Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Number of Injuries:	0
Number of Fatalities:	0
Description:	Responsible parties dumped the substance in a driveway in front of an office bldg. Per R/P, believe this occ'd last nite. It is being investigated by LAPD. Two people Grace Moghadan & Michael Moghadan are with WD Gem Corp and are the responsible pparties. Their business was located at 611 Wilshire Blvd, Suite 1100 in Los Angeles but they are no longer there. This was originally called in as a possible radioactive incident but nothing was found at the location per the R/P.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource

TIMES MIRROR COMPANY (Continued) **1000221221**

Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

HAZARDOUS WASTE BIENNIAL REPORTER

CRITERIA AND HAZARDOUS AIR POLLUTANT INVENTORY

US EPA RACT/BACT/LAER Clearinghouse (RBLC) database contains case-specific information on the "Best Available" air pollution technologies that have been required to reduce the emission of air pollutants from stationary sources (e.g., power plants, steel mills, chemical plants, etc.). RACT, or Reasonably Available Control Technology, is required on existing sources in areas that are not meeting national ambient air quality standards. BACT, or Best Available Control Technology, is required on major new or modified sources in clean areas. LAER, or Lowest Achievable Emission Rate, is required on major new or modified sources in non-attainment areas.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D018
Waste name: BENZENE

Waste code: D035
Waste name: METHYL ETHYL KETONE

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F005
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS

LADWP JOHN FERRARO BUILIDING (Continued) **1000474498**

LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Environmental Interest/Information System

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

HAZARDOUS WASTE BIENNIAL REPORTER

US Facility Response Plan (FRP) contains plans for responding, to the maximum extent practical, to worst case discharges of oil.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Agency City,St,Zip: 0
Agency Contact: Not reported
Agency Telephone: Not reported
Agency Type: Private
SIC Code: 4932
SIC Code 2: Not reported
Primary Waste: Miscellaneous (Includes wastes from dewatering, recreational lake overflow, swimming pool wastes, water ride wastewater, ground water seepage and other wastes of this type)
Primary Waste Type: Inert/Influent or Solid Wastes that do not contain soluble pollutants or organic wastes and have little adverse impact on water quality. Such wastes could cause turbidity and siltation. Uncontaminated soils, rubble and concrete are examples of this category.
Secondary Waste: Not reported
Secondary Waste Type: Not reported
Design Flow: 0
Baseline Flow: 0
Reclamation: No reclamation requirements associated with this facility.
POTW: The facility is not a POTW.
Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

POTW:	The facility is not a POTW.
Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport,

METROPOLITAN STUCTURE WEST (Continued) **1000455475**

and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 03/30/2012
Date Data Arrived at EDR: 04/05/2012
Date Made Active in Reports: 05/15/2012

Next Scheduled EDR Contact: 10/22/2012
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Data Release Frequency: No Update Planned

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Data Release Frequency: Quarterly

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 12/27/2011

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database
The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Date of Government Version: 06/27/2011

Local Lists of Hazardous waste / Contaminated Sites

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

US HIST CDL: National Clandestine Laboratory Register

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 09/01/2007

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Other Ascertainable Records

RCRA-NonGen: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

SAN DIEGO COUNTY:

Hazardous Materials Management Division Database

The database includes: HE58 - This report contains the business name, site address, business phone number, establishment 'H' permit number, type of permit, and the business status. HE17 - In addition to providing the same information provided in the HE58 listing, HE17 provides inspection dates, violations received by the establishment, hazardous waste generated, the quantity, method of storage, treatment/disposal of waste and the hauler, and information on underground storage tanks. Unauthorized Release List - Includes a summary of environmental contamination cases in San Diego County (underground tank cases, non-tank cases, groundwater contamination, and soil contamination are included.)

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: Rextag Strategies Corp.
Telephone: (281) 769-2247
U.S. Electric Transmission and Power Plants Systems Digital GIS Data

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2011 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Summary

The Restoration of Historic Streetcar Service in Downtown Los Angeles (Project) consists of the construction and operation of a streetcar line in downtown Los Angeles, California along a 3.8-mile loop.

The project alignment would begin at Hill and 1st Streets, run east along 1st Street, south along Broadway, west along 11th Street, north along Figueroa Street, east along 7th Street or 9th Street, and north along Hill Street, back to its beginning at 1st Street. Potential inclusion of a Grand Avenue Extension would also provide an alignment spur west along 1st Street, beginning at Hill Street, and continuing south along Grand Avenue to a stop north of 2nd Street.

The route would traverse an area composed primarily of commercial land uses with a mix of residential, public, and entertainment land uses. The Project would travel through several neighborhoods or districts within the Central City Community Plan Area of the City of Los Angeles: Civic Center, Bunker Hill, Historic Core, Jewelry District, Financial Core, South Park, Fashion District, and LA Live/Convention Center. This dense urban area is the region's largest employment center and one of the region's largest tourist destinations, and it has a rapidly growing residential population. Streetcar stops would be located approximately every block in the north/south direction and approximately every other block in the east/west direction. Figure 1 depicts the regional location of the Project.

This Archaeological Resources Technical Report was prepared for the City of Los Angeles, Department of Public Works, Bureau of Engineering (LABOE) for the proposed Project. It presents the results of an archaeological resources study conducted by ICF International (ICF) to meet standards outlined in the National Historic Preservation Act (NHPA) and the California Environmental Quality Act (CEQA).

The City of Los Angeles (City) is the lead agency for the Project under CEQA. The project is being sponsored with the cooperation of the LABOE, the Los Angeles Department of Transportation (LADOT), the Los Angeles County Metropolitan Transportation Authority (Metro), and Los Angeles Streetcar Inc. (LASI). Funding assistance is also being sought from the Federal Transit Administration (FTA).

A cultural resources records search was conducted to identify archaeological sites located within the Project's Area of Potential Effect (APE) and within a 0.25-mile buffer around the APE. The records search was conducted by the South Central Coastal Information Center (SCCIC) on August 20, 2012. Results of the records search indicate that 19 cultural resource studies have been conducted within the project APE. The entire APE, consisting of a 7th Street Alternative and a 9th Street Alternative, has been previously surveyed and one archaeological resource, 19-003129, is recorded within the APE. The site is located outside of the proposed alignment and does not overlap proposed project work areas. Four additional archaeological sites (19-002741, 19-003097, 19-003347, and 19-004114) are recorded within a 0.25-mile radius of the APE. As these sites are located outside of the proposed project work areas, they would not be affected by the proposed Project.

A search of the Native American Heritage Commission's (NAHC) Sacred Lands Files was requested for the project (see Appendix A). Results of the search indicate the presence of Native American sacred places and/or sites in the vicinity of the APE, specifically a prehistoric Native American cemetery found during construction of the Metropolitan Water District (MWD) Headquarters. This area is 0.42 mile northeast of the APE, outside of all proposed project activities, and would not be affected by the Project. The NAHC provided a list of 10 tribes and individuals who may have knowledge of cultural resources in or near the APE and recommended contacting the people on the list. Letters were sent by the FTA to these 10 contacts on July 1, 2013. Follow-up phone calls were made on August 20 and August 27, 2013. Details of this contact effort are provided in Appendix A.

A review of aerial maps indicates that the APE has been heavily altered by the construction and urbanization of downtown Los Angeles and the natural ground surface is not visible. Because the natural ground surface is not visible, an archaeological field survey was not conducted. However, a historical resources survey was conducted and the results of that survey can be found in the Project's *Historic Resources Technical Report*. The lack of archaeological resources identified within the APE does not preclude the possibility of identifying subsurface archaeological material during construction activities. However, due to the heavy subsurface disturbance caused by previous construction—including the construction and installation of utilities, roads, and skyscrapers—the likelihood of encountering intact, subsurface archaeological material is low. If cultural materials are discovered during construction, ICF recommends that all earth-moving activity within and around the immediate discovery area be diverted until a qualified archaeologist can assess the nature and significance of the find. If the resources are determined to be significant, further treatment may include avoidance or data recovery activities.

If human remains are discovered, California Health and Safety Code (HSC) Section 7050.5 states that further disturbances and activities shall cease in any area or nearby area suspected to overlie remains, and the County Coroner shall be contacted. Pursuant to Public Resources Code (PRC) Section 5097.98, if the remains are thought to be Native American, the coroner will notify the NAHC, which will then notify the Most Likely Descendant. Further provisions of PRC 5097.98 are to be followed as applicable.

Introduction

ICF conducted an archaeological resources study for Project's APE in compliance with NHPA and CEQA. This report discusses the findings of that study. The study included an archaeological resources records search and NAHC Sacred Lands File search. An Environmental Impact Report (EIR) will be prepared to analyze five project alternatives: a No Project Alternative, and four possible streetcar routes for the Project.

The five Alternatives are:

- No Project
- 7th Street Alternative with Grand Avenue Extension
- 7th Street Alternative without Grand Avenue Extension
- 9th Street Alternative with Grand Avenue Extension
- 9th Street Alternative without Grand Avenue Extension

The City is the lead agency for the Project under CEQA. The project is being sponsored with the cooperation of LABOE, LADOT, Metro, and LASI. Funding assistance is also being sought from the FTA.

Introduction

The Project consists of the construction and operation of streetcar service in downtown Los Angeles, California, along an up to 3.8-mile route. The project alignment would begin at Hill and 1st Streets, run east along 1st Street, south along Broadway, west along 11th Street, north along Figueroa Street, east along 7th Street or 9th Street, and north along Hill Street, back to its beginning at 1st Street. Potential inclusion of a Grand Avenue Extension would also provide a two-way alignment spur west along 1st Street, beginning at Hill Street, and continuing south along Grand Avenue to a stop north of 2nd Street. The Project route would cover an area composed primarily of commercial land uses with a mix of residential, public, and entertainment land uses. The Project would link several neighborhoods or districts within the Central City Community Plan Area of the City of Los Angeles: Civic Center, Bunker Hill, Historic Core, Jewelry District, Financial Core, South Park, Fashion District, and LA Live/Convention Center.

Figure 1 depicts the regional location of the Project. Figure 2 shows the Project's routing within downtown Los Angeles.

