corridors occur in the viewshed, and the Project's degree of view obstruction would be very low given that most of its features would be at street level or slightly above street level, small in terms of mass, and generally non-opaque. In addition, aerial components such as catenary poles and OCS wires would be

Figure 10 (KOP 7). View along 11th Street at Grand Avenue, Looking West

Figure 10A (KOP 7). Simulated View, 11th Street at Grand Avenue, Looking West



minimally apparent and would not block informal views. Streetcar platforms and shelters would not cast shadows that would affect shade-sensitive uses, nor would these features significantly alter ambient illumination levels or result in impacts on surrounding uses related to spill light. The streetcar trains would be lighted in a manner that would minimize the potential for spill light. They would not generate more nighttime light than existing downtown buses.

As is shown in Figures 10 and 10A, the tracks and new paving along the track path, accompanied by street restriping to demarcate the shared streetcar/motor vehicle lane and reconfigured drive lanes, would read as extensions of the current public street infrastructure that occurs within the existing public right-of-way. OCS electrical wiring would include several components, based on which of the two potential configurations is selected. Both of these configurations would use decorative poles consistent with the streetscape along the Project alignment, with the possibility of integrating poles used for street lighting, traffic signals, or traffic signs. Viewer response is expected to be minimal because the Project features would read as extensions of the street infrastructure and seem appropriate to the setting in terms of scale and design. Accordingly, the degree of change in view would be negligible. Informal views across the viewshed of key buildings (e.g., Desmond's warehouse; Ritz Carlton) would not be impaired because all streetcar infrastructure, with the exception of the OCS system and catenary poles, would be at street level and would not affect views of key buildings. Because of their limited presence, OCS wires and catenaries would have a less-than-significant effect on views across the viewshed. Finally, Figueroa Corridor Streetscape Project landscape features (e.g., supplemental street trees and parkway groundcover plantings) would add a small degree of visual cohesiveness to the view.

Traction Power Substations

Resource Change under the Project

The TPSS would be constructed outside the viewsheds within KOP 7. As a result, no new visual elements would be introduced and no resource change would occur under this option.

Viewer Response

Again, under this option, construction of the TPSS housings would not occur within KOP 7. As a result, no new visual elements would be introduced and no viewer response would occur.

Maintenance and Storage Facilities

Resource Change under the Project

The proposed MSF siting locations occur outside the viewsheds within KOP 7. As a result, no new visual elements would be introduced and no resource change would occur.

Viewer Response

Again, as mentioned, construction of an MSF would not occur within KOP 7. As a result, no new visual elements would be introduced and no viewer response would occur.

Avoidance, Minimization, and Mitigation Measures

No mitigation measures are required under either the 7th Street Alternative or the 9th Street Alternatives with or without the Grand Avenue extension because none of those alternatives would substantially alter the visual character of the Project viewshed. However, avoidance and minimization measures and other best management practices are suggested below to ensure that Project design components are built with sensitivity to the visual environment. Notwithstanding the moderate to moderately high visual quality found along the Project alignment, no effects/impacts on visual resources are expected to occur that would be considered adverse/significant under NEPA/CEQA. The Project improvements would expand existing public transportation facilities on selected local streets by providing an updated, but limited version of the extensive streetcar system that once crisscrossed downtown during the first half of the twentieth century (Figure 11). The primary Project components—streetcar platforms, track, and new paving—would be constructed at or near street level and, consequently, would not obscure views. In addition, the OCS system would be supported either by a contact wire with a span wire between two poles perpendicular to the streetcar track or by a contact wire supported from cantilever arms on a single catenary pole. Both would be designed to be consistent with specific downtown design contexts (e.g., Historic Downtown Los Angeles Design Guidelines, Figueroa Corridor Streetscape Project, and Broadway Streetscape Master Plan). Design and installation of the OCS poles would be consistent with the surrounding design context. Another option previously under consideration but now deemed infeasible was to affix the OCS wires to eyehooks attached to adjacent non-historic buildings, per practice downtown during the first half of the twentieth century (Figure 12).

Figure 11. Streetcar and Overhead Contact System, Broadway at 9th Street, Looking North. Circa 1937

Photo shows both the presence of large streetcars in the center of the street and the then-prevailing overhead streetcar electrification system, which was suspended from building walls. Source: Los Angeles Public Library, Herman Schultheis Photo Collection.

As previously discussed, some mature trees, as well as younger trees (with trunk diameters of 5 inches or less) may have the potential to be trimmed or removed. City policy requires all tree removals be replaced on a 2:1 basis for street trees and 4:1 basis for protected private property trees. Replacement trees would be placed as near their original locations as possible. Alternative methods and options to removal, such as trimming, would be explored prior to considering potential tree removal. The project's compliance with the City of Los Angeles Tree Preservation Ordinance and Tree Preservation Policy would ensure that any trees slated for removal would be planted at or near their original locations at 2:1 or 4:1 ratios.

Construction of the TPSS and MSF buildings would call for placing structures on private property outside the public right-of-way. Although construction of the MSF may involve a greater level of disruption on a temporary basis than the tracks or platforms for streetcar stops (e.g., excavation; soil remediation, if necessary; street closures; construction staging areas; traffic control; utility issues), both support structures, as well as all proposed streetcar design elements, would be designed in accordance with the design guidelines set forth in the *Historic Downtown Los Angeles Design Guidelines* and *Downtown Design Guide* to fit into and complement the surrounding neighborhood. Thus, in consideration of the surrounding design context, the architectural treatment of the MSF building would be appropriate with respect to scale, proportion, detail, materials, texture, articulation, and color. Additionally, the MSF facility would also provide a continuous landscaped parkway next to the curb and would line the property with an attractive façade (no chain link or barbed wire) (City of Los Angeles, 2009).

Similarly, all TPSS structures would be designed to minimize their presence in visual terms. Where the site and design allow, they would incorporate setbacks from adjoining street frontages, screening, and/or an architectural treatment that would be appropriate to the design setting visible from the public right-of-way at street level. Should a TPSS be located within the public right-of-way, it would be designed in conformance with the "Los Angeles Aboveground Facility" regulations contained in Section 62.08 of the Los Angeles Municipal Code. Substations could be prefabricated in metal boxes or built in place in a small building. The substations would be small in size (i.e., 11 feet tall or less) and given an architectural design treatment that would be compatible with adjacent architecturally/historically significant buildings. Through adherence to pertinent downtown design guidelines (such as HDLADG and DDG), and the avoidance and minimization measures regarding the design and placement of the TPSS buildings, adverse effects/impacts on visual resources would be avoided or substantially minimized. The effects/impacts would be less than significant.

The Project components proposed under the build alternatives would not have the potential to result in significant shade/shadow impacts on shade-sensitive viewers at any one of the potential locations currently under consideration. MSF structures do not possess shade-/shadow-casting characteristics (i.e., height, bulk, density of built structural elements) that could adversely affect shade-/shadow-sensitive viewers. The largest building proposed as part of the MSF would not have an envelope that would be more than 25 feet high, thereby providing opportunities to provide open space for adjoining shade-sensitive uses. Thus, the MSF would not have the potential to significantly affect nearby shade-sensitive viewers, such as residents, because most downtown residents typically occupy units in multi-story buildings in which the lower floors are devoted to commercial uses rather than housing.

Other Project-related buildings, such as the TPSS buildings, would also be designed to be compatible with their design settings rather than prefabricated building units. By virtue of their low height (approximately 11 feet), massing, and siting, the TPSS buildings would not possess architectural design characteristics that would cast shade/shadow on shade-sensitive viewing groups.

All Project engineering and construction would be completed in conformance with applicable City, state, and federal regulations and standards, including, but not limited to, the Los Angeles Municipal Code, Noise Ordinance, Historic Downtown Los Angeles Design Guidelines, Downtown Design Guide, Section 112.05; *LADOT Traffic Control Handbook and Traffic Manual*; California Public Utilities Commission regulations; California Building Code; American Railway Engineering and Maintenance of Way Association Standards; and national stormwater pollution discharge regulations. Although such standard design minimization measures would be incorporated as part of the Project and normally would be enough to ensure that visual resource effects/impacts would be avoided (e.g., through conformance with all applicable laws, regulations, ordinances, and formally adopted city standards as well as special district master plans, such as the BSMP), to ensure that adverse effects on visual character and quality under NEPA and significant impacts under CEQA would be avoided, the avoidance and minimization measures recommended in this section would ensure that Project design components would be built with sensitivity to the visual environment.

Temporary construction fencing would be placed along the periphery of active construction areas to screen as much of the construction activity as possible from view at the street level. To minimize views of stockpiled materials and idle construction equipment in staging areas, as well as visual clutter and disorder, Project construction staging areas would be enclosed or screened from view at the street level with appropriate screening materials. The contractor would provide daily visual inspections to ensure that the immediate surroundings of the construction staging areas are free from construction-related clutter and maintain the areas in a clean and orderly manner throughout the construction period. In compliance with the Los Angeles Municipal Code, any graffiti would be removed from the construction site and staging areas within 24 hours, where possible. Temporary changes to views as a result of construction-period activities, such as excavating, pouring concrete, paving, or installing streetcar electrification systems, are not considered adverse/significant. Such activities are simply larger scale expressions of public works activities that have commonly occurred along downtown streets over the years and are expected to be a part of the related downtown improvement projects, including the Figueroa Corridor Streetscape Project and BSMP. Construction would occur in stages, sequentially, or in a leap-frog manner along affected streets to avoid full street closures. As a result, and because construction-period activities typically call for construction at or near street level and do not involve erecting design features with the potential to significantly obscure views of visual resources (e.g., historic buildings), standard best management practices and the avoidance and minimization measures would be adequate with respect to avoiding adverse effects/impacts. Should construction activities occur during nighttime hours, lighting would be directed away from surrounding sensitive land uses and toward the specific location intended for illumination. Lighting associated with construction activities and security purposes would be shielded to minimize glare and spill light around sensitive land uses in the surrounding area.

Cumulative Effects

In the context of the list of related projects, those that could contribute to a cumulative visual impact are limited to those within the sightlines of the Project alignment under the build alternatives. These include the following 50 cumulative projects (the numbers correspond to the numbering found on the related projects list/figure):

Map No. (Figure 2-5)	Project Name	Location	Description	Size
3	Vibiana Lofts	225 S Los Angeles Street	Condominiums Retail	300 units 3,400 sf
4	Northeast Tower	215 W 9th Street	Condominiums Retail	210 units 9,000 sf

The area for cumulative impacts on visual resources within the densely developed context of downtown would consist of the viewshed along the streets that make up the 3.8-mile-long Project alignment itself. The area for cumulative visual impacts would also extend out laterally from the alignment to the limits of sightlines, typically a maximum distance of 0.5 mile when topographic features, freeway configurations, or building placements do not further reduce sightline distances. Within this definition, 50 projects with potentially cumulative effects define portions of the northern, southern, and eastern segments of the cumulative viewshed.

None of the build alternatives would result in effects that would be cumulatively significant when combined with other related projects in downtown Los Angeles. Development proposed as part of the related projects calls for the adaptive reuse of existing buildings and new development on vacant land (e.g., typically land that is improved for use as surface parking lots), which will be subject to design regulations and policies governing downtown development. Such policies are premised on protecting visual resources and promoting high-quality, aesthetically attractive new development. These policies were previously summarized in the regulatory framework section of this document (see Chapter 2, Affected Environment).

No scenic vistas or scenic corridors have been identified within the Project viewshed. Views within the viewshed are of medium visual quality, and views of architecturally or historically significant individual buildings—the primary visual resource type within the viewshed—would be preserved. Building placements and, in some instances, topography (e.g., locations on or adjoining Bunker Hill) block many views across downtown. They isolate views in one portion of downtown from other portions of downtown as well as views in one portion of a design district from another. In addition, outside the Historic Core—where there is a significant concentration of architecturally and historically significant buildings and other objects (e.g., certain special sidewalk treatments along Broadway, historic streetlight bases)—the diversity in architectural treatments within most portions of downtown makes it a fairly forgiving and flexible urban design context in which to incorporate new public transit infrastructure and streetscape design elements. Within the Historic Core, specific design guidelines, including the Broadway Streetscape Master Plan and Historic Downtown Los Angeles Design Guidelines, would ensure that all improvements would be designed in a manner that would be appropriate to the design setting. A majority of the design interventions proposed under the build alternatives would occur slightly above, at, or below street level. Therefore, they would not block certain informal views (e.g., either from buildings or outdoors along streets). Also, no significant views were identified in this analysis. Other informal views would typically be acquired by less-sensitive viewing groups (e.g., office workers, pedestrians, commuters). These groups constitute the majority of the viewers within the Project viewshed. Such viewers are considered to be relatively tolerant of design changes within the viewshed.

Visual and scenic resources are limited to groupings of architecturally and historically significant buildings within the Historic Core, other individual buildings outside the Historic Core, and other design elements of secondary importance, such as landscape features, including formally designed landscapes (e.g., Pershing Square, Civic Center) and mature street trees. As previously discussed, some mature trees, as well as younger trees (with trunk diameters of 5 inches or less) may have the potential to be trimmed or removed. City policy requires all tree removals be replaced on a 2:1 basis for street trees and 4:1 basis for protected private property trees. Replacement trees would be placed as near their original locations as possible. Alternative methods and options to removal, such as trimming, would be explored prior to considering potential tree removal. The project's compliance with the City of Los Angeles Tree Preservation Ordinance and Tree Preservation Policy would ensure that any trees slated for removal would be planted at or near their original locations at 2:1 or 4:1 ratios. As a result, no long-term, significant effects/impacts related to street trees are expected. Also, as previously stated, no formal scenic vistas or scenic corridors have been identified or designated within the viewshed. Therefore, the build alternatives would not damage scenic or visual resources or substantially degrade existing visual character or quality.

With the exception of the MSF, the Project components proposed under the build alternatives do not have the potential to result in significant shade/shadow impacts on shade-sensitive viewers in one location because they would not have shade-/shadow-casting characteristics (e.g., height, bulk, density of built structural elements) that could adversely affect shade-/shadow-sensitive viewers. The MSF would not have an envelope that would be more than 25 feet high and would not have the potential to affect shade-sensitive viewers.

Power for the streetcar system would be provided by the TPSS and OCS. There are two potential configurations for the OCS wires. The first configuration would be to support the contact wire with a span wire between two poles perpendicular to the streetcar track. The second configuration would support the contact wire from cantilever arms connected to a single pole. Both of these configurations would use decorative poles consistent with the streetscape along the Project alignment, with the possibility of integrating poles used for street lighting, traffic signals, or traffic signs. Catenary poles would measure 25 to 30 feet tall. They are typically installed at intervals of 100 to 120 feet. Wire heights typically range between 18 and 19 feet. Catenary poles could be designed to incorporate elements of the decorative streetlights or meet design standards for designated streetscapes. Historically, streetcars operated along many of the streets within the viewshed, utilizing a system of poles and overhead wires that was far more extensive than the system proposed under the build alternatives. Also, because the proposed features would be consistent with all design policies governing downtown design districts and with new streetscape elements (e.g., landscaping or street furniture proposed as part of other related projects along both Figueroa Street and Broadway), the build alternatives would not be expected to result in cumulatively significant incremental effects on visual resources or on existing visual character and quality.

The Project features proposed consist of elements at or near street level and, accordingly, do not have the potential to alter views of visual resources substantially. Proposed buildings, such as the MSF and TPSS, would be designed to be compatible with their design settings and would not possess either the massing or height required to cast shade/shadow on shade-sensitive viewing groups. Any nighttime lighting necessary for the operation of the MSF would be directed on site to minimize spill effects and reduce potential visual impacts related to nighttime illumination. Due to the highly urbanized nature throughout the proposed alignment, its surrounding commercial, industrial, retail, and residential land uses, and the varying size of the neighboring buildings and high-rises and residences, the potential addition of nighttime lighting to the two or three story facility, which would replace an existing parking lot, would not introduce a substantial amount of light when compared to existing conditions. Therefore, when considered along with other related projects, none of the build alternatives would be expected to contribute to a cumulatively significant incremental effect on shade-/shadow-sensitive receptors.

Chapter 4
Conclusions

None of the build alternatives would result in substantial adverse effects or significant impacts on visual resources. Visual quality would not be diminished under the proposed Project. Rather, along Broadway and at other locations (e.g., along Figueroa Street), Project actions, combined with other local design improvement initiatives (e.g., the Figueroa Corridor Streetscape Project), would most likely improve visual quality slightly through the implementation of consistent paving, landscaping, and streetscape furniture. Significant recognized scenic vistas are not present in the viewshed, and the Project features would not have the potential to obscure or block views of the primary visual resources within the viewshed (i.e., architecturally and historically significant buildings) significantly. Thus, views of architecturally and historically significant buildings would not be adversely affected by Project features, nor would Project features create substantial shade/shadow effects that would have the potential to affect shade-/shadow-sensitive viewers adversely.

The Project does not include the development of natural open space. The streetcar system would be integrated into its design setting with a very minor degree of contrast. In addition, the Project's degree of view obstruction would be very low, given that most of its features would be at street level or slightly above street level, small in terms of mass, and generally non-opaque. In addition, aerial components such as catenary poles and OCS wires would be minimally apparent and would not block informal views. Streetcar platforms, shelters, and other Project features would not significantly alter ambient illumination levels or result in impacts on surrounding uses related to spill light. The streetcar trains would be lighted in a manner that would minimize the potential for spill light. They would not generate more nighttime light than existing downtown buses.

The FHWA aesthetic guidelines mandate that a qualitative aesthetic approach be taken to mitigate for the loss of visual quality in the study area. The Project's build alternatives fulfill these guidelines because no loss of visual quality would occur within the Project viewshed. The Project would be implemented in adherence to pertinent state and federal standards and regulations governing the engineering and construction of street railroad projects as well as specific downtown design guidance, which pertains to segments of the Project alignment. The Project would incorporate design features that would ensure the protection of visual quality. Because of the absence of significant visual impacts/effects, no mitigation measures are proposed in this document. Adherence to the avoidance and minimization measures outlined above would ensure that Project design components would be built with sensitivity to the visual environment.

WCI	Western Climate Initiative

Summary

This report provides an analysis of potential air quality and climate change impacts related to the Restoration of Historic Streetcar Service in Downtown Los Angeles (Project). All analyses have been conducted to comply with the South Coast Air Quality Management District (SCAQMD) requirements for air quality and climate change assessments and satisfy California Environmental Quality Act (CEQA), National Environmental Policy Act (NEPA), and Transportation Conformity Determination requirements. The analyses findings are as follows:

- Project emissions during construction and operations would not exceed SCAQMD regional and localized mass emissions thresholds.
- The Project would satisfy the federal Clean Air Act requirement to demonstrate transportation conformity.
- The Project's carbon monoxide (CO) emissions during long-term project operations would not create any new or exacerbate any existing CO hot spots.
- The Project's local particulate matter emissions during long-term project operations would not be significant, as determined by the Southern California Association of Governments (SCAG) Transportation Conformity Working Group.
- The Project would meet all Federal Transit Administration (FTA) Transportation Conformity Determination requirements.
- The Project would be consistent with air quality policies set forth by SCAQMD and SCAG, as presented in the region's most recent Air Quality Management Plan.
- The Project would not conflict with the state's goals of reducing greenhouse gas emissions to 1990 levels by 2020.
- The Project would not result in a cumulative air quality impact.

This page intentionally left blank.

Introduction and Project Description

This chapter describes the proposed Project, including its purpose and need, design elements, location, and construction activities.

The lead agency for the Project under CEQA is the City of Los Angeles (City). Funding from the FTA is being sought, and therefore documentation requirements under NEPA are also being analyzed.

ICF International (ICF) was retained by HDR Engineering (HDR is a contractor to the Los Angeles County Metropolitan Transportation Authority [Metro] and is assisting the City with preparation of its environmental impact report [EIR]) to evaluate the potential air quality impacts that may occur as a result of construction and operation of the Project in downtown Los Angeles. The project route would be 3.8 miles long (see *Project Description*).

The objective of this report is to evaluate the Project's potential effect on regional and local air quality as well as its potential effect on climate change. The report includes an evaluation of project criteria pollutant, toxic air contaminant (TAC), and greenhouse gas (GHG) emissions that would occur during short-term construction and long-term operations as well as discussions of applicable federal, state, and local air quality and climate change regulations.

Project Description

The Project consists of the construction and operation of streetcar service in downtown Los Angeles, California, along an up to 3.8-mile route. The project alignment would begin at Hill and 1st Streets, run east along 1st Street, south along Broadway, west along 11th Street, north along Figueroa Street, east along 7th Street or 9th Street, and north along Hill Street, back to its beginning at 1st Street. Potential inclusion of a Grand Avenue Extension would also provide a two-way alignment spur west along 1st Street, beginning at Hill Street, and continuing south along Grand Avenue to a stop north of 2nd Street. The project route would cover an area composed primarily of commercial land uses with a mix of residential, public, and entertainment land uses. The Project would link several neighborhoods or districts within the Central City Community Plan Area of the City of Los Angeles: Civic Center, Bunker Hill, Historic Core, Jewelry District, Financial Core, South Park, Fashion District, and LA Live/Convention Center.

Figure 1 depicts the regional location of the Project. Figure 2 shows the Project's routing within downtown Los Angeles.

The track and roadway configuration would allow for a mixed flow of vehicles and a fleet of electrically powered streetcars. Power to the streetcar vehicles would be provided by approximately five traction power substations (TPSSs) and an overhead contact system (OCS). A maintenance and storage facility (MSF) site would also be constructed as part of the Project.

Project Alternatives

Five project alternatives are being considered; these include four build alternatives for the proposed Project and a No Project Alternative.

Alternative 1 – No Project Alternative

The No Project Alternative, which is required by Section 15126.6(e) of the State CEQA Guidelines, represents conditions in the project study area that would remain if the proposed Project would not occur.

Alternative 2 – 7th Street with Grand Avenue Extension

The 7th Street with Grand Avenue Extension Alternative would construct and implement streetcar service along an alignment that would begin on Grand Avenue north of 2nd Street adjacent to the Disney Concert Hall, then continue northward until turning east on 1st Street. From 1st Street, the streetcar would turn south on Broadway, traveling to 11th Street where it would turn west and continue on to Figueroa Street. The streetcar would then turn north on Figueroa Street and travel to 7th Street, where it would turn east. From 7th Street, the streetcar would turn north on Hill Street, then continue back to 1st Street, completing the circuit by turning west on 1st Street to return to the streetcar stop on Grand Avenue.

Alternative 3 – 7th Street without Grand Avenue Extension

Alternative 3 would follow the same alignment as Alternative 2, with the exception that the Grand Avenue Extension would not be incorporated. Therefore, Hill and 1st Streets would be the terminal point, rather than Grand Avenue north of 2nd Street.

Alternative 4 – 9th Street with Grand Avenue Extension

The 9th Street with Grand Avenue Extension Alternative would follow the same alignment as the 7th Street with Grand Avenue Extension Alternative, but it would run eastbound on 9th Street between Figueroa Street and Hill Street, rather than 7th Street, and the project alignment would still begin and terminate on Grand Avenue, north of 2nd Street.

Alternative 5 – 9th Street without Grand Avenue Extension

Alternative 5 would follow the same alignment as Alternative 3, but it would run eastbound on 9th Street between Figueroa Street and Hill Street, rather than 7th Street.

Elements of the Streetcar Alternatives

A brief overview of the elements common to all build alternatives of the Project is presented below.

Vehicles

The Project's operating plan calls for 7-minute headways (i.e., time spacing between vehicles) during peak periods. A fleet of six electrically powered streetcars is currently estimated to be needed to operate on the system. An estimated two additional streetcars would serve as backup vehicles to the operating fleet, for a total estimated fleet size of eight vehicles. Each vehicle would measure approximately 80 feet long and be approximately 13 feet high. The streetcars would be articulated to make tight turns and have a capacity of approximately 100 passengers. The streetcars would be similar to the modern streetcar models that are currently used in other cities in the United States. Examples of similar streetcars can be found in Portland, Oregon; both Tacoma and Seattle, Washington; Tucson, Arizona; Dallas, Texas; Atlanta, Georgia; and Charlotte, North Carolina. The streetcars would be designed with low floors to be compliant with the Americans with Disabilities Act (ADA). Operating speeds would be at the maximum posted downtown speed limit, which is currently 25 miles per hour (mph) on all streets other than Figueroa Street, between 5th Street and Pico Boulevard, where it is 30 mph. Power for the streetcars would be transmitted by overhead catenary wires supported by poles along the streetcar tracks.

Platforms

The streetcars would make stops at approximately 25 platforms along the alignment; the number of platforms is subject to change based upon further design of the Project. With varying configurations, the platforms would generally consist of a raised concrete pad approximately 8 feet wide by 70 feet long. Some of the streetcar platforms would be shared by buses operated by Metro, LADOT Downtown Area Short Hop (DASH), and other regional operators. Shared platforms would generally be approximately 120 feet long, though physical constraints on some street segments could limit them to shorter lengths. The maximum curb height would be approximately 8 to 14 inches. Platforms could be located either in the center of the roadway or adjacent to the sidewalk, along the curb. Platforms would transition from the sidewalk to match or nearly match the floor height of the streetcar vehicles. Platforms would be designed and constructed to connect to the sidewalk in a way that meets ADA and building access requirements.

Support Facilities

Overhead Contact System

There are two potential configurations for the OCS contact wires, which would supply electrical power to the streetcar vehicles. One configuration would be to support the contact wire with a span wire between two poles located on either side of the street, perpendicular to the streetcar track. Another configuration would support the contact wire from cantilever arms connected to single poles. Configurations would be site specific and be made based upon engineering design and aesthetic considerations. Either of these configurations could use decorative poles chosen to be consistent with the streetscape along the project alignment. It is possible that poles used for delivering streetcar power could also be integrated with other streetscape infrastructure such as street lighting, traffic signals, or traffic signs. OCS suspension at corner turning locations (e.g., Hill/1st Streets, 1st Street/Broadway, Broadway/11th Street, 11th/Figueroa Streets, Figueroa/9th or 7th Streets, 9th or 7th/Hill Streets) would be more specialized and tailored to each location, possibly requiring a combination of wire-mounting configurations. OCS poles would be approximately 25 to 30 feet tall and would be typically installed at intervals of about 80 to 120 feet, with added poles at turns. Wire heights above the tracks would typically range between approximately 18 and 19 feet in the public right-of-way.