Figure 1. Regional Location Map

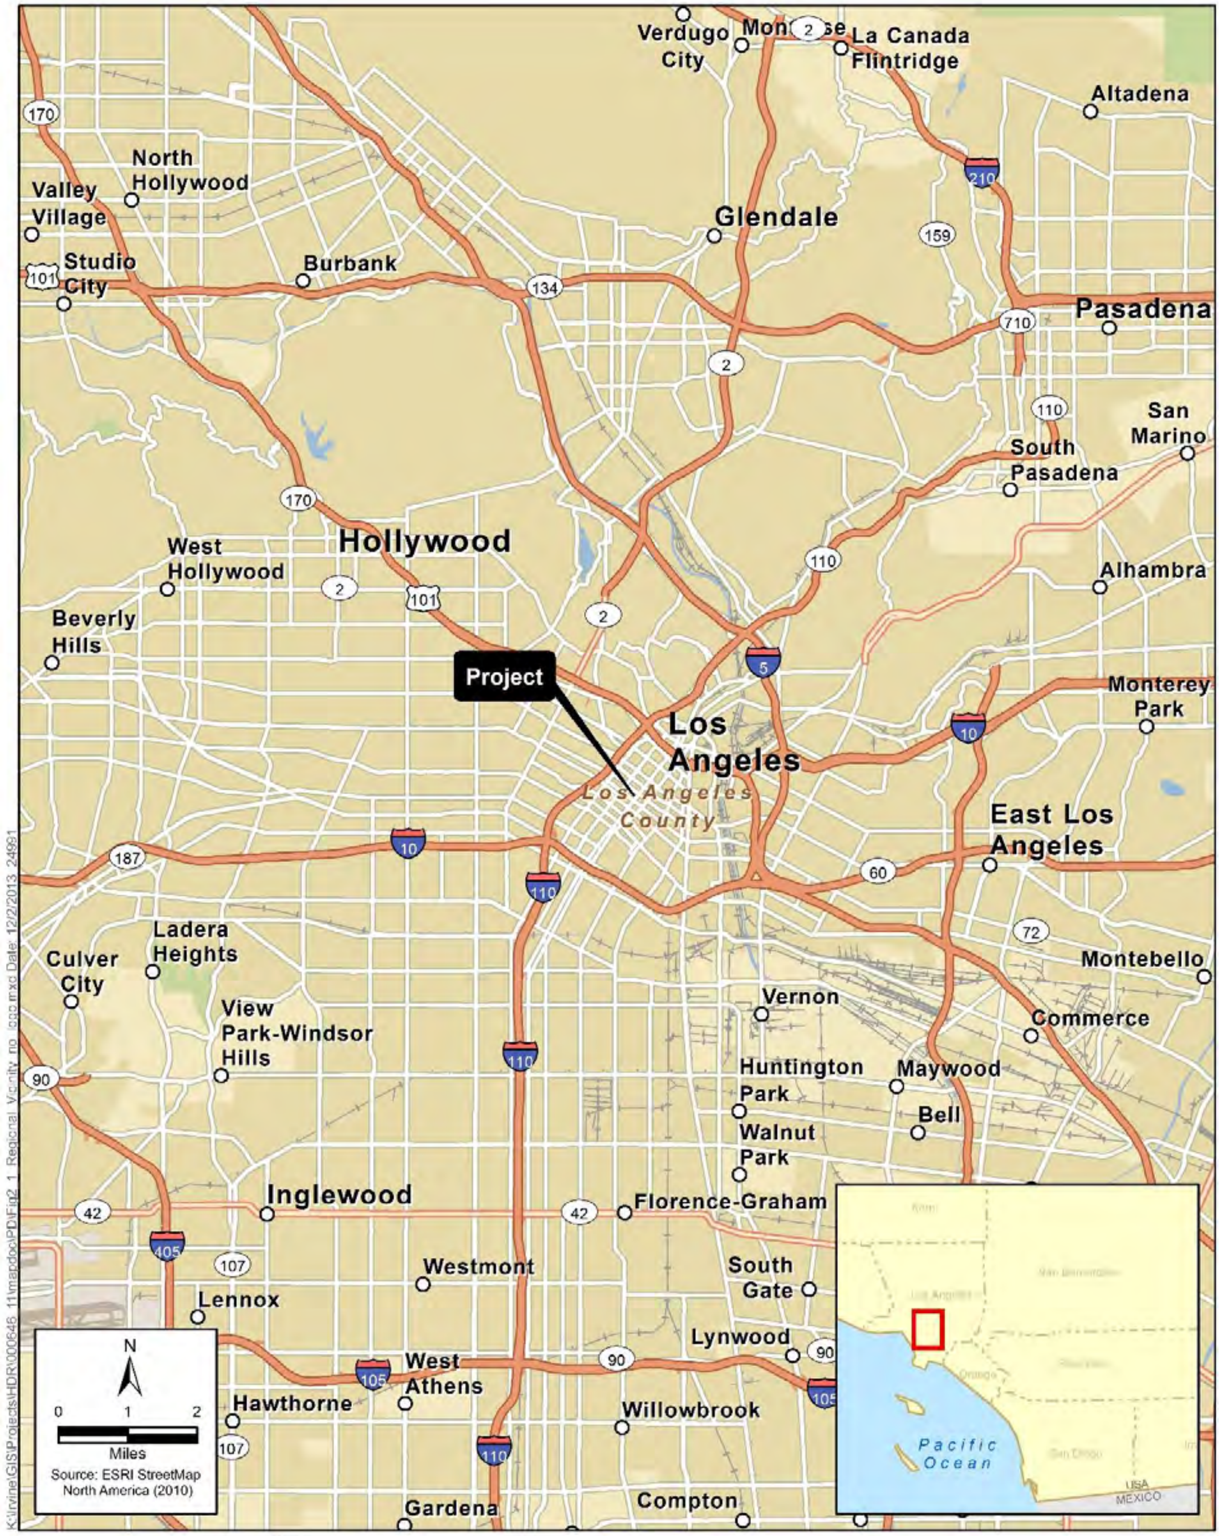

Figure 2. Proposed Downtown Los Angeles Streetcar Route

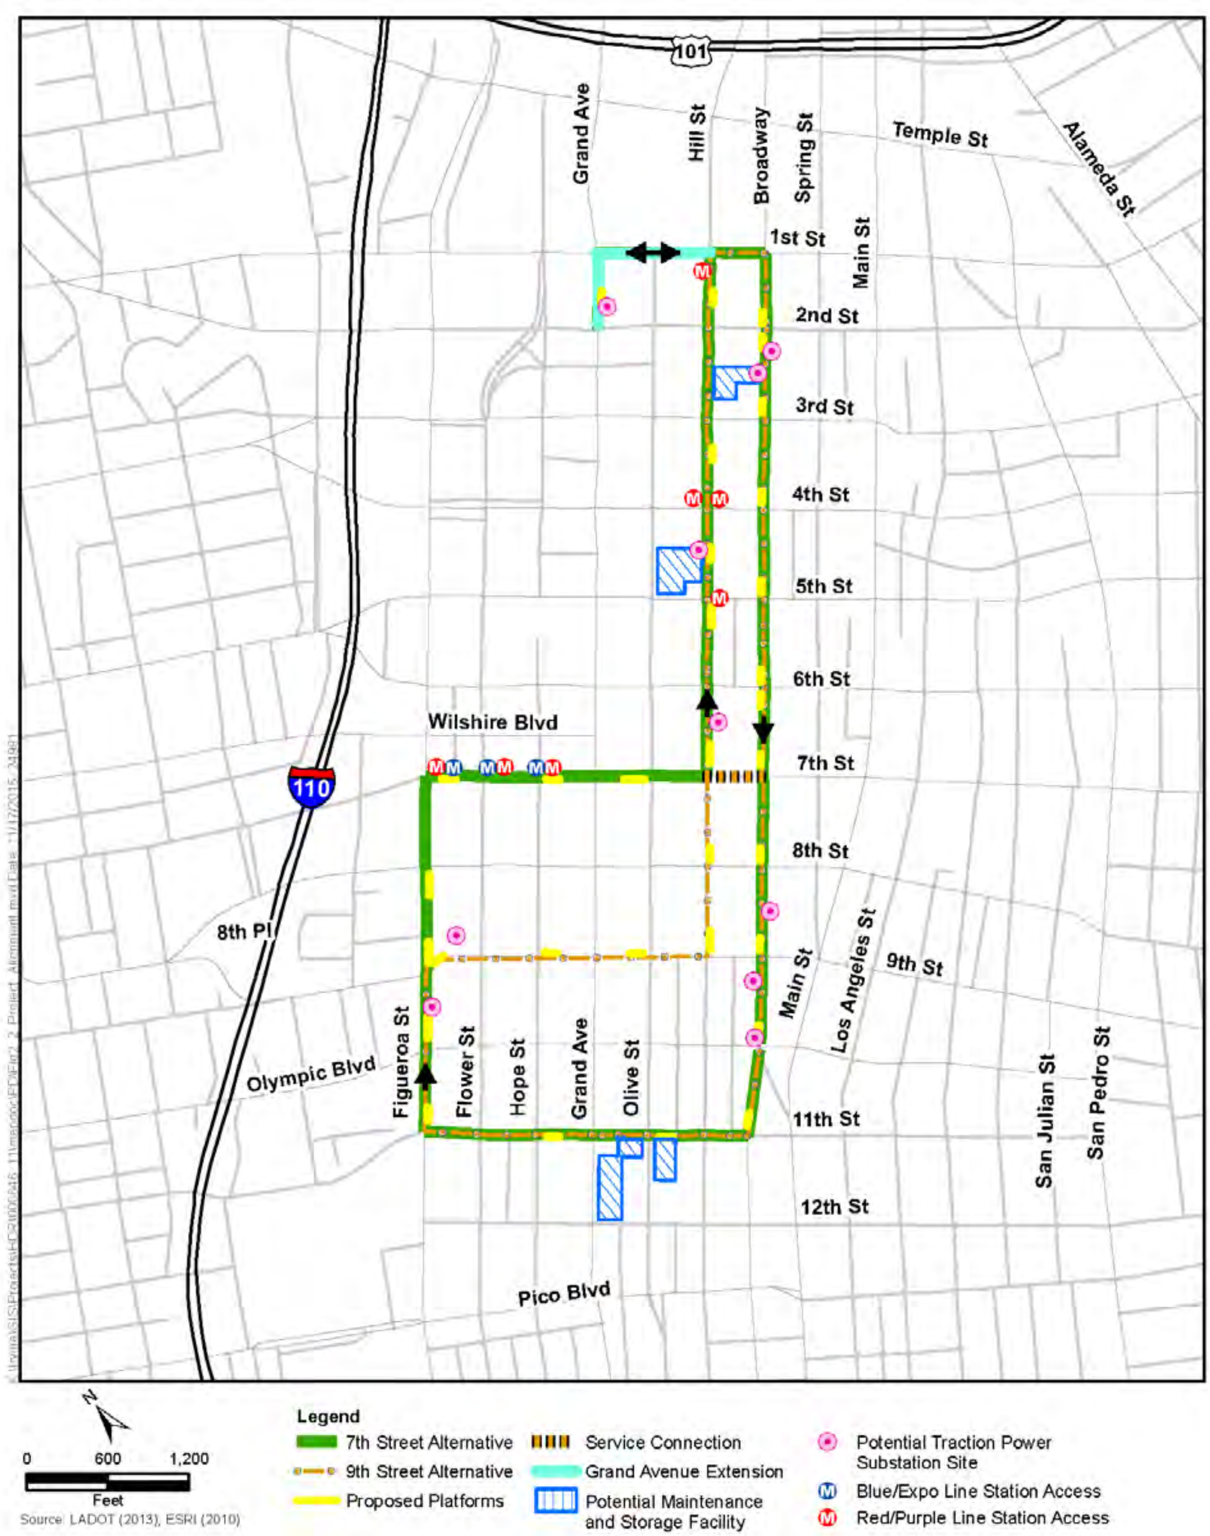


The track and roadway configuration would allow for a mixed flow of vehicles and a fleet of electrically powered streetcars. Power to the streetcar vehicles would be provided by approximately five traction power substations (TPSSs) and an overhead contact system (OCS). A maintenance and storage facility (MSF) site would also be constructed as part of the Project.

Project Alternatives

Five project alternatives are being considered; these include four build alternatives for the proposed Project and a No Project Alternative.

Alternative 1 – No Project Alternative

The No Project Alternative, which is required by Section 15126.6(e) of the State CEQA Guidelines, represents conditions in the project study area that would remain if the proposed Project would not occur.

Alternative 2 – 7th Street with Grand Avenue Extension

The 7th Street with Grand Avenue Extension Alternative would construct and implement streetcar service along an alignment that would begin on Grand Avenue north of 2nd Street adjacent to the Disney Concert Hall, then continue northward until turning east on 1st Street. From 1st Street, the streetcar would turn south on Broadway, traveling to 11th Street where it would turn west and continue on to Figueroa Street. The streetcar would then turn north on Figueroa Street and travel to 7th Street, where it would turn east. From 7th Street, the streetcar would turn north on Hill Street, then continue back to 1st Street, completing the circuit by turning west on 1st Street to return to the streetcar stop on Grand Avenue.

Alternative 3 – 7th Street without Grand Avenue Extension

Alternative 3 would follow the same alignment as Alternative 2, with the exception that the Grand Avenue Extension would not be incorporated. Therefore, Hill and 1st Streets would be the terminal point, rather than Grand Avenue north of 2nd Street.

Alternative 4 – 9th Street with Grand Avenue Extension

The 9th Street with Grand Avenue Extension Alternative would follow the same alignment as the 7th Street with Grand Avenue Extension Alternative, but it would run eastbound on 9th Street between Figueroa Street and Hill Street, rather than 7th Street, and the Project alignment would still begin and terminate on Grand Avenue, north of 2nd Street.

Alternative 5 – 9th Street without Grand Avenue Extension

Alternative 5 would follow the same alignment as Alternative 3, but it would run eastbound on 9th Street between Figueroa Street and Hill Street, rather than 7th Street.

Elements of the Streetcar Alternatives

A brief overview of the elements common to all build alternatives of the Project is presented below.

Vehicles

The Project's operating plan calls for 7-minute headways (i.e., time spacing between vehicles) during peak periods. A fleet of six electrically powered streetcars is currently estimated to be needed to operate on the system. An estimated two additional streetcars would serve as backup vehicles to the operating fleet, for a total estimated fleet size of eight vehicles. Each vehicle would measure approximately 80 feet long and be approximately 13 feet high. The streetcars would be articulated to make tight turns and have a capacity of approximately 100 passengers. The streetcars would be similar to the modern streetcar models that are currently used in other cities in the United States. Examples of similar streetcars can be found in Portland, Oregon; both Tacoma and Seattle, Washington; Tucson, Arizona; Dallas, Texas; Atlanta, Georgia; and Charlotte, North Carolina. The streetcars would be designed with low floors to be compliant with the Americans with Disabilities Act (ADA). Operating speeds would be at the maximum posted downtown speed limit, which is currently 25 miles per hour (mph) on all streets other than Figueroa Street, between 5th Street and Pico Boulevard, where it is 30 mph. Power for the streetcars would be transmitted by overhead catenary wires supported by poles along the streetcar tracks.

Platforms

The streetcars would make stops at approximately 25 platforms along the alignment; the number of platforms is subject to change based upon further design of the Project. With varying configurations, the platforms would generally consist of a raised concrete pad approximately 8 feet wide by 70 feet long. Some of the streetcar platforms would be shared by buses operated by Metro, LADOT Downtown Area Short Hop (DASH), and other regional operators. Shared platforms would generally be approximately 120 feet long, though physical constraints on some street segments could limit them to shorter lengths. The maximum curb height would be approximately 8 to 14 inches. Platforms could be located either in the center of the roadway or adjacent to the sidewalk, along the curb. Platforms would transition from the sidewalk to match or nearly match the floor height of the streetcar vehicles. Platforms would be designed and constructed to connect to the sidewalk in a way that meets ADA and building access requirements.

Support Facilities

Overhead Contact System

There are two potential configurations for the OCS contact wires, which would supply electrical power to the streetcar vehicles. One configuration would be to support the contact wire with a span wire between two poles located on either side of the street, perpendicular to the streetcar track. Another configuration would support the contact wire from cantilever arms connected to single poles. Configurations would be site specific and be made based upon engineering design and aesthetic considerations. Either of these configurations could use decorative poles chosen to be consistent with the streetscape along the project alignment. It is possible that poles used for delivering streetcar power could also be integrated with other streetscape infrastructure such as street lighting, traffic signals, or traffic signs. OCS suspension at corner turning locations (e.g., Hill/1st Streets, 1st Street/Broadway, Broadway/11th Street, 11th/Figueroa Streets, Figueroa/9th or 7th Streets, 9th or 7th/Hill Streets) would be more specialized and tailored to each location, possibly requiring a combination of wire-mounting configurations. OCS poles would be approximately 25 to 30 feet tall and would be typically installed at intervals of about 80 to 120 feet, with added poles at turns. Wire heights above the tracks would typically range between approximately 18 and 19 feet in the public right-of-way.

Traction Power Substations

The streetcars would be powered by an estimated five TPSS units spaced relatively evenly throughout the alignment to provide direct current (DC) power for the streetcars; the final number and placement will be determined by further project design. Each unit would be a durable structure containing electrical and electronic equipment. Based on typically sized equipment used in other cities, the TPSS units would most likely measure approximately 17 feet long by 11 feet wide by 11 feet high, although these dimensions could vary. The footprint needed for the TPSS installations could be up to approximately 250 square feet. The substations, typically rated at 350 kilowatts, would convert 480-volt commercial alternating current (AC) power to 750-volt DC power for the streetcars.

Each TPSS would typically be placed in an off-street location, such as a parking lot or other suitable site. At one location, 2nd Street and Grand Avenue, the currently recommended potential TPSS site may need to occupy space in the public right-of-way. A number of potential TPSS locations and alternate sites are being evaluated in the event that primary sites are found to be infeasible.

Maintenance and Storage Facility

The Project would require an MSF to provide a location for secure storage of streetcar vehicles when they are not in operation, and regular light maintenance of the vehicles to keep them clean and in good operating condition.

Four sites are currently being considered as a potential location for the MSF: (1) the southwest corner of 11th and Olive Streets; (2) the southeast corner of 11th and Olive Streets; (3) the northwest corner of Hill and 5th Streets; or (4) the west side of Broadway between 2nd and 3rd Streets. All four candidate sites are currently being used as parking lots. The MSF would consist of an enclosed building and an outdoor area where routine inspections, maintenance work, and light repairs could be performed. The facility would have sufficient storage capacity to handle the needs of the streetcar system, with paved maintenance aisles, a pit track, overhead crane, paved truck access, staff offices, parts storage areas, and a machine shop. An employee parking area may also be provided. A maintenance building for a system of the size of the Project would generally be 12,000 to 18,000 square feet, approximately two to three stories tall, contain tracks inside a garage enclosure for maintenance of the vehicles, and be constructed to comply with the City's Green Building Code and also meet minimum Leadership in Energy & Environmental Design (LEED) certification requirements. Acquisition of private property for the MSF site would be required. Streetcars would gain access to the facility from a short segment of track that would be connected to the mainline. A storage area outside of the maintenance facility would provide an area for overnight cleaning (i.e., wash facility with clarifier) and secure storage of streetcar vehicles.

Signaling

Streetcar movement would be governed by "line-of-sight" operations, with passage through intersections controlled by traffic signals. "Line-of-sight" operations means that streetcars would be controlled by an operator who would proceed when traffic signals and traffic allow, and who would stop for traffic signals, station stops, pedestrians, bicycles, and other vehicles. A separate signal head may be provided at intersections for streetcar control. The streetcar control signal would be interconnected with the traffic signals and would clearly indicate to the streetcar operator when it is clear for the streetcar to move or required to stop.

Transit signals (i.e., special signals separated from the general purpose signal system) would be necessary where the streetcar would require a special traffic signal phase to maneuver so as to avoid conflicts with general traffic. These signals are also required at locations where a track switch is used by the streetcar operator to choose between different paths. Most of the route for the proposed Project would not have separate transit signals. Where they are needed, operation of transit signals would be separated from the normal traffic signals in order to not confuse the general public.

Potential Layover Locations

Locations on the streetcar route are needed to provide space for a streetcar to layover out of traffic, to allow dispatch according to a regular schedule, or to provide space for a streetcar to be temporarily taken out of service. In addition, these locations would allow the streetcar operator to take a short break. For the route currently proposed, two such locations would be desirable.

Under the Grand Avenue Extension (Alternatives 2 and 4), at the stop on Grand Avenue north of 2nd Street, a single track in an exclusive median is currently proposed. This configuration would allow the streetcars to complete their round trip and layover out of traffic for several minutes until the next scheduled departure. The streetcar vehicles would have operator cabs on both ends of the cars so that they would be able to operate in either direction of travel.

In addition to the Grand Avenue location, four other locations have currently been identified as potential second layover sites. Should Alternative 3 or 5 be ultimately selected, two of these locations may be needed. At each of these locations, a short section of parallel track would need to be provided to allow space for the streetcar to move off the main line while the layover is taking place. These sites include (a) Broadway, near-side at 2nd Street; (b) Broadway, far-side at 2nd Street; (c) Broadway, mid-block between 2nd and 3rd Streets; and (d) 11th Street, near-side at Hill Street.

All of the above currently considered layover locations are being evaluated as part of further design advancement of the Project, and are therefore subject to change with regard to location and/or track layout.

Construction Activities

Construction activities associated with the Project would affect portions of Grand Avenue, 1st Street, Broadway, 11th Street, Figueroa Street, 7th Street or 9th Street, and Hill Street, as well as the selected MSF and TPSS sites. Construction activities would include: (a) pavement removal, (b) utility relocation, (c) excavation, (d) construction of track drains, (e) installation of concrete track slab and rails, (f) construction of station platforms, (g) installation of special track work units, (h) reconstruction of ramps and sidewalks, (i) paving, and (j) striping. Other activities would include installation of specialty system work, such as traction power, overhead contact wire, communications systems, train/traffic signaling, and OCS pole foundations.

Laydown and storage area(s) for construction would be established near the project alignment and would be used for storage of equipment and materials. The laydown and storage area(s) could be located within the right-of-way, in parking lots, or on vacant land, and would be used to store equipment and materials. Four potential laydown and storage areas have currently been identified for evaluation: (1) the southeast corner of 3rd Street and Main Street; (2) northeast corner of 3rd Street and Spring Street; (3) 243 S. Spring Street; and (4) Grand Avenue to Olive Street, between 8th and 9th Streets. These should be regarded as example sites; other locations within the study area may become available and could also be chosen. All four example locations are currently being used as parking lots adjoining City streets within one block of the Project alignment.

Project construction activities would typically take place on weekdays between 7 a.m. and 9 p.m., in accordance with Los Angeles Municipal Code (LAMC) 41.40(a). To expedite construction, certain construction activities may be permitted to occur during nighttime, weekend, and holiday periods with the approval of the Board of Police Commissioners pursuant to LAMC Section 41.40(j). In addition, construction within City roadways may occur during peak periods (i.e., 6 a.m. to 9 a.m. and 3:30 p.m. to 7 p.m.) in accordance with Mayor's Executive Directive No. 2 and Bureau of Engineering Special Order No. 001-0406, which provide an exemption to the rush hour roadway construction prohibition for major public works projects having traffic mitigation plans. Construction activities will be required to follow the City Planning Department's new policy (in effect June 2015) to maintain safe adjacent pedestrian access at all times during construction.

The analysis in this document assumes that, unless otherwise stated, the Project would be designed, constructed, and operated following all applicable laws, regulations, ordinances, and formally adopted City standards, including but not limited to the LAMC; LADOT design standards and special provisions; *California Manual on Uniform Traffic Control Devices*; and all City bureaus' design manuals, special provisions, and standard plans, including the latest *Standard Specification for Public Works Construction* (Greenbook); the LABOE's Brown Book; the *Work Area Traffic Control Handbook*; and any FTA requirements.

Section 106 of the National Historic Preservation Act

The NHPA of 1966, as amended (16 United States Code [U.S.C.] 470 et seq.), is the primary federal legislation that outlines the federal government's responsibility to consider the effects of its actions on historic properties and affords the Advisory Council on Historic Preservation a reasonable opportunity to comment. Section 106 of the NHPA and its implementing regulations at 36 Code of Federal Regulations (CFR) Part 800 describe the process that the federal agency shall take to identify cultural resources and assess the level of effect that the proposed undertaking would have on historic properties. An undertaking is defined as a "project, activity or program funded in whole or in part, under the direct or indirect jurisdiction of a federal agency." This includes projects that are carried out by, or on behalf of, the agency; those carried out with federal assistance; those requiring a federal permit, license, or approval; and those subject to state or local regulation administered pursuant to a delegation, or approval by, a federal agency (Section 301(7) 16 U.S.C. 470w(7)).

Cultural resource is a broad term that includes prehistoric, historic, architectural, and traditional cultural properties. Those cultural resources that are listed on, or are eligible for inclusion in, the National Register of Historic Places (NRHP) are referred to as *historic properties*. The criteria for NRHP eligibility are outlined at 36 CFR Part 60. Other applicable federal cultural resources laws and regulations that could apply include, but are not limited to, the Native American Graves Protection and Repatriation Act and the Archaeological Resources Protection Act.

Compliance with Section 106 of the NHPA (36 CFR Part 800) follows a series of steps that are designed to identify and consult with interested parties, determine the APE, determine if historic properties are present within the APE, and assess the effects the undertaking would have on historic properties. Section 106 requires consultation with Indian Tribes concerning the identification of sites of religious or cultural significance and with individuals or groups who are entitled, or requested, to be consulting parties. The regulations at 36 CFR Part 800.5 require federal agencies to apply the criterion of adverse effect to the historic properties identified within the APE. The criterion of adverse effect, defined at 36 CFR Part 800.5(a)(1), states:

> "An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association."

The 36 CFR Part 800 regulations include consultation with the State Historic Preservation Officer (SHPO) to provide an opportunity to comment on, and concur with, the eligibility determinations. If the undertaking would result in adverse effects on historic properties, these adverse effects must be resolved in consultation with the SHPO and other parties identified during the Section 106 process before the undertaking can proceed to implementation.

National Register Criteria for Evaluation

The criteria for evaluation of NRHP eligibility are outlined at 36 CFR Part 60.4. A district, archaeological site, building, structure, or object must generally be at least 50 years old to be eligible for consideration as a historic property. That district, site, building, structure, or object must retain integrity of location, design, setting, materials, workmanship, feelings, and association as well as meet one of the following criteria to demonstrate its significance in American history, architecture, archaeology, engineering, and culture:

(A) be associated with events that have made a significant contribution to the broad patterns of history;

(B) be associated with the lives of people significant in our past;

(C) embody the distinct characteristics of a type, period, or method of construction, or represent the work of a master, or possess high artistic values, or represent a significant and distinguishable entity whose components may lack individual distinction;

(D) have yielded, or may be likely to yield, information important in prehistory or history.

A site must have integrity and meet one of the four criteria of eligibility to demonstrate its historic associations in order to convey its significance. A property must be associated with one or more events important in history or prehistory in order to be considered for listing under Criterion A. The specific association of the property, itself, must also be considered significant. Criterion B applies to properties associated with individuals whose specific contributions to history can be identified and documented. Properties significant for their physical design or construction under Criterion C must have features with characteristics that exemplify such elements as architecture, landscape architecture, engineering, and artwork. Criterion D most commonly applies to properties, especially archaeological sites that have the potential to answer, in whole or in part, important research questions about human history or prehistory that can only be answered by the actual physical materials of cultural resources. A property eligible under Criterion D must demonstrate the potential to contain information relevant to prehistory and history (National Register Bulletin 15).

A district, site, building, structure, or object may also be eligible for consideration as a historic property if that property meets the criteria considerations for properties generally less than 50 years old, in addition to possessing integrity and meeting the criteria for evaluation.

California Environmental Quality Act

The proposed Project is governed by CEQA. In accordance with PRC §21084.1, the proposed Project would have a significant adverse environmental impact if it "causes a substantial or potentially substantial adverse change in the significance of a historical resource." As defined under state law in Title 14 California Code of Regulations (CCR) §4850, a historical resource is "any object, building, structure, site, area, place, record, or manuscript which is historically or archaeologically significant, or which is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural history of California." An historical resource is further defined under CCR §15064.5 as a "resource listed in, or determined eligible for listing in the California Register of Historical Resources (CRHR)." A resource shall be considered by the lead state agency to be historically significant under CEQA if it meets any of the following criteria for listing on the CRHR.

(A) The resource is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

(B) The resource is associated with the lives of persons important in our past;

(C) The resource embodies the distinctive characteristics of a type, period, region, or method of construction or represents the work of an important creative individual or possesses high artistic values; or

(D) The resource has yielded, or may be likely to yield, information important in prehistory or history.

In addition, properties listed in or determined eligible for listing in the NRHP are automatically listed in the CRHR. Therefore, all historic properties under federal preservation law are automatically considered historical resources under CEQA. CCR §15064.5 (c) specifies further details regarding assessment of archaeological sites, including those that do not meet the CRHR criteria above. These sites may still be evaluated to be a "unique archaeological resource" under PRC Section 21083.2, however, this rarely happens in practice.

State Health and Safety Code Section 7050.5 and California Public Resources Code, Section 5097.9

Archaeological sites containing human remains shall be treated in accordance with the provisions of HSC Section 7050.5 and PRC Section 5097.9. Under HSC 7050.5, if human remains are discovered, the county coroner must be notified immediately. If human remains are exposed, HSC Section 7050.5 states that no further disturbance shall occur until the county coroner has made the necessary findings as to origin and disposition pursuant to PRC Section 5097.98. Construction must halt in the area of the discovery of human remains, the area of the discovery shall be protected, and consultation and treatment shall occur as prescribed by law. If the remains are determined by the coroner to be Native American, the coroner is responsible for contacting the NAHC within 24 hours. The NAHC, pursuant to Section 5097.98, will immediately notify those persons it believes to be most likely descended from the deceased person so they can inspect the burial site and make recommendations for treatment or disposal.

Los Angeles Municipal Code

The Project is located within the City of Los Angeles. City statutes and guidelines specify how historical resources, including archaeological resources, are to be managed in the context of projects such as the proposed project. Briefly, archival and field surveys must be conducted, and identified historical resources must be inventoried and evaluated in prescribed ways.

The City designates local landmarks, which it calls Historic-Cultural Monuments, and local historic districts, which it calls Historic Preservation Overlay Zones, through Ordinance Number 175891, Section 12.20.3, of the LAMC. Historic-Cultural Monuments and historic districts located within the APE are discussed in the Project's *Historic Resources Technical Report*.

Los Angeles CEQA Thresholds

The City of Los Angeles has developed thresholds for determining impact significance pursuant to CEQA (Section 21068; State CEQA Guidelines Section 15064) and has published those thresholds in the *L.A. CEQA Thresholds Guide* (2006). These thresholds (City Thresholds) are to be used to determine the significance of potential impacts resulting from or associated with the proposed Project. The *L.A. CEQA Thresholds Guide* (2006) states that the following impact significance factors shall apply to archaeological resources.

Archaeological Resources

A project would normally have a significant impact on archaeological resources if it could disturb, damage, or degrade an archaeological resource or its setting that is found to be important under the criteria of CEQA because it:

- Is associated with an event or person of recognized importance in California or American prehistory or of recognized scientific importance in prehistory;
- Can provide information that is both of demonstrable public interest and useful in addressing scientifically consequential and reasonable archaeological research questions;
- Has a special or particular quality, such as the oldest, best, largest, or last surviving example of its kind;
- Is at least 100 years old and possesses substantial stratigraphic integrity; or
- Involves important research questions that historical research has shown can be answered only with archaeological methods.

Area of Potential Effect

This study focused on identifying archaeological resources within the Project's APE (Figure 3). The project APE consists of the area of direct impact of the four build alternatives, and parcels surrounding the alternatives that may have direct or indirect effects from project construction. The APE includes alternative MSF sites and TPSS locations as described in the *Project Description*. The vertical APE includes the depth of all ground-disturbing activities. These ground disturbing activities would extend to a depth of approximately 3–5 feet below ground surface in most areas, and a maximum depth of 30 feet below the ground's surface in limited areas for underground TPSS facilities and utility relocation.