Traction Power Substations

The streetcars would be powered by an estimated five TPSS units spaced relatively evenly throughout the alignment to provide direct current (DC) power for the streetcars; the final number and placement will be determined by further project design. Each unit would be a durable structure containing electrical and electronic equipment. Based on typically sized equipment used in other cities, the TPSS units would most likely measure approximately 17 feet long by 11 feet wide by 11 feet high, although these dimensions could vary. The footprint needed for the TPSS installations could be up to approximately 250 square feet. The substations, typically rated at 350 kilowatts, would convert 480-volt commercial alternating current (AC) power to 750-volt DC power for the streetcars.

Each TPSS would typically be placed in an off-street location, such as a parking lot or other suitable site. At one location, 2nd Street and Grand Avenue, the currently recommended potential TPSS site may need to occupy space in the public right-of-way. A number of potential TPSS locations and alternate sites are being evaluated in the event that primary sites are found to be infeasible.

Maintenance and Storage Facility

The Project would require an MSF to provide a location for secure storage of streetcar vehicles when they are not in operation, and regular light maintenance of the vehicles to keep them clean and in good operating condition.

Four sites are currently being considered as a potential location for the MSF: (1) the southwest corner of 11th and Olive Streets; (2) the southeast corner of 11th and Olive Streets; (3) the northwest corner of Hill and 5th Streets; or (4) the west side of Broadway between 2nd and 3rd Streets. All four candidate sites are currently being used as parking lots. The MSF would consist of an enclosed building and an outdoor area where routine inspections, maintenance work, and light repairs could be performed. The facility would have sufficient storage capacity to handle the needs of the streetcar system, with paved maintenance aisles, a pit track, overhead crane, paved truck access, staff offices, parts storage areas, and a machine shop. An employee parking area may also be provided. A maintenance building for a system of the size of the Project would generally be 12,000 to 18,000 square feet, approximately two to three stories tall, contain tracks inside a garage enclosure for maintenance of the vehicles, and be constructed to comply with the City's Green Building Code and also meet minimum Leadership in Energy & Environmental Design (LEED) certification requirements. Acquisition of private property for the MSF site would be required. Streetcars would gain access to the facility from a short segment of track that would be connected to the mainline. A storage area outside of the maintenance facility would provide an area for overnight cleaning (i.e., wash facility with clarifier) and secure storage of streetcar vehicles.

Signaling

Streetcar movement would be governed by "line-of-sight" operations, with passage through intersections controlled by traffic signals. "Line-of-sight" operations means that streetcars would be controlled by an operator who would proceed when traffic signals and traffic allow, and who would stop for traffic signals, station stops, pedestrians, bicycles, and other vehicles. A separate signal head may be provided at intersections for streetcar control. The streetcar control signal would be interconnected with the traffic signals and would clearly indicate to the streetcar operator when it is clear for the streetcar to move or required to stop.

Transit signals (i.e., special signals separated from the general purpose signal system) would be necessary where the streetcar would require a special traffic signal phase to maneuver so as to avoid conflicts with general traffic. These signals are also required at locations where a track switch is used by the streetcar operator to choose between different paths. Most of the route for the proposed Project would not have separate transit signals. Where they are needed, operation of transit signals would be separated from the normal traffic signals in order to not confuse the general public.

Potential Layover Locations

Locations on the streetcar route are needed to provide space for a streetcar to layover out of traffic, to allow dispatch according to a regular schedule, or to provide space for a streetcar to be temporarily taken out of service. In addition, these locations would allow the streetcar operator to take a short break. For the route currently proposed, two such locations would be desirable.

Under the Grand Avenue Extension (Alternatives 2 and 4), at the stop on Grand Avenue north of 2nd Street, a single track in an exclusive median is currently proposed. This configuration would allow the streetcars to complete their round trip and layover out of traffic for several minutes until the next scheduled departure. The streetcar vehicles would have operator cabs on both ends of the cars so that they would be able to operate in either direction of travel.

In addition to the Grand Avenue location, four other locations have currently been identified as potential second layover sites. Should Alternative 3 or 5 be ultimately selected, two of these locations may be needed. At each of these locations, a short section of parallel track would need to be provided to allow space for the streetcar to move off the main line while the layover is taking place. These sites include (a) Broadway, near-side at 2nd Street; (b) Broadway, far-side at 2nd Street; (c) Broadway, mid-block between 2nd and 3rd Streets; and (d) 11th Street, near-side at Hill Street.

All of the above currently considered layover locations are being evaluated as part of further design advancement of the Project, and are therefore subject to change with regard to location and/or track layout.

Construction Activities

Construction activities associated with the Project would affect portions of Grand Avenue, 1st Street, Broadway, 11th Street, Figueroa Street, 7th Street or 9th Street, and Hill Street, as well as the selected MSF and TPSS sites. Construction activities would include: (a) pavement removal, (b) utility relocation, (c) excavation, (d) construction of track drains, (e) installation of concrete track slab and rails, (f) construction of station platforms, (g) installation of special track work units, (h) reconstruction of ramps and sidewalks, (i) paving, and (j) striping. Other activities would include installation of specialty system work, such as traction power, overhead contact wire, communications systems, train/traffic signaling, and OCS pole foundations.

Laydown and storage area(s) for construction would be established near the project alignment and would be used for storage of equipment and materials. The laydown and storage area(s) could be located within the right-of-way, in parking lots, or on vacant land, and would be used to store equipment and materials. Four potential laydown and storage areas have currently been identified for evaluation: (1) the southeast corner of 3rd Street and Main Street; (2) northeast corner of 3rd Street and Spring Street; (3) 243 S. Spring Street; and (4) Grand Avenue to Olive Street, between 8th and 9th Streets. These should be regarded as example sites; other locations within the study area may become available and could also be chosen. All four example locations are currently being used as parking lots adjoining City streets within one block of the project alignment.

Project construction activities would typically take place on weekdays between 7 a.m. and 9 p.m., in accordance with Los Angeles Municipal Code (LAMC) 41.40(a). To expedite construction, certain construction activities may be permitted to occur during nighttime, weekend, and holiday periods with the approval of the Board of Police Commissioners pursuant to LAMC Section 41.40(j). In addition, construction within City roadways may occur during peak periods (i.e., 6 a.m. to 9 a.m. and 3:30 p.m. to 7 p.m.) in accordance with Mayor's Executive Directive No. 2 and Bureau of Engineering Special Order No. 001-0406, which provide an exemption to the rush hour roadway construction prohibition for major public works projects having traffic mitigation plans. Construction activities will be required to follow the City Planning Department's new policy (in effect June 2015) to maintain safe adjacent pedestrian access at all times during construction.

The analysis in this document assumes that, unless otherwise stated, the Project would be designed, constructed, and operated following all applicable laws, regulations, ordinances, and formally adopted City standards, including but not limited to the LAMC; LADOT design standards and special provisions; *California Manual on Uniform Traffic Control Devices*; and all City bureaus' design manuals, special provisions, and standard plans, including the latest *Standard Specification for Public Works Construction* (Greenbook); the LABOE's Brown Book; the *Work Area Traffic Control Handbook*; and any FTA requirements.

Description of Relevant Air Pollutants

Air pollutants regulated by federal and state law include criteria air pollutants, TACs/mobile source air toxics (MSATs), and GHG. A description of each is provided below.

Criteria Air Pollutants

Criteria air pollutants are defined as those pollutants for which the federal and state governments have established air quality standards for outdoor or ambient concentrations to protect public health. Criteria air pollutants are categorized as primary and secondary pollutants. Primary air pollutants are those that are emitted directly and include carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), lead (Pb), and particulate matter with a diameter of 10 microns or less (PM10) and particulate matter with a diameter of 2.5 microns or less (PM2.5). Reactive organic gases (ROG) and oxides of nitrogen (NO_X) are precursor pollutants that form ozone (O_3). Presented below is a description of each of the primary and precursor pollutants and their known health effects.

Carbon Monoxide (CO) is a colorless, odorless, toxic gas produced by incomplete combustion of carbon-based fuels, such as gasoline or diesel fuel. The primary adverse health effect associated with CO is that it replaces oxygen in the blood, which results in deprivation of oxygen to body cells and tissues, and ultimately leads to death (SCAQMD 2005).

Reactive Organic Gases (ROG), or volatile organic compounds (VOC), are compounds made up of carbon chains with attached hydrogen atoms as well as oxygen, chlorine or nitrogen atoms. Internal combustion engines are a major source of hydrocarbon emissions. Other sources of ROG are emissions associated with the use of paints and solvents, the application of asphalt paving, and the use of household consumer products such as aerosols. Adverse effects on human health are not caused directly by ROG but rather by reactions of ROG to form secondary pollutants such as O_3(SCAQMD 2005).

Nitrogen Oxides (NO_X) serve as integral participants in the process of photochemical smog production. The two major forms of NO_X are nitric oxide (NO) and NO_2. NO is a colorless, odorless gas formed from atmospheric nitrogen and oxygen when combustion takes place under high temperature and/or high pressure. NO_2 is a reddish-brown irritating gas formed by the combination of NO and oxygen. NO_X acts as an acute respiratory irritant and increases susceptibility to respiratory pathogens.

Nitrogen Dioxide (NO_2) is a by-product of fuel combustion. The principal form of NO_x produced by combustion is NO, but NO reacts with oxygen to form NO_2. NO_2 acts as an acute irritant and, in equal concentrations, is more injurious than NO. At atmospheric concentrations, however, NO_2 is only potentially irritating. There is some indication of a relationship between NO_2 and chronic pulmonary fibrosis. Some increase in bronchitis in children (2 and 3 years old) has also been observed at concentrations below 0.3 parts per million (ppm). NO_2 absorbs light in the blue wavelength; the result is a brownish-red cast to the atmosphere and reduced visibility. NO_2 also contributes to the formation of PM10. NO_X are also precursors to the formation of both O_3 and PM2.5 (SCAQMD 2005; SCAQMD 2007).

Sulfur Dioxide (SO_2) is a colorless, pungent, irritating gas formed by the combustion of sulfurous fossil fuels. Fuel combustion is the primary source of SO_2. At high concentrations, SO_2 may irritate the upper respiratory tract. At lower concentrations and when combined with particulates, SO_2 may do greater harm by injuring lung tissue. A primary source of SO_2 emissions is from the combustion of high sulfur-content coal. Gasoline and natural gas have a very low sulfur content and hence do not release significant quantities of SO_2 (SCAQMD 2005).

Particulate Matter (PM) consists of suspended, finely divided solids or liquids such as soot, dust, aerosols, fumes, and mists. Two forms of fine particulates are now recognized. Inhalable coarse particles, or PM10, include the particulate matter with a diameter of 10 microns (10 millionths of a meter or 0.0004 inch) or less. Inhalable fine particles, or PM2.5, have a diameter of 2.5 microns (i.e., 2.5 millionths of a meter or 0.0001 inch) or less. Particulate discharge into the atmosphere results primarily from industrial, agricultural, construction, and transportation activities. However, wind on arid landscapes also contributes substantially to local particulate loading. Both PM10 and PM2.5 may adversely affect the human respiratory system, especially in those people who are naturally sensitive or susceptible to breathing problems (SCAQMD 2005).

Fugitive dust is airborne PM that does not pass through a stack, vent, duct, or similar opening. Fugitive dust primarily poses two public health and safety concerns. The first concern is that of respiratory problems attributable to the particulates suspended in the air. The second concern is that of motor vehicle accidents caused by reduced visibility during severe wind conditions.[1] Fugitive dust may also cause significant property damage during strong windstorms by acting as an abrasive material agent (much like sandblasting) (SCAQMD 2005).

Ozone (O_3), or smog, is one of a number of substances called photochemical oxidants that are formed when ROG and NO_X (both by-products of the internal combustion engine) react with sunlight. O_3 is present in relatively high concentrations in the South Coast Air Basin (Basin), and the damaging effects of photochemical smog are generally related to the concentrations of O_3. O_3 poses a health threat to those who already suffer from respiratory diseases as well as to healthy people. Additionally, O_3 has been tied to crop damage, typically in the form of stunted growth and premature death. O_3 can also act as a corrosive, resulting in property damage such as the degradation of rubber products (SCAQMD 2005).

Lead (Pb) a metal, and its compounds, negatively affect human health. Fetuses, infants, and children are more sensitive than others to the adverse effects of Pb exposure. Exposure to low levels of Pb can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands, and a lower intelligence quotient. In adults, increased Pb levels are associated with increased blood pressure. Pb poisoning can cause anemia, lethargy, seizures, and death. It appears that there are no direct effects of Pb on the respiratory system. Pb accumulates in bone from an early-age from environmental exposure, and elevated blood Pb levels can occur because of the breakdown of bone tissue during pregnancy, hyperthyroidism (increased secretion of hormones from the thyroid gland), and osteoporosis (loss of bone density and breakdown of bony tissue). Fetuses and breast-fed babies can be exposed to higher levels of Pb through previous environmental Pb exposure of their mothers (SCAQMD 2005).

[1] Wind-blown dust is typically more of a concern in rural areas, not in urban areas such as downtown Los Angeles.

Toxic Air Contaminants/Mobile-Source Air Toxics

Although Ambient Air Quality Standards (AAQS) exist for criteria pollutants, no ambient standards exist for TACs. Many pollutants are identified as TACs because of their potential to increase the risk of developing cancer or because of their acute or chronic health risks. For TACs that are known or suspected carcinogens, the California Air Resources Board (ARB) has consistently found that there are no levels or thresholds below which exposure is risk-free. Individual TACs vary greatly in the risks they present. At a given level of exposure, one TAC may pose a hazard that is many times greater than another. TACs are identified and their toxicity is studied by the California Office of Environmental Health Hazard Assessment (OEHHA). TACs are a category of air pollutants that have been shown to have an impact on human health but are not classified as criteria pollutants.

Air toxics are generated by a number of sources, including: stationary sources, such as dry cleaners, gas stations, auto body shops, and combustion sources; mobile sources, such as diesel trucks, ships, and trains; and area sources, such as farms, landfills, and construction sites. Adverse health effects of TACs can be carcinogenic (cancer-causing), short-term (acute) non-carcinogenic, and long-term (chronic) non-carcinogenic. Direct exposure to these pollutants has been shown to cause cancer, birth defects, damage to the brain and nervous system, and respiratory disorders. For certain TACs, a unit risk factor can be developed to evaluate cancer risk. For acute and chronic health risks, a similar factor, called a Hazard Index, is used to evaluate risk.

The federal Clean Air Act (CAA) made controlling air toxic emissions a national priority, by which Congress mandated that the U.S. Environmental Protection Agency (EPA) regulate 188 air toxics. These substances are also known as hazardous air pollutants (HAPs). In EPA's latest rule on the control of hazardous air pollutants from mobile sources (72 Federal Register [FR] 8430), it identified a group of 93 compounds emitted from mobile sources that are listed in its Integrated Risk Information System. From this list of 93 compounds, EPA has identified seven as priority MSATs. The high regulation priority of these seven MSATs was based on EPA's 1999 National Air Toxics Assessment.

- Acrolein
- Benzene
- 1,3-Butadiene
- Diesel particulate matter/diesel exhaust organic gases
- Formaldehyde
- Naphthalene
- Polycyclic organic matter

The 2007 rule mentioned above requires controls that will dramatically decrease MSAT emissions through cleaner fuels and cleaner engines. According to a Federal Highway Administration (FHWA) analysis using EPA's MOVES2010b model, even if vehicle activity (vehicle miles traveled [VMT]) increases by 102 percent as assumed from 2010 to 2050, a combined reduction of 83 percent in the total annual emission rate for the priority MSAT is projected for the same time period (FHWA 2012).

Greenhouse Gases

The principal anthropogenic GHGs contributing to global warming are carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), and fluorinated compounds, including sulfur hexafluoride (SF_6), hydrofluorocarbons (HFCs), and perfluorocarbons (PFCs), as codified in state law and the State CEQA Guidelines (Health and Safety Code 38505(g); 14 California Code of Regulations 15364.5). Water vapor, the most abundant GHG, is not included in this list because its natural concentrations and fluctuations far outweigh its anthropogenic (human-made) sources.[2] Presented below is a description of each GHG and their known sources.

Carbon Dioxide (CO_2) enters the atmosphere through the burning of fossil fuels (oil, natural gas, and coal), solid waste, trees and wood products, respiration, and also as a result of other chemical reactions (e.g., manufacture of cement). Carbon dioxide is also removed from the atmosphere (or "sequestered") when it is absorbed by plants as part of the biological carbon cycle, or dissolved into the oceans, or incorporated into the shells of animals.

Methane (CH_4) is emitted during the production and transport of coal, natural gas, and oil. Methane emissions also result from the organismic digestion process, from livestock and from other agricultural practices and by the decay of organic waste in municipal solid waste landfills.

Nitrous Oxide (N_2O) is emitted during agricultural and industrial activities, as well as during combustion of fossil fuels and solid waste.

Fluorinated Gases are synthetic, strong greenhouse gases that are emitted from a variety of industrial processes. Fluorinated gases are sometimes used as substitutes for ozone-depleting substances. These gases are typically emitted in smaller quantities, but because they are potent greenhouse gases, they are sometimes referred to as High Global Warming Potential gases.

- *Chlorofluorocarbons (CFCs)* are greenhouse gases covered under the 1987 Montreal Protocol and used for refrigeration, air conditioning, packaging, insulation, solvents, or aerosol propellants. Since they are not destroyed in the lower atmosphere (troposphere, stratosphere), CFCs drift into the upper atmosphere where, given suitable conditions, they break down ozone. These gases are being replaced by other compounds that are greenhouse gases covered under the 1997 Kyoto Protocol.
- *Perfluorocarbons (PFCs)* are a group of human-made chemicals composed of carbon and fluorine only. These chemicals (predominantly perfluoromethane [CF_4] and perfluoroethane [C_2F_6]) were introduced as alternatives, along with HFCs, to the ozone-depleting substances. In addition, PFCs are emitted as by-products of industrial processes and are also used in manufacturing. PFCs do not harm the stratospheric ozone layer, but they are strong greenhouse gases.
- *Sulfur Hexafluoride (SF_6)* is a colorless gas soluble in alcohol and ether, slightly soluble in water. SF_6 is a strong greenhouse gas used primarily in electrical transmission and distribution systems as a dielectric agent.[3]

[2] Although water vapor plays a substantive role in the natural greenhouse effect, the change in GHG concentration in the atmosphere due to anthropogenic actions is enough to upset the radiative balance of the atmosphere and result in global warming.

[3] A dielectric is an electrical insulator that is highly resistant to the flow of an electric current.

- *Hydrochlorofluorocarbons (HCFCs)* contain hydrogen, fluorine, chlorine, and carbon atoms. Although ozone-depleting substances, they are less potent than CFCs. They have been introduced as temporary replacements for CFCs and are also greenhouse gases.
- *Hydrofluorocarbons (HFCs)* contain only hydrogen, fluorine, and carbon atoms. They were introduced as alternatives to ozone-depleting substances in serving many industrial, commercial, and personal needs. HFCs are emitted as by-products of industrial processes and are also used in manufacturing. They do not significantly deplete the stratospheric ozone layer, but they are strong greenhouse gases.

This page intentionally left blank.

The air quality in the United States is governed by the federal CAA. In addition to being subject to requirements of the CAA, air quality in California is also governed by more stringent regulations under the California Clean Air Act (CCAA). At the federal level, the CAA is administered by EPA. In California, the CCAA is administered by ARB at the state level and by air districts at regional and local levels. The CAA and CCAA set overall air quality standards that are achieved by a multitude of rules and regulations at the regional and local level.

Federal

Federal Clean Air Statutes

The first Air Pollution Control Act was enacted in 1955, and amended in 1965 and 1967. The subsequent federal CAA was enacted in 1970, and then amended numerous times in subsequent years (1977 and 1990). The CAA establishes federal AAQS, known as National Ambient Air Quality Standards (NAAQS), and specifies future dates for achieving compliance. The CAA also mandates that the state submit and implement a State Implementation Plan (SIP) for local areas not meeting those standards. The plans must include pollution control measures that demonstrate how the standards will be met. The City of Los Angeles is within the Basin and, as such, is in an area designated a nonattainment area for certain pollutants that are regulated under the CAA.

The 1990 amendments to the CAA identify specific emission-reduction goals for areas not meeting the NAAQS. These amendments require both a demonstration of reasonable further progress toward attainment and incorporation of additional sanctions for failure to attain or meet interim milestones. The sections of the CAA that would most substantially affect the development of the Project include Title I (Nonattainment Provisions) and Title II (Mobile-Source Provisions).

Title I provisions were established with the goal of attaining the NAAQS for criteria pollutants. Table 1 shows the NAAQS currently in effect for each criteria pollutant. The Basin fails to meet national standards for O_3, inhalable particulate matter (PM10 and PM2.5), NO_2, and lead and is, therefore, designated a federal nonattainment area for those pollutants. The Basin is a maintenance area for CO (EPA 2015a), as a former nonattainment area that has achieved attainment with the CO NAAQS. Table 1 also provides the attainment status for each pollutant.

Transportation Conformity

Under the 1990 CAA, the U.S. Department of Transportation cannot fund, authorize, or approve federal actions to support programs or projects that are not first found to conform to the SIP for achieving the goals of the CAA requirements. Conformity with the CAA takes place on two levels—first at the regional level, and second at the project level. The Project must conform at both levels to be approved.

Table 1. Federal and State Ambient Air Quality Standards

Pollutant	Averaging Time [11]	State [8] Standard	Federal [8] Standard	Principal Health and Atmospheric Effects	Typical Sources	Project Area Attainment Status
Ozone (O_3) [2]	1 hour 8 hours	0.09 ppm 0.070 ppm	--- [4] 0.075 ppm (4th highest measurement in 3 years)	High concentrations irritate lungs. Long-term exposure may cause lung tissue damage and cancer. Long-term exposure damages plant materials and reduces crop productivity. Precursor organic compounds include many known toxic air contaminants. Biogenic VOC may also contribute.	Low-altitude ozone is almost entirely formed from ROG/VOC and NO_X in the presence of sunlight and heat. Common precursor emitters include motor vehicles and other internal combustion engines, solvent evaporation, boilers, furnaces, and industrial processes.	Federal: Non-attainment State: Non-attainment
Carbon Monoxide (CO)	1 hour 8 hours 8 hours (Lake Tahoe)	20 ppm 9.0 ppm [1] 6 ppm	35 ppm 9 ppm ---	CO interferes with the transfer of oxygen to the blood and deprives sensitive tissues of oxygen. CO also is a minor precursor for photochemical ozone. Colorless, odorless.	Combustion sources, especially gasoline-powered engines and motor vehicles. CO is the traditional signature pollutant for on-road mobile sources at the local and neighborhood scale.	Federal: Attainment/ Maintenance State: Maintenance
Respirable Particulate Matter (PM10) [2]	24 hours Annual	50 µg/m³ 20 µg/m³	150 µg/m³ --- [2] (expected number of days above standard < or equal to 1)	Irritates eyes and respiratory tract. Decreases lung capacity. Associated with increased cancer and mortality. Contributes to haze and reduced visibility. Includes some toxic air contaminants. Many toxic & other aerosol and solid compounds are part of PM10.	Dust- and fume-producing industrial and agricultural operations; combustion smoke & vehicle exhaust; atmospheric chemical reactions; construction and other dust-producing activities; unpaved road dust and re-entrained paved road dust; natural sources.	Federal: Non-attainment State: Non-attainment
Fine Particulate Matter (PM2.5) [2]	24 hours Annual 24 hours (conformity process [5]) Secondary Standard (annual; also for conformity process [5])	--- 12 µg/m³ --- ---	35 µg/m³ 12.0 µg/m³ 65 µg/m³ 15 µg/m³ (98th percentile over 3 years)	Increases respiratory disease, lung damage, cancer, and premature death. Reduces visibility and produces surface soiling. Most diesel exhaust particulate matter – a toxic air contaminant – is in the PM2.5 size range. Many toxic and other aerosol and solid compounds are part of PM2.5.	Combustion including motor vehicles, other mobile sources, and industrial activities; residential and agricultural burning; also formed through atmospheric chemical and photochemical reactions involving other pollutants including NO_X, sulfur oxides (SO_X), ammonia, and ROG.	Federal: Non-attainment State: Non-attainment

Pollutant	Averaging Time [11]	State [8] Standard	Federal [8] Standard	Principal Health and Atmospheric Effects	Typical Sources	Project Area Attainment Status
Nitrogen Dioxide (NO_2)	1 hour Annual	0.18 ppm 0.030 ppm	0.100 ppm [6] (98th percentile over 3 years) 0.053 ppm	Irritating to eyes and respiratory tract. Colors atmosphere reddish-brown. Contributes to acid rain & nitrate contamination of stormwater. Part of the "NOx" group of ozone precursors.	Motor vehicles and other mobile or portable engines, especially diesel; refineries; industrial operations.	Federal: Attainment/ Maintenance State: Non-attainment
Sulfur Dioxide (SO_2)	1 hour 3 hours 24 hours	0.25 ppm --- 0.04 ppm	0.075 ppm [7] (99th percentile over 3 years) 0.5 ppm [9]	Irritates respiratory tract; injures lung tissue. Can yellow plant leaves. Destructive to marble, iron, steel. Contributes to acid rain. Limits visibility.	Fuel combustion (especially coal and high-sulfur oil), chemical plants, sulfur recovery plants, metal processing; some natural sources like active volcanoes. Limited contribution possible from heavy-duty diesel vehicles if ultra-low sulfur fuel not used.	Federal: Attainment State: Attainment
Lead (Pb)[3]	Monthly Rolling 3-month average	1.5 µg/m³ ---	--- 0.15 µg/m³ [10]	Disturbs gastrointestinal system. Causes anemia, kidney disease, and neuromuscular and neurological dysfunction. Also a TAC and water pollutant.	Lead-based industrial processes like battery production and smelters. Lead paint, leaded gasoline. Aerially deposited lead from older gasoline use may exist in soils along major roads.	Federal: Non-attainment State: Non-attainment
Sulfate	24 hours	25 µg/m³	---	Premature mortality and respiratory effects. Contributes to acid rain. Some TACs attach to sulfate aerosol particles.	Industrial processes, refineries and oil fields, mines, natural sources like volcanic areas, salt-covered dry lakes, and large sulfide rock areas.	Federal: n/a State: Attainment
Hydrogen Sulfide (H_2S)	1 hour	0.03 ppm	---	Colorless, flammable, poisonous. Respiratory irritant. Neurological damage and premature death. Headache, nausea. Strong odor.	Industrial processes such as: refineries and oil fields, asphalt plants, livestock operations, sewage treatment plants, and mines. Some natural sources like volcanic areas and hot springs.	Federal: n/a State: Unclassified

Pollutant	Averaging Time [11]	State [8] Standard	Federal [8] Standard	Principal Health and Atmospheric Effects	Typical Sources	Project Area Attainment Status
Visibility Reducing Particles (VRP)	8 hours	Visibility of 10 miles or more (Tahoe: 30 miles) at relative humidity less than 70%	---	Reduces visibility. Produces haze. NOTE: not directly related to the Regional Haze program under the federal CAA, which is oriented primarily toward visibility issues in National Parks and other "Class I" areas. However, some issues and measurement methods are similar.	See particulate matter above. May be related more to aerosols than to solid particles.	Federal: n/a State: Unclassified
Vinyl Chloride[3]	24 hours	0.01 ppm	---	Neurological effects, liver damage, cancer. Also considered a TAC.	Industrial processes	Federal: n/a State: Unclassified

Notes: ppm = parts per million; μg/m³ = micrograms per cubic meter; ppb=parts per billion (thousand million)

1 Rounding to an integer value is not allowed for the state 8-hour CO standard. A violation occurs at or above 9.05 ppm.

2 Annual PM10 NAAQS revoked October 2006; was 50 μg/m³. The 24-hour PM2.5 NAAQS tightened October 2006; was 65 μg/m³. Annual PM2.5 NAAQS tightened from 15 μg/m³ to 12 μg/m³ December 2012 and secondary annual standard set at 15 μg/m³. 8-hour O_3 NAAQS tightened from 75 ppb (0.075 ppm) to 70 ppb (0.070 ppm) in October 2015. Nonattainment areas for the 70 ppb O_3 NAAQS have not yet been designated as of February 2016.