Environmental Setting

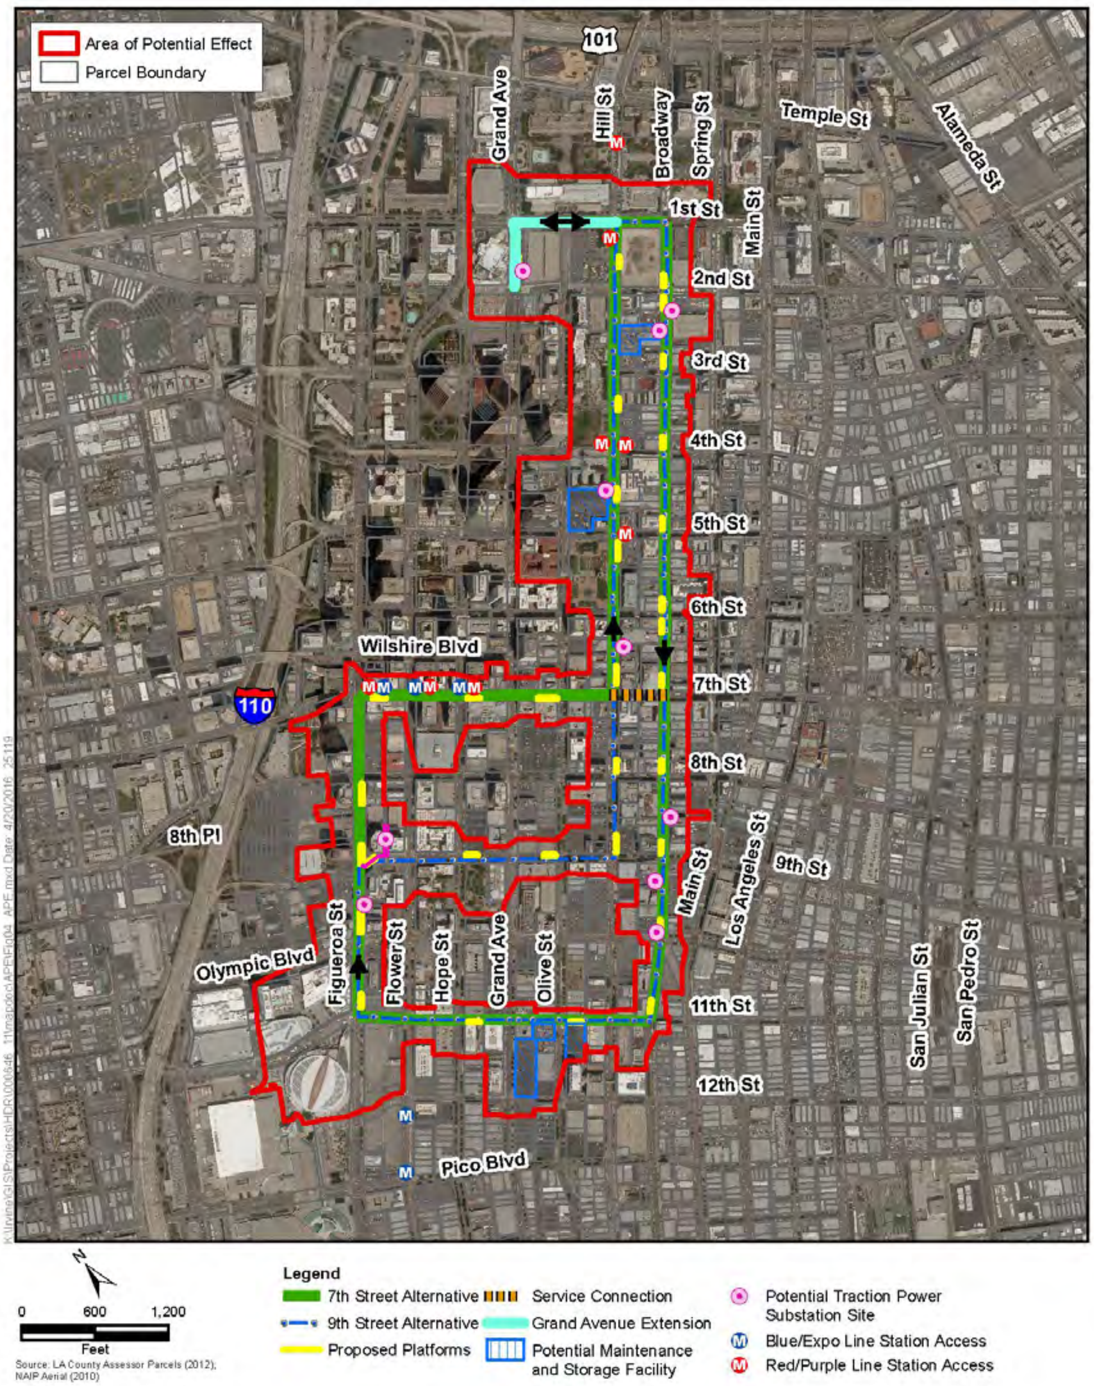
The Project is located in the heart of downtown Los Angeles, an area noted for its skyscrapers and dense urban development. This area is the region's largest employment center and a major tourist destination. The APE traverses the following areas in downtown Los Angeles, from north to south: the Civic Center, Bunker Hill, the Historic Core, the Jewelry District, the Financial Core, South Park, Fashion District, and LA Live/Convention Center, all of which are located within the Central City Community Plan, the land use element of the General Plan for the downtown area of the City. The proposed 3.8-mile project alignment, which would run along 1st Street, Broadway, 11th Street, Figueroa Street, Grand Avenue, 7th Street or 9th Street, and Hill Street, would cover an area of mostly commercial land uses. Within the Civic Center district, many land uses are government-owned office buildings for city, state, and federal employees. In addition, there is a high concentration of historic buildings in and around the project alignment.

The natural ground surface within the APE has been completely altered by dense urbanization, including the construction of buildings, roads, and utilities. The natural ground surface is not visible within the APE and therefore was not surveyed for archaeological resources. The lack of archaeological resources on the surface does not preclude the possibility that subsurface archaeological resources may exist within the APE. However, due to heavy alteration of the ground surface, the likelihood of encountering intact prehistoric archaeological deposits is low. Remnants of built resources are more likely to be encountered in the APE, but most of these found in the past have proved to be insignificant and not eligible for the NRHP or CRHR.

Prehistoric Human Occupation

The prehistoric human occupation of southern California is divided chronologically into four temporal phases or horizons (Moratto 1984). Horizon I, or the Early Man Horizon, began at the first appearance of people in the region, at least 12,000 years ago, and continued until about 5,000 B.C. Although little is known about these people, it is assumed that they were semi-nomadic and subsisted primarily on game.

Figure 3. Preliminary Area of Potential Effects



Horizon II, also known as the Millingstone Horizon or Encinitas Tradition, began around 5,000 B.C. and continued until about 1,500 B.C. The Millingstone Horizon is characterized by widespread use of milling stones (manos and metates), core tools, and few projectile points or bone and shell artifacts. This horizon appears to represent a diversification of subsistence activities and a more sedentary settlement pattern. Archaeological evidence suggests that hunting became less important and that reliance on collecting shellfish and vegetal resources increased (Moratto 1984).

Horizon III, the Intermediate Horizon or Campbell Tradition, began around 1,500 B.C. and continued until about A.D. 600–800. Horizon III is defined by a shift from the use of milling stones to increased use of mortar and pestle, indicating a greater reliance on acorns as a food source. Projectile points become more abundant and, together with faunal remains, indicate increased use of both land and sea mammals (Moratto 1984).

Horizon IV, the Late Horizon, which began around A.D. 600–800 and terminated with the arrival of Europeans, is characterized by dense populations; diversified hunting and gathering subsistence strategies, including intensive fishing and sea mammal hunting; extensive trade networks; use of the bow and arrow; and a general cultural elaboration (Moratto 1984). The Prehistoric Period in California is considered to have ended in 1769, with settlement by the Spanish in San Diego, and the subsequent destruction of the majority Native American population.

Native American Ethnographic Background

The APE lies within Gabrielino/Tongva ethnographic territory. The term Gabrielino refers to Native American groups historically associated with the San Gabriel Mission. Gabrielino territory is not well defined, but is generally believed to incorporate the watersheds of the Los Angeles, San Gabriel, and Santa Ana Rivers. It includes the entire Los Angeles Basin, the coast between Aliso Creek and Topanga Creek, and the islands of San Clemente, San Nicholas, and Santa Catalina. The ancestors of the Gabrielinos likely arrived in the Los Angeles Basin around 2500 years before present (B.P.) as part of what Kroeber (1925) referred to as the “Shoshonean Wedge.” By 1500 B.P., permanent villages were built in the lowlands along rivers and streams. Over 50 villages may have been occupied simultaneously with populations of between 50 and 200 people per village (Bean and Smith 1978).

Gabrielino houses were primarily domed, semi-subterranean, thatched structures of locally accessible materials including tule, fern, and carrizo. Principal game included deer, rabbit, fish, sea mammals, jackrabbit, woodrat, mice, ground squirrels, antelope, quail, and other birds. Acorns were the most important single food source and villages seem to have been located near water resources necessary for the leaching of acorns. Grass seeds were the next most abundant food source. Seeds were parched, ground, and cooked as a mush in various combinations. Additional food sources included various greens, cactus pods, yucca buds, bulbs, roots, and tubers (Bean and Smith 1978). Tools for food acquisition, storage, and preparation included an inventory made from widely available materials. Hunting tools included shoulder-height bows with fire-hardened wood or stone-tipped arrows, curved throwing sticks, rabbit nets, slings, and traps. Seeds were ground with handstones on shallow basin metates. The same granites were made into mortars and pestles for pounding acorns or small game. Coiled and twined baskets and steatite bowls were used in food gathering, preparation, storage, and serving. Other utensils for food preparation included wooden food paddles, brushes, tongs, tweezers, and wooden digging sticks (Bean and Smith 1978).

Historical Background

The start of the Historic Period in California is considered to begin in 1769 with the Spanish occupation of San Diego. Mission San Gabriel was established in the Los Angeles Basin in 1771, and the Los Angeles pueblo was established as a civilian settlement on September 4, 1781. The Pueblo was located north of the project APE, in what is now the El Pueblo de Los Angeles Historical Monument. Early development of Los Angeles did not encompass the project APE. However, as agricultural development took place surrounding the Pueblo, ditches to convey water, called *zanjas,* were built across open lands, including parts of the APE. The zanjas were in use until 1885, when they were officially abandoned and filled in, replaced by piped water systems.

In 1821, Mexico won independence from Spain and subsequently became a republic. In 1833, the Mexican government secularized the missions. Although secularization was intended to distribute the mission lands to the settlers and native population, few Native Americans received land grants. The large-scale cattle ranchers, or rancheros, claimed the bulk of the resources. These cattle ranches became the driving force in the economy.

At the end of the war between Mexico and the United States in 1848, the Treaty of Guadalupe Hidalgo was signed, giving control of California to the United States. In 1850, California was admitted into the Union. On April 4, 1850, the City was incorporated as a municipality. The history of Los Angeles County through most of the nineteenth and twentieth centuries is one of remarkable urban growth. The motion picture industry and manufacturing sector created numerous jobs and supported new businesses. As a result of the opportunities created by these industries, the population of Los Angeles grew from 102,000 in 1900 to 576,000 in 1920 and 1.2 million by 1930. Today, Los Angeles is a thriving commercial center and the second largest city in the United States, with a population of nearly 4 million people.

A detailed historic background of the APE can be found in the Project's *Historic Resources Technical Report*.

Literature and Records Search

A cultural resources records search was conducted to identify archaeological sites located within the APE and within a 0.25-mile buffer of the APE. The records search was conducted by SCCIC on August 20, 2012, and the NRHP was consulted again in March 2013. The SCCIC, located at California State University Fullerton, is a branch of the California Historical Resources Information Center and maintains the State of California's official records of cultural resource studies and archaeological sites within Los Angeles and Orange Counties. In addition to archaeological site records, the SCCIC maintains copies of the following reference material.

- NRHP
- Historic Property Data Files
- CRHR
- California Historical Landmarks Database
- Los Angeles Historic-Cultural Monuments Inventory

Results of the records search indicate that 19 cultural resource studies have been conducted within the APE. The entire APE has been previously surveyed and one archaeological resource, 19-003129, is recorded within it. Archaeological site 19-003129 contains late nineteenth and early twentieth century residential refuse deposits. The site is located on both sides of North Grand Avenue, approximately 40 feet northeast of the Grand Avenue/1st Street Intersection, within the APE, but outside of the proposed alignment.

Four additional archaeological sites (19-002741, 19-003097, 19-003347, and 19-004114) are recorded within a 0.25-mile radius of the APE. These sites are located outside of the project area, and would not be affected by the proposed Project.

Archaeological site 19-002741 is a buried red brick footing or wall. It is at the corner of 3rd Street and Harlem Place, approximately 365 feet southeast of the APE.

Archaeological site 19-003097 is mid- to late nineteenth century structural remains and associated features, located approximately 405 feet east of the APE, between 1st Street and 2nd Street, southwest of Los Angeles Street.

Archaeological site 19-003347 consists of two areas of early twentieth century granite-top pavement in the vicinity of Werdin Place, approximately 300 feet north of 3rd Street. The pavement was evaluated by Monica Strauss in 2004 and found not eligible for the CRHR due to its lack of integrity (Strauss 2004). The site is approximately 450 feet southeast of the APE.

Archaeological site 19-004114 consists of historic structural foundations and refuse features. The site is located both east and west of Werdin place, north of 3rd Street and east of Main Street. The site is approximately 540 feet southeast of the APE.

A review of historic maps of the Los Angeles Zanja system[1] (Gust and Pritchard-Parker 2004) indicates that the proposed Project would cross several mapped Zanja locations. Specifically, the Project would cross Zanja #8 between 4th and 5th Streets at Hill, and at 9th Street and 11th Street at Hill. The mapped location of Zanja #8R is crossed by the Project at 7th and Flower Street, and Zanja #7 paralleled the Project along Figueroa Street between 7th Street and 11th Street. However, modern development has destroyed all surface traces of these Zanja ditches. Given the shallow nature of these water conveyance features, it is unlikely any trace of them remains buried under modern infrastructure within the APE, especially because much of modern development, location of utilities, and subway construction has occurred in many of these locations much farther below the ground surface (Gust and Pritchard-Parker 2004).

Sacred Lands Files Search

A search of the NAHC's Sacred Lands Files was requested on March 8, 2013 for the 7th Street Alternative and on May 23, 2013 for the 9th Street Alternative (Appendix A). The NAHC sent a letter to ICF on April 3, 2013, summarizing the results of the Sacred Lands search for the 7th Street Alternative. Results of the search indicate the presence of Native American sacred places and/or sites in the vicinity of the APE. The NAHC letter referenced the MWD Headquarters, located 0.42 mile northeast of the APE.

In 1999, a prehistoric Native American cemetery was found within the MWD property and adjacent Union Station parking lot. The remains of 19 individuals, 14 found in primary interments and five as cremations, were recovered during emergency excavations. These remains date to between 1000 B.P. and 130 B.P. Prehistoric artifacts found with these remains were few, but included projectile points, a steatite bowl, a basket fragment, a metate fragment, a stone pipe fragment, a bowl mortar fragment, ceramic vessel fragments, and bone awls and hairpins as well as hundreds of shell, schist, talc and jadeite beads. These burials were found at depths ranging from approximately 1.7 meters to 2.5 meters below the asphalt of the parking lot. These burials may be associated with the ethnohistoric village of *Yaan'ga.* (This site also encompasses an extensive Historic Period component.) Site CA-LAN-1575/H is located 0.42 mile outside of the APE and outside of all proposed project activities, and would not be affected by the Project.

As part of the consultation process, the NAHC recommends that local governments and project developers contact Tribal governments and individuals to determine if any cultural places might be affected by the proposed action. The NAHC provided the following list of 10 Tribes and individuals who may have knowledge of cultural resources in or near the APE and recommended contacting the people on the list.

- LA City/County Native American Indian Commission, Attn: Ron Andrade, Director
- Ti'At Society/Inter-Tribal Council of Pimu, Attn: Cindi M. Alvitre, Chairwoman-Manisar
- Tongva Ancestral Territorial Tribal Nation, Attn: John Tommy Rosas, Tribal Administrator
- Gabrieleno/Tongva San Gabriel Band of Mission Indians, Attn: Anthony Morales, Chairperson
- Gabrielino Tongva Nation, Attn: Sam Dunlap, Cultural Resources Director

[1] The Zanja system was an early system of ditches that conveyed water to citizens for household use and irrigation, and persisted into the nineteenth century (Creason 2013).