3 ARB has identified vinyl chloride and the particulate matter fraction of diesel exhaust as toxic air contaminants. Diesel exhaust particulate matter is part of PM10 and, in larger proportion, PM2.5. Both ARB and EPA have identified lead and various organic compounds that are precursors to ozone and PM2.5 as toxic air contaminants. There are no exposure criteria for adverse health effect due to toxic air contaminants, and control requirements may apply at ambient concentrations below any criteria levels specified above for these pollutants or the general categories of pollutants to which they belong.

4 Prior to 6/2005, the 1-hour ozone NAAQS was 0.12 ppm. Emission budgets for 1-hour ozone are still in use in some areas where 8-hour ozone emission budgets have not been developed, such as the S.F. Bay Area.

5 The 65 μg/m³ PM2.5 (24-hour) NAAQS was not revoked when the 35 μg/m³ NAAQS was promulgated in 2006. The 15 μg/m³ annual PM2.5 standard was not revoked when the 12 μg/m³ standard was promulgated in 2012. The 0.08 ppm 1997 ozone standard is revoked FOR CONFORMITY PURPOSES ONLY when area designations for the 2008 0.75 ppm standard become effective for conformity use (7/20/2013). Conformity requirements apply for all NAAQS, including revoked NAAQS, until emission budgets for newer NAAQS are found adequate, SIP amendments for the newer NAAQS are approved with a emission budget, EPA specifically revokes conformity requirements for an older standard, or the area becomes attainment/unclassified. SIP-approved emission budgets remain in force indefinitely unless explicitly replaced or eliminated by a subsequent approved SIP amendment. During the "Interim" period prior to availability of emission budgets, conformity tests may include some combination of build vs. no build, build vs. baseline, or compliance with prior emission budgets for the same pollutant.

6 Final 1-hour NO_2 NAAQS published in the Federal Register on 2/9/2010, effective 3/9/2010. Initial area designation for California (2012) was attainment/unclassifiable throughout. Project-level hot spot analysis requirements do not currently exist. Near-road monitoring starting in 2013 may cause redesignation to nonattainment in some areas after 2016.

7 EPA finalized a 1-hour SO_2 standard of 75 ppb in June 2010. Nonattainment areas have not yet been designated as of 9/2012.

8 State standards are "not to exceed" or "not to be equaled or exceeded" unless stated otherwise. Federal standards are "not to exceed more than once a year" or as described above.

9 Secondary standard, set to protect public welfare rather than health. Conformity and environmental analysis address both primary and secondary NAAQS.

10 Lead NAAQS are not considered in Transportation Conformity analysis.

11 "Averaging Time" is the time period established for specific ambient air quality standards, which must also be used when interpreting air quality monitoring data. National and California ambient air quality standards have different maximum levels for different averaging times.

Greenhouse Gases: Greenhouse gases do not have concentration standards.

EPA's transportation conformity rule (40 CFR Parts 51 and 93) establishes the criteria for conformity. At the regional level, EPA transportation conformity regulations require that the project be included in a currently conforming regional transportation plan (RTP) and transportation improvement program (TIP) at the time of project approval. Using the projects included in the RTP, an air quality model is run to determine whether the implementation of those projects would conform to emission budgets or other tests showing that federal CAA attainment requirements are met. If the conformity analysis is successful, metropolitan planning organizations (MPOs), such as SCAG, and the appropriate federal agencies, such as FHWA and FTA, make the determination that the RTP and TIP are in conformity with the SIP for achieving NAAQS goals. Otherwise, the projects in the RTP and TIP must be modified until conformity is attained. If the design and scope of the proposed transportation project are the same as those described in the RTP and TIP, the project is deemed to meet regional conformity requirements for purposes of project-level analysis.

Conformity at the project level requires hot-spot analysis if a region is designated nonattainment or maintenance for CO and/or PM. Hot-spot analysis is essentially the same, for technical purposes, as CO or PM analysis performed for NEPA purposes. In general, projects must not cause the CO or PM standards to be violated, and in nonattainment regions the project must not cause any increase in the number and severity of violations. If known CO or PM violations are located in the project vicinity, a project must include measures to reduce or eliminate the existing violations as well.

With respect to NAAQS, the Project is located in an area designated nonattainment for ozone, PM10, PM2.5, and lead and is in a maintenance area for CO and NO_2 (see Table 1). Therefore, the requirement to demonstrate regional and project-level conformity applies to the Project.

Federal Hazardous Air Pollutant Regulations

As noted above, EPA has identified seven MSATs (acrolein, benzene, 1,3-butadiene, diesel particulate matter plus diesel exhaust organic gases, formaldehyde, naphthalene, and polycyclic organic matter) as being priority MSATs. To address emissions of MSATs, EPA has issued a number of regulations that have and will continue to dramatically decrease MSATs through cleaner fuels and cleaner engines.

Federal Greenhouse Gas and Climate Change Policy

Although there is currently no federal overarching law specifically related to climate change or the reduction of GHGs, EPA is developing regulations under the CAA that may be adopted pursuant to EPA's authority under the CAA in the next 2 years. Foremost among recent developments have been the settlement agreements between EPA, several states, and nongovernmental organizations to address GHG emissions from electric generating units and refineries; the U.S. Supreme Court's decision in *Massachusetts v. EPA;* and EPA's "Endangerment Finding," "Cause or Contribute Finding," Mandatory Reporting Rule, and EPA's Clean Power Plan Final Rule. Although periodically debated in Congress, there is no federal legislation concerning greenhouse gas emissions limitations. In *Coalition for Responsible Regulation, Inc., et al. v. EPA*, the United States Court of Appeals upheld EPA's authority to regulate GHG emissions under the CAA.

Massachusetts, et al. vs. U.S. Environmental Protection Agency (2007)

Twelve U.S. states and cities, including California, in conjunction with several environmental organizations sued to force EPA to regulate GHGs as a pollutant pursuant to the CAA in *Massachusetts, et al. v. Environmental Protection Agency* 549 US 497 (2007). The court ruled that the plaintiffs had standing to sue, GHGs fit within the CAA's definition of a pollutant, and EPA's reasons for not regulating GHGs were insufficiently grounded in the CAA.

U.S. Environmental Protection Agency Mandatory Reporting Rule for GHGs (2009)

On September 22, 2009, EPA released its final Greenhouse Gas Reporting Rule (Reporting Rule). The Reporting Rule is a response to the fiscal year (FY) 2008 Consolidated Appropriations Act (H.R. 2764; Public Law 110-161), which required EPA to develop "mandatory reporting of greenhouse gasses above appropriate thresholds in all sectors of the economy." The Reporting Rule applies to most entities that emit 25,000 metric tons of carbon dioxide equivalent ($MTCO_2e$) or more per year. Starting in 2010, facility owners from 41 industrial categories were required to submit annual GHG emissions report with detailed calculations of facility GHG emissions. An additional 12 categories begin reporting for calendar year 2011 emissions. The Reporting Rule mandates recordkeeping and administrative requirements in order for EPA to verify annual GHG emissions reports.

U.S. Environmental Protection Agency Endangerment Finding and Cause or Contribute Finding (2009)

On December 7, 2009, the EPA Administrator signed two distinct findings regarding greenhouse gases under section 202(a) of the CAA.

1. Endangerment Finding: that that the current and projected concentrations of the greenhouse gases in the atmosphere threaten the public health and welfare of current and future generations.
2. Cause or Contribute Finding: that the combined emissions of greenhouse gases from new motor vehicles and new motor vehicle engines contribute to the greenhouse gas pollution, which threatens public health and welfare.

These findings did not themselves impose any requirements on industry or other entities. However, this action was a prerequisite to EPA's GHG emission standards for motor vehicles, which EPA subsequently proposed in joint rulemakings with the National Highway Traffic Safety Administration (NHTSA) to revise the Corporate Average Fuel Economy (CAFE) standards for light-duty vehicles and establish medium- and heavy-duty vehicle fuel economy standards.

Update to Corporate Average Fuel Economy Standards (2009)

The revised CAFE standards for autos and light-duty trucks incorporate stricter fuel economy standards promulgated by the state of California into one uniform standard. Additionally, automakers are required to cut GHG emissions in new vehicles by roughly 25 percent by 2016.[4]

EPA, NHTSA, and ARB worked together on a joint EPA-NHTSA rulemaking to establish fuel economy and GHG emissions standards for 2017 to 2025 model year passenger vehicles, which required an industry-wide average of 54.5 miles per gallon. The Interim Joint Technical Assessment Report for the standards evaluated four potential future standards ranging from 47 to 62 miles per gallon in 2025 (EPA et al. 2010). The official proposal was released by both EPA and NHTSA on December 1, 2011. The final environmental document for the revised CAFE standards was released by NHTSA and EPA on July 9, 2012. On August 28, 2012, NHTSA issued the *Final Rule for CAFE Standards for Model Years 2017 and Beyond* (EPA and NHTSA 2012).

[4] Reduction compared with the previously existing standard.

Update to Medium- and Heavy-Duty Vehicle Fuel Economy Standards (2015)

In a process similar to the revision of the CAFE standards, on September 15, 2011 EPA and NHTSA issued the first-ever national fuel economy standards for medium- and heavy-duty vehicle (MDHD) standards. These Phase 1 standards applied to model year 2014-2018 MDHD vehicles. NHTSA currently is proposing fuel efficiency standards for HD engines, vehicles, and trailers as part of a joint rulemaking with EPA to establish the Phase 2 HD National Program for model years 2018-2027. The proposed rule was released by both EPA and NHTSA on June 19, 2015. The final rule and EIS for the Phase 2 MDHD standards are expected to be published in the summer of 2016 (EPA and NHTSA 2015).

Council on Environmental Quality Draft NEPA Guidance (2010, 2014)

On February 19, 2010, the Council on Environmental Quality (CEQ) issued draft NEPA guidance on the consideration of the effects of climate change and GHG emissions. This guidance advises federal agencies that they should consider opportunities to reduce GHG emissions caused by federal actions, adapt their actions to climate change effects throughout the NEPA process, and address these issues in their agency NEPA procedures. Where applicable, the scope of the NEPA analysis should cover the GHG emissions effects of a proposed action and alternative actions, as well as the relationship of climate change effects on a proposed action or alternatives. The guidance identified a reference point of 25,000 $MTCO_2e$ per year for direct GHG emissions as an indicator that further NEPA review may be warranted. This reference point, however, is not intended to be used as a threshold for determining a significant impact or effect on the environment due to GHG emissions. The guidance also does not propose a reference point for indirect GHG emissions (CEQ 2010).

In December 2014, the CEQ issued revised draft guidance to provide federal agencies with direction on when and how to consider the potential impacts of GHG emissions and climate change in accordance with NEPA including environmental assessments, environmental impact statements, and when apply existing or establishing new categorical exclusions. The draft guidance states that agencies should consider the potential impacts of a proposed action on climate change by evaluating potential GHG emissions and considering the implications of climate change for the environmental effects of the proposed action. The 2014 guidance retained the reference point of 25,000 $MTCO_2e$ per year (CEQ 2014).

State

California Clean Air Act

The CCAA, signed into law in 1988, requires all areas of the state to achieve and maintain the California Ambient Air Quality Standards (CAAQS) by the earliest practical date. The CAAQS incorporate additional standards for most of the criteria pollutants and set standards for other pollutants recognized by the state. In general, the California standards are more health protective than the corresponding NAAQS. California has also set standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles. Table 1 shows the CAAQS currently in effect for each criteria pollutant. The Basin fails to meet state standards for O_3, PM10, PM2.5, NO_2, and Pb and is, therefore, designated a state nonattainment area for those pollutants, and is also a maintenance area for CO. The Basin is in attainment (compliance) with state standards for SO_2, sulfates, hydrogen sulfide, visibility-reducing particles, and vinyl chloride. Table 1 lists each criteria pollutant and its state and federal attainment status.

California Toxic Air Contaminants Regulations

California regulates TACs primarily through the Toxic Air Contaminant Identification and Control Act (Tanner Act) (Assembly Bill [AB] 1807) and the Air Toxics "Hot Spots" Information and Assessment Act of 1987 ("Hot Spots" Act) (AB 2588). In the early 1980s, ARB established a statewide comprehensive air toxics program to reduce exposure to air toxics. The Tanner Act (AB 1807) created California's program to reduce exposure to air toxics. The "Hot Spots" Act (AB 2588) supplements the AB 1807 program by requiring a statewide air toxics inventory, notification of people exposed to a significant health risk, and facility plans to reduce these risks.

In August 1998, ARB identified particulate emissions from diesel-fueled engines as TACs. In September 2000, ARB approved a comprehensive diesel risk reduction plan to reduce emissions from both new and existing diesel-fueled engines and vehicles. The goal of the plan is to reduce diesel PM10 (respirable particulate matter) emissions and the associated health risk by 75 percent in 2010 and by 85 percent by 2020. The plan identifies 14 measures that ARB will implement over the next several years. Because the ARB measures would be enacted before any phase of construction, the Project would be required to comply with applicable diesel control measures.

The Tanner Act sets forth a formal procedure for ARB to designate substances as TACs. This includes research, public participation, and scientific peer review before ARB designates a substance as a TAC. To date, ARB has identified 21 TACs, and has also adopted EPA's list of HAPs as TACs. In August 1998, diesel particulate matter (DPM) was added to the ARB list of TACs (ARB 1998).

The "Hot Spots" Act requires that existing facilities that emit toxic substances above specified levels (1) prepare a toxic emission inventory, (2) prepare a risk assessment if emissions are significant (i.e., 10 tons per year or on District's Health Risk Assessment list), (3) notify the public of significant risk levels, and (4) prepare and implement risk reduction measures. ARB's Diesel Risk Reduction Plan outlines a comprehensive and ambitious program that includes the development of numerous new control measures over the next several years aimed at substantially reducing emissions from new and existing on-road vehicles (e.g., heavy-duty trucks and buses), off-road equipment (e.g., graders, tractors, forklifts, sweepers, and boats), portable equipment (e.g., pumps), and stationary engines (e.g., stand-by power generators). ARB has adopted several regulations that will reduce diesel emissions from in-use vehicles and engines throughout California. In some cases, the particulate matter reduction strategies also reduce smog-forming emissions, such as NO_X. As an ongoing process, ARB reviews air contaminants and identifies those that are classified as TACs. ARB also continues to establish new programs and regulations for the control of TACs, including diesel particulate matter, as appropriate.

California Greenhouse Gas and Climate Change Policy

California has adopted statewide legislation addressing various aspects of climate change and GHG emissions mitigation. Much of this establishes a broad framework for the state's long-term GHG reduction and climate change adaptation program. The Governor of California has also issued several executive orders related to the state's evolving climate change policy. Of particular importance to local governments is the direction provided by the AB 32 Scoping Plan, which recommends local governments reduce their GHG emissions by a level consistent with state goals.

In the absence of federal regulations, control of GHGs is generally regulated at the state level and is typically approached by setting emission reduction targets for existing sources of GHGs, setting policies to promote renewable energy and increase energy efficiency, and developing statewide action plans. Summaries of key policies, legal cases, regulations, and legislation at the state levels that are relevant to the city are provided below. Figure 3 displays a timeline of key state and federal regulatory activity. Key statewide GHG regulations that are directly applicable to the Project include the following.

Executive Order S-3-05

Executive Order (EO) S-3-05 is designed to reduce California's GHG emissions to (1) 2000 levels by 2010, (2) 1990 levels by the 2020, and (3) 80 percent below the 1990 levels by the year 2050.[5]

Executive orders are binding only on state agencies. Accordingly, EO S-03-05 will guide state agencies' efforts to control and regulate GHG emissions but will have no direct binding effect on local government or private actions. The Secretary of the California Environmental Protection Agency is required to report to the Governor and state legislature biannually on the impacts of global warming on California, mitigation and adaptation plans, and progress made toward reducing GHG emissions to meet the targets established in this executive order.

Assembly Bill 1493—Pavley Rules (2002, amendments 2009)/Advanced Clean Cars (2011)

Known as "Pavley I," AB 1493 standards are the nation's first GHG standards for automobiles. AB 1493 required ARB to adopt vehicle standards that will lower GHG emissions from new light duty autos to the maximum extent feasible beginning in 2009. Additional strengthening of the Pavley standards (referred to previously as "Pavley II," now referred to as the "Advanced Clean Cars" measure) has been proposed for vehicle model years 2017–2020. Together, the two standards are expected to increase average fuel economy to roughly 43 miles per gallon by 2020 and reduce GHG emissions from the transportation sector in California by approximately 14 percent. In June 2009, EPA granted California's waiver request enabling the state to enforce its GHG emissions standards for new motor vehicles beginning with the then-current model year.

EPA and ARB are currently working together on a joint rulemaking to establish GHG emissions standards for 2017 to 2025 model year passenger vehicles. The Interim Joint Technical Assessment Report for the standards evaluated four potential future standards ranging from 47 and 62 miles per gallon in 2025 (EPA et al. 2010). The official proposal was released by both EPA and ARB on December 7, 2011, and was unanimously approved by ARB on January 26, 2012.

Assembly Bill 32 (AB 32), the Global Warming Solutions Act of 2006/2011 Update

AB 32 codified the state's GHG emissions target by requiring that the state's global warming emissions be reduced to 1990 levels by 2020. Since being adopted, ARB, the California Energy Commission, the California Public Utilities Commission, and the Building Standards Commission have been developing regulations that will help meet the goals of AB 32 and EO S-03-05. The Scoping Plan for AB 32 identifies specific measures to reduce GHG emissions to 1990 levels by 2020, and requires ARB and other state agencies to develop and enforce regulations and other initiatives

[5] Statewide GHG emissions were estimated to be 449.59 $MMTCO_2e$ for year 2010 compared to 462.9 $MMTCO_2e$ for year 2000 (ARB 2013).

for reducing GHGs. Specifically, the Scoping Plan articulates a key role for local governments, recommending they establish GHG reduction goals for both their municipal operations and the community consistent with those of the state.

In March 2011, a San Francisco Superior Court enjoined the implementation of ARB's Scoping Plan, finding the alternatives analysis and public review process violated both CEQA and ARB's certified regulatory program (Association of Irritated Residents, et al v. California Air Resources Board, Case No. CPF-09-509562, March 18, 2011). In response to this litigation, ARB adopted the new CEQA document (*Final Supplement to the AB 32 Scoping Plan Functional Equivalent Document*) on August 24, 2011. ARB staff re-evaluated the baseline in light of the economic downturn and updated the projected 2020 emissions to 545 million metric tons of carbon dioxide equivalent ($MMTCO_2e$). Two reduction measures (Pavley I and the Renewables Portfolio Standard [12–20 percent]) not previously included in the 2008 Scoping Plan baseline were incorporated into the updated baseline, further reducing the 2020 statewide emissions projection to 507 $MMTCO_2e$. The updated forecast of 507 $MMTCO_2e$ is referred to as the AB 32 2020 baseline. Reduction of an estimated 80 $MMTCO_2e$ are necessary to reduce statewide emissions to the AB 32 Target of 427 $MMTCO_2e$ by 2020 (ARB 2011).

Executive Order S-01-07, Low Carbon Fuel Standard (2007)

Executive Order S-01-07 mandates: (1) that a statewide goal be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020, and (2) that a low carbon fuel standard (LCFS) for transportation fuels be established in California. The executive order initiates a research and regulatory process at ARB. Based on an implementation plan developed by CEC, ARB will be responsible for implementing the LCFS. On December 29, 2011, a federal judge issued a preliminary injunction blocking enforcement of the LCFS, ruling that the LCFS violates the interstate commerce clause (Georgetown Climate Center 2012). On April 23, 2012, the U.S. Court of Appeals for the Ninth Circuit granted ARB's motion to stay the injunction that had prevented ARB from enforcing California's LCFS. Thus, although the case is ongoing, ARB is permitted to continue its implementation and enforcement of the LCFS pending the outcome of the appeal. On November 16, 2015 the Office of Administrative Law in the State of California approved the re-adoption of the Low Carbon Fuel Regulation.

Executive Order B-30-15, Greenhouse Gas Reduction Target (2015)

Executive Order B-30-15 was announced by Governor Brown on April 29, 2015 and establishes a greenhouse gas reduction target of 40 percent below 1990 levels by 2030 in the State of California. California is currently on track to meet or exceed the target of reducing GHG emissions to 1990 levels by 2020, which was previously established in the California Global Warming Solutions Act of 2006 (AB 32, see section above for more details). The State's new emission reduction target will make it possible to reach the State's overall goal of reducing emissions 80 percent under 1990 levels by 2050 (Office of Governor 2015).

SB 375 (Steinberg), Statutes of 2008

Senate Bill (SB) 375 requires regional transportation plans, developed by MPOs, to incorporate a "sustainable communities strategy" (SCS) in their RTPs that will achieve GHG emission reduction targets set by ARB, which finalized the regional targets in February 2011. SB 375 also includes provisions for streamlined CEQA review for some infill projects such as transit-oriented development. However, those provisions will not become effective until an SCS is adopted. The final targets require SCAG to identify strategies that will reduce per capita GHG emissions from passenger vehicles by approximately 8 percent by 2020 and 13 percent by 2035 over base year 2005. SCAG adopted the Final 2012 RTP, which incorporates the SCS, on April 4, 2012 (SCAG 2012a). The Draft 2016-2040 RTP/SCS was released in December 2015. The revised RTP/SCS includes $556.5 billion in transportation investments and the strategies outlined in the 2016 RTP/SCS will help reduce GHG emissions to meet California's targets, as mentioned above (SCAG 2015).

Other Vehicle Efficiency Measures from ARB

ARB has adopted or is pursuing additional measures to promote vehicle efficiency in order to reduce GHG emissions. In 2008, ARB adopted a measure concerning heavy-duty vehicle aerodynamics. In 2009, ARB adopted regulations for tire pressure. ARB also evaluated hybridization of medium-heavy vehicles and cool car design (i.e., a clear, reflective glaze on car windows designed to cut emissions by virtue of blocking excessive sunlight and heat). In November 2016, ARB released the Draft Technology Assessment for Heavy-Duty Hybrid Vehicles which analyzed the current and future development of heavy-duty hybrid vehicle technologies. The use of these technologies would help to reduce fuel consumption and GHG emissions within the vehicle fleet; however, these technologies are currently cost prohibitive and would increase vehicle weights (ARB 2015b).

State CEQA Guidelines

The State CEQA Guidelines require lead agencies to describe, calculate, or estimate the amount of GHG emissions that would result from a project. Moreover, the State CEQA Guidelines emphasize the necessity to determine potential climate change effects of the project and propose mitigation as necessary. The State CEQA Guidelines confirm the discretion of lead agencies to determine appropriate significance thresholds, but require the preparation of an EIR if "there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with adopted regulations or requirements" (Section 15064.4).

State CEQA Guidelines Section 15126.4 includes considerations for lead agencies related to feasible mitigation measures to reduce GHG emissions, which may include, among others:

- Measures in an existing plan or mitigation program for the reduction of emissions that are required as part of the lead agency's decision;
- Implementation of project features, project design, or other measures which are incorporated into the project to substantially reduce energy consumption or GHG emissions;
- Off-site measures, including offsets that are not otherwise required, to mitigate a project's emissions; and
- Measures that sequester carbon or carbon-equivalent emissions.

ARB GHG Mandatory Reporting Rule Title 17 (2009)

In December of 2007, ARB approved a rule requiring mandatory reporting of GHG emissions from certain sources, pursuant to AB 32. Facilities subject to the mandatory reporting rule must have reported their emissions from the calendar year 2009 and have had those emissions verified by a third party in 2010. In general the rule applies to facilities emitting more than 25,000 $MTCO_2e$ in any given calendar year or electricity generating facilities with a nameplate generating capacity greater than 1 megawatt and/or emitting more than 2,500 $MTCO_2e$ per year. Additional requirements also apply to cement plants and entities that buy and sell electricity in the state.

Western Climate Initiative/California Cap and Trade (2010/2011)

The Western Climate Initiative (WCI) is a collaboration of seven western states (Washington, Oregon, California, Arizona, New Mexico, Utah, and Montana) and four Canadian provinces (British Columbia, Manitoba, Ontario, and Quebec) that are working together to identify, evaluate, and implement policies to tackle climate change at a regional level. On July 27, 2010, the Partner jurisdictions of the WCI released a comprehensive strategy designed to reduce climate-warming GHG emissions, stimulate development of clean-energy technologies, create green jobs, increase energy security and independence, and protect public health. The objective of the WCI Partner jurisdictions' plan is to reduce regional GHG emissions to 15 percent below 2005 levels by 2020 (similar to AB 32). The regional goal will be reached by creating a market-based system that caps GHG emissions and uses tradable permits to incentivize development of renewable and lower-polluting energy sources; encouraging GHG emissions reductions in industries not covered by the emissions cap, thus reducing energy costs region wide; and advancing policies that expand energy efficiency programs, reduce vehicle emissions, encourage energy innovation in high-emitting industries, and help individuals transition to new jobs in the clean-energy economy. The central component of the WCI Partner jurisdictions' comprehensive strategy is a flexible, market-based, regional cap-and-trade program that encourages the most cost-effective, reliable alternatives to reduce GHG emissions (WCI 2010).[6] ARB is working closely with the other members of the WCI to design a regional cap-and-trade program that can deliver GHG emission reductions within the region at costs lower than could be realized through a California-only program.

To that end, pursuant to the directives of AB 32, ARB approved measures on December 16, 2010, to enact a GHG Cap-and-Trade program for the state of California. The California Cap-and-Trade Program created a CO_2 market system with a GHG emissions cap that will be decreased over time. Building on the data required by the 2007 California Mandatory GHG Reporting rule, only stationary

[6] In February 2010, per Executive Order 2010-06, Arizona pulled out of the cap and trade proposal, citing economic worries. However, Arizona remains a member of the WCI.

sources that emit more than 25,000 $MTCO_2e$ per year are affected by the Cap-and-Trade program. These sources include mostly large operations, such as power plants, refineries, cement plants, hydrogen production facilities, and other large, stationary sources. Official rulemaking associated with achieving this emissions cap was adopted by January 1, 2011 and adopted the final cap-and-trade regulation and adaptive management plan on October 20, 2011. The program commenced in January 2012 and compliance began in January 2013.

Local

South Coast Air Quality Management District

At the local level, responsibilities of air quality districts include overseeing stationary-source emissions, approving permits, maintaining emissions inventories, maintaining air quality stations, overseeing agricultural burning permits, and reviewing air quality-related sections of environmental documents required by CEQA. The air quality districts are also responsible for establishing and enforcing local air quality rules and regulations that address the requirements of federal and state air quality laws and for ensuring that NAAQS and CAAQS are met.

The SCAQMD has jurisdiction over an area of approximately 10,743 square miles. This area includes all of Orange County, all of Los Angeles County except for the Antelope Valley, the non-desert portion of western San Bernardino County, and the western and Coachella Valley portions of Riverside County. The Basin is a subregion of the SCAQMD jurisdiction. While air quality in this area has improved, the Basin requires continued diligence to meet air quality standards.

SCAQMD has adopted a series of AQMPs to meet the CAAQS and NAAQS. These plans require, among other emissions-reducing activities: control technology for existing sources; control programs for area sources and indirect sources; a SCAQMD permitting system designed to allow no net increase in emissions from any new or modified (i.e., previously permitted) emission sources; and transportation control measures.

The last adopted AQMP was in 2012 and was adopted by the AQMD Governing Board on December 7, 2012. Control measure IND-01 was approved for adoption and inclusion in the Final 2012 AQMP at the February 1, 2013 Governing Board meeting (SCAQMD 2012). The Final 2012 AQMP addresses several federal planning requirements and incorporates significant new scientific data, primarily in the form of updated emissions inventories, ambient measurements, new meteorological episodes, and new air quality modeling tools. The 2012 AQMP builds upon the approaches taken in the 2007 AQMP for the Basin for the attainment of NAAQS. The 2012 AQMP addresses federal CAA requirements, including a 24-hour PM2.5 Plan, 8-hour ozone additional measures and VMT offset demonstration, and 1-hour ozone attainment demonstration and VMT offset demonstration. Additionally, the AQMP highlights the significant amount of reductions needed and the need to identify additional strategies, especially in the area of mobile sources, to meet federal criteria pollutant standards within the timeframes allowed under federal CAA.

The 2012 AQMP focuses on attainment of federal PM2.5 standards by the 2014 attainment date, which focuses on directly-emitted PM2.5 and NO_X reductions, since NO_X is also a precursor to ozone. The 8-hour ozone control strategy builds on the PM2.5 strategy, augmented with additional NO_X and VOC reductions to meet the standard by 2024. The 2012 AQMP concluded that substantial emission reductions from all sources are necessary. SCAQMD has initiated development of the 2016 AQMP, which will focus on attainment of the federal 8-hour ozone standard (0.070 ppm).

The upcoming 2016 AQMP will include strategies to meet the following NAAQS: 8-hour ozone (70 parts per billion [ppb]) by 2032; annual PM2.5 (12 micrograms per cubic meter [$\mu g/m^3$]) by 2021-2025; 8-hour ozone (80 ppb) by 2024; 1-hour ozone (120 ppb) by 2023; and 24-hour PM2.5 (35 $\mu g/m^3$) by 2019. The SCAQMD governing board is expected by summer 2016 to consider adoption of the 2016 AQMP and would submit the plan to EPA shortly thereafter. Until the 2016 AQMP receives EPA approval, the 2012 AQMP will remain in effect.

SCAQMD has published the *CEQA Air Quality Handbook* (SCAQMD 1993) to help local governments analyze and mitigate project-specific air quality impacts. The handbook provides standards, methodologies, and procedures for conducting air quality analyses and was used extensively in the preparation of this report. In addition, SCAQMD has published additional documents (*Localized Significance Threshold Methodology for CEQA Evaluations* in 2003, *Particulate Matter (PM) 2.5 Significance Thresholds and Calculation Methodology* in 2006, and *Supplemental Guidelines for Preparing Risk Assessment for the Air Toxics "Hot Spots"* in 2015) that provide guidance in evaluating localized effects from mass emissions during construction and operations. These documents were used in the preparation of this report.

SCAQMD Rules and Regulations

Through the attainment planning process, SCAQMD develops the SCAQMD Rules and Regulations to regulate sources of air pollution in the Basin. The SCAQMD rules most pertinent to construction and operation of the Project are listed below. In addition, to the extent that MSF or TPSS equipment would require SCAQMD permits, the Project would be subject to additional SCAQMD rules that apply to stationary sources, such as Regulation XIII (New Source Review), Rule 1401 (New Source Review of Toxic Air Contaminants), or Rule 431.2 (Sulfur Content of Liquid Fuels), among other rules.

SCAQMD Rule 402—Nuisance. This rule prohibits discharge of air contaminants or other material that:

- Cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public;
- Endanger the comfort, repose, health, or safety of any such persons or the public; and
- Cause, or have a natural tendency to cause, injury, or damage to business or property.

SCAQMD Rule 403—Fugitive Dust. This rule prohibits emissions of fugitive dust from any active operation, open storage pile, or disturbed surface area that remains visible beyond the emission source property line. During construction of the Project, best available control measures identified in the rule would be required to minimize fugitive dust emissions from proposed earth-moving and grading activities. These measures would include site prewatering and rewatering as necessary to maintain sufficient soil moisture content. Additional requirements apply to construction projects on property with 50 or more acres of disturbed surface area, or for any earth-moving operation with a daily earth-moving or throughput volume of 5,000 cubic yards or more three times during the most recent 365-day period. These requirements include submittal of a dust control plan, maintaining dust control records, and designating a SCAQMD-certified dust control supervisor.

SCAQMD Regulation XIII. This regulation sets forth pre-construction review requirements for new, modified, or relocated facilities to ensure that the operation of such facilities does not interfere with progress in attainment of the national ambient air quality standards, and that future economic growth within the SCAQMD is not unnecessarily restricted. The specific air quality goal of this regulation is to achieve no net increases from new or modified permitted sources of nonattainment air contaminants or their precursors.

In addition to nonattainment air contaminants, this regulation will also limit emission increases of ammonia and ozone-depleting compounds from new, modified, or relocated facilities by requiring the use of best available control technology (BACT).

SCAQMD Regulation XIV. This rule specifies limits for maximum individual cancer risk, cancer burden, and noncancer acute and chronic hazard index from new permit units, relocations, or modifications to existing permit units that emit TACs. The rule establishes allowable risks for permit units requiring new permits.

SCAQMD Rule 1403—Asbestos Emissions from Demolition/Renovation Activities. The purpose of this rule is to limit emissions of asbestos, a TAC, from structural demolition/renovation activities. The rule requires people to notify the SCAQMD of proposed demolition/renovation activities and to survey these structures for the presence of asbestos-containing materials (ACMs). The rule also includes: notification requirements for any intent to disturb ACM; emission control measures; and ACM removal, handling, and disposal techniques. All proposed structural demolition activities associated with proposed construction would need to comply with the requirements of Rule 1403.

SCAQMD Regulation XXXV. This regulation sets forth rules for railroads and railroad operations, including requiring operators to keep a record of idling events of 30 minutes or more (Rule 3501), idling restriction on freight trains (Rule 3502), and requirements for health risk assessments at rail yards (Rule 3503). Rules within Regulation XXXV apply only to Class I freight railroads defined by the Surface Transportation Board as having an annual revenue of $250 million or more and switching and terminal freight and rail yards. The streetcar does not handle freight. Therefore, these rules are not applicable to the Project.

With respect to GHGs, ARB's Climate Change Scoping Plan states that local governments are "essential partners" in the effort to reduce GHG emissions. The Climate Change Scoping Plan also acknowledges that local governments have "broad influence and, in some cases, exclusive jurisdiction" over activities that contribute to significant direct and indirect GHG emissions through their planning and permitting processes, local ordinances, outreach and education efforts, and municipal operations. Many of the proposed measures to reduce GHG emissions rely on local government actions. The Climate Change Scoping Plan encourages local governments to reduce GHG emissions by approximately 15 percent from current levels by 2020.

To provide guidance to local lead agencies on determining significance for GHG emissions in its CEQA documents, SCAQMD staff established an ongoing GHG CEQA Significance Threshold Working Group. Members of the working group include government agencies implementing CEQA and representatives from various stakeholder groups that provide input to SCAQMD staff on developing GHG CEQA significance thresholds. To date, SCAQMD has formally adopted 10,000 $MTCO_2e$ as a threshold only for industrial facilities (i.e., industrial facilities that require issuance of a SCAQMD Title V or RECLAIM permit). Because the Project would not require such a permit, the 10,000 $MTCO_2e$ threshold is not applicable.

Southern California Association of Governments

SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties. It addresses regional issues relating to transportation, economy, community development, and environment. SCAG is the federally designated MPO for the majority of the southern California region and is the largest MPO in the nation. With respect to air quality planning, SCAG has prepared the Regional Comprehensive Plan and Guide for the SCAG region, which includes Growth Management and Regional Mobility chapters, which form the basis for the land use and transportation components of the AQMP. These chapters are utilized in the preparation of air quality forecasts and the consistency analysis that is included in the AQMP.

With respect to air quality planning, SCAG prepares the RTP for the SCAG region every 3 years, which, along with the Regional Comprehensive Plan and Guide, forms the basis for the land use and transportation components of the AQMP, and is used to prepare the air quality forecasts and the consistency analysis that are included in the AQMP.

City of Los Angeles

The City of Los Angeles published a climate action plan in 2007 titled *GreenLA*. In order to provide detailed information on action items discussed in GreenLA, the City published an implementation document in 2008 titled *ClimateLA*. ClimateLA presents the existing GHG inventory for the city, includes enforceable GHG reduction requirements, provides mechanisms to monitor and evaluate progress, and includes mechanisms that allow the plan to be revised in order to meet targets. By 2030, the plan aims to reduce GHG emissions by 35 percent from 1990 levels, which were estimated to be approximately 54.1 million metric tons.

Therefore, the City will need to lower annual GHG emissions to approximately 35.1 million metric tons per year by 2030. To achieve these reductions the City has developed strategies that focus on energy, water use, transportation, land use, waste, open space and greening, and economic factors. To reduce emissions from energy usage, ClimateLA proposes the following goals: increase the amount of renewable energy provided by the Los Angeles Department of Water and Power; present a comprehensive set of green building policies to guide and support private sector development; reduce energy consumed by City facilities and utilize solar heating where applicable; and help citizens to use less energy. With regard to waste, ClimateLA sets the goal of reducing or recycling 70 percent of trash by 2015. With regard to open space and greening, ClimateLA includes the following goals: create 35 new parks; revitalize the Los Angeles River to create open space opportunities; plant one million trees throughout the city; identify opportunities to “daylight” streams; identify promising locations for stormwater infiltration to recharge groundwater aquifers; and collaborate with schools to create more parks in neighborhoods. The 2007 GreenLA/2008 ClimateLA documents remain current as of February 2016.

Existing Conditions

Ambient air quality is affected by climatological conditions, topography, and the types and amounts of pollutants emitted. The area potentially affected by the Project is located within the City of Los Angeles, within Los Angeles County, and within the Basin. The following discussion describes relevant characteristics of the Basin and an overview of conditions affecting ambient air pollutant concentrations.

Regional Context

The project site is located within the Basin, an area covering approximately 6,745 square miles and bounded by the Pacific Ocean to the west and south and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The Basin includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties, in addition to the San Gorgonio Pass area in Riverside County. The terrain and geographical location determine the distinctive climate of the Basin, which is a coastal plain with connecting broad valleys and low hills.

The Southern California region lies in the semi-permanent high-pressure zone of the eastern Pacific. As a result, the climate is mild and tempered by cool sea breezes. The usually mild climatological pattern is interrupted infrequently by periods of extremely hot weather, winter storms, or Santa Ana winds. The extent and severity of the air pollution problem in the Basin is a function of the area's natural physical characteristics (weather and topography) as well as human-made influences (development patterns and lifestyle). Factors such as wind, sunlight, temperature, humidity, rainfall, and topography all affect the accumulation and dispersion of pollutants throughout the Basin, making it an area of high pollution potential.

The greatest air pollution impacts in the Basin occur from June through September. These are generally attributed to the large amount of pollutant emissions, light winds, and shallow vertical atmospheric mixing. This condition frequently reduces pollutant dispersion, thereby causing elevated air pollution levels. Pollutant concentrations in the Basin vary with location, season, and time of day. O_3 concentrations, for example, tend to be lower along the coast, higher in the near inland valleys, and lower in the far inland areas of the Basin and adjacent desert.

SCAQMD completed an ambient air monitoring and evaluation study in the Basin (i.e., the Multiple Air Toxics Exposure Study III [MATES III] study) (SCAQMD 2013). MATES III was a follow up to previous air toxics studies in the Basin and part of the SCAQMD Governing Board's Environmental Justice Initiative. The MATES III study concluded that the average carcinogenic risk throughout the Basin, which was attributed to TACs, is approximately 1,194 in one million. Mobile sources (e.g., cars, trucks, trains, ships, aircraft) are the greatest contributors. About 83.6 percent of all risk is attributed to DPM emissions (SCAQMD 2008a). SCAQMD completed its MATES IV study in May 2015 which concluded that air toxic exposure within the Basin has decreased when compared against previous studies and monitoring location data. MATES IV estimated that the carcinogenic risk from air toxics in the Basin was 65 percent lower than the monitored average in MATES III with the greatest risk around ports and major transportation corridors (SCAQMD 2015b).

Local Air Conditions

Local Climate

Data from the closest climate monitoring station—Western Regional Climate Center's Los Angeles Civic Center Station (COOPID 045115)—was used to characterize project vicinity climate conditions. Over the period of record (1906–2012), the average project area summer (August) high and low temperatures were 83.1 degrees Fahrenheit (°F) and 63.8°F, respectively, while temperatures exceed 90°F an average of 8.5 times per year. The average winter (January) high and low temperatures were 66.4°F and 48.3°F, respectively, while temperatures rarely drop below 32°F. Rainfall varies widely from year to year, with an annual average of 14.77 inches with an average of 36 days with measureable rainfall (greater than or equal to 0.01 inches) (Western Regional Climate Center 2013).

The closest wind monitoring station, located approximately 1.5 miles northeast of the project area, is the Central Los Angeles wind monitoring station (1630 Main Street). Wind patterns in the project vicinity arise primarily from the west-southwest, with seasonal and diurnal variations resulting in northeast (during Santa Ana events) and southerly winds (before and during winter storms) (National Oceanic and Atmospheric Administration n.d.). Over the period of record (1/1/2006 to 12/31/2009), winds at the Central Los Angeles station averaged a speed of 2.23 meters per second (5.0 mph), while calm wind conditions were present only 0.32 percent of the time (SCAQMD 2011).

Existing Pollutant Levels at Nearby Monitoring Station

SCAQMD has divided the Basin into air monitoring areas and maintains a network of air quality monitoring stations located throughout the Basin. The project alignment is located in the Central Los Angeles County Monitoring Area (Source Receptor Area [SRA] 1). The nearest monitoring station is the Los Angeles – North Main Street station (ARB 70087, 1630 North Main Street), located approximately 1.5 miles northeast of the Project. Criteria pollutants monitored at the Los Angeles – North Main Street station include O_3, CO, NO_2, PM10, PM2.5, SO_2, and lead.

Concentrations of pollutants over the last 3 years for which complete data are available (2013–2015) have been compiled from the stations' data (see Table 2) (EPA 2016a; ARB 2016). Monitoring data show the following pollutant concentration violations:

- 1-hour O_3 CAAQS was exceeded multiple times in 2014 and 2015.
- 8-hour O_3 CAAQS and NAAQS were exceeded multiple times in 2014.
- 24-hour PM10 CAAQS was exceeded several times each year.
- 24-hour PM10 NAAQS was not exceeded in 2013–2015.
- 24-hour PM2.5 NAAQS was exceeded once in 2013 and several times in 2014 and 2015.
- 1-hour NO_2 NAAQS and CAAQS were not exceeded in 2013–2015.
- No exceedances of the CO CAAQS or NAAQS were recorded.
- The annual standard for PM2.5 has been exceeded in 2013–2015, but not for PM10.

Existing Health Risk in the Surrounding Area

According to SCAQMD inhalation cancer risk data (MATES IV), the project area is within cancer risk zones ranging from approximately 1,516 in one million (at the southwest corner of the project area, near I-10) to approximately 1,830 in one million (at the northern portion of the project area, near

US-101) (SCAQMD 2015b). For comparison, the average Basin cancer risk from air toxics based on the annual average levels calculated from the 10 study monitoring sites is approximately 418 in one million. This is about 65 percent lower than the estimated risks from the 2004–2006 time period.

Table 2. Air Quality Data from Los Angeles – North Main Street Station (ARB 70087, AQS 06-037-1103)

Pollutant and Standard	2013	2014	2015
Ozone (O_3)			
Maximum concentration 1-hour period	0.081	0.113	0.104
Maximum concentration 8-hour period	0.069	0.094	0.074

Source: ARB 2016; EPA 2016a. Compiled by ICF, April 2016. Notes: ppm = parts per million; μg/m^3 = micrograms per cubic meter; mg/m^3 = milligrams per cubic meter; NA = Insufficient data available to determine the value.			

Sensitive Receptors and Locations

SCAQMD defines sensitive receptor locations as residential, commercial, and industrial land use areas as well as other locations where sensitive populations may be located. Other sensitive receptor locations include schools, hospitals, convalescent homes, day care centers, and other locations where children, chronically ill individuals, or other sensitive persons could be exposed (SCAQMD 2005).

The Project would occur within the heavily developed downtown Los Angeles area, and would traverse the following neighborhoods/districts from north to south: the Civic Center, Bunker Hill, the Historic Core, the Jewelry District, the Financial Core, South Park, and the Los Angeles Sports and Entertainment District. Sensitive receptor locations within 1/4 mile of the Project include multiple land use categories such as residential, medical, and child care, among other uses. Detailed below under the discussion of *Significance Thresholds*, the most conservative (i.e., lowest number) SCAQMD localized thresholds are used to evaluate local impacts throughout the project limits. This will ensure that all sensitive receptor locations are evaluated using the most conservative localized significance criteria.

State Greenhouse Gas Emissions

More than 97 percent of U.S. GHG emissions are the result of burning fossil fuels. Of these GHGs, 83 percent are in the form of CO_2, 10 percent are CH_4, and 4.5 percent are N_2O. Fossil fuels are burned to power vehicles, create electricity, and generate heat. Vehicle emissions are the largest source of CO_2 emissions in California, representing 38 percent of statewide emissions in 2011. Electrical generation is the second-largest source of emissions in California, at 19 percent; commercial and residential land uses are the third-largest generator of California GHG emissions, at 10 percent (ARB 2013). On a national level, electrical generation is the largest emissions sector, and transportation is the second largest. Other sources of GHG emissions generated within the U.S. and California include agriculture, land clearing, the landfilling of waste, refrigerants, and certain industrial processes.

Although many nations, including the U.S., regularly monitor and report GHG emissions, federal legislation to reduce global emissions has not been adopted and is the subject of much debate. As noted above, EPA is presently pursuing regulation of GHGs through the federal CAA, following a U.S. Supreme Court ruling (*Massachusetts, et al. v. Environmental Protection Agency* 549 US 497) clarifying that it has the authority under the CAA to do so. Many states, including California as a prominent leader, have passed legislation to reduce GHG emissions. California's GHG regulatory framework is discussed further in the Regulatory Setting.

Greenhouse Gas Inventories

A GHG inventory is a quantification of all GHG emissions and sinks within a selected physical and/or economic boundary. GHG inventories can be performed on a large scale (i.e., for global and national entities) or on a small scale (i.e., for a particular building or person). Although many processes are difficult to evaluate, several agencies have developed tools to quantify emissions from certain sources.

U.S. Greenhouse Gas Emissions Inventory

EPA estimates that total U.S. GHG emissions for 2014 amounted to 6,870 $MMTCO_2e$, which is 7.4 percent greater than 1990 levels and a 1.0 percent increase over 2013 levels (EPA 2016b). U.S. GHG emissions were responsible for approximately 168 percent of global GHG emissions in 2011 (U.S. Department of Energy 2015). The largest contributors to U.S. GHG emissions in 2014 were electricity generation (30 percent), transportation (26 percent), and the industrial sector (21 percent). Emissions in the electricity generation, transportation, residential, commercial, and industrial sectors consist primarily of CO_2. GHG emissions due to agriculture consist predominantly of CH_4 and N_2O. In general, industrial emissions in the U.S. have declined over the last decade, while emissions in other sectors, such as transportation, have grown steadily (EPA 2016b).

California Greenhouse Gas Emissions Inventory

In 2013, total California GHG emissions were 459 $MMTCO_2e$. Although total emissions have decreased by 14 percent from 2000 to 2013, emissions increased by 1.6 percent from 2010 to 2013 (452 to 459 $MMTCO_2e$). The transportation sector accounted for approximately 37 percent of the total emissions, the industrial sector accounted for approximately 23 percent, and electricity generation accounted for approximately 20 percent, with almost equal contributions from in-state and imported electricity (ARB 2015a). From a broader geographical perspective, the state of California ranked second in the United States for 2013 GHG emissions, only behind Texas. However, from a per capita standpoint, California had the 48th lowest emissions (U.S. Energy Information Administration 2015). On a global scale, if California were considered as a nation, in 2013 California had the 12th largest CO_2 emissions and the 9th largest per capita emissions (European Commission 2016).

City of Los Angeles Greenhouse Gas Emissions Inventory

In 2004, total community-wide GHG emissions were greater than 50 $MMTCO_2e$, roughly the same amount as the country of Sweden. The transportation sector accounted for approximately 47 percent of the total emissions, electricity generation accounted for approximately 32 percent, natural gas use generates 9 percent of emissions, and the balance of 12 percent is from burning other industrial fuels. The City's *GreenLA*, discussed above, includes more than 50 actions to reduce city-wide GHG emissions, as well as measures to adapt to the effects of climate change. The City's goal is to reduce GHG emissions to 35 percent below 1990 levels by 2030 (City of Los Angeles 2007).

This page intentionally left blank.

State and SCAQMD

Based on Appendix G of the State CEQA Guidelines, the Project would have a potentially significant effect on air quality if it would:

- Conflict with or obstruct implementation of the applicable air quality plan,
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation,
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions that exceed quantitative thresholds for ozone precursors),
- Expose sensitive receptors to substantial pollutant concentrations,
- Create objectionable odors affecting a substantial number of people,
- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment, or
- Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

The CEQA Guidelines also state that the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the determinations above.

Based on SCAQMD's regulatory role in the Basin, the significance thresholds and analysis methodologies outlined in the SCAQMD *CEQA Air Quality Handbook* (1993, as updated per its website), *Final Localized Significance Threshold Methodology for CEQA Evaluations* (2003), and *Final—Methodology to Calculate Particulate Matter (PM) 2.5 and PM 2.5 Significance Thresholds* guidance documents were used in evaluating project impacts.

Construction Emissions

According to criteria set forth by SCAQMD, a project would have a significant impact on construction emissions if any of the following were to occur.