- Gabrielino Tongva Indians of California Tribal Council, Attn: Robert F. Dorame, Tribal Chair/Cultural Resources
- Gabrielino-Tongva Tribe, Attn: Bernie Acuna, Co-Chairperson
- Gabrielino-Tongva Tribe, Attn: Linda Candelaria, Co-Chairperson
- Gabrieleno Band of Mission Indians, Attn: Andrew Salas, Chairperson
- Gabrielino-Tongva Tribe, Attn: Conrad Acuna

FTA contacted the Tribes and tribal representatives in writing on July 1, 2013. One response was received via email from Mr. John Tommy Rosas, stating that the FTA letter would be reviewed and further comments provided. Telephone calls were made to eight Native American representatives (one person does not have a phone number in the NAHC listing) on August 20, 2013. Mr. Andy Salas and Mr. Bernie Acuna requested that the original FTA letter be emailed to them, which was done on August 27, 2013. Messages requesting comment were left with the other six Native American representatives. These six individuals were called again on August 27, 2013; voice mails were left for all six requesting a return call if there were any comments or concerns regarding the Project. The details of this contact effort are provided in Table 1. Copies of written and emailed correspondence are provided in Appendix A.

Table 1. Summary of Native American Contacts

Name/Organization	Date & Type of Contact	Response
LA City/County Native American Indian Commission Ron Andrade, Director	Initial consultation letter sent July 1, 2013	No response received.
	First phone call August 20, 2013	Left a detailed message requesting a return call if the Commission has any comments and concerns regarding the proposed project.
	Second phone call August 27, 2013	Left a detailed message requesting a return call if the Commission has any comments and concerns regarding the proposed project.
Ti'At Society/Inter-Tribal Council of Pimu Cindi M. Alvitre, Chairwoman-Manisar	Initial consultation letter sent July 1, 2013	No response received.
	First phone call August 20, 2013	Left a detailed message requesting a return call if the Society has any comments and concerns regarding the proposed project.
	Second phone call August 27, 2013	Left a detailed message requesting a return call if the Society has any comments and concerns regarding the proposed project.
Tongva Ancestral Territorial Tribal Nation John Tommy Rosas, Tribal Administrator	Email regarding Project sent July 1, 2013 per request on NAHC contact letter	Response received July 3, 2013, via email. Mr. Rosas stated he would review the FTA letter and reply soon. No further response has been received.

Name/Organization	Date & Type of Contact	Response
Gabrieleno/Tongva San Gabriel Band of Mission Indians Anthony Morales, Chairperson	Initial consultation letter sent July 1, 2013	No response received.
	First phone call August 20, 2013	Left a detailed message requesting a return call if the Tribe has any comments and concerns regarding the proposed project.
	Second phone call August 27, 2013	Left a detailed message requesting a return call if the Tribe has any comments and concerns regarding the proposed project.
Gabrielino Tongva Nation Sam Dunlap, Cultural Resources Director	Initial consultation letter sent July 1, 2013	No response received.
	First phone call August 20, 2013	Left a detailed message requesting a return call if the Tribe has any comments and concerns regarding the proposed project.
	Second phone call August 27, 2013	Left a detailed message requesting a return call if the Tribe has any comments and concerns regarding the proposed project.
Gabrielino Tongva Indians of California Tribal Council Robert F. Dorame, Tribal Chair/Cultural Resources	Initial consultation letter sent July 1, 2013	No response received.
	First phone call August 20, 2013	Left a detailed message requesting a return call if the Tribe has any comments and concerns regarding the proposed project.
	Second phone call August 27, 2013	Left a detailed message requesting a return call if the Tribe has any comments and concerns regarding the proposed project.
Gabrielino Tongva Tribe Bernie Acuna, Co-Chairperson	Initial consultation letter sent July 1, 2013	No response received.
	First phone call August 20, 2013	Mr. Acuna called back on August 23, 2013, and requested that the original FTA letter be emailed to him. This was done on August 27, 2013. No further response has been received.
Gabrielino Tongva Tribe Linda Candelaria, Co-Chairperson	Initial consultation letter sent July 1, 2013	No response received.
	First phone call August 20, 2013	Left a detailed message requesting a return call if the Tribe has any comments and concerns regarding the proposed project.
	Second phone call August 27, 2013	Left a detailed message requesting a return call if the Tribe has any comments and concerns regarding the proposed project.
Gabrieleno Band of Mission Indians Andrew Salas, Chairperson	Initial consultation letter sent July 1, 2013	No response received.
	First phone call August 20, 2013	Contacted Mr. Salas, who requested that the original FTA letter be emailed to him. This was done on August 27, 2013. No further response has been received.

Name/Organization	Date & Type of Contact	Response
Gabrielino Tongva Tribe Conrad Acuna, Co-Chairperson	Initial consultation letter sent July 1, 2013	No response received.
	No follow up phone calls could be made, as the NAHC listing for Conrad Acuna does not include a phone number	–

Field Survey

Because the APE is located within a built environment, an intensive archaeological resources survey was not conducted. Streets were inspected with a windshield survey for evidence of older curbs, pavers, or abandoned rail segments; none were observed. During the archaeological field survey, it was observed that the area is paved and developed, with few open spaces for landscape vegetation. No surficial archaeological resources were observed during the survey. The lack of archaeological resources identified within the project APE does not preclude the possibility of identifying subsurface archaeological material during construction activities. Excavation in city streets often uncovers evidence of previous American-era street development, such as utility conduits, old pavement or curbs, and rails and ties from older street rail systems that have been buried in fill and covered with asphalt. However, these items are now usually fragmentary and no longer associated with their original context; such historical cultural materials are almost always determined to not be significant. In terms of prehistoric resources, the APE has been heavily disturbed by past construction activities, including the construction and installation of utilities, roads, and skyscrapers. Therefore, the likelihood of encountering intact, subsurface prehistoric archaeological material within the APE is low. A historical resources survey was conducted and the results of that survey can be found in the Project's *Historic Resources Technical Report*.

Results and Recommendations

Results of the cultural resources records search conducted at the SCCIC indicate that one archaeological site has been identified within the APE and four additional archaeological sites have been identified within a 0.25-mile radius of the APE. The site within the APE consists of late nineteenth and early twentieth century refuse deposits located approximately 40 feet northeast of the Grand Avenue/1st Street intersection. Although the site is within the APE, it is outside the proposed alignment and it does not overlap any proposed MSF or TPSS locations. Because the site is located outside of proposed project work areas, it would not be affected by proposed project activities.

Four additional sites have been identified within a 0.25-mile radius of the APE. All four sites are outside of the APE and not located within any proposed project work area. Therefore, these sites would not be affected by proposed project activities.

The NAHC was contacted and stated that there are Native American sacred places or sites located within the vicinity of the APE. The letter received from the NAHC referenced prehistoric site CA-LAN-1575, located 0.42 mile northeast of the APE. Site CA-LAN-1575 contains a Native American cemetery. Because CA-LAN-1575 is outside the APE and outside of all proposed project activities, the site would not be affected by the Project. The NAHC recommends that local governments and project developers contact local Tribal governments and individuals, as they may have more information on sacred sites in the vicinity of the project APE. Native Americans were contacted by letter and follow up telephone calls; no comments have been received.

The entire APE has been heavily altered by the construction and urbanization of downtown Los Angeles, and the natural ground surface is not visible. Per standard procedure in such situations, a team of archaeologists drove the alignments and inspected the streets for any evidence of older curbs, pavers, or abandoned rail segments. Because the natural ground surface is not visible, a pedestrian archaeological field survey was not conducted. No resources were observed. The lack of archaeological resources identified within the project APE does not preclude the possibility of identifying subsurface archaeological material during construction activities. Excavation in city streets often uncovers evidence of previous American-era street development, such as utility conduits, old pavement or curbs, and rails and ties from older street rail systems that have been buried in fill and covered with asphalt. However, these items are now usually fragmentary and no longer associated with their original context; such historical cultural materials are almost always determined to not be significant. In terms of prehistoric resources, the APE has been heavily disturbed by past construction activities, including the construction and installation of utilities, roads, and skyscrapers. Therefore, the likelihood of encountering intact, subsurface prehistoric archaeological material within the APE is low.

Due to the lack of known resources in the project APE and a low potential for discovery of significant archaeological resources, the proposed Project would not have an impact on archaeological resources. The ICF survey and research did not result in the identification of any surficial prehistoric or historic archaeological sites or features. Possible archaeological discoveries during the project would be addressed as specified in LABOE's Greenbook (2009).

If any prehistoric or historical cultural materials are discovered during construction, it is required that all earth-moving activity within and around the immediate discovery area be diverted until a qualified archaeologist can assess the nature and significance of the find. If the resource is determined to be significant, further treatment may include avoidance or data recovery activities. If only particular types of historical features, such as abandoned rails, prove to be common in the project work area during excavation and grading, the project archaeologist and project manager should establish that the archaeologist inspect these finds only briefly. For example, during the removal of a length of ties, the archaeologist need only inspect the area once a day. However, if numerous types of discoveries are being made, full-time archaeological monitoring may be necessary to protect the resources and avoid the inefficiency of repeated archaeologist visits.

If human remains are discovered, HSC Section 7050.5 states that further disturbances and activities shall cease in any area or nearby area suspected to overlie remains, and the County Coroner shall be contacted. Pursuant to PRC Section 5097.98, if the remains are thought to be Native American, the coroner will notify the NAHC who will then notify the Most Likely Descendant. Further provisions of PRC 5097.98 are to be followed as applicable.

Professional Qualifications

Shelly Long prepared this archaeological study report. Long has a Master of Arts degree in Public Archaeology and more than 10 years of experience working on archaeological field projects in Southern California. She meets the Secretary of the Interior's Standards for Professional Qualifications in Archaeology as a Principal Investigator and meets the State Personnel Board Specifications as an Associate Archaeologist.

Mark Robinson reviewed this report. Robinson has a Master of Science degree in Anthropology and over 30 years of experience working in the field of archaeology. He meets the Secretary of the Interior's Standards for Professional Qualifications in Archaeology as a Principal Investigator and meets the State Personnel Board Specifications as an Associate Archaeologist.

Project Description:

The Los Angeles Streetcar Project is a 3.8 mile single looped track system that will operate from Grand Avenue at 2nd Street, north to 1st Street, east to Broadway, south to 11th Street, west to Figueroa, then north on Figueroa from 11th Street to 7th Street. It will continue east on 7th Street to Hill Street, where it will turn north to 1st Street, then west to Grand Avenue to 2nd Street to complete the loop.

Re: Request for Sacred Lands File Search and Native American Contacts list for the "Los Angeles Street Car Project;" located in the City of Los Angeles (Downtown); Los Angeles County, California

Dear Ms. Long:

A record search of the NAHC Sacred Lands File did indicate the presence of Native American sacred places/site in the area you identified by the USGS coordinates, the Area of Potential Effect (APE) (the area in the vicinity of the Metropolitan Water District Headquarters). Also, the absence of archaeological or cultural resources does not preclude their existence. Other data sources for Native American sacred places/sites should also be contacted. A Native American tribe of individual may be the only sources of presence of traditional cultural places or sites.

In the 1985 Appellate Court decision (170 Cal App 3rd 604), the Court held that the NAHC has jurisdiction and special expertise, as a state agency, over affected Native American resources impacted by proposed projects, including archaeological places of religious significance to Native Americans, and to Native American burial sites.

Attached is a list of Native American tribes, individuals/organization who may have knowledge of cultural resources in or near the project area. As part of the consultation process, the NAHC recommends that local governments and project developers contact the tribal governments and individuals to determine if any cultural places might be impacted by the proposed action. If a response is not received in two weeks of notification the NAHC requests that a follow telephone call be made to ensure that the project information ahs been received.

If you have any questions or need additional information, please contact me at (916) 653-6251.

Sincerely,

Dave Singleton
Program Analyst

RE: Cultural and Historic Resources Consultation for the Restoration of Historic Streetcar Service in Downtown Los Angeles Project

Dear Mr. Andrade:

The City of Los Angeles, Department of Public Works, Bureau of Engineering (LABOE) in partnership with the Los Angeles County Metropolitan Transportation Authority (LACMTA) and in coordination with Federal Transit Administration (FTA) are conducting research for the proposed Restoration of Historic Streetcar Service in Downtown Los Angeles Project (Project). The Project entails the construction and operation of a streetcar system that would run a fleet of electric-powered vehicles along a one-way loop within existing traffic lanes in Downtown Los Angeles.

The Environmental Impact Report/Environmental Assessment will analyze two build alternatives and a no-build alternative. The Locally Preferred Alternative (LPA) would run within existing traffic lanes on 1st Street, Broadway, 11th Street, South Figueroa Street, Grand Avenue, 7th Street or 9th Street, and Hill Street. The project alignment would begin and terminate on Grand Avenue, one block south of 1st Street. From that point, the streetcar would run northbound and turn eastbound on 1st Street. From 1st Street, the streetcar would turn southbound, traveling 1.25 miles south along Broadway, and then turning westbound on 11th Street. The streetcar would then turn north on South Figueroa Street and travel 0.5 miles north to 7th Street where it would turn in the eastbound direction. From 7th Street, the streetcar would turn northbound on Hill Street, continue north back to 1st Street. It would then turn westbound on 1st Street to return to the streetcar terminal stop on Grand Avenue south of 1st Street, by the Disney Concert Hall.

The Project is also considering the 9th Street Alternative, which would follow the same alignment as the LPA but would run eastbound on 9th Street between South Figueroa Street and Hill Street rather than 7th Street. A copy of the Project Location Map is enclosed for your reference. Additional information on the project may be found on the project website at: http://www.metro.net/projects/historic-streetcar-service/.

The streetcar system would run a fleet of electric-powered vehicles using a track and roadway configuration that allow for mixed-flow operations of streetcar vehicles and automobiles. Power for the streetcar system would be provided by a traction power system featuring traction power substations (TPSS) and an overhead contact system. The TPSS would convert high voltage

power to an approximately 600-volt direct current to power the electric trains. The TPSS are approximately 20 feet long, 15 feet wide and 10 feet tall. There would be approximately five TPSS spaced evenly around the 3.8-mile loops, and possibly another TPSS at the maintenance and storage facility. Streetcar stops would typically resemble bus stops with a raised platform along sidewalks. Streetcar stops will be 70 to 120 feet long, and would generally be located along the existing sidewalk or along a sidewalk extension into the traffic lane that meets the streetcar vehicle. Streetcar stops would generally be placed on every block in the north-south direction, and on every other block in the east-west direction.

The Project requires construction of a maintenance and storage facility. Three potential sites for this facility include an approximately 39,800-square-foot site located along Broadway, midblock between 2nd Street and 3rd Street; an approximately 66,600-square-foot site at the northeast corner of 5th Street and Olive Street; and an approximately 30,500-square-foot site at the southeast corner of 11th Street and Grand Avenue.