- Regional emissions from both direct and indirect sources exceed any of the following SCAQMD prescribed threshold levels: (1) 75 pounds a day for ROG, (2) 100 pounds per day for NO_X, (3) 550 pounds per day for CO, (4) 150 pounds per day for PM10 or sulfur oxides (SO_X), (5) 55 pounds per day for PM2.5, and (6) 3 pounds per day for Pb; or
- Localized emissions from on-site construction equipment and site disturbance activity exceed any of the following SCAQMD-prescribed threshold levels: (1) 74 pounds per day for NO_X, (2) 562 pounds per day for CO, (3) 4 pounds per day for PM10, and (4) 2 pounds per day for PM2.5.[7]

[7] Derived from SCAQMD Localized Significance Threshold Tables—SRA 1 (Central Los Angeles County) 1-acre site, 25-meter receptor distance, which are the most conservative available localized thresholds.

Operational Emissions

According to criteria set forth by SCAQMD, a project would have a significant impact with regard to operational emissions if:

- Regional emissions from both direct and indirect sources would exceed any of the following SCAQMD prescribed threshold levels: (1) 55 pounds a day for ROG, (2) 55 pounds per day for NO_X, (3) 550 pounds per day for CO, (4) 150 pounds per day for PM10 or SO_X, (5) 55 pounds per day for PM2.5, and (6) 3 pounds per day for Pb (SCAQMD 1993, 2006);
- Localized emissions from on-site sources exceed any of the following SCAQMD prescribed threshold levels: (1) 74 pounds per day for NO_X, (2) 680 pounds per day for CO, (3) 5 pounds per day for PM10, and (4) 3 pounds per day for PM2.5;[8] or
- The project would cause an exceedance of the California 1-hour or 8-hour CO standards of 20 or 9 ppm, respectively, at an intersection or roadway within 0.25 mile of a sensitive receptor.[9]

Toxic Air Contaminants

According to guidelines provided in the SCAQMD *CEQA Air Quality Handbook*, a project would have a significant impact from TACs if:

- On-site stationary sources emit carcinogenic or TACs that individually or cumulatively exceed the maximum individual cancer risk of ten in one million (1.0×10^{-5}) or an acute or chronic hazard index of 1.0 (SCAQMD 1998);
- Hazardous materials associated with on-site stationary sources result in an accidental release of air toxic emissions or acutely hazardous materials, posing a threat to public health and safety; or
- The project would be occupied primarily by sensitive individuals within 0.25 mile of any existing facility that emits TACs, which could result in a health risk from pollutants identified in District Rule 1401 (SCAQMD 1993).

Climate Change/Greenhouse Gas Emissions

A number of agencies throughout the state, including multiple air districts, have drafted and/or adopted varying threshold approaches and guidelines for analyzing GHG emissions and climate change in CEQA documents. Some commonly used thresholds and methodologies include (1) compliance with a qualified GHG reduction strategy, (2) performance-based reductions,[10] (3) numeric "bright-line" thresholds, and (4) efficiency-based thresholds.

The recent California Supreme Court decision in the *Center for Biological Diversity et al. vs. California Department of Fish and Wildlife, the Newhall Land and Farming Company* (November 30, 2015, Case

---

[8] Derived from SCAQMD Localized Significance Threshold Tables – SRA 1 (Central Los Angeles County) and SRA 2 (Northwest Los Angeles County Coastal), 1-acre site, 25-meter receptor distance, which are the most conservative available localized thresholds.

[9] Where the CO standard is exceeded at the intersection, a project would result in a significant impact if the incremental increase due to the project is equal to or greater than 1.0 ppm for the California 1-hour CO standard or 0.45 ppm for the 8-hour CO standard.

[10] Performance-based reductions include the "percent below Business as Usual" threshold approach, which has been used widely in the past. This approach was the subject of the *Newhall Ranch* case and currently is subject to uncertainty until the issues raised in the Supreme Court ruling are resolved.

No. S217763) (hereafter Newhall Ranch) clarified various ways to analyze climate change impacts for the Project.[11]

Pursuant to *Newhall Ranch*, a project-level analysis that uses ARB's business-as-usual (BAU) model must present substantial evidence to support the use of the model for the particular project at the specific project location, which may require examination of the data behind the state-wide model and adjustment to the levels of reduction from BAU. To date, neither ARB nor any lead agencies have provided any guidance on how to adjust AB 32's statewide BAU target to the project level.

Moreover, the Court appeared to potentially endorse the following methodologies, but did not foreclose other methodologies that may be used by lead agencies depending on the circumstances of a given project.

- Assessment, in whole or in part, by looking to compliance with regulatory programs designed to reduce GHG from particular activities (e.g., building efficiency, transportation, water usage) and to the extent that a project's design features comply with or exceed the regulations outlined in the Scoping Plan and adopted by ARB or other state agencies, the lead agency could appropriately rely on their use as showing compliance with CEQA.
- Use of a GHG emission reduction plan consistent with State CEQA Guidelines Sections 15183.5 or 15064.4 for a particular geographic area.
- Certain land use projects (such as residential, mixed use, and transit priority projects) could use CEQA's expressed allowance for streamlining of transportation impacts based on metropolitan regional sustainable communities strategies.
- Use of a bright-line threshold, although such threshold is not required.

Under any methodology, the *Newhall Ranch* case recognizes that if GHG emission impacts are still significant after adoption of all feasible mitigation measures and/or project alternatives, the lead agency may adopt a statement of overriding consideration with the appropriate findings. Moreover, thresholds only define the level at which an environmental effect is "normally" considered significant; they do not relieve the lead agency of its duty to determine the significance of an impact independently.

Although the *Newhall Ranch* holding did not rule on whether a post-2020 climate change analysis is required for CEQA documents, the court did state that consistency with 2020 goals will become a less definitive guide over time and consistency with long-term emission reduction targets may be needed in the near future. Although EO B-30-15 has set forth an interim reduction target to reduce GHG emissions by 40% below 1990 levels by 2030 and EO S-03-05 has set forth a long-term reduction target to reduce GHG emissions by 80% below 1990 levels by 2050, and there are proposals at the state legislature to adopt interim (2030) and long-term (2050) binding GHG targets,[12] there is no current statewide or local GHG reduction plan that extends beyond 2020.[13] Additionally these EOs have not been codified into law.

[11]The *Newhall Ranch* holding did not rule on whether CEQA climate change analysis for post-2020 was required.

[12]The 2030 target of 40% below 1990 levels may be adopted in legislation per the proposed SB 32, which was withdrawn during the 2015 legislative term but is expected to be considered in the 2016 legislative term.

[13]EO B-30-15 requires ARB to update the scoping plan to include a plan to achieve the 2030 target, which is expected in late 2016.

However, the State and the District have shown interest in adopting regulatory programs and frameworks designed to support meeting statewide post-2020 reduction goals. For example, the Scoping Plan First Update includes some post-2020 concepts (reduction measures) either currently underway or being considered that may be incorporated in the next Scoping Plan update. Meeting the ambitious targets in EO B-30-15 and EO S-03-05 will require substantial effort at the state, regional, and local levels. Lacking an adopted post-2020 plan, the Association of Environmental Professionals (2015) recommends that CEQA GHG analyses evaluate project emissions in light of the trajectory of state climate change legislation and assess their "substantial progress" toward achieving longer-term reduction targets identified in available plans (e.g., climate action plans), legislation, or executive orders. Currently there are no proposed or adopted significance thresholds for analyzing post-2020 emissions for development projects in California, and there are no adopted statewide or local plans to reduce emissions 40% below 1990 levels by 2030.

Currently there are no adopted bright-line quantitative thresholds relevant to the Project. The SCAQMD has adopted 10,000 MT screening significance threshold level for industrial projects (SCAQMD 2008b), and has also drafted a 3,000 MT screening significance threshold level for commercial/residential projects. The Project is a transportation project that does not fit into the industrial, commercial or residential project categories. The SCAQMD has not proposed or adopted a threshold level for transportation projects. For purposes of this analysis, both direct and indirect GHG emissions from the Project are discussed with respect to both the 10,000 and 3,000 MT threshold levels.

City of Los Angeles

The City of Los Angeles has not adopted specific Citywide significance thresholds for air quality impacts. However, because of SCAQMD's regulatory role in the Basin, the *L.A. CEQA Thresholds Guide* (City of Los Angeles 2006) references the significance threshold and analysis methodologies in the SCAQMD's *CEQA Air Quality Handbook* to assist in evaluating projects proposed within the City. The following are the impact significance thresholds taken from the *CEQA Air Quality Handbook*.

Construction Emissions

According to criteria set forth in the SCAQMD *CEQA Air Quality Handbook*, *Localized Significance Threshold Methodology for CEQA Evaluations*, and *Particulate Matter (PM) 2.5 Significance Thresholds and Calculation Methodology* guidance documents, a project would have a significant impact on construction emissions if any of the following were to occur.

- Regional emissions from both direct and indirect sources exceed any of the following SCAQMD prescribed threshold levels: (1) 75 pounds a day for ROG, (2) 100 pounds per day for NO_X, (3) 550 pounds per day for CO, (4) 150 pounds per day for PM10 or SO_X, (5) 55 pounds per day for PM2.5, and (6) 3 pounds per day for Pb; or
- Localized emissions from on-site construction equipment and site disturbance activity exceed any of the following SCAQMD-prescribed threshold levels: (1) 74 pounds per day for NO_X, (2)

562 pounds per day for CO, (3) 4 pounds per day for PM10, and (4) 2 pounds per day for PM2.5.[14]

Operational Emissions

According to criteria set forth in the SCAQMD *CEQA Air Quality Handbook*, a project would have a significant impact with regard to operational emissions if:

- Regional emissions from both direct and indirect sources would exceed any of the following SCAQMD prescribed threshold levels: (1) 55 pounds a day for ROG, (2) 55 pounds per day for NO_X, (3) 550 pounds per day for CO, (4) 150 pounds per day for PM10 or SO_X, (5) 55 pounds per day for PM2.5, and (6) 3 pounds per day for Pb (SCAQMD 1993, 2006);
- Localized emissions from on-site sources exceed any of the following SCAQMD prescribed threshold levels: (1) 74 pounds per day for NOx, (2) 680 pounds per day for CO, (3) 5 pounds per day for PM10, and (4) 3 pounds per day for PM2.5[15]; or
- The project would cause an exceedance of the California 1-hour or 8-hour CO standards of 20 or 9 ppm, respectively, at an intersection or roadway within 0.25 mile of a sensitive receptor.[16]

Toxic Air Contaminants

According to guidelines provided in the SCAQMD CEQA *Air Quality Handbook*, a project would have a significant impact from TACs if:

- On-site stationary sources emit carcinogenic or TACs that individually or cumulatively exceed the maximum individual cancer risk of ten in one million (1.0×10^{-5}) or an acute or chronic hazard index of 1.0 (SCAQMD 1998);
- Hazardous materials associated with on-site stationary sources result in an accidental release of air toxic emissions or acutely hazardous materials, posing a threat to public health and safety; or
- The project would be occupied primarily by sensitive individuals within 0.25 mile of any existing facility that emits TACs, which could result in a health risk from pollutants identified in District Rule 1401 (SCAQMD 1993).

Climate Change/Greenhouse Gas Emissions

The 2006 *L.A. CEQA Thresholds Guide* does not address climate change or GHGs. Appendix G of the State CEQA Guidelines does address this topic and the following significance threshold will be used.

The Project would be considered to have a significant impact if it would:

---

[14] Derived from SCAQMD Localized Significance Threshold Tables – SRA 1 (Central Los Angeles County) and SRA 2 (Northwest Los Angeles County Coastal), 1 acre site, 25-meter receptor distance.

[15] Derived from SCAQMD Localized Significance Threshold Tables – SRA 1 (Central Los Angeles County) and SRA 2 (Northwest Los Angeles County Coastal), 1 acre site, 25-meter receptor distance.

[16] Where the CO standard is exceeded at the intersection, a project would result in a significant impact if the incremental increase due to the project is equal to or greater than 1.0 ppm for the California 1-hour CO standard or 0.45 ppm for the 8-hour CO standard.

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; or would conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Transportation Conformity

The Project is a transportation project seeking FTA approval. Thus, the Project is subject to transportation conformity requirements at both the regional and project level.

Regional Conformity

The Project is located in an extreme nonattainment area with regard to the federal 8-hour ozone standard. Because ozone and its precursors are regional pollutants, the Project must be evaluated under the transportation conformity requirements described earlier. An affirmative regional conformity determination must be made before the Project can proceed. Such a determination is not required if the Project is described in an approved RTP and TIP and the Project has not been altered in design concept or scope described in said RTP and TIP documents.

Project-Level Conformity

As stated above, if a project is located in a non-attainment or maintenance area for localized pollutants, then a hot-spot analysis and possible emission reduction measures to address that pollutant are required. Project level hot-spot analyses are only required for localized pollutants (i.e., CO, PM10, and PM2.5).

Carbon Monoxide

The Project is located in a maintenance area with regard to the federal CO standard. Consequently, the evaluation of transportation conformity for CO is required. The CO transportation conformity analysis is based on the Transportation Project-Level Carbon Monoxide Protocol (CO Protocol) developed for the California Department of Transportation (Caltrans) by the Institute of Transportation Studies at the University of California, Davis (Garza et al. 1997) and is consistent with the assumptions used in the RTP regional emissions analysis. This CO protocol details a step-by-step procedure to determine whether project-related CO concentrations have a potential to generate new air quality violations, worsen existing violations, or delay attainment of NAAQS and CAAQS for CO.

Project traffic during the operational phase of the Project would have the potential to create congestion at nearby intersections, thereby potentially leading to localized CO hot spots. Intersections were screened to capture those intersections that displayed the worst (i.e., longest) delay and highest peak hour traffic volumes. From this screening five intersections were selected for analysis of potential localized CO hot-spot impacts. These intersections represent the worst traffic conditions in the vicinity of the Project. This screening analysis was completed for each alternative (SCAQMD 1993).

CO hot-spot impacts were evaluated through CO dispersion modeling using the EMFAC 2014 web-tool, the CALINE4 model, and traffic data provided by the traffic engineers. CO emissions were modeled for existing year 2016 (2014–2015 traffic data), and the opening year (2020) and horizon year (2040) no-Project and with-Project build alternatives at the five selected intersections. Each intersection was modeled under no-Project and with-Project traffic conditions to note the projected net change in CO concentrations. CO emission rates were based on an SCAQMD average fleet operating under winter emission rate conditions and an average speed of 5 mph. The above method provides a conservative (tending to overestimate impacts) analysis because vehicle CO emission rates are highest at both low travel speeds and in cold air temperatures.

PM10 and PM2.5

The Project is located in a nonattainment area for the federal PM10 and PM2.5 standards. Consequently, project-level conformity determinations for PM10 and PM2.5 are required. In December 2010, EPA finalized conformity guidance for determining which transportation projects must be analyzed for local air quality impacts in PM2.5 and PM10 nonattainment and maintenance areas (FHWA and EPA 2010). The final rule requires PM10 and PM2.5 hot-spot analyses to be performed for a project of air quality concern (POAQC) or any other project identified by the PM10 or PM2.5 SIP as a localized air quality concern.

In November 2015 EPA updated the conformity guidance for quantifying local air quality impacts of transportation projects on PM2.5 and PM10 to reflect the MOVES2014 emissions model and its revisions—*Transportation Conformity Guidance for Quantitative Hot-Spot Analyses in PM2.5 and PM10 Nonattainment and Maintenance Areas* (EPA 2015c). This guidance requires lead agencies to conduct a quantitative hot-spot analysis for projects in PM2.5 and PM10 nonattainment and maintenance areas. The FHWA and EPA guidance identifies examples of projects that are most likely POAQCs and details a qualitative step-by-step screening procedure to determine whether project-related particulate emissions have a potential to generate new air quality violations, worsen existing violations, or delay attainment of NAAQS for PM2.5 or PM10.

POAQCs are certain highway and transit projects that involve significant levels of diesel traffic or any other project identified in the PM2.5 or PM10 SIP as a localized air quality concern. As noted in EPA's March 2006 final rule, the following are examples of POAQCs.

- A project on a new highway or expressway that serves a significant volume of diesel truck traffic, such as facilities with greater than 125,000 annual average daily traffic (AADT) where 8 percent or more of such AADT is diesel truck traffic;
- New exit ramps and other highway facility improvements to connect a highway or expressway to a major freight, bus, or intermodal terminal;
- Expansion of an existing highway or other facility that affects a congested intersection (operating at level of service [LOS] D, E, or F) that has a significant increase in the number of diesel trucks;
- Similar highway projects that involve a significant increase in the number of diesel transit busses and/or diesel trucks;
- A major new bus or intermodal terminal that is considered to be a "regionally significant project" under 40 CFR 93.101; and
- An existing bus or intermodal terminal that has a large vehicle fleet where the number of diesel buses increases by 50 percent or more as measured by bus arrivals.

As noted in EPA's March 2006 final rule, the examples below are projects that are not of air quality concern:

- Any new or expanded highway project that primarily serves gasoline vehicle traffic (i.e., does not involve a significant number or increase in the number of diesel vehicles), including such projects involving congested intersections operating at LOS D, E, or F;
- An intersection channelization project or interchange configuration project that involves either turn lanes or slots or lanes or movements that are physically separated. These kinds of projects improve freeway operations by smoothing traffic flow and vehicle speeds by improving weave and merge operations, which would not be expected to create or worsen PM2.5 or PM10 violations;
- Intersection channelization projects; traffic circles or roundabouts; intersection signalization projects at individual intersections; and interchange reconfiguration projects that are designed to improve traffic flow and vehicle speeds, do not involve any increases in idling, and would be expected to have a neutral or positive influence on PM2.5 or PM10 emissions as a result;
- A new or expanded bus terminal that is served by non-diesel vehicles (e.g., compressed natural gas) or hybrid-electric vehicles; and
- A 50 percent increase in daily arrivals at a small terminal (e.g., a facility with 10 buses in the peak hour).

For projects identified as not being a POAQC, PM2.5 and PM10 (for regions without an approved conformity SIP) hot-spot analyses are not required. For these types of projects, state and local project sponsors should briefly document in their project-level conformity determinations that federal CAA and 40 CFR 93.116 requirements were met without a hot-spot analysis, because such projects have been found to not be of air quality concern under 40 CFR 93.123(b)(1).

For areas with an approved conformity SIP, the final rule does not apply (i.e., when a state withdraws the existing provisions from its approved conformity SIP and EPA approves the withdrawal, or when a state includes the revised PM10 hot-spot requirements in a SIP revision and EPA approves that SIP revision). For these areas, the assessment should continue to follow the PM10 hot-spot procedures in their existing conformity SIPs until the SIP is updated and subsequently approved by EPA.

Although the guidance for conducting a PM10 hot-spot analysis for conformity purposes contains separate requirements for PM10 nonattainment/maintenance areas with and without approved conformity SIPs, guidance from EPA indicates that there are no areas within California where a conformity SIP has been approved. Consequently, all projects that are POAQCs must undergo PM10 (and PM2.5) hot-spot conformity determinations. Projects identified as not being a POAQC do not require qualitative PM2.5 and PM10 hot-spot analyses. Because the Project would be located in an area classified as a nonattainment area for the PM2.5 standard, a determination must be made as to whether it would result in a PM2.5 hot spot. This determination is made below under the section heading *Local CO and PM Hot-Spot Analyses/Project-Level Conformity.*

Criteria Pollutants, TAC, and GHG Emissions

Construction

Construction of the Project would result in the short-term generation of criteria pollutant and TAC emissions. Mass daily combustion exhaust, fugitive dust (PM10 and PM2.5), and fugitive off-gassing paving emissions were estimated using the Sacramento Metropolitan Air Quality Management District's Roadway Construction Emissions Model, version 7.4.1 and the California Emissions Estimator Model (CalEEMod), version 2013.2.1. Both models estimate criteria pollutant and GHG emissions associated with construction. CalEEMod also estimates emissions associated with project operations. Each phase of construction would result in combustion exhaust emissions from on-site construction equipment and construction workers' commutes. All emissions calculation worksheets and air quality modeling output files are provided in Appendix A.

Operations

VMT Estimation

Some streetcar riders will use the streetcar to replace trips that were formerly made by car. The tool provided by the FTA for estimating transit ridership is the Simplified Trips-On-Project Software (STOPS) model. The STOPS model also produces an estimate of person miles traveled (PMT) by automobile that would be reduced as a result of a project. For existing and future years of the Project, Metro used the STOPS model to estimate streetcar ridership and reduced PMT by auto.

To convert reduced auto PMT to reduced VMT, an average vehicle occupancy factor was applied. This factor was derived from the City of Los Angeles Travel Demand Model, and it accounts for cars that carry more than one person (Fehr & Peers 2013). Table 3 shows the STOPS model estimates of daily riders and associated auto person miles reduced, as well as the calculated estimates of vehicle miles reduced, for each of the four project alternatives.

To assess the benefit of reduced VMT on air quality, the speeds of vehicles traveling these miles were estimated using results from the City of Los Angeles Travel Demand Model (Fehr & Peers 2013). This is important because mobile exhaust emissions rates vary by travel speed. For example, grams per mile emission rates are lower for all mobile exhaust pollutants at 55 mph than at 5 mph. As such, VMT is more useful when quantifying emissions when apportioned by travel speed, rather than "total" or "average speed" metrics. The aggregated estimate of total VMT reduction, as derived from the STOPS model, was apportioned into speed bins (0–5 mph, 6–10 mph, 11–15 mph, etc.). These VMT estimates by travel speed and CT-EMFAC2014, the emissions model developed by ARB and Caltrans, are then used to estimate project emissions reductions by Build Alternative. Tables 4, 5, and 6 provide estimates of project vicinity VMT reductions anticipated to occur under the Build Alternative, when compared to the No Project Alternative, by speed bin for each of the four Build Alternatives for existing and future years.

Emissions Calculations

As discussed above, the Project is anticipated to have an effect on local VMT and travel speeds. As such, the Project would have an effect on mobile-source criteria pollutant, MSAT, and GHG emissions. Changes in mobile-source emissions associated with regional traffic were estimated using Caltrans' CT-EMFAC2014 emissions model (Version 6.0) and VMT data discussed above.

Table 3. LA Streetcar Daily Ridership and Auto Travel Reduction Estimates

Alternative	2015			2020			2040

Construction Impacts

Regional Construction Impacts

Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation, and, for dust, the prevailing weather conditions. The assessment of construction air quality impacts considers each of these potential sources. The equipment mix and duration for each construction stage is detailed in the Road Construction Model and CalEEMod printout sheets provided in Appendix A.

The total amount of construction, the duration of construction, and the intensity of construction activity could have a substantial effect upon the amount of construction emissions, the concentrations, and the resulting impacts occurring at any one time. As such, the emission forecasts provided herein reflect a specific set of conservative assumptions based on the expected construction scenario wherein a relatively large amount of construction is occurring in a relatively intensive manner. Because of this conservative assumption, actual emissions could be less than those forecasted. If construction is delayed or occurs over a longer time period, emissions could be reduced because of (1) a more modern and cleaner burning construction equipment fleet mix, and/or (2) a less intensive build-out schedule (i.e., fewer daily emissions occurring over a longer time interval).

Table 4 shows the emissions calculated for construction of the Project. Table 8 shows that criteria pollutant emissions would be less than the applicable SCAQMD significance thresholds, and as such, impacts to regional air quality during construction would be less than significant.

Table 8. Worst-Case Regional Construction Emissions (pounds per day)

Phase	Pb	ROG	NO_X	CO	SO_X	PM10	PM2.5
Road Demolition and Excavation	<1	11	92	70	<1	16	7
Drainage/Utilities/Subgrade Work	<1	7	71	37	<1	9	5
Track and TPSS Installation, Paving	<1	3	27	17	<1	2	2
Maintenance Facility Construction	<1	70	35	21	<1	2	2
Concurrent Track Installation and Maintenance Facility Construction	<1	73	62	38	<1	4	4
SCAQMD Significance Threshold	3	75	100	550	150	150	55
Threshold exceeded for any phase?	**No**	**No**	**No**	**No**	**No**	**No**	**No**
Note: Construction Road Emissions Model and CalEEMod modeling output sheets are provided in Appendix A.							

Local Construction Impacts

In addition to regional emissions thresholds, the SCAQMD has developed Localized Significance Threshold (LST) and a set of mass emissions rate look-up tables that can be used to evaluate localized impacts that may result from construction-period emissions. If the on-site emissions from proposed construction activities are below the LST emission levels found in the LST mass rate look-up tables for the project vicinity SRA, then project emissions would not have the potential to cause a significant localized air quality impact.

When quantifying mass emissions for LST analysis, only emissions that occur on site are considered. Consistent with SCAQMD LST guidelines, emissions related to off-site delivery/haul truck activity and employee trips are not considered in the evaluation of localized impacts. Table 9 presents a conservative estimate of the Project's construction-period mass emissions. Table 9 shows that the worst-case maximum emissions for all NO_X, PM10 and PM2.5 would exceed their respective SCAQMD localized significance thresholds. As such, localized impacts would be significant prior to incorporation of mitigation measures.

Table 9. Worst-Case Localized Construction Emissions, Unmitigated (pounds per day)

Phase	NO_X	CO	PM10[a]	PM2.5[a]
Road Demolition and Excavation	94	52	6	5
Drainage/Utilities/Subgrade Work	70	45	5	5
Track and TPSS Installation, Paving	26	13	2	2
Maintenance Facility Construction	20	11	2	1
SCAQMD Localized Significance Thresholds[b]	74	680	5	4
Threshold exceeded for any phase?	**Yes**	**No**	**Yes**	**Yes**

Note: Construction Road Emissions Model and CalEEMod output sheets are provided in Appendix A.

[a] PM10 and PM2.5 emissions estimates assume compliance with SCAQMD Rule 403 requirements for fugitive dust suppression, which require that no visible dust be present beyond the site boundaries.