As part of our research, FTA and the City of Los Angeles, Department of Public Works, Bureau of Engineering (LABOE) are contacting interested parties to help identify prehistoric sites, sacred sites, and/or traditional cultural properties located in the vicinity of the Project Area. The Native American Heritage Commission (NAHC) has been contacted regarding the proposed project and recommended that we contact you. Please inform us if you are not the designated representative for such consultation.

If you have any information that would be relevant to this Project and its possible effect on cultural resources, or if you have any questions please contact Ms. Mary Nguyen, Environmental Protection Specialist, at (213) 202-3960, or mary.nguyen@dot.gov.

RE: Cultural and Historic Resources Consultation
for the Restoration of Historic Streetcar Service
in Downtown Los Angeles Project

Dear Mr. Rosas:

The City of Los Angeles, Department of Public Works, Bureau of Engineering (LABOE) in partnership with the Los Angeles County Metropolitan Transportation Authority (LACMTA) and in coordination with Federal Transit Administration (FTA) are conducting research for the proposed Restoration of Historic Streetcar Service in Downtown Los Angeles Project (Project). The Project entails the construction and operation of a streetcar system that would run a fleet of electric-powered vehicles along a one-way loop within existing traffic lanes in Downtown Los Angeles.

The Environmental Impact Report/Environmental Assessment will analyze two build alternatives and a no-build alternative. The Locally Preferred Alternative (LPA) would run within existing traffic lanes on 1st Street, Broadway, 11th Street, South Figueroa Street, Grand Avenue, 7th Street or 9th Street, and Hill Street. The project alignment would begin and terminate on Grand Avenue, one block south of 1st Street. From that point, the streetcar would run northbound and turn eastbound on 1st Street. From 1st Street, the streetcar would turn southbound, traveling 1.25 miles south along Broadway, and then turning westbound on 11th Street. The streetcar would then turn north on South Figueroa Street and travel 0.5 miles north to 7th Street where it would turn in the eastbound direction. From 7th Street, the streetcar would turn northbound on Hill Street, continue north back to 1st Street. It would then turn westbound on 1st Street to return to the streetcar terminal stop on Grand Avenue south of 1st Street, by the Disney Concert Hall.

The Project is also considering the 9th Street Alternative, which would follow the same alignment as the LPA but would run eastbound on 9th Street between South Figueroa Street and Hill Street rather than 7th Street. A copy of the Project Location Map is enclosed for your reference. Additional information on the project may be found on the project website at: http://www.metro.net/projects/historic-streetcar-service/.

The streetcar system would run a fleet of electric-powered vehicles using a track and roadway configuration that allow for mixed-flow operations of streetcar vehicles and automobiles. Power for the streetcar system would be provided by a traction power system featuring traction power substations (TPSS) and an overhead contact system. The TPSS would convert high voltage

RE: Cultural and Historic Resources Consultation
for the Restoration of Historic Streetcar Service
in Downtown Los Angeles Project

Dear Mr. Morales:

The City of Los Angeles, Department of Public Works, Bureau of Engineering (LABOE) in partnership with the Los Angeles County Metropolitan Transportation Authority (LACMTA) and in coordination with Federal Transit Administration (FTA) are conducting research for the proposed Restoration of Historic Streetcar Service in Downtown Los Angeles Project (Project). The Project entails the construction and operation of a streetcar system that would run a fleet of electric-powered vehicles along a one-way loop within existing traffic lanes in Downtown Los Angeles.

The Environmental Impact Report/Environmental Assessment will analyze two build alternatives and a no-build alternative. The Locally Preferred Alternative (LPA) would run within existing traffic lanes on 1st Street, Broadway, 11th Street, South Figueroa Street, Grand Avenue, 7th Street or 9th Street, and Hill Street. The project alignment would begin and terminate on Grand Avenue, one block south of 1st Street. From that point, the streetcar would run northbound and turn eastbound on 1st Street. From 1st Street, the streetcar would turn southbound, traveling 1.25 miles south along Broadway, and then turning westbound on 11th Street. The streetcar would then turn north on South Figueroa Street and travel 0.5 miles north to 7th Street where it would turn in the eastbound direction. From 7th Street, the streetcar would turn northbound on Hill Street, continue north back to 1st Street. It would then turn westbound on 1st Street to return to the streetcar terminal stop on Grand Avenue south of 1st Street, by the Disney Concert Hall.

The Project is also considering the 9th Street Alternative, which would follow the same alignment as the LPA but would run eastbound on 9th Street between South Figueroa Street and Hill Street rather than 7th Street. A copy of the Project Location Map is enclosed for your reference. Additional information on the project may be found on the project website at: http://www.metro.net/projects/historic-streetcar-service/.

The streetcar system would run a fleet of electric-powered vehicles using a track and roadway configuration that allow for mixed-flow operations of streetcar vehicles and automobiles. Power for the streetcar system would be provided by a traction power system featuring traction power

substations (TPSS) and an overhead contact system. The TPSS would convert high voltage power to an approximately 600-volt direct current to power the electric trains. The TPSS are approximately 20 feet long, 15 feet wide and 10 feet tall. There would be approximately five TPSS spaced evenly around the 3.8-mile loops, and possibly another TPSS at the maintenance and storage facility. Streetcar stops would typically resemble bus stops with a raised platform along sidewalks. Streetcar stops will be 70 to 120 feet long, and would generally be located along the existing sidewalk or along a sidewalk extension into the traffic lane that meets the streetcar vehicle. Streetcar stops would generally be placed on every block in the north-south direction, and on every other block in the east-west direction.

The Project requires construction of a maintenance and storage facility. Three potential sites for this facility include an approximately 39,800-square-foot site located along Broadway, midblock between 2nd Street and 3rd Street; an approximately 66,600-square-foot site at the northeast corner of 5th Street and Olive Street; and an approximately 30,500-square-foot site at the southeast corner of 11th Street and Grand Avenue.

As part of our research, FTA and the City of Los Angeles, Department of Public Works, Bureau of Engineering (LABOE) are contacting interested parties to help identify prehistoric sites, sacred sites, and/or traditional cultural properties located in the vicinity of the Project Area. The Native American Heritage Commission (NAHC) has been contacted regarding the proposed project and recommended that we contact you. Please inform us if you are not the designated representative for such consultation.

If you have any information that would be relevant to this Project and its possible effect on cultural resources, or if you have any questions please contact Ms. Mary Nguyen, Environmental Protection Specialist, at (213) 202-3960, or mary.nguyen@dot.gov.

RE: Cultural and Historic Resources Consultation
for the Restoration of Historic Streetcar Service
in Downtown Los Angeles Project

Dear Ms. Candelaria:

The City of Los Angeles, Department of Public Works, Bureau of Engineering (LABOE) in partnership with the Los Angeles County Metropolitan Transportation Authority (LACMTA) and in coordination with Federal Transit Administration (FTA) are conducting research for the proposed Restoration of Historic Streetcar Service in Downtown Los Angeles Project (Project). The Project entails the construction and operation of a streetcar system that would run a fleet of electric-powered vehicles along a one-way loop within existing traffic lanes in Downtown Los Angeles.

The Environmental Impact Report/Environmental Assessment will analyze two build alternatives and a no-build alternative. The Locally Preferred Alternative (LPA) would run within existing traffic lanes on 1st Street, Broadway, 11th Street, South Figueroa Street, Grand Avenue, 7th Street or 9th Street, and Hill Street. The project alignment would begin and terminate on Grand Avenue, one block south of 1st Street. From that point, the streetcar would run northbound and turn eastbound on 1st Street. From 1st Street, the streetcar would turn southbound, traveling 1.25 miles south along Broadway, and then turning westbound on 11th Street. The streetcar would then turn north on South Figueroa Street and travel 0.5 miles north to 7th Street where it would turn in the eastbound direction. From 7th Street, the streetcar would turn northbound on Hill Street, continue north back to 1st Street. It would then turn westbound on 1st Street to return to the streetcar terminal stop on Grand Avenue south of 1st Street, by the Disney Concert Hall.

The Project is also considering the 9th Street Alternative, which would follow the same alignment as the LPA but would run eastbound on 9th Street between South Figueroa Street and Hill Street rather than 7th Street. A copy of the Project Location Map is enclosed for your reference. Additional information on the project may be found on the project website at: http://www.metro.net/projects/historic-streetcar-service/.

The streetcar system would run a fleet of electric-powered vehicles using a track and roadway configuration that allow for mixed-flow operations of streetcar vehicles and automobiles. Power for the streetcar system would be provided by a traction power system featuring traction power substations (TPSS) and an overhead contact system. The TPSS would convert high voltage

power to an approximately 600-volt direct current to power the electric trains. The TPSS are approximately 20 feet long, 15 feet wide and 10 feet tall. There would be approximately five TPSS spaced evenly around the 3.8-mile loops, and possibly another TPSS at the maintenance and storage facility. Streetcar stops would typically resemble bus stops with a raised platform along sidewalks. Streetcar stops will be 70 to 120 feet long, and would generally be located along the existing sidewalk or along a sidewalk extension into the traffic lane that meets the streetcar vehicle. Streetcar stops would generally be placed on every block in the north-south direction, and on every other block in the east-west direction.

The Project requires construction of a maintenance and storage facility. Three potential sites for this facility include an approximately 39,800-square-foot site located along Broadway, midblock between 2nd Street and 3rd Street; an approximately 66,600-square-foot site at the northeast corner of 5th Street and Olive Street; and an approximately 30,500-square-foot site at the southeast corner of 11th Street and Grand Avenue.

As part of our research, FTA and the City of Los Angeles, Department of Public Works, Bureau of Engineering (LABOE) are contacting interested parties to help identify prehistoric sites, sacred sites, and/or traditional cultural properties located in the vicinity of the Project Area. The Native American Heritage Commission (NAHC) has been contacted regarding the proposed project and recommended that we contact you. Please inform us if you are not the designated representative for such consultation.

If you have any information that would be relevant to this Project and its possible effect on cultural resources, or if you have any questions please contact Ms. Mary Nguyen, Environmental Protection Specialist, at (213) 202-3960, or mary.nguyen@dot.gov.

in Downtown Los Angeles Project

Dear Mr. Acuna:

The City of Los Angeles, Department of Public Works, Bureau of Engineering (LABOE) in partnership with the Los Angeles County Metropolitan Transportation Authority (LACMTA) and in coordination with Federal Transit Administration (FTA) are conducting research for the proposed Restoration of Historic Streetcar Service in Downtown Los Angeles Project (Project). The Project entails the construction and operation of a streetcar system that would run a fleet of electric-powered vehicles along a one-way loop within existing traffic lanes in Downtown Los Angeles.

The Environmental Impact Report/Environmental Assessment will analyze two build alternatives and a no-build alternative. The Locally Preferred Alternative (LPA) would run within existing traffic lanes on 1st Street, Broadway, 11th Street, South Figueroa Street, Grand Avenue, 7th Street or 9th Street, and Hill Street. The project alignment would begin and terminate on Grand Avenue, one block south of 1st Street. From that point, the streetcar would run northbound and turn eastbound on 1st Street. From 1st Street, the streetcar would turn southbound, traveling 1.25 miles south along Broadway, and then turning westbound on 11th Street. The streetcar would then turn north on South Figueroa Street and travel 0.5 miles north to 7th Street where it would turn in the eastbound direction. From 7th Street, the streetcar would turn northbound on Hill Street, continue north back to 1st Street. It would then turn westbound on 1st Street to return to the streetcar terminal stop on Grand Avenue south of 1st Street, by the Disney Concert Hall.

The Project is also considering the 9th Street Alternative, which would follow the same alignment as the LPA but would run eastbound on 9th Street between South Figueroa Street and Hill Street rather than 7th Street. A copy of the Project Location Map is enclosed for your reference. Additional information on the project may be found on the project website at: http://www.metro.net/projects/historic-streetcar-service/.

The streetcar system would run a fleet of electric-powered vehicles using a track and roadway configuration that allow for mixed-flow operations of streetcar vehicles and automobiles. Power for the streetcar system would be provided by a traction power system featuring traction power substations (TPSS) and an overhead contact system. The TPSS would convert high voltage

power to an approximately 600-volt direct current to power the electric trains. The TPSS are approximately 20 feet long, 15 feet wide and 10 feet tall. There would be approximately five TPSS spaced evenly around the 3.8-mile loops, and possibly another TPSS at the maintenance and storage facility. Streetcar stops would typically resemble bus stops with a raised platform along sidewalks. Streetcar stops will be 70 to 120 feet long, and would generally be located along the existing sidewalk or along a sidewalk extension into the traffic lane that meets the streetcar vehicle. Streetcar stops would generally be placed on every block in the north-south direction, and on every other block in the east-west direction.

The Project requires construction of a maintenance and storage facility. Three potential sites for this facility include an approximately 39,800-square-foot site located along Broadway, midblock between 2nd Street and 3rd Street; an approximately 66,600-square-foot site at the northeast corner of 5th Street and Olive Street; and an approximately 30,500-square-foot site at the southeast corner of 11th Street and Grand Avenue.

As part of our research, FTA and the City of Los Angeles, Department of Public Works, Bureau of Engineering (LABOE) are contacting interested parties to help identify prehistoric sites, sacred sites, and/or traditional cultural properties located in the vicinity of the Project Area. The Native American Heritage Commission (NAHC) has been contacted regarding the proposed project and recommended that we contact you. Please inform us if you are not the designated representative for such consultation.

If you have any information that would be relevant to this Project and its possible effect on cultural resources, or if you have any questions please contact Ms. Mary Nguyen, Environmental Protection Specialist, at (213) 202-3960, or mary.nguyen@dot.gov.

Sincerely,

Leslie T. Rogers

RE: Cultural and Historic Resources Consultation for the Restoration of Historic Streetcar Service in Downtown Los Angeles Project

Dear Mr. Dorame:

The City of Los Angeles, Department of Public Works, Bureau of Engineering (LABOE) in partnership with the Los Angeles County Metropolitan Transportation Authority (LACMTA) and in coordination with Federal Transit Administration (FTA) are conducting research for the proposed Restoration of Historic Streetcar Service in Downtown Los Angeles Project (Project). The Project entails the construction and operation of a streetcar system that would run a fleet of electric-powered vehicles along a one-way loop within existing traffic lanes in Downtown Los Angeles.

The Environmental Impact Report/Environmental Assessment will analyze two build alternatives and a no-build alternative. The Locally Preferred Alternative (LPA) would run within existing traffic lanes on 1st Street, Broadway, 11th Street, South Figueroa Street, Grand Avenue, 7th Street or 9th Street, and Hill Street. The project alignment would begin and terminate on Grand Avenue, one block south of 1st Street. From that point, the streetcar would run northbound and turn eastbound on 1st Street. From 1st Street, the streetcar would turn southbound, traveling 1.25 miles south along Broadway, and then turning westbound on 11th Street. The streetcar would then turn north on South Figueroa Street and travel 0.5 miles north to 7th Street where it would turn in the eastbound direction. From 7th Street, the streetcar would turn northbound on Hill Street, continue north back to 1st Street. It would then turn westbound on 1st Street to return to the streetcar terminal stop on Grand Avenue south of 1st Street, by the Disney Concert Hall.