[b] The project site is located in SCAQMD SRA Number 1. These LSTs are based on the site location SRA, distance to nearest sensitive receptor location from the project site (25 meters), and project area that could be under construction on any given day (1 acre) that is within 25 meters of an individual sensitive receptor location.

Toxic Air Contaminants

The greatest potential for TAC emissions would be related to diesel particulate matter emissions associated with heavy equipment operations during site grading activities. Construction activities associated with the Project would be sporadic, transitory, and short term in nature. The assessment of cancer risk is typically based on a 70-year exposure period. Because exposure to diesel exhaust would be well below the 70-year exposure period, construction of the Project is not anticipated to result in an elevated cancer risk to exposed persons due to the short-term nature of construction. As such, project-related toxic emission impacts during construction would not be significant.

Operational Impacts

Regional Operations Impacts

Regional Conformity

The Project is included in the SCAG 2012–2035 RTP/SCS Amendment #1 (SCAG 2012a) and the SCAG 2013 Federal Transportation Improvement Program (FTIP) Amendment #13-04 under project identification number LA0G901 (SCAG 2012b). The 2012-2035 RTP/SCS Amendment #1 and 2013 FTIP Amendment #13-04 were found to be conforming by FTA/FHWA on July 14, 2013. The project design concept and scope as described in this report is consistent with the project description in the currently conforming RTP/SCS and FTIP. As such, the Project's regional conformity determination requirement is satisfied. SCAG has issued the Draft 2016-2040 RTP/SCS which includes the Project (SCAG 2015). Based on the Transportation Conformity Analysis in the Draft 2016-2040 RTP/SCS, the Project's regional conformity determination requirement is expected to continue to be satisfied.

Regional Mass Emissions

Regional air pollutant emissions associated with project operations would result from (1) the net change in passenger VMT that would occur within the project area under each build condition compared to the no-build condition, (2) employee trip (mobile-source) and energy demand emissions (area and stationary-source) related to maintenance and storage facility lighting and temperature control, and (3) the net change electricity generation emissions needed to power streetcar operations.

Based on the VMT estimates derived above under the methodology sub-section *VMT Estimation*, the Project is anticipated to result in a reduction of project vicinity VMT that would be due primarily to diversion of private automobile trips that would occur under each Build Alternative when compared to the No-Build Alternative. Table 10 lists the emission reductions that were estimated to occur for each year and Project Build Alternative.

Table 10. Estimated Change in Passenger Vehicle Emissions due to VMT Reduction during Operations (pounds per day)

Year	Alternative	Daily VMT Reduction	Pb[a]	ROG	NO_X	CO	SO_X	PM10	PM2.5

[a] EPA in 1996 phased out the use of Pb as a fuel additive for on-road vehicles. As such, current fuel blends for on-road vehicles contains no Pb. Therefore, on-road motor vehicle exhaust contains no Pb emissions.
NA = not applicable.
Source: ICF International 2016.
Note: CT-EMFAC2014 modeling output sheets are provided in Appendix A.

The CT-EMFAC2014 model was used to estimate the emission reductions shown above in Table 10 that would result from the reduction of daily VMT under each Build Alternative. The CalEEMod model was used to estimate emissions related to maintenance and storage facility operations. Emissions related to streetcar operations were estimated based on an engineering estimate of system energy demand. Table 11 summarizes the emissions from all of these sources. To be conservative, passenger vehicle emissions shown below in Table 11 are for the 2015 Existing plus Project Build Alternative 5, which results in the smallest emission reduction. Table 11 shows that regional mass emissions would be less than significant.

Table 11. Estimate of Operations-Period Mass Emissions (pounds per day)

Local Operational Impacts

Emissions associated with maintenance and storage facility operations were estimated using the SCAQMD CalEEMod model. With respect to local mass emissions, Table 12, below, shows that on-site operations-period emissions associated with maintenance and storage facility operations would be below SCAQMD's localized significance thresholds. Impacts from emissions of these criteria pollutants would be less than significant.

Table 12. Estimate of Operation-Period Localized Emissions (pounds per day)

Local Operational Emissions	**CO**	**NO_X**	**PM10**	**PM2.5**

Local CO and PM Hot-Spot Analyses/Project-Level Conformity

Carbon Monoxide

Within an urban setting, vehicle exhaust is the primary source of CO. Consequently, the highest CO concentrations are generally found close to congested intersections. Under typical meteorological conditions, CO concentrations tend to decrease as the distance from the emissions source (i.e., congested intersection) increases. For purposes of providing a conservative worst-case impact analysis, CO concentrations are typically analyzed at congested intersection locations. If impacts are less than significant close to congested intersections, impacts will also be less than significant at more distant sensitive-receptor locations.

Project traffic during the operational phase of the Project would have the potential to create local area CO impacts. To ascertain the Project's potential to generate localized air quality impacts, the project-specific traffic impact analysis (Intueor 2015) was reviewed to determine the potential for the creation of localized CO hot spots at congested intersection locations. SCAQMD recommends a hot spot evaluation of potential localized CO impacts when volume to capacity (V/C) ratios are increased by two percent or more at intersections with an LOS of D or worse. The traffic impact analysis identified 65 key intersection locations along routes that accommodate much of the traffic traveling within the project area. Of the 65 key intersection locations, the traffic analysis concluded that for the opening year 2020 and horizon year 2040, five intersections could potentially create a localized CO hot spot with the Project under any of the build alternatives.[17]

For these five intersections, local area CO concentrations were predicted using the CALINE4 traffic pollutant dispersion model with EMFAC2014 emissions factors. Traffic data for the p.m. peak hour was used, as volumes are generally higher and LOS lower during the p.m. peak hour than during the a.m. peak hour. The analysis of CO impacts followed the protocol recommended by the California Department of Transportation, published as *Transportation Project-Level Carbon Monoxide Protocol*, (Garza et al. 1997, reissued 2010). It is also consistent with procedures identified through SCAQMD's CO modeling protocol, with all four corners of each intersection analyzed to determine whether project development would result in a CO concentration that exceeds federal or state CO standards.

Table 13 presents the estimated 1- and 8-hour CO concentrations for the existing conditions, the project opening year 2020 and horizon year 2040. Table 13 shows that the Project would not have a significant impact on 1-hour or 8-hour local CO concentrations due to mobile source emissions.

Because significant impacts would not occur at the intersections with the highest traffic volumes or lowest LOS located adjacent to sensitive receptors under any alternative, no significant impacts are anticipated to occur at any other locations in the study area because the conditions yielding CO hot spots would not be worse than those occurring at the analyzed intersections. Consequently, the sensitive receptors that are included in this analysis would not be significantly affected by CO emissions generated by increases in traffic that could occur with the Project. Because no project alternative would cause an exceedance or exacerbate an existing exceedance of an AAQS, localized operational air quality impacts would be less than significant. No mitigation measures are necessary.

Particulate Matter

The Project is within a nonattainment area for federal PM2.5 and PM10 standards. Therefore, per 40 CFR Part 93, project-level analyses are required for conformity purposes. However, EPA does not require hot-spot analyses for projects that are not listed in section 93.123(b)(1) as a POAQC. The Project does not qualify as a POAQC for the following reasons:

- The Project is not a new or expanded highway project that would have a significant increase in the number of diesel vehicles;

[17] Based on SCAQMD-recommended screening criteria, any intersection that (1) operates at LOS D or worse, and (2) would experience an increase in peak-hour volume to capacity ratio of 2 percent or more as a result of project-related traffic, should be evaluated for potential to create a localized CO hot spot.

- The Project would not affect intersections that operate at poor LOS with a significant number of diesel vehicles;
- The Project would not include the construction of a new bus or rail terminal that would significantly increase the number of diesel-powered vehicles congregating in a single location;
- The Project would not expand an existing bus or rail terminal that would significantly increase the number of diesel-powered vehicles congregating in a single location; and
- The Project would not be located in nor affect any location, area, or categories of sites that are identified in the PM2.5 and PM10 applicable implementation plan or implementation plan submission, as appropriate, as sites of violation or possible violation.

Therefore, the Project meets the CAA requirements and 40 CFR 93.116 without any explicit hot-spot analysis. The Project would not create a new, or worsen an existing, PM10 or PM2.5 violation.

Toxic Air Contaminants/Mobile-Source Air Toxics

The purpose of the Project is to enhance mobility and transit circulation in downtown Los Angeles. The Project has been determined to generate minimal air quality impacts related to CAA criteria pollutants and has been shown not to result in MSAT concerns. While the Project would not result in meaningful changes in traffic volumes or vehicle fleet mix, VMT would be reduced under each Build Alternative when compared to the No-Build Alternative. Since MSAT emissions are a function of VMT, reductions in VMT would lead to reductions in project vicinity MSAT emissions. As such, potential impacts would be less than significant.

Moreover, EPA regulations for vehicle engines and fuels will cause overall MSAT emissions to decline significantly over the next several decades. Based on regulations now in effect, an analysis of national trends with EPA's MOVES model forecasts a combined reduction of over 80 percent in the total annual emission rate for the priority MSAT from 2010 to 2050 while during this same time vehicle-miles of travel are projected to increase by over 100 percent (FHWA 2012). This will further reduce the background level of MSATs.

Climate Change/Greenhouse Gas Emissions

Global climate change is caused by combined worldwide GHG emissions, and mitigating global climate change will require worldwide solutions. GHGs play a critical role in the Earth's radiation budget by trapping infrared radiation emitted from the Earth's surface, which could have otherwise escaped to space. Prominent GHGs contributing to this process include water vapor, CO_2, N_2O, CH_4, O_3, and certain hydro- and fluorocarbons. This phenomenon, known as the "greenhouse effect," keeps the Earth's atmosphere near the surface warmer than it would be otherwise and allows for successful habitation by humans and other forms of life. Increases in these gases lead to more absorption of radiation and warm the lower atmosphere further, thereby increasing evaporation rates and temperatures near the surface. Emissions of GHGs in excess of natural ambient concentrations are thought to be responsible for the enhancement of the greenhouse effect and to contribute to what is termed "global warming," a trend of unnatural warming of the Earth's natural climate. Climate change is a global problem, and GHGs are global pollutants, unlike criteria air pollutants (such as O_3 precursors) and TACs, which are pollutants of regional and local concern.

One of the main strategies to reduce California GHG emissions is to make California's transportation system more efficient. Projects that reduce VMT or relieve congestion will lead to an overall reduction in GHG emissions. Also, during construction, existing ARB regulations (Title 13 of the California Code of Regulations, Sections 2480 and 2485), which limit idling of diesel-fueled commercial motor vehicles, would help to limit GHG emissions associated with project-related construction vehicles.

Table 14 presents an estimate of project-related GHG emissions. The net change in GHG emissions due to the Project depends on the level of ridership (and consequent reduction in VMT) that the Project attracts. Under the lowest ridership forecast of Build Alternative 5, the Project is estimated to result in a net decrease in GHG emissions of 335 metric tons per year. Net GHG emissions reductions under all other Build Alternatives would be greater than 335 metric tons per year. As such, project GHG emissions under all Build Alternatives would remain below the significance threshold of 10,000 $MTCO_2e$ per year that SCAQMD applies to industrial emissions sources (SCAQMD 2008b). In addition, project GHG emissions under all Build Alternatives would remain below the SCAQMD draft screening significance threshold of 3,000 MT per year for commercial/residential projects. Thus, project impacts related to GHG emissions would be less than significant under all Build Alternatives, and no mitigation measures are necessary.

Table 14. Project-related Greenhouse Gas Emissions during Operation under the 2015 plus Project Condition (Metric Tons CO_2e per Year)

Source Description	Build Alternative 2	Build Alternative 3	Build Alternative 4	Build Alternative 5

Consistency with GHG Reduction Plans

SB 375 was enacted to reduce GHG emissions from automobiles and light trucks through integrated transportation, land use, housing and environmental planning. Under the law, SCAG is tasked with developing an SCS, a newly required element of the 2012-2035 RTP that provides a plan for meeting emissions reduction targets set forth by ARB.

On September 23, 2010, ARB issued a regional 8 percent per capita reduction target for the planning year 2020, and a conditional target of 13 percent for 2035 for the SCAG region. The currently conforming SCAG 2012-2035 RTP/SCS successfully achieves and exceeds these GHG emission-reduction targets set by ARB by achieving a 9 percent reduction by 2020 and 16 percent reduction by 2035 compared to the 2005 level on a per capita basis. The Project is also identified in the recently adopted (April 2016), but not yet approved by EPA, SCAG 2016-2040 RTP/SCS, which also meets SB 375 GHG per capita reduction targets.

Because the proposed Project is identified in the currently conforming SCAG 2012 RTP/SCS (project number LA0G901) and recently adopted SCAG 2016-2040 RTP/SCS, project emissions would not conflict with any plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs. Project GHG emissions would be less than significant. No mitigation measures are necessary.

Mitigation Measures

As shown above in Table 9, localized emissions of NO_X, PM10, and PM2.5 during construction are predicted to exceed SCAQMD significance thresholds without incorporation of mitigation measures. The following mitigation is prescribed to reduce impacts that may result from local construction emissions.

MM-AQ-C1: Use cleaner-burning off-road construction equipment per the following schedule: All off-road diesel-powered construction equipment greater than 50 horsepower (hp) shall meet the Tier 4 emission standards, where available. In addition, all construction equipment shall be outfitted with BACT devices certified by ARB. Any emissions control device used by the contractor shall achieve emissions reductions that are no less than what could be achieved by a Level 3 diesel emissions control strategy for a similarly sized engine as defined by ARB regulations.

MM-AQ-C2: Limitation on concurrent construction activities: Work related to utilities relocation and/or installation shall not occur during periods of road excavation.

A copy of each unit's certified tier specification, BACT documentation, and ARB or SCAQMD operating permit shall be provided to the City's project manager at the time of mobilization of each applicable unit of equipment.

Level of Significance after Mitigation

As shown below in Table 15, prescribed Mitigation Measure AQ-1 would reduce off-road NO_X, PM10 and PM2.5 exhaust emissions by approximately 36 percent, 53 percent, and 51 percent, respectively. With mitigation, worst-case localized NO_X emissions would be reduced from 94 pounds (lb)/day to 61 lb/day, which would be below the SCAQMD LST of 74 lb/day. Worst-case emissions of PM10 and PM2.5 would be reduced to approximately 3 lb/day and 2 lb/day, respectively, which would be below the SCAQMD LSTs of 5 lb/day and 4 lb/day, respectively. Accordingly, localized emissions during construction would be less than significant with implementation of the prescribed mitigation measures.

Table 15. Worst-Case Localized Construction Emissions with Mitigation (pounds per day)

Description	NO_X	PM10[a]	PM2.5[a]
Worst-case Emissions Prior to Mitigation	94	6	5
Emissions Reduction with Mitigation	(33)	(3)	(2)
Maximum Emissions with Mitigation	61	3	3
Localized Significance Thresholds[b]	74	5	4
Threshold Exceeded?	**No**	**No**	**No**

Source: ICF International 2013.

Note: Construction Road Emissions Model and CalEEMod output sheets are provided in Appendix A.

[a] PM10 and PM2.5 emissions estimates assume compliance with SCAQMD Rule 403 requirements for fugitive dust suppression, which require that no visible dust be present beyond the site boundaries.

[b] The project site is located in SCAQMD SRA Number 1. These LSTs are based on the site location SRA, distance to nearest sensitive receptor location from the project site (25 meters), and project area that could be under construction on any given day (1 acre) that is within 25 meters of any individual sensitive receptor location.

This page intentionally left blank.

Project Consistency with Regional AQMP

SCAQMD is required, pursuant to the CAA, to reduce emissions of criteria pollutants for which the Basin is in non-attainment (i.e., O_3, PM10, and PM2.5). The Project would be subject to SCAQMD's AQMP. The AQMP contains a comprehensive list of pollution control strategies directed at reducing emissions and achieving ambient air quality standards. These strategies are developed, in part, based on regional population, housing, and employment projections prepared by SCAG.

The Project would be consistent with the City of Los Angeles General Plan and it would be compatible with surrounding land uses (see EIR Section 3.8).

Because the Project would be consistent with the general plan, detailed in the Project's *Community Impact Assessment,* pursuant to SCAQMD guidelines, the Project would be considered to be consistent with the region's AQMP. As such, project-related emissions are accounted for in the AQMP, which is crafted to bring the Basin into attainment for all criteria pollutants. Accordingly, the Project would be consistent with the projections in the AQMP, thus resulting in a less-than-significant impact.

This page intentionally left blank.

SCAQMD's approach for assessing cumulative impacts is based on the AQMP forecasts of attainment of ambient air quality standards in accordance with the requirements of the federal and state Clean Air Acts. As previously discussed, the Project would be consistent with the AQMP, which is intended to bring the Basin into attainment for all criteria pollutants.[18]

In addition, the mass regional emissions calculated for the Project and presented earlier would not exceed applicable SCAQMD daily significance thresholds, which are designed to assist the region in attaining the applicable state and national ambient air quality standards. Projects that exceed project-specific significance thresholds are considered by SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant.

The Project would comply with SCAQMD's Rule 403 (fugitive dust control) during construction, as well as all other adopted AQMP emissions control measures. Per SCAQMD rules and mandates, as well as the CEQA requirement that significant impacts be mitigated to the extent feasible, these same requirements (i.e., Rule 403 compliance, the implementation of all feasible mitigation measures, and compliance with adopted AQMP emissions control measures) would also be imposed on all projects Basin-wide, which would include all related projects. As such, cumulative impacts with respect to criteria pollutant emissions would be less than significant.

The net change in GHG emissions due to the Project depends on the level of ridership (and consequent reduction in VMT) that the Project attracts, as discussed above. Under the lowest ridership forecast of Build Alternative 5, the Project is estimated to result in a net decrease in GHG emissions of 335 metric tons per year. Net GHG emissions reductions under all other Build Alternatives would be greater than 335 metric tons per year. As such, project GHG emissions under all Build Alternatives would remain below the SCAQMD significance threshold of 10,000 $MTCO_2e$ per year and the SCAQMD draft screening significance threshold of 3,000 MT/year. And finally, since the proposed Project is identified in the SCAG 2012 RTP/SCS (project number LA0G901), project emissions would not conflict with any plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs. For these reasons, the Project's contribution to global GHG emissions and climate change would be less than significant.

[18] State CEQA Guidelines Section 15064(h)(3) states "A lead agency may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project will comply with the requirements in a previously approved plan or mitigation program which provides specific requirements that will avoid or substantially lessen the cumulative problem (e.g. water quality control plan, air quality plan, integrated waste management plan) within the geographic area in which the project is located. Such plans or programs must be specified in law or adopted by the public agency with jurisdiction over the affected resources through a public review process to implement, interpret, or make specific the law enforced or administered by the public agency."

Re: Corridor Phase I Environmental Site Assessment Report Submittal
Restoration of Historic Streetcar Service in Downtown Los Angeles
Los Angeles, Los Angeles County, California

Dear Ms. Chivaratanond:

We are pleased to provide you with the above-referenced Corridor Phase I Environmental Site Assessment report. The attached report presents our methodology, findings, opinions, conclusions, and recommendations.

HDR appreciates the opportunity to serve Metro on this important project. If you have any questions or comments, please feel free to contact us at (602) 522-7700.

Cordially,

HDR ENGINEERING, INC.

EXECUTIVE SUMMARY

HDR Engineering, Inc. (HDR) has conducted a Corridor Phase I Environmental Site Assessment (ESA) for the Restoration of Historic Streetcar Service in Downtown Los Angeles, located in Los Angeles, Los Angeles County, California. The proposed streetcar project is situated in Downtown Los Angeles from approximately 1st Street to 11th Street, and from Broadway to Figueroa Street (hereafter referenced as the project area). The project area also includes the proposed locations for the Maintenance Facility Site (MFS). The three options are the west of Broadway / north of 3rd Street MFS option, the west of Hill Street / north of 5th Street MFS option and the south of 11th Street / west of Olive Street MFS option. In addition to the project area, a one-eighth-mile surrounding vicinity was also evaluated for the purposes of this report. Figures depicting the configuration and location of the project area are included in Appendix A, with photographs included in Appendix B.

This Phase I ESA identifies recognized environmental conditions (RECs), as defined by the American Society for Testing and Materials (ASTM) Environmental (E) 1527-05 standard for the project area that may adversely affect construction or project area right-of-way acquisition (if required). In the event that a REC's regulatory issue has been resolved by the regulatory agency with jurisdiction, it may be classified as a "Historical REC" (HREC). In addition to the ASTM-based REC classification of a site, HDR also utilizes a risk ranking system to describe "sites of concern" located within the project area. A site of concern is one that the investigative process has determined to have sufficient possibility of contamination, which warrants special attention during the Phase I ESA investigation. A site of concern may or may not ultimately be classified as a REC as defined by ASTM, yet still may be "of concern" and is therefore highlighted in the report. A site of concern may or may not be carried forward in recommendations for further investigation, depending upon the specific issues associated with the site.

This ESA includes a summary of the site reconnaissance conducted on August 15-16, 2012, a review of environmental databases, and a review of historical data sources.

The ESA process resulted in the following findings and conclusions:

FINDINGS

- The project area is located in an urban area of mixed-use development in Los Angeles, California. Development in the area consists of the paved roadways of the Locally Preferred Alternative (LPA), surrounded by high-rise office buildings, music and sporting event venues, commercial and retail facilities, churches, libraries, hotels, residential complexes, multi-story parking garages, and public parks. Potential locations for the MFS within the project area currently consist of paved parking lots and a high-rise building with retail and office facilities. Locations of the traction power substations (TPSSs) are dispersed throughout the project area, adjacent to the LPA, and include parking lots, parking structures and an alley. Prior streetcar tracks have existed within the project area. Subsurface utilities typical of urban development exist within the project area, as well as subsurface petroleum exploration, production and distribution facilities.
- The Environmental Data Resources, Inc. (EDR) environmental database report identified 493 environmental records for sites located within the project area and the one-eighth-mile surrounding vicinity. Within an urban area, it is anticipated

that commercial operations will increase the number of listings in a database search. As a result, 426 of the 494 records listed are not considered to be of concern to the project. The remaining 68 records correspond to 37 sites considered to be of concern to the project. The discrepancy between the number of records and the number of sites is a result of sites often being listed in multiple databases.

- For the purposes of this report, sites listed in the State Underground Storage Tank (UST) database (and no other database) were considered a concern if the site was listed as a moderate, high and indeterminate-risk sites, as well as sites located in or adjacent to a proposed MFS or TPSS location.
- Eight additional sites of concern were identified from historical resource review (Sanborn fire insurance maps, historical aerial imagery, and city directories). The sites are considered to be of concern based on the likelihood for USTs to have previously been stored onsite. It has been the experience of HDR professionals that oftentimes subsurface contamination is present in the area of USTs not otherwise classified as a leaking UST (LUST).
- The site reconnaissance of the project area did not identify other sites of concern. No indications of large-scale, previous spills or hazardous material usage or disposal were identified within the project area. No pits, ponds, lagoons, or other indications of buried or large-scale hazardous material were identified during the reconnaissance of the project area.

CONCLUSION

HDR has identified RECs and HRECs in connection with the project area. The following statement is required by the ASTM E 1527-05 standard as a positive declaration of whether REC(s) were found:

HDR has performed a Phase I Environmental Site Assesssment (ESA) in conformance with the scope and limitations of ASTM E 1527-05 of the project area (as defined elsewhere in this report). Any exceptions to or deletions from these practices are described in the report. This report has revealed evidence of 27 Recognized Environmental Conditions (RECs) and 10 HRECs, in connection with the project area.

RECOMMENDATIONS

Based on the findings and conclusions reached in this report, HDR makes the following recommendations for the project area:

RECOMMENDATION 1

HDR recommends that a focused Preliminary Site Investigation (PSI) be conducted at specified locations adjacent to the identified sites of concern for moderate, high and indeterminate-risk sites, as well as the proposed locations for the MFS and TPSSs. A PSI in these areas will include a soil boring and laboratory analytical program, to address contaminants of concern specific to each site.

RECOMMENDATION 2

HDR recommends that all construction contractors should be instructed to immediately stop all subsurface activities in the event that potentially hazardous materials are encountered, an odor is identified, or significantly stained soil is visible. Contractors should be instructed to follow all applicable regulations regarding discovery and response for hazardous materials encountered during the construction process.

1.0 INTRODUCTION

1.1 PURPOSE AND INVOLVED PARTIES

This Corridor Phase I Environmental Site Assessment (ESA) documents the evaluation of the project area for indications of "recognized environmental conditions." A recognized environmental condition (REC) is defined by ASTM Practice E 1527-05 as: *"The presence or likely presence of any hazardous substances or petroleum products on a project site under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the project site or into the ground, groundwater, or surface water of the project site. The term includes hazardous substances or petroleum products even under conditions of storage and use in compliance with local and state laws and regulations. In the event that a site's regulatory issue has been resolved by the regulatory agency with jurisdiction, that site may be classified as a "Historical REC". This classification means that although the issue has been resolved to the satisfaction of the regulatory agency, a possibility exists that residual contamination may be present at the site. The terms "REC" and "Historical REC" are not intended to include de minimis conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of regulatory agencies. Conditions determined to be de minimis are not recognized environmental conditions."*

HDR Engineering, Inc. (HDR), received authorization from Metro to conduct an ESA for the Restoration of Historic Streetcar Service in Downtown Los Angeles project, located in Los Angeles, Los Angeles County, California. This Phase I ESA has been prepared for Metro and the city of Los Angeles (the ultimate users of the report), and only Metro and the City of Los Angeles have the right to rely on the contents of this Phase I ESA.

1.2 ESA METHODOLOGY

This ESA was designed to conform to the level of documentation recommended in the ASTM standard (ASTM E 1527-05) for the performance of ESAs. Deviations from the ASTM standard include the deletion of certain records sources determined to be inapplicable or of limited value to the specific needs of this project. In accordance with HDR's contracted scope of work, HDR did not conduct interviews with property owners or operators with facilities located within the project area.

HDR included the four primary activities included in the ASTM guidance (conforming to EPA's All Appropriate Inquiry [AAI] requirements), namely (1) records review, (2) site reconnaissance, (3) review of historic data sources, and (4) preparation of this report.

In addition to the ASTM-based REC classification, HDR also employs a relative risk ranking system that includes several investigative elements to describe "sites of concern" located within a project area. A site of concern is a site that the investigative process has determined to have sufficient possibility of contamination, which warrants special attention during the Phase I ESA investigation. A site of concern may or may not ultimately be classified as a REC as defined by ASTM, yet still may be "of concern" and is therefore highlighted in the report. A site of concern may or may not be carried forward in recommendations for further investigation, depending upon the specific issues associated with the site.

Once the elements of the investigation process are completed, identified sites of concern are categorized using a subjective risk ranking system, classifying the sites as low-risk, moderate-risk, high-risk, or (in some instances) indeterminate-risk. The following paragraphs provide general descriptions of each category.

Low-risk sites are those sites that have few indications of potential for release of hazardous materials. On some occasions, sites that have had a hazardous materials issue in the past but have been remediated with approval of the local state environmental agency (or EPA) may qualify as low-risk. Examples of low-risk sites include undeveloped or agricultural property, residential property, or benign commercial properties such as office buildings, warehouses, distribution facilities, or municipal facilities with no listed violation.

Moderate-risk sites are those sites that have some indications of possible hazardous materials issues. A moderate-risk site may appear on a database as having a permit to handle hazardous materials, but has recorded no violations to date. Another way that a site could be interpreted as moderate risk would be if the environmental records search indicated no listing, but the site is an auto repair facility with visible surface staining. Examples of moderate-risk sites include auto repair garages, welding shops, or manufacturing facilities with minor listings in the environmental database.

High-risk sites are those sites that have a high potential for releasing hazardous materials to the soil or groundwater, or have a recorded release issue. Examples of high-risk sites include current service stations, bulk fueling terminals, sites listed in environmental databases as having had a release, or a known release that has not been remediated.

Indeterminate sites are those which, at the time of report preparation, did not include sufficient information to include a high, medium or low ranking. Indeterminate sites often require additional file review to determine the details of any related environmental issues at the site.

When HDR assigns a risk ranking to a site, the risk ranking criteria are reviewed and concurred with by at least one Environmental Professional as defined in ASTM. It is HDR policy to have subjective criteria cross-reviewed for accuracy and adherence to its assessment protocols and internal quality assurance standards. It is worthwhile to note that risk ranking does not directly correspond to whether a site qualifies as a REC; rather, the risk ranking system is intended as a method of categorizing sites on large projects for consideration of common contamination characteristics.

1.3 Scope of Services, Significant Assumptions, and Limitations

The services provided for this project consisted of the following:

- Provide a description of the project area including current land uses.
- Provide a general description of the topography, soils, geology, and groundwater flow direction.
- Review reasonably ascertainable and reviewable regulatory information published by federal, state, local, tribal, health, and/or environmental agencies pertaining to the project area.
- Review historical data sources for the project area, including aerial photographs, topographic maps, fire insurance maps, city directories, and other readily available development data.

- Conduct an area reconnaissance and an environmental review—including a visual inspection of adjoining properties—with a focus on indications of hazardous substances, petroleum products, polychlorinated biphenyls (PCBs), wells, storage tanks, solid waste disposal pits and sumps, and utilities.
- Prepare a written report of methods, findings, and conclusions.

The goal of this scope of services is to assist the user in identifying conditions near the project area that may indicate risks regarding hazardous materials storage, disposal, or other impacts. The resulting report may qualify the user for relief from liabilities as one of three “defenses” identified in the 2002 Brownfields Amendments to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Section 9607 (AAI subsections). These three defenses include:

1. The “innocent landowner” defense to potential liabilities under 42 United States Code [U.S.C.] § 9601
2. The “contiguous project corridor owner” defense pursuant to 42 U.S.C. § 9607q
3. The “bona fide prospective purchaser” defense pursuant to 42 U.S.C. § 9607r

Federal regulations at 40 Code of Federal Regulations [C.F.R.] Part 312, promulgated by EPA, require that liability release be based (in part) on completion of AAI prior to purchase of a property. Those inquiries are documented by Phase I reports, or ESAs. EPA has agreed that the recently developed ASTM guidance (ASTM Practice E 1527-05) specifies and interprets AAI requirements.

A user is defined by ASTM Practice E 1527-05 as the party seeking to use Practice E 1527 to complete an ESA of the project area and may include a potential purchaser of land at the project area, a potential tenant of the project area, an owner of land at the project area, a lender, or a project area manager. Investigative areas not included in the standard ASTM ESA scope include: asbestos, lead-based paint, lead in drinking water, radon, urea formaldehyde, wetland issues, regulatory compliance, cultural and historic resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality, and high voltage power lines. The scope of services for ESA projects also does not include the completion of soil borings, the installation of groundwater monitoring wells, or the collection of soil or groundwater samples. Likely sources of vapor intrusion, from potential on-site or off-site sources, are identified. State and national policies and standards relevant to vapor intrusion are in flux and subject to change.

HDR has made certain assumptions in preparing the scope of this assessment:

- Data gathered from public information sources (i.e., libraries or public regulatory agencies) are accurate and reliable.
- Site operations reflect site conditions relative to potential releases, and no intentional concealment of environmental conditions or releases has occurred.
- Interview information (if gathered) is directly reported as gathered by the assessor and is limited by the accuracy of the interviewee’s recollection and experience.

- Published geologic information and site observations made by the environmental professional are used to estimate likely contaminant migration pathways in the subsurface. These estimates by the environmental professional are limited in accuracy and are generally cross-referenced with existing information about similar sites and environmental releases in the area.

Regulatory information is limited to sites discovered after the late 1980s because reliable records were not kept by regulatory agencies prior to that time frame.

Where a REC has resulted from historical uses or conditions, but apparently no longer persists at the site, the term Historical REC (HREC) is used.

The findings and conclusions presented in this report are based on the procedures described in ASTM Practice E 1527-05, informal discussions with various agencies, a review of the available literature cited in this report, conditions noted at the time of this ESA, and HDR's interpretation of the information obtained as part of this Phase I ESA. The findings and conclusions are limited to the specific project and properties described in this report, and by the accuracy and completeness of the information provided by others.

An ESA cannot entirely eliminate uncertainty regarding the potential for RECs. Conducting this assessment is intended to reduce, but not eliminate, uncertainty regarding the potential for RECs in connection with the project area within reasonable limits of time and cost. In conducting its services, HDR used a degree of care and skill ordinarily exercised under similar circumstances by reputable members of its profession practicing in the same locality. No other warranty is made or intended. This ESA generally conforms to the level of documentation required in ASTM Practice E 1527-05. Deviations from the ASTM standard included deletion of certain records sources deemed to be inapplicable, or of limited value, to the specific needs of this client. The ASTM standard offers several options for sources of information. In the course of the investigation, some sources are determined to be of little or no value and other, more informative/applicable options are selected and utilized.

2.0 SITE DESCRIPTION

2.1 LOCATION AND LEGAL DESCRIPTION

The Restoration of Historic Streetcar Service in Downtown Los Angeles project is located in downtown Los Angeles, Los Angeles County, California. The Locally Preferred Alternative (LPA) is situated between 1st Street and 11th Street, with the southern half located between Broadway and Figueroa Street, and the northern half extending roughly between Broadway and Hill Street (a short segment extends to Grand Avenue). Adjacent to the LPA are potential locations for maintenance facility sites (MFS). Three specific MFS options were considered for the purposes of this report, referred to as MFS 1 (located north of Third Street, between Hill Street and Broadway), MFS 2 (located west of Hill Street and north of 5th Street), and MFS 3 (located south of 11th Street, between Olive Street and Grand Avenue). Five traction power substation (TPSS) locations and five alternate TPSS locations were also considered for the purpose of this report. The TPSS locations are presented below (the TPSS numbering is for use with this report only).

- TPSS 1 and Alt TPSS 1 – north of 2nd Street, east side of Grand Avenue
- TPSS 2 – northeast corner of Broadway and 2nd Street
- Alt TPSS 2 – west side of Broadway, south of 2nd Street
- TPSS 3 – east side of Broadway, between 8th Street and 9th Street
- Alt TPSS 3 – west side of Broadway, south of 9th Street
- TPSS 4 – between Figueroa and Flower Streets and between 8th and 9th Streets
- Alt TPSS 4 – east side of Figueroa Street, south of 9th Street
- TPSS 5 – west side of Hill Street, south of 4th Street
- Alt TPSS 5 – east of Hill Street, south of 6th Street

In addition to the LPA, an alternate route was also considered for this project. The LPA Variation extends along Hill Street from 7th Street to 9th Street, and on 9th Street from Broadway to Figueroa Street (see Figure 2). The LPA, LPA Variation, potential MFS and TPSS locations are considered the “project area” for the purposes of this report (and only this report). All land in the project area was included for analysis, including public rights-of-way and private properties. In addition to the project area, a one-eighth-mile surrounding buffer (referred to as the surrounding vicinity) was also evaluated for the purposes of this report. Figures depicting the configuration and location of the project area are included in Appendix A. Photographic documentation of the project area is included in Appendix B.

2.2 SITE AND VICINITY CHARACTERISTICS

The project area consists of eight different streets located in downtown Los Angeles: 1st Street, Grand Avenue, Hill Street, Broadway, 7th Street, 11th Street, 9th Street and Figueroa Street. The development located adjacent to the roadways is typical of a downtown area, including high-rise office buildings, music and sporting event venues, commercial and retail facilities, churches, libraries, hotels, residential complexes, multi-story parking garages, and public parks. The surrounding vicinity consists of similar urban development. California State Route 110 (SR 110) is located approximately 500 feet to one-half-mile west of the project area. Interstate 10 (I-10) is located approximately one-half-mile south of the project area, and US Route 101 (US

101) is located approximately 1500 feet north of the project area. According to the United States Geological Survey 7.5 minute series quadrangle maps for Hollywood, California (1994), the elevation of the project area ranges from approximately 240 to 280 feet above mean sea level. The natural topography in the area is relatively flat, sloping slightly to the southwest. One exception is the Bunker Hill area (located to the west of the northern portion of the project area) where the elevation increases to the northwest.

2.3 Description of Structures, Roads, and Other Site Improvements

Structures located within the project area consist largely of multi-story buildings that include office/commercial/retail space. Commercial warehouses and other retail and commercial structures are also present. Structures include both first and second generation construction, with many dating back to at least the late 1920s. Based on the mixed use of the area, the configuration, construction, and size of the structures within the project area and surrounding vicinity vary depending on the type of development (residential, commercial, retail, etc) and the date of construction. In addition to the structures, numerous paved parking lots are also located within the project area. All of the roads located within the project area are paved and multi-lane. Prior streetcar tracks have existed within the project area. Subsurface utilities typical of urban development exist within the project area, as well as subsurface petroleum exploration, production, and distribution facilities.

2.4 Area Geology and Hydrogeology

The project area is located in the Coastal Plain of Los Angeles County. The project area is underlain by interbedded layers of sandy silt, silt with sand, and gravelly sand. According to the California Department of Water Resources, the project area is located within the Los Angeles Forebay Area of the Central Groundwater Basin, with groundwater between 30 and 50 feet below ground surface (Perry, 2011).

3.0 USER-PROVIDED INFORMATION

Metro provided HDR with documents identifying the proposed location of the project area. Survey maps were provided by Coast Surveying, Inc. Information provided by Metro indicated that it has no specialized information for the project area pertaining to land use, previous environmental cleanups, previous chemical spills or releases, purchase price of any properties within the area or cleanup liens against properties within the project area or surrounding vicinity. If applicable at a later date, further analysis of the sites identified will include a request of information from other agencies that have information related to hazardous materials concerns or releases (such as the local fire department).

4.0 RECORDS REVIEW

4.1 ENVIRONMENTAL RECORDS REVIEW

Environmental Data Resources, Inc. (EDR) was contracted by HDR to complete an environmental records search of federal, state, local, tribal databases (as defined by ASTM E 1527-05) and EDR proprietary databases. HDR provided EDR with the project area location and search parameters (radius of concern) for the database search. The database report contains a map and a report of pertinent environmental records found for the specified area. For the purposes of this report, the radius of concern was limited to one-eighth-mile in an attempt to focus the results of the search to sites most likely to affect the project area given the current project scope. The boundaries provided to EDR were based on the LPA for the project (including the LPA Variation), as defined in July 2012. The database search report was produced by EDR on July 5, 2012. A complete copy of the EDR environmental database report is included in Appendix C.

Table 4-1 Summary of Environmental Database Search

Database	Description	Records Listed	Records of Concern to the Project
Federal			
NPL	The National Priorities List (NPL) is the U.S. EPA's database of uncontrolled or abandoned hazardous waste facilities that have been listed for priority remedial actions under the Superfund program.	0	0
Delisted NPL	The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) established the criteria that the EPA uses to delete sites from the NPL.	0	0
CERCLIS	The CERCLIS database is a compilation of facilities that the USEPA has investigated or is currently investigating for a release or threatened release of hazardous substances pursuant to CERCLA. No Further Remedial Action Planned (NFRAP) refers to facilities that have been removed and archived from its inventory of CERCLA sites.	2	2
LIENS 2	CERCLIS lien information. A Federal CERCLA ('Superfund') lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. These monies are spent to investigate and address releases and threatened releases of contamination. CERCLIS provides information as to the identity of these sites and properties.	0	0
TSCA	The Toxic Substances Control Act (TSCA) identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site.	1	1
RCRA TSD/ CORRACTS	The USEPA maintains a database of Resource Conservation and Recovery Act (RCRA) facilities associated with treatment, storage, and disposal (TSD) of hazardous materials that are undergoing "corrective action." A Corrective Action Report (CORRACTS) order is issued when there has been a release of hazardous waste or constituents into the environment from a RCRA facility.	0	0
RCRA INFO	The RCRA INFO database, maintained by the EPA, lists facilities that generate hazardous waste as part of their normal business practices. Generators are listed as large, small, or conditionally exempt. Large quantity generators (LQG) produce at least 1,000 kg/month of nonacutely hazardous waste or 1 kg/month of acutely hazardous waste. Small quantity generators (SQG) produce 100 to 1,000 kg/month of nonacutely hazardous waste. Conditionally exempt small quantity generators (CESQG) are those that generate less than 100 kg/month of nonacutely hazardous waste.	133	1

Database	Description	Records Listed	Records of Concern to the Project
US ENG Controls	A listing of sites with engineering controls in place.	0	0
US INST Controls	A listing of sites with institutional controls in place.	0	0
ERNS	Emergency Response Notification System (ERNS) records and stores information on reported releases of oil and hazardous substances.	14	0
PADS	PCB Activity Database System (PADS) identifies generators, transporters, commercial storers, and/or brokers and disposers of PCBs who are required to notify the USEPA of such activities.	0	0
FTTS	FIFRA/TSCA Tracking System, Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA)/Toxic Substances Control Act (TSCA). FTTS tracks administrative cases and pesticide enforcement actions and compliance activities related to FIFRA, TSCA, and EPCRA (Emergency Planning and Community Right-to-Know Act).	7	0
ICIS	The Integrated Compliance Information System (ICIS) supports the information needs of the national enforcement and compliance program as well as the unique needs of the National Pollutant Discharge Elimination System (NPDES) program.	3	1
State			
RESPONSE	The Department of Toxic Substances Control's (DTSC) list which identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.	0	0
HIST CAL-SITES	The CALSITES database contains potential or confirmed hazardous substance release properties. In 1996, California EPA (Cal/EPA) reevaluated and significantly reduced the number of sites in the Calsites database. The database is no longer updated by the State agency. It has been replaced by ENVIROSTOR.	0	0
ENVIROSTOR	DTSC Site Mitigation and Brownfields Reuse Program's EnviroStor database identifies sites that have known contamination or sites for which there may be reason to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)), State Response, including Military Facilities and State Superfund, Voluntary Cleanup, and School sites. EnviroStor provides information including, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.	6	6
LUST	Leaking Underground Storage Tanks (LUST) Incident Report – State Water Resources Control Board (SWRCB) LUST records contain an inventory of reported leaking UST incidents.	16	14
CA FID UST	The California Facility Inventory Underground Storage Tank (CA FID UST) database contains historical active and inactive UST listings as provided by the SWRCB. The database has not been updated since 1994.	94	12
State UST	UST Database – SWRCB provides a database of registered Underground Storage Tanks within the specified area.	37	7
HIST UST	The Hazardous Substance Storage Container Database is a historical listing of UST sites previously maintained by SWRCB. Current data can be found in the State or local UST database.	34	7

Database	Description	Records Listed	Records of Concern to the Project
SWEEPS UST	Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.	100	15
SWF/LF State Landfill/ Historical Landfill	Solid Waste Information System – The Integrated Waste Management Board maintains a list of Solid Waste Facilities/Landfill (SWF/LF) Sites, including active and inactive, permitted and non-permitted solid waste disposal facilities.	1	0
CHMIRS	California's Hazardous Materials Incident Report System (CHMIRS) contains information on reported hazardous material incidents (accidental releases or spills), as maintained by the Office of Emergency Services.	24	0
DEED	The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.	0	0
DRYCLEANERS	DTSC's list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial; garment pressing and cleaner's agents; linen supply; coin-operated laundries and cleaning; dry cleaning plants, except rugs; carpet and upholster cleaning; industrial launderers; laundry and garment services.	1	1
Manufactured Gas Plants	The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.	0	0
CA WDS	California Waste Discharge Systems (CA WDS) include sites which have been issued waste discharge requirements by the SWRCB.	10	0
NPDES	The National Pollutant Discharge Elimination System (NPDES) database contains a list of NPDES permits, as provided by the SWRCB.	6	0
Cortese/HIST Cortese	Cortese Hazardous Waste & Substances Sites – The Cal/EPA/Office of Emergency Information previously maintained a list of sites designated as LUST, SWF/LF or Cal-Sites. The list is no longer updated and cases are maintained by the SWRCB, Integrated Waste Management Board and DTSC.	0	0
SWRCY	A listing of recycling facilities in the state of California, provided by the Department of Conservation.	0	0
SLIC	The SLIC (Spills, Leaks, Investigations and Cleanup) program is designated to protect and restore water quality from spills, leaks and similar discharges. Statewide SLIC cases are maintained by the SWRCB.	3	1
UIC	A listing of underground control injection wells, maintained by the Department of Conservation.	1	0
HAZNET	Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments.	0	0
PROC	A list of certified processors maintained by the Department of Conservation	0	0

Database	Description	Records Listed	Records of Concern to the Project
Brownfields	A Brownfield site is an industrial or commercial project corridor that is abandoned, inactive, or underutilized, on which expansion or redevelopment is complicated because of the actual or perceived environmental contamination.	1	0
	Total Records	**494**	**68**

4.2 SUMMARY OF LISTED RECORDS

The EDR report identified 494 environmental records in the databases identified above for listings located within the project area or the one-eighth-mile surrounding vicinity. Within an urban area, it is anticipated that commercial operations will increase the number of listings in a database search. Many of the database listings, however, are not considered to be of concern to the project due to the scope of the project, the distance of the listed site from the project, and/or a facility's lack of or compliance with any previously noted violation(s). Additional database findings are not considered to be of concern to the project due to the nature of the database. For example, records listed in the HAZNET database only identify facilities that have shipped hazardous waste with a manifest, which does not necessarily indicate a hazardous materials release concern. As a result of these factors, 426 of the 494 records listed are not considered to be of concern to the project. The remaining 68 records correspond to 37 sites considered to be of concern to the project, based on the evaluation of HDR's environmental professionals (as defined by ASTM). The discrepancy between the number of records and the number of sites is a result of sites often being listed in multiple databases.

Details regarding each of the sites are presented in Tables 4-2 and 4-3 below. Table 4-2 contains information related to sites listed in various hazardous materials release-related databases. Table 4-3 contains information specific to leaking underground storage tank (LUST) sites. Regulatory files for each of the sites listed Tables 4-2 and 4-3 were requested for review from the Los Angeles Regional Water Quality Control Board (LARWQCB), or reviewed via the associated online file database (GeoTracker). Only files related to some of the LUST sites were returned from the LARWQCB. Regulatory files typically provide specific information regarding a release, including location of underground tanks, boundaries and type of contamination, and/or remediation activities (when conducted). Without being provided files to review, this type of information may not otherwise be available. As available, regulatory file information is presented below. Map codes indicated below are for use with Figure 2, in Appendix B.

Table 4-2 Hazardous Materials Release Cases

Map Code	Site Name	Address	Associated Database(s)[1]	Risk Ranking/ REC or HREC[2]
U	Jewelry Design Center/Kirk-Rick Dials	404 W. 7th Street	CERCLIS, Envirostor, ICIS	Low/HREC
AE	Staples Center	1111 S. Figueroa	CERCLIS, SLIC, UST	High/REC
O	Unique Premium Metals	640 S. Hill Street	RCRA Large Quantity Generator (with violations)	Moderate/ No REC
Q	West Sixth and	314 W. 6th Street	Envirostor	Indeterminate/REC

Map Code	Site Name	Address	Associated Database(s)[1]	Risk Ranking/ REC or HREC[2]
	Broadway Partnership			
P	Los Angeles United Investment Co	650 S. Hill Street	Envirostor	Indeterminate/REC
N	M&M Holding, LLC	629 S. Hill Street	Envirostor	Indeterminate/REC
T	United Building Associates	707 S. Broadway	Envirostor	Indeterminate/REC
R	Park Central Building	412 W. 6th Street	Envirostor	Indeterminate/REC
S	Arco-Lyondell Petrochemical	911 Wilshire Boulevard	TSCA	Indeterminate/REC
AP	Biltmore Cleaners	342 W. 9th Street	Drycleaners	Moderate/REC

[1] CERCLIS = Comprehensive Environmental Response, Compensation and Liability Information System, ICIS = Integrated Compliance Information System, SLIC = Spills, Leaks, Investigations and Cleanup, UST = underground storage tank, RCRA = Resource Conservation and Recovery Act, TSCA = Toxic Substances and Control Act tracking

[2] REC = Recognized Environmental Condition, HREC = Historical REC

- Jewelry Design Center/Kirk-Rick Dials located at 404 W. 7th Street (map code U) is listed in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS), Envirostor, and Integrated Compliance Information System (ICIS) databases. The CERCLIS listing stems from the potential for radium contamination onsite, likely due to its jewelry making/metal plating operations. The site was classified as a “removal only site (no site assessment work needed)” and was listed with a priority level of “cleaned up” in April 2005. The site is not listed in the CERCLIS-No Further Remedial Action Planned (CERCLIS-NFRAP) database, indicating it has not yet been archived. The site’s Envirostor listing did not contain any specific details, only that the case had been referred to another agency.

  The site is also listed in the Integrated Compliance Information System (ICIS) database with three enforcement action items listed. Based on the location of the site (directly adjacent to proposed LPA) the site is considered to be a concern. However, based on the “cleaned up” status of the CERCLIS listing, this site is considered low-risk, and an HREC.

- Staples Center located at 1111 S. Figueroa Street (map code AE) is listed in the CERCLIS and Spills, Leaks, Investigations and Cleanup (SLIC) databases. The facility is also listed in the State Underground Storage Tank (UST) database. According to the EDR report, the CERCLIS listing results from operations at the site in 2000 designed to track counter-terrorism actions and funding. No additional details related to known or suspected contaminants or affected media (soil, water) were mentioned. Two SLIC cases are also listed for the site, one active case and one closed case. The active case involves total petroleum hydrocarbon (TPH), volatile organic compound (VOC) and metal contamination onsite. According to the active SLIC listing, the site is currently undergoing remediation. The second, closed SLIC case involved chromium, heavy metals, petroleum/fuels/oils and VOC contamination; however, the affected media was not listed. The SLIC case was opened in 1999 and closed in 2005. A permitted UST is also listed at the site; no additional details regarding UST contents or tank status were provided. Based on the active status of the SLIC case and possible active UST(s) onsite, the site is considered high-risk, and a REC.

- Unique Premium Metals located at 640 S. Hill Street (map code O) is listed as a Resource Conservation and Recovery Act (RCRA) Large Quantity Generator (LQG) site, with violations. The areas of violations involve container use and administrative issues. Based on the site's location along the LPA and listed violations, the site is of concern. However, based upon the nature of the violations, the site is considered moderate-risk, and not a REC.
- West Sixth and Broadway Partnership located at 314 W. 6th Street (map code Q) is listed in the Envirostor database. No specific details regarding the case are listed in the EDR report, and no regulatory files were returned for review. Based on the limited information provided, this site is considered to be of indeterminate risk to the project, and a REC.
- Los Angeles United Investment Co. located at 650 S. Hill Street (map code P) is listed in the Envirostor database. No specific details regarding the case are listed in the EDR report, and no regulatory files were returned for review. Based on the limited information provided, this site is considered to be of indeterminate risk to the project, and a REC.
- M&M Holding, LLC located at 629 S. Hill Street (map code N) is listed in the Envirostor database. No specific details regarding the case are listed in the EDR report, and no regulatory files were returned for review. Based on the limited information provided, this site is considered to be of indeterminate risk to the project, and a REC.
- United Building Associates located at 707 S. Broadway (map code T) is listed in the Envirostor database. No specific details regarding the case are listed in the EDR report and no regulatory files were returned for review. Based on the limited information provided, this site is considered to be of indeterminate risk to the project, and a REC.
- Park Central Building located at 412 W. 6th Street (map code R) is listed in the Envirostor database. No specific details regarding the case are listed in the EDR report and no regulatory files were returned for review. Based on the limited information provided, this site is considered to be of indeterminate risk to the project, and a REC.
- Arco-Lyondell Petrochemical located at 911 Wilshire Boulevard (map code S) is listed in the Toxic Substances and Control Act (TSCA) chemical substance inventory list. According to the EDR report, the facility imported or manufactured chemicals including distillates, petroleum and paraffinic products. The site is also listed in two UST databases, neither of which is still updated. According to Statewide Environmental Evaluation and Planning System (SWEEPS) UST database, paint sludge was stored in a UST onsite. No additional information regarding the number of tanks, tank(s) size or content was available. Based on the limited information provided, this site is considered to be of indeterminate risk to the project, and a REC.
- Biltmore Cleaners located at 342 W. 9th Street (map code AR) is listed in the Drycleaners database. Facilities with (current or former) drycleaning operations are considered to be of concern based on the hazardous waste streams associated with onsite operations. According to the EDR report, Biltmore Cleaners operated from 1995 until 1998. No regulatory information for the site was available. Based on the former

drycleaning operations conducted at the site, and its location along the LPA Variation, this site is considered moderate-risk, and a REC.