The Project is also considering the 9th Street Alternative, which would follow the same alignment as the LPA but would run eastbound on 9th Street between South Figueroa Street and Hill Street rather than 7th Street. A copy of the Project Location Map is enclosed for your reference. Additional information on the project may be found on the project website at: http://www.metro.net/projects/historic-streetcar-service/.

The streetcar system would run a fleet of electric-powered vehicles using a track and roadway configuration that allow for mixed-flow operations of streetcar vehicles and automobiles. Power for the streetcar system would be provided by a traction power system featuring traction power

substations (TPSS) and an overhead contact system. The TPSS would convert high voltage power to an approximately 600-volt direct current to power the electric trains. The TPSS are approximately 20 feet long, 15 feet wide and 10 feet tall. There would be approximately five TPSS spaced evenly around the 3.8-mile loops, and possibly another TPSS at the maintenance and storage facility. Streetcar stops would typically resemble bus stops with a raised platform along sidewalks. Streetcar stops will be 70 to 120 feet long, and would generally be located along the existing sidewalk or along a sidewalk extension into the traffic lane that meets the streetcar vehicle. Streetcar stops would generally be placed on every block in the north-south direction, and on every other block in the east-west direction.

The Project requires construction of a maintenance and storage facility. Three potential sites for this facility include an approximately 39,800-square-foot site located along Broadway, midblock between 2nd Street and 3rd Street; an approximately 66,600-square-foot site at the northeast corner of 5th Street and Olive Street; and an approximately 30,500-square-foot site at the southeast corner of 11th Street and Grand Avenue.

As part of our research, FTA and the City of Los Angeles, Department of Public Works, Bureau of Engineering (LABOE) are contacting interested parties to help identify prehistoric sites, sacred sites, and/or traditional cultural properties located in the vicinity of the Project Area. The Native American Heritage Commission (NAHC) has been contacted regarding the proposed project and recommended that we contact you. Please inform us if you are not the designated representative for such consultation.

If you have any information that would be relevant to this Project and its possible effect on cultural resources, or if you have any questions please contact Ms. Mary Nguyen, Environmental Protection Specialist, at (213) 202-3960, or mary.nguyen@dot.gov.

RE: Cultural and Historic Resources Consultation
for the Restoration of Historic Streetcar Service
in Downtown Los Angeles Project

Dear Mr. Dunlap:

The City of Los Angeles, Department of Public Works, Bureau of Engineering (LABOE) in partnership with the Los Angeles County Metropolitan Transportation Authority (LACMTA) and in coordination with Federal Transit Administration (FTA) are conducting research for the proposed Restoration of Historic Streetcar Service in Downtown Los Angeles Project (Project). The Project entails the construction and operation of a streetcar system that would run a fleet of electric-powered vehicles along a one-way loop within existing traffic lanes in Downtown Los Angeles.

The Environmental Impact Report/Environmental Assessment will analyze two build alternatives and a no-build alternative. The Locally Preferred Alternative (LPA) would run within existing traffic lanes on 1st Street, Broadway, 11th Street, South Figueroa Street, Grand Avenue, 7th Street or 9th Street, and Hill Street. The project alignment would begin and terminate on Grand Avenue, one block south of 1st Street. From that point, the streetcar would run northbound and turn eastbound on 1st Street. From 1st Street, the streetcar would turn southbound, traveling 1.25 miles south along Broadway, and then turning westbound on 11th Street. The streetcar would then turn north on South Figueroa Street and travel 0.5 miles north to 7th Street where it would turn in the eastbound direction. From 7th Street, the streetcar would turn northbound on Hill Street, continue north back to 1st Street. It would then turn westbound on 1st Street to return to the streetcar terminal stop on Grand Avenue south of 1st Street, by the Disney Concert Hall.

The Project is also considering the 9th Street Alternative, which would follow the same alignment as the LPA but would run eastbound on 9th Street between South Figueroa Street and Hill Street rather than 7th Street. A copy of the Project Location Map is enclosed for your reference. Additional information on the project may be found on the project website at: http://www.metro.net/projects/historic-streetcar-service/.

The streetcar system would run a fleet of electric-powered vehicles using a track and roadway configuration that allow for mixed-flow operations of streetcar vehicles and automobiles. Power for the streetcar system would be provided by a traction power system featuring traction power

substations (TPSS) and an overhead contact system. The TPSS would convert high voltage power to an approximately 600-volt direct current to power the electric trains. The TPSS are approximately 20 feet long, 15 feet wide and 10 feet tall. There would be approximately five TPSS spaced evenly around the 3.8-mile loops, and possibly another TPSS at the maintenance and storage facility. Streetcar stops would typically resemble bus stops with a raised platform along sidewalks. Streetcar stops will be 70 to 120 feet long, and would generally be located along the existing sidewalk or along a sidewalk extension into the traffic lane that meets the streetcar vehicle. Streetcar stops would generally be placed on every block in the north-south direction, and on every other block in the east-west direction.

The Project requires construction of a maintenance and storage facility. Three potential sites for this facility include an approximately 39,800-square-foot site located along Broadway, midblock between 2nd Street and 3rd Street; an approximately 66,600-square-foot site at the northeast corner of 5th Street and Olive Street; and an approximately 30,500-square-foot site at the southeast corner of 11th Street and Grand Avenue.

As part of our research, FTA and the City of Los Angeles, Department of Public Works, Bureau of Engineering (LABOE) are contacting interested parties to help identify prehistoric sites, sacred sites, and/or traditional cultural properties located in the vicinity of the Project Area. The Native American Heritage Commission (NAHC) has been contacted regarding the proposed project and recommended that we contact you. Please inform us if you are not the designated representative for such consultation.

If you have any information that would be relevant to this Project and its possible effect on cultural resources, or if you have any questions please contact Ms. Mary Nguyen, Environmental Protection Specialist, at (213) 202-3960, or mary.nguyen@dot.gov.

Overview

From the mid-1870s to the early 1960s, several streetcar companies operated throughout downtown Los Angeles. For more than 60 years, electric streetcars or interurbans, such as the Yellow Cars (Los Angeles Railway) or the Red Cars (Pacific Electric), and the associated catenary wires, poles, and signals were familiar sights along South Broadway, South Hill Street, South Figueroa Street, and the numbered east-west streets. Many buildings along these routes still retain vestiges of the original streetcar era, evidenced by the presence of metal anchor hooks that held the catenary wires embedded in the building façades. Restoration of Historic Streetcar Service in Downtown Los Angeles (Project) proposes to bring back streetcar service to enhance mobility and transit circulation in, and support the growth and revitalization of, downtown Los Angeles.

This technical document delivers an analysis of the Project's impacts, both construction and operation, under the City of Los Angeles thresholds. The first part of this report provides a discussion of the project alternatives, followed by the regulatory framework, and environmental setting for the Project. In order to analyze the potential for adverse effect on historical resources, this report includes a thorough historic context for the project area and identifies historical built resources within the project area. The final section of this document applies the City of Los Angeles significance thresholds for impacts to historical resources.

The City of Los Angeles (City) is the lead agency for the Project under the California Environmental Quality Act (CEQA). The Project is being sponsored with the cooperation of the Los Angeles Bureau of Engineering (LABOE), the Los Angeles Department of Transportation (LADOT), the Los Angeles County Metropolitan Transportation Authority (Metro), and Los Angeles Streetcar Inc. (LASI). Funding assistance is also being sought from the Federal Transit Administration (FTA).

Project Description

Introduction

The Project consists of the construction and operation of streetcar service in downtown Los Angeles, California, along an up to 3.8-mile route. The project alignment would begin at Hill and 1st Streets, run east along 1st Street, south along Broadway, west along 11th Street, north along Figueroa Street, east along 7th Street or 9th Street, and north along Hill Street, back to its beginning at 1st Street. Potential inclusion of a Grand Avenue Extension would also provide a two-way alignment spur west along 1st Street, beginning at Hill Street, and continuing south along Grand Avenue to a stop north of 2nd Street. The project route would cover an area composed primarily of commercial land uses with a mix of residential, public, and entertainment land uses. The Project would link several neighborhoods or districts within the Central City Community Plan Area of the City of Los Angeles: Civic Center, Bunker Hill, Historic Core, Jewelry District, Financial Core, South Park, Fashion District, and LA Live/Convention Center.

Figure 1 depicts the regional location of the Project. Figure 2 shows the Project's routing within downtown Los Angeles.

The track and roadway configuration would allow for a mixed flow of vehicles and a fleet of electrically powered streetcars. Power to the streetcar vehicles would be provided by approximately five traction power substations (TPSSs) and an overhead contact system (OCS). A maintenance and storage facility (MSF) site would also be constructed as part of the Project.

Project Alternatives

Five project alternatives are being considered; these include four build alternatives for the proposed Project and a No Project Alternative.

Alternative 1 – No Project Alternative

The No Project Alternative, which is required by Section 15126.6(e) of the State CEQA Guidelines, represents conditions in the project study area that would remain if the proposed Project would not occur.

Alternative 2 – 7th Street with Grand Avenue Extension

The 7th Street with Grand Avenue Extension Alternative would construct and implement streetcar service along an alignment that would begin on Grand Avenue north of 2nd Street adjacent to the Disney Concert Hall, then continue northward until turning east on 1st Street. From 1st Street, the streetcar would turn south on Broadway, traveling to 11th Street where it would turn west and continue on to Figueroa Street. The streetcar would then turn north on Figueroa Street and travel to 7th Street, where it would turn east. From 7th Street, the streetcar would turn north on Hill Street, then continue back to 1st Street, completing the circuit by turning west on 1st Street to return to the streetcar stop on Grand Avenue.

Alternative 3 – 7th Street without Grand Avenue Extension

Alternative 3 would follow the same alignment as Alternative 2, with the exception that the Grand Avenue Extension would not be incorporated. Therefore, Hill and 1st Streets would be the terminal point, rather than Grand Avenue north of 2nd Street.

Alternative 4 – 9th Street with Grand Avenue Extension

The 9th Street with Grand Avenue Extension Alternative would follow the same alignment as the 7th Street with Grand Avenue Extension Alternative, but it would run eastbound on 9th Street between Figueroa Street and Hill Street, rather than 7th Street, and the project alignment would still begin and terminate on Grand Avenue, north of 2nd Street.

Alternative 5 – 9th Street without Grand Avenue Extension

Alternative 5 would follow the same alignment as Alternative 3, but it would run eastbound on 9th Street between Figueroa Street and Hill Street, rather than 7th Street.

Figure 1. Regional Location Map

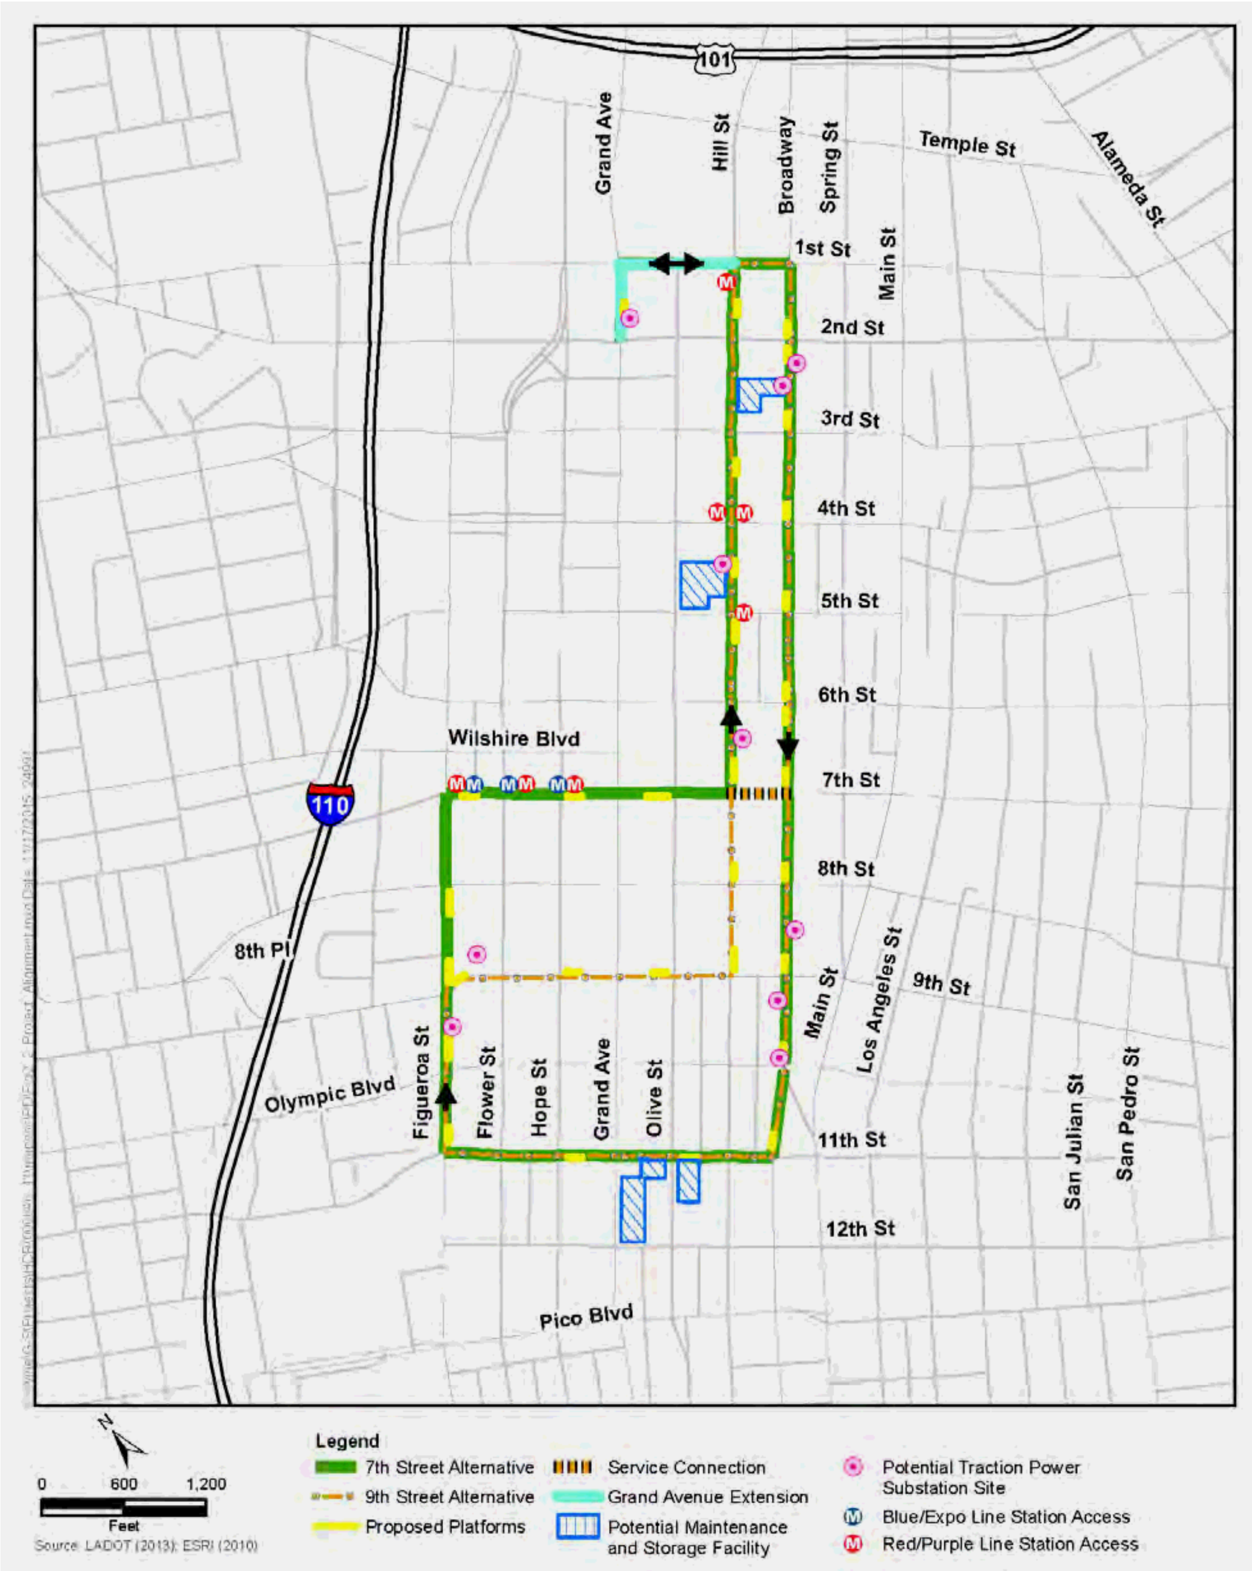
Figure 2. Proposed Downtown Los Angeles Streetcar Route