The 14 sites presented in Table 4-3 are listed in the LUST database, Cortese and/or Hist Cortese database(s). The Cortese and Hist Cortese databases include LUST sites, but records are no longer updated, and information listed in these databases may not be current. Both active and closed LUST cases are of concern to the project, based on the potential for residual subsurface contamination (often present even in closed cases). During the regulatory file review, it was identified that many of the USTs involved in these LUST cases were located under the sidewalk of the associated address. In these cases, it is possible for contaminants to have migrated into the path of the LPA/LPA Variation or TPSS/MFS if either is located within 100 feet of the LUST site. In the event that the tanks were not located under the sidewalk (or where no information as to the tanks' location was available), the potential for contaminant migration into the path of the LPA/LPA Variation is still present.

[1] MTBE = methyl tertiary butyl ether, TBA = tertiary butyl alcohol, TPH = total petroleum hydrocarbon

[2] Regulatory files reviewed at the Los Angeles County Regional Water Quality Control Board, and/or associated Geotracker website.

[3] REC = Recognized Environmental Condition, HREC = Historical REC

Bold text indicates open or active regulatory case.

In addition to the above-listed sites, 112 UST sites were also listed in the EDR report. (Some of the USTs identified in the EDR report are listed above). It is important to note that in the state of California, several databases exist for the purpose of tracking USTs. Many of the databases are no longer updated, and limited information is available for the tanks identified in these UST databases (HIST UST, SWEEPS UST, CA FID UST). The current, actively updated UST database is the State UST database. While some overlap of findings does exist among the databases, each database may contain USTs not listed elsewhere. Often, the USTs identified in historical databases are not listed in the current State UST database. According to the EDR report, 36 sites are listed as “permitted UST” sites in the State UST database. The remaining 76 sites are listed in historical UST databases, and not in the State UST database. While not listed as currently permitted facilities, it is possible that USTs remain onsite at these 76 locations. In order to serve the most valuable purpose for this report, only UST sites located at or adjacent to a potential MFS and/ or TPSS are mentioned below. A complete listing of all UST sites located within the project area can be found in the EDR report included in Appendix C. The lack of specific mention of the UST sites located adjacent to the LPA/LPA Variation (not otherwise at or adjacent to a TPSS or MFS) is not anticipated to affect the findings of this report. Analysis of the UST sites listed in the EDR report identified a high density of sites located throughout the project area. Based on the close proximity of the current and former UST sites to one another, and the amount of ground disturbance associated with track construction only, a general recommendation regarding USTs was made for this report (See Section 8.1 for additional information). Based on the potential for acquisition and increased ground disturbance in the area of a MFS/TPSS, and the potential for soil contamination to be present in the vicinity of USTs even if not classified as a LUST, the UST sites listed in Table 4-4 are considered to be a moderate risk, and a REC.

Table 4-4 Underground Storage Tank Sites

4.3 Historical Use Information

The objective of reviewing historical use information is to develop a history of previous land uses in the vicinity of the project area, and to assess these uses for potential hazardous materials impacts that may affect the project. HDR reviewed those historical sources that were readily available and reviewable, and likely to provide useful information, given the time and cost constraints inherent in ESA projects.

4.3.1 Fire Insurance Maps

Fire insurance maps are produced by private fire insurance companies to indicate uses of the project area on specified dates. HDR reviewed Sanborn fire insurance maps at the Los Angles Public Library in Los Angeles, California. Sanborn maps for the years 1888, 1906, 1923 and 1950 were reviewed for the project area.

From 1888 to 1950, the maps depicted the project area and surrounding vicinity's development as typical urban facilities including banks, churches, hotels, municipal buildings, parking garages (or carriage sheds), residences, retail stores, post offices, restaurants and service stations. The seven sites listed in Table 4-5 were identified as a concern from the Sanborn map review. These sites are considered to be of concern, based on waste streams likely associated with onsite operations, and the location relative to the project area. Based on the lack of additional or regulatory information, most of the sites are considered to be an indeterminate risk, but not RECs (based on the ASTM definition of a REC). One exception is noted below. The site names are listed as they appeared on the Sanborn maps. Map codes listed below are for use with Figure 2.

Table 4-5 Sites of Concern Identified from Sanborn Insurance Maps

Map Code	Site Name	Location	Year(s) Depicted	Notes
D	Gas & Oil	Southwest corner of 1st Street and Hill Street	1906, 1923, 1950	Site located adjacent to LPA.
E	Gas & Oil	Southeast corner of 1st Street and Hill Street	1906, 1923, 1950	Site located adjacent to LPA.
F	Gas & Oil	Southeast corner of 2nd Street and Grand Avenue	1906, 1923, 1950	Site located adjacent to LPA.
AH	Gas Station	South of 11th Street, between Grand Avenue and Olive Street	1888	Historic gas station was located in the location of MFS 3[1].
AB	Gas & Oil	Southeast corner of Figueroa Street and Olympic Boulevard	1906, 1923, 1950	Site is in the location of the Unocal Station identified from the EDR review. **Risk ranking**

Map Code	Site Name	Location	Year(s) Depicted	Notes
				elevated to high-risk based on regulatory listing.
Y	Gas & Oil	Southwest corner of 8th Street and Figueroa Street	1906, 1923, 1950	Site located adjacent to LPA.
AF	Gas & Oil	Southwest corner of Flower and 11th Street	1906, 1923, 1950	Site located adjacent to LPA.
AP	Gas & Oil	Northwest corner of 9th Street and Flower Street	1906, 1923, 1950	Site located adjacent to LPA Variation
AQ	Gas & Oil	Southwest corner of 9th Street and Hope Street	1906, 1923, 1950	Site located adjacent to LPA Variation

[1] Maintenance Facility Site (MFS) location options defined in Section 2.1

4.3.2 Historical Aerial Photographs

Historical aerial photographs are valuable for the environmental assessor to review features of properties in/near the project area over a long period of time. HDR reviewed historical aerial photographs provided by EDR for the years 1927, 1938, 1947, 1956, 1965, 1976, 1989, 1994, and 2005. Details related to the aerial photography review are presented below.

Since at least 1927, the project area and surrounding vicinity have been extensively developed with commercial, retail, residential and other typical urban development. The density of development within the project area has undergone changes over the past 85 years, though some structures have been demolished and reconstructed throughout the area. Some of the commercial/warehouse buildings located in the project area, particularly in the southern half, were replaced with parking areas by the mid-1950s. Many of the multi-story buildings located throughout downtown Los Angeles were present by the mid-1950s. One noticeable change is in the area of the current Los Angeles Convention Center and Staples Center. Prior to the early 1970s, the area consisted of commercial and retail development. By 1972, the northernmost building of the convention center was built, and the southernmost building by the late 1980s. Construction of the Staples Center began 1998. Based on the scale of the aerial photographs and the condensed nature of a downtown area, specific details are difficult to determine from aerial imagery. No additional sites of concern were identified from historical photographs.

4.3.3 City Directory Information

A review of city directories was conducted at the Los Angeles Public Library in Los Angeles, California. The years between 1956 and 2009 were reviewed, in intervals of approximately five years (not all years between 1949 and 2009 were available for review). The directory review identified the project area's development as similar to that which was depicted in the Sanborn maps and historical aerial images. One additional site of concern was identified in the city directory review. A Union Oil Service Station located at 705 S. Figueroa Street (map code X) was listed beginning in 1961. The service station, which is no longer present, was located adjacent to the LPA. Based on the likelihood for USTs to have previously been located onsite, but the lack of any regulatory information, the site is considered to be an indeterminate risk and a REC.

4.3.4 Historical Topographic Maps

Historical topographic maps provide an overview of the area relative to potential previous land uses. HDR reviewed historical topographic maps of the project area and adjoining properties from the United States Geological Survey 7.5 minute series quadrangle maps for Hollywood, California (1954, photorevised 1967, 1973, and 1994). These maps served to verify the information gathered in the historic aerial photograph review.

4.4 Environmental Liens and Additional Information

No information regarding the chain-of-title ownership history or environmental liens recorded against the project area was provided by the user. Environmental lien searches were not conducted as part of the scope of work for this project.

4.5 Summary of Previous Environmental Investigations

No previous environmental investigations were reviewed for the purposes of this report. Exceptions include the information provided by regulatory file review, which is provided in Section 4.2.

5.0 SITE RECONNAISSANCE AND INTERVIEWS

5.1 SITE RECONNAISSANCE

On August 15 and 16, 2012, HDR personnel conducted a site reconnaissance of the project area (including MFS and TPSS location options) and surrounding vicinity. The project area consisted of the eight paved roadways of the proposed project area (1st Street, Grand Avenue, Hill Street, Broadway, 7th Street, 9th Street 11th Street and Figueroa Street), located in an urban area of mixed-use development in downtown Los Angeles. The development located within the project area was typical of a downtown area, including high-rise office buildings, music and sporting event venues, commercial and retail facilities, churches, libraries, hotels, residential complexes, multi-story parking garages, and public parks. Many of the sites identified as a concern were either no longer present, or no indications of suspected contamination (such as soil staining or distressed vegetation) were visible during the site reconnaissance. The locations of the MFS options consisted of paved parking lots and a high-rise building with office and retail facilities. The surrounding vicinity consists of similar urban development. No pits, ponds, lagoons, or other indications of large-scale hazardous material were identified during the reconnaissance of the project area.

5.2 INTERVIEW

Interviews were not conducted for the purposes of this report.

5.3 KNOWN CURRENT AND PAST USES OF THE SITE AND ADJOINING PROPERTIES

The project area currently consists of the mixed-use development that is typical in a downtown area. Development includes high-rise office buildings, restaurants, commercial and retail facilities, churches, libraries, hotels, residential complexes, multi-story parking garages, and public parks. The area has been developed since at least the late 1880s, according to historic source review. The area consisted of residential, commercial and retail properties as early as 1888. Expansion of the project area continued and by the mid-1950s, many of the multi-story buildings located throughout downtown Los Angeles were present. The surrounding vicinity experienced a similar development history. The surrounding vicinity consists of residential, commercial and retail development, as well as I-10, SR 110 and US 101 (are all located within one-half-mile of the project area). Prior streetcar tracks have existed within the project area. Subsurface utilities typical of urban development exist within the project area, as well as subsurface petroleum exploration, production, and distribution facilities.

5.4 UTILITIES

HDR did not observe indications of subsurface utilities other than typical municipal utilities such as water, sewer, electrical, and telecommunications facilities. The presence of subsurface petroleum exploration, production, and distribution facilities is likely in the project area, but no indications of widespread contamination from these facilities was reported in regulatory files.

6.0 DATA GAP ANALYSIS

The ASTM E 1527-05 standard requires a listing of “data gaps” encountered during the investigative process that may affect the validity of the conclusions drawn by the environmental professional. The ASTM E 1527-05 standard also requires that the environmental professional estimate the relative importance of the data gaps. Generally, gaps in available data are related to the availability of historical data sources for specific sites of concern. The environmental professional uses multiple historical data sources as a method to provide coverage for data gaps. Historical information is collected on a recurring basis, and the passage of time between data sets may or may not constitute a significant gap in data coverage. For this project, the following items may constitute a data gap as defined by ASTM:

- Lack of site-specific interviews
- Lack of adequate regulatory files available for review

The absence of site-specific interviews is not anticipated to be a significant data gap based on the other supporting information gathered during the investigative process.

Because regulatory files were already requested for the suspected or known release-related sites of concern, and many were not returned by the regulatory agency, the lack of adequate regulatory files available for review is considered a significant data gap. Section 8.1 of this report addresses the next step in the investigative process, which would account for the information missing from regulatory file review.

7.0 FINDINGS AND CONCLUSIONS

HDR has conducted a Corridor Phase I ESA for the Restoration of Historic Streetcar Service in Downtown Los Angeles project located in Los Angeles, Los Angeles County, California. The proposed streetcar project is situated in Downtown Los Angeles, from approximately 1st Street to 11th Street, and from Broadway to Figueroa Street. In addition to the project area, a one-eighth-mile surrounding vicinity was also evaluated for the purposes of this report. Figures depicting the configuration and location of the project area are included in Appendix A, with photographs included in Appendix B.

This Phase I ESA identifies recognized environmental conditions (RECs, as defined in ASTM E 1527-05) for the project area that may adversely affect construction or project area right-of-way acquisition. In the event that the regulatory issue has been resolved by the regulatory agency with jurisdiction, the condition may be classified as a “Historical REC”.

This ESA includes a summary of the site reconnaissance conducted on August 15-16, 2012, a review of environmental databases, and a review of historical data sources.

The ESA process resulted in the following findings and conclusions:

7.1 FINDINGS

- The project area is located in an urban area of mixed-use development in Los Angeles, California. Development in the area consists of the paved roadways of the LPA and the Variation, surrounded by high-rise office buildings, music and sporting event venues, commercial and retail facilities, churches, libraries, hotels, residential complexes, multi-story parking garages, and public parks. Potential locations for the Maintenance Facility Sites (MFSs) within the project area currently consist of paved parking lots and a retail shopping center. Locations of the traction power substations (TPSSs) are dispersed throughout project area, adjacent to the LPA, and include parking lots, parking structures and an alley. Prior streetcar tracks have existed within the project area. Subsurface utilities typical of urban development exist within the project area, as well as subsurface petroleum exploration, production, and distribution facilities.
- The EDR environmental database report identified 493 environmental records for sites located within the project area and the one-eighth-mile surrounding vicinity. Within an urban area it is anticipated that commercial operations will increase the number of listings in a database search. As a result, 426 of the 494 records listed are not considered to be of concern to the project. The remaining 68 records correspond to 37 sites considered to be of concern to the project. The discrepancy between the number of records and the number of sites is a result of sites often being listed in multiple databases.
- For the purposes of this report, sites listed in the State UST database (and no other database) were considered a concern only if the site is located in or adjacent to a proposed MFS or TPSS location.
- Eight additional sites of concern were identified from historical resource review (Sanborn fire insurance maps, historical aerial imagery and city directories). The sites are considered to be a concern based on the likelihood for USTs to have previously been stored onsite. It has been the experience of HDR professionals that oftentimes, subsurface contamination is present in the area of USTs not

otherwise classified as a LUST.

- The site reconnaissance of the project area did not identify any additional sites of concern. No indications of large-scale, previous spills or hazardous material usage or disposal were identified within the project area. No pits, ponds, lagoons, or other indications of buried or large-scale hazardous material were identified during the reconnaissance of the project area.

7.2 CONCLUSIONS

HDR has identified RECs and HRECs in connection with the project area. The following statement is required by ASTM E 1527-05 as a positive declaration of whether REC(s) were found:

HDR has performed a Phase I Environmental Site Assesssment (ESA) in conformance with the scope and limitations of ASTM E 1527-05 of the project area (as defined elsewhere in this report). Any exceptions to or deletions from these practices are described in the report. This report has revealed evidence of 27 Recognized Environmental Conditions (RECs) and 10 HRECs, in connection with the project area.

8.0 RECOMMENDATIONS

Recommendations included in this report have been developed through the investigative procedures described in the *Scope of Services, Significant Assumptions, and Limitations* section of this report. These findings should be reviewed within the context of the limitations provided in the *Scope of Services, Significant Assumptions, and Limitations* section. Based on the location and specific details of the identified risks, HDR has identified 27 RECs and 10 HRECs associated with the project area.

Based on the findings and conclusions reached in this report, HDR makes the following recommendations for the project area:

8.1 RECOMMENDATION 1

HDR recommends that a focused Preliminary Site Investigation (PSI) be conducted at specified locations adjacent to the identified sites of concern for moderate, high and indeterminate-risk sites, as well as the proposed locations for the MFS and TPSSs. A PSI in these areas will include a soil boring and laboratory analytical program, to address contaminants of concern specific to each site.

8.2 RECOMMENDATION 2

HDR recommends that all construction contractors should be instructed to immediately stop all subsurface activities in the event that potentially hazardous materials are encountered, an odor is identified, or significantly stained soil is visible. Contractors should be instructed to follow all applicable regulations regarding discovery and response for hazardous materials encountered during the construction process

9.0 QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONALS

9.1 SIGNATURES AND QUALIFICATIONS

We declare that, to the best of our professional knowledge and belief, we meet the definition of environmental professional as defined in Section 312.10 of 42 C.F.R. Part 312. This Phase I ESA was conducted under the supervision of a qualified environmental professional.

We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the project area. We have developed and performed the AAI in conformance with standards and practices set forth in 40 C.F.R. Part 312.

The preceding report has been prepared in general conformance with standard industry practice for performance of ESAs, and includes the applicable portions of the investigation procedures codified in ASTM E 1527-05, *Standard Practice for Environmental Site Assessments: Environmental Site Assessment Process*. The end user of this report may rely on the contents, findings, and conclusions to be accurate within the limitations stated in this report and in the ASTM standard. The report also complies with specific requirements supplied by the client.

Environmental Professional
Kelly W. Kading, CPG, CHMM
Senior Professional Associate

9.1.1 Qualifications of Environmental Professionals

Mr. Kelly W. Kading, CPG, CHMM, an environmental professional as defined by ASTM E 1527-05, has more than 25 years of experience in assessment and remediation of impacted properties and compliance with environmental regulations. He has a B.S. in Geology from Colorado State University and is a Certified Professional Geologist (#9173), and a Certified Hazardous Materials Manager (#1995). He specializes in forensic investigation of hazardous materials-impacted properties for municipal and state agencies, as well as commercial clients. His experience covers assessment of more than 3,000 properties ranging from agricultural land to multigenerational industrial properties in 34 states and 2 foreign countries. He is highly knowledgeable of federal, state, and local environmental regulations and standards and has served on the National Board of Directors of the Academy of Certified Hazardous Materials Managers. He serves as HDR's National Phase I Best Practices Team leader, and is responsible for training HDR's Phase I practitioners nationwide.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

EXECUTIVE SUMMARY

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS list

CERCLIS: The Comprehensive Environmental Response, Compensation and Liability Information System contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the CERCLIS list, as provided by EDR, and dated 12/27/2011 has revealed that there are 2 CERCLIS sites within approximately 0.125 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA’s comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/15/2012 has revealed that there are 6 RCRA-LQG sites within approximately 0.125 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/15/2012 has revealed that there are 125 RCRA-SQG sites within approximately 0.125 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/15/2012 has revealed that there are 2 RCRA-CESQG sites within approximately 0.125 miles of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 05/07/2012 has revealed that there are 6 ENVIROSTOR sites within approximately 0.125 miles of the target property.

State and tribal landfill and/or solid waste disposal site lists

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the SWF/LF list, as provided by EDR, and dated 05/21/2012 has revealed that there is 1 SWF/LF site within approximately 0.125 miles of the target property.

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 100 SWEEPS UST sites within approximately 0.125 miles of the target property.

Records of Emergency Release Reports

CHMIRS: The California Hazardous Material Incident Report System contains information on reported hazardous material incidents, i.e., accidental releases or spills. The source is the California Office of Emergency Services.

A review of the CHMIRS list, as provided by EDR, and dated 03/28/2012 has revealed that there are 24 CHMIRS sites within approximately 0.125 miles of the target property.

EXECUTIVE SUMMARY

Other Ascertainable Records

RCRA-NonGen: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA-NonGen list, as provided by EDR, and dated 03/15/2012 has revealed that there are 16 RCRA-NonGen sites within approximately 0.125 miles of the target property.

TSCA: The Toxic Substances Control Act identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site. The United States Environmental Protection Agency has no current plan to update and/or re-issue this database.

A review of the TSCA list, as provided by EDR, and dated 12/31/2006 has revealed that there is 1 TSCA site within approximately 0.125 miles of the target property.

EXECUTIVE SUMMARY

FTTS: FTTS tracks administrative cases and pesticide enforcement actions and compliance activities related to FIFRA, TSCA and EPCRA (Emergency Planning and Community Right-to-Know Act) over the previous five years. To maintain currency, EDR contacts the Agency on a quarterly basis.

A review of the FTTS list, as provided by EDR, and dated 04/09/2009 has revealed that there are 7 FTTS sites within approximately 0.125 miles of the target property.

HIST FTTS: A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

A review of the HIST FTTS list, as provided by EDR, and dated 10/19/2006 has revealed that there are 7 HIST FTTS sites within approximately 0.125 miles of the target property.

EXECUTIVE SUMMARY

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

A review of the FINDS list, as provided by EDR, and dated 10/23/2011 has revealed that there are 169 FINDS sites within approximately 0.125 miles of the target property.

EXECUTIVE SUMMARY

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency

A review of the HAZNET list, as provided by EDR, and dated 12/31/2010 has revealed that there are 484 HAZNET sites within approximately 0.125 miles of the target property.

EXECUTIVE SUMMARY

EMI: Toxics and criteria pollutant emissions data collected by the ARB and local air pollution agencies

A review of the EMI list, as provided by EDR, and dated 12/31/2008 has revealed that there are 147 EMI sites within approximately 0.125 miles of the target property.

US FIN ASSUR: All owners and operators of facilities that treat, store, or dispose of hazardous waste are required to provide proof that they will have sufficient funds to pay for the clean up, closure, and post-closure care of their facilities.

A review of the US FIN ASSUR list, as provided by EDR, and dated 05/24/2012 has revealed that there is 1 US FIN ASSUR site within approximately 0.125 miles of the target property.

EXECUTIVE SUMMARY

HWP: Detailed information on permitted hazardous waste facilities and corrective action ("cleanups") tracked in EnviroStor.

A review of the HWP list, as provided by EDR, and dated 08/09/2010 has revealed that there is 1 HWP site within approximately 0.125 miles of the target property.

HWT: A listing of hazardous waste transporters. In California, unless specifically exempted, it is unlawful for any person to transport hazardous wastes unless the person holds a valid registration issued by DTSC. A hazardous waste transporter registration is valid for one year and is assigned a unique registration number.

A review of the HWT list, as provided by EDR, and dated 04/11/2012 has revealed that there are 2 HWT sites within approximately 0.125 miles of the target property.

EDR PROPRIETARY RECORDS

EDR Proprietary Records

EDR Historical Auto Stations: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc.

A review of the EDR Historical Auto Stations list, as provided by EDR, has revealed that there are 114 EDR Historical Auto Stations sites within approximately 0.125 miles of the target property.

EDR Historical Cleaners: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc.

A review of the EDR Historical Cleaners list, as provided by EDR, has revealed that there are 114 EDR

EXECUTIVE SUMMARY

Historical Cleaners sites within approximately 0.125 miles of the target property.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

SIC Code:	8399
SIC Code 2:	Not reported
Primary Waste:	Miscellaneous (Includes wastes from dewatering, recreational lake overflow, swimming pool wastes, water ride wastewater, ground water seepage and other wastes of this type)
Primary Waste Type:	Designated/Influent or Solid Wastes that pose a significant threat to water quality because of their high concentrations (E.G., BOD, Hardness, TRF, Chloride). 'Manageable' hazardous wastes (E.G., inorganic salts and heavy metals) are included in this category.
Secondary Waste:	Not reported
Secondary Waste Type:	Not reported
Design Flow:	0
Baseline Flow:	0
Reclamation:	No reclamation requirements associated with this facility.
POTW:	The facility is not a POTW.
Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:

Waste code: D002

Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003

Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES

ASK GOLD INC (Continued) **1007370126**

WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Violation Status: No violations found

Facility Status:	Unique Premium Metals, Inc. is a precious metal recycler. A new Standardized Hazardous Waste Facility Permit, Series C was issued to Unique Premium Metals, Inc. on April 13, 2006 and became effective on May 23, 2006. The Permit will expire on May 22, 2016. Unique Premium Metals is located in a suite within the St. Vincent Jewelry Center Building, in the downtown Los Angeles Jewelry District. Unique Premium Metals Inc. accepts jewelry polishing dust ("sweeps") from jewelry manufacturers, processes it, and then assays for precious metal content. The sweeps contain precious metals, and are regulated as hazardous waste in California because they are a fine powder containing metals (copper, barium, nickel, zinc, silver) that typically exceed the regulatory levels. The Series C Standardized Permit authorizes Unique Premium Metals to store and treat the jewelry sweeps.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

SHELL SERVICE STATION (Continued) **1005441239**

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D018
Waste name: BENZENE

Violation Status: No violations found

FINDS:

Registry ID: 110012543168

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Used oil fuel marketer to burner:	No
Used oil Specification marketer:	No
Used oil transfer facility:	No
Used oil transporter:	No

Hazardous Waste Summary:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D005
Waste name: BARIUM

Waste code: D006
Waste name: CADMIUM

Waste code: D007
Waste name: CHROMIUM

Waste code: D008
Waste name: LEAD

Waste code: D016

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and

CAL-MART PLATING CO (Continued) **1000139348**

corrective action activities required under RCRA.

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of

JEWELRY DESIGN CENTER (Continued) **1000597500**

events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

PCS (Permit Compliance System) is a computerized management information system that contains data on National Pollutant Discharge Elimination System (NPDES) permit holding facilities. PCS tracks the permit, compliance, and enforcement status of NPDES facilities.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA

HERRERAS JEWELRY (Continued) **1000356364**

program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA’s programs. The vision for ICIS is to replace EPA’s independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit

LOS ANGELES BUREAU OF SANITATION (Continued) **1007649280**

Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Used oil transfer facility:	No
Used oil transporter:	No

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Waste code:	D006
Waste name:	CADMIUM
Violation Status:	No violations found