This page intentionally left blank.

Elements of the Streetcar Alternatives

A brief overview of the elements common to all build alternatives of the Project is presented below.

Vehicles

The Project's operating plan calls for 7-minute headways (i.e., time spacing between vehicles) during peak periods. A fleet of six electrically powered streetcars is currently estimated to be needed to operate on the system. An estimated two additional streetcars would serve as backup vehicles to the operating fleet, for a total estimated fleet size of eight vehicles. Each vehicle would measure approximately 80 feet long and be approximately 13 feet high. The streetcars would be articulated to make tight turns and have a capacity of approximately 100 passengers. The streetcars would be similar to the modern streetcar models that are currently used in other cities in the United States. Examples of similar streetcars can be found in Portland, Oregon; both Tacoma and Seattle, Washington; Tucson, Arizona; Dallas, Texas; Atlanta, Georgia; and Charlotte, North Carolina. The streetcars would be designed with low floors to be compliant with the Americans with Disabilities Act (ADA). Operating speeds would be at the maximum posted downtown speed limit, which is currently 25 miles per hour (mph) on all streets other than Figueroa Street, between 5th Street and Pico Boulevard, where it is 30 mph. Power for the streetcars would be transmitted by overhead catenary wires supported by poles along the streetcar tracks.

Platforms

The streetcars would make stops at approximately 25 platforms along the alignment; the number of platforms is subject to change based upon further design of the Project. With varying configurations, the platforms would generally consist of a raised concrete pad approximately 8 feet wide by 70 feet long. Some of the streetcar platforms would be shared by buses operated by Metro, LADOT Downtown Area Short Hop (DASH), and other regional operators. Shared platforms would generally be approximately 120 feet long, though physical constraints on some street segments could limit them to shorter lengths. The maximum curb height would be approximately 8 to 14 inches. Platforms could be located either in the center of the roadway or adjacent to the sidewalk, along the curb. Platforms would transition from the sidewalk to match or nearly match the floor height of the streetcar vehicles. Platforms would be designed and constructed to connect to the sidewalk in a way that meets ADA and building access requirements.

Support Facilities

Overhead Contact System

There are two potential configurations for the OCS contact wires, which would supply electrical power to the streetcar vehicles. One configuration would be to support the contact wire with a span wire between two poles located on either side of the street, perpendicular to the streetcar track. Another configuration would support the contact wire from cantilever arms connected to single poles. Configurations would be site specific and be made based upon engineering design and aesthetic considerations. Either of these configurations could use decorative poles chosen to be consistent with the streetscape along the project alignment. It is possible that poles used for delivering streetcar power could also be integrated with other streetscape infrastructure such as street lighting, traffic signals, or traffic signs. OCS suspension at corner turning locations (e.g., Hill/1st Streets, 1st Street/Broadway, Broadway/11th Street, 11th/Figueroa Streets, Figueroa/9th or 7th Streets, 9th or 7th/Hill Streets) would be more specialized and tailored to each location, possibly requiring a combination of wire-mounting configurations. OCS poles would be approximately 25 to 30 feet tall and would be typically installed at intervals of about 80 to 120 feet, with added poles at turns. Wire heights above the tracks would typically range between approximately 18 and 19 feet in the public right-of-way.

Traction Power Substations

The streetcars would be powered by an estimated five TPSS units spaced relatively evenly throughout the alignment to provide direct current (DC) power for the streetcars; the final number and placement will be determined by further project design. Each unit would be a durable structure containing electrical and electronic equipment. Based on typically sized equipment used in other cities, the TPSS units would most likely measure approximately 17 feet long by 11 feet wide by 11 feet high, although these dimensions could vary. The footprint needed for the TPSS installations could be up to approximately 250 square feet. The substations, typically rated at 350 kilowatts, would convert 480-volt commercial alternating current (AC) power to 750-volt DC power for the streetcars.

Each TPSS would typically be placed in an off-street location, such as a parking lot or other suitable site. At one location, 2nd Street and Grand Avenue, the currently recommended potential TPSS site may need to occupy space in the public right-of-way. A number of potential TPSS locations and alternate sites are being evaluated in the event that primary sites are found to be infeasible.

Maintenance and Storage Facility

The Project would require an MSF to provide a location for secure storage of streetcar vehicles when they are not in operation, and regular light maintenance of the vehicles to keep them clean and in good operating condition.

Four sites are currently being considered as a potential location for the MSF: (1) the southwest corner of 11th and Olive Streets; (2) the southeast corner of 11th and Olive Streets; (3) the northwest corner of Hill and 5th Streets; or (4) the west side of Broadway between 2nd and 3rd Streets. All four candidate sites are currently being used as parking lots. The MSF would consist of an enclosed building and an outdoor area where routine inspections, maintenance work, and light repairs could be performed. The facility would have sufficient storage capacity to handle the needs of the streetcar system, with paved maintenance aisles, a pit track, overhead crane, paved truck access, staff offices, parts storage areas, and a machine shop. An employee parking area may also be provided. A maintenance building for a system of the size of the Project would generally be 12,000 to 18,000 square feet, approximately two to three stories tall, contain tracks inside a garage enclosure for maintenance of the vehicles, and be constructed to comply with the City's Green Building Code and also meet minimum Leadership in Energy & Environmental Design (LEED) certification requirements. Acquisition of private property for the MSF site would be required. Streetcars would gain access to the facility from a short segment of track that would be connected to the mainline. A storage area outside of the maintenance facility would provide an area for overnight cleaning (i.e., wash facility with clarifier) and secure storage of streetcar vehicles.

Signaling

Streetcar movement would be governed by "line-of-sight" operations, with passage through intersections controlled by traffic signals. "Line-of-sight" operations means that streetcars would be controlled by an operator who would proceed when traffic signals and traffic allow, and who would stop for traffic signals, station stops, pedestrians, bicycles, and other vehicles. A separate signal head may be provided at intersections for streetcar control. The streetcar control signal would be interconnected with the traffic signals and would clearly indicate to the streetcar operator when it is clear for the streetcar to move or required to stop.

Transit signals (i.e., special signals separated from the general purpose signal system) would be necessary where the streetcar would require a special traffic signal phase to maneuver so as to avoid conflicts with general traffic. These signals are also required at locations where a track switch is used by the streetcar operator to choose between different paths. Most of the route for the proposed Project would not have separate transit signals. Where they are needed, operation of transit signals would be separated from the normal traffic signals in order to not confuse the general public.

Potential Layover Locations

Locations on the streetcar route are needed to provide space for a streetcar to layover out of traffic, to allow dispatch according to a regular schedule, or to provide space for a streetcar to be temporarily taken out of service. In addition, these locations would allow the streetcar operator to take a short break. For the route currently proposed, two such locations would be desirable.

Under the Grand Avenue Extension (Alternatives 2 and 4), at the stop on Grand Avenue north of 2nd Street, a single track in an exclusive median is currently proposed. This configuration would allow the streetcars to complete their round trip and layover out of traffic for several minutes until the next scheduled departure. The streetcar vehicles would have operator cabs on both ends of the cars so that they would be able to operate in either direction of travel.

In addition to the Grand Avenue location, four other locations have currently been identified as potential second layover sites. Should Alternative 3 or 5 be ultimately selected, two of these locations may be needed. At each of these locations, a short section of parallel track would need to be provided to allow space for the streetcar to move off the main line while the layover is taking place. These sites include (a) Broadway, near-side at 2nd Street; (b) Broadway, far-side at 2nd Street; (c) Broadway, mid-block between 2nd and 3rd Streets; and (d) 11th Street, near-side at Hill Street.

All of the above currently considered layover locations are being evaluated as part of further design advancement of the Project, and are therefore subject to change with regard to location and/or track layout.

Construction Activities

Construction activities associated with the Project would affect portions of Grand Avenue, 1st Street, Broadway, 11th Street, Figueroa Street, 7th Street or 9th Street, and Hill Street, as well as the selected MSF and TPSS sites. Construction activities would include: (a) pavement removal, (b) utility relocation, (c) excavation, (d) construction of track drains, (e) installation of concrete track slab and rails, (f) construction of station platforms, (g) installation of special track work units, (h) reconstruction of ramps and sidewalks, (i) paving, and (j) striping. Other activities would include installation of specialty system work, such as traction power, overhead contact wire, communications systems, train/traffic signaling, and OCS pole foundations.

Laydown and storage area(s) for construction would be established near the project alignment and would be used for storage of equipment and materials. The laydown and storage area(s) could be located within the right-of-way, in parking lots, or on vacant land, and would be used to store equipment and materials. Four potential laydown and storage areas have currently been identified for evaluation: (1) the southeast corner of 3rd Street and Main Street; (2) northeast corner of 3rd Street and Spring Street; (3) 243 S. Spring Street; and (4) Grand Avenue to Olive Street, between 8th and 9th Streets. These should be regarded as example sites; other locations within the study area may become available and could also be chosen. All four example locations are currently being used as parking lots adjoining City streets within one block of the project alignment.

Project construction activities would typically take place on weekdays between 7 a.m. and 9 p.m., in accordance with Los Angeles Municipal Code (LAMC) 41.40(a). To expedite construction, certain construction activities may be permitted to occur during nighttime, weekend, and holiday periods with the approval of the Board of Police Commissioners pursuant to LAMC Section 41.40(j). In addition, construction within City roadways may occur during peak periods (i.e., 6 a.m. to 9 a.m. and 3:30 p.m. to 7 p.m.) in accordance with Mayor's Executive Directive No. 2 and Bureau of Engineering Special Order No. 001-0406, which provide an exemption to the rush hour roadway construction prohibition for major public works projects having traffic mitigation plans. Construction activities will be required to follow the City Planning Department's new policy (in effect June 2015) to maintain safe adjacent pedestrian access at all times during construction.

The analysis in this document assumes that, unless otherwise stated, the Project would be designed, constructed, and operated following all applicable laws, regulations, ordinances, and formally adopted City standards, including but not limited to the LAMC; LADOT design standards and special provisions; *California Manual on Uniform Traffic Control Devices;* and all City bureaus' design manuals, special provisions, and standard plans, including the latest *Standard Specification for Public Works Construction*; the LABOE Brown Book; the *Work Area Traffic Control Handbook*; and any FTA requirements.

Regulatory Framework

This section discusses the applicable federal, state, and local regulations that (1) define historic properties and historical resources and (2) provide thresholds for determining effects on historic properties under the National Historic Preservation Act (NHPA) and impacts on historical resources under NEPA and CEQA.

Federal

Section 106 of the National Historic Preservation Act

Section 106 requires federal agencies, or those they fund or permit, to consider the effects of their actions on *historic properties*. These are defined by Advisory Council on Historic Preservation regulations (36 Code of Federal Regulations [CFR] Part 800) for implementing Section 106, as follows.

> *Historic property* means any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places (NRHP) maintained by the Secretary of the Interior. This term includes artifacts, records, and remains that are related to and located within such properties. The term includes properties of traditional religious and cultural importance to an Indian tribe or Native Hawaiian organization that meet the NRHP criteria [36 CFR Section 800.16(l)].

The implementing regulations for Section 106 set forth a four-step process for compliance. Initiation of the Section 106 process includes the establishment of an undertaking, identification of the appropriate State Historic Preservation Officer (SHPO), and coordination with other reviews, such as NEPA (36 CFR 800.3). In the second step, the Area of Potential Effects (APE) is established and historic properties are identified. During this step, information from interested parties is sought, and SHPO is consulted regarding the eligibility of historic properties in the APE (36 CFR 800.4). Following this, in step three, the criteria of adverse effect are applied to those properties that have been identified as NRHP-listed or eligible, and SHPO concurrence is obtained (36 CFR 800.5). Finally, adverse effects are resolved in step four, either through avoidance, minimization, or mitigation, resulting in either a change to the proposed Project or the execution of a Memorandum of Agreement (36 CFR 800.6).

As a result of consultation with the SHPO on February 14, 2013, for the purposed of the built environment survey, the preliminary APE would be defined as those parcels adjacent to the corridors described in the project description, including the 7th and 9th Street Alternatives (with or without the Grand Avenue Extension). This would encompass all project components, including proposed maintenance and storage facility options and TPSS.

To determine whether an undertaking could affect NRHP-listed or -eligible properties, cultural resources (including archaeological, historical, and architectural properties) must be inventoried and evaluated for listing in the NRHP. For projects involving a federal agency, cultural resource significance is evaluated in terms of eligibility for listing in the NRHP. For a property to be considered for inclusion in the NRHP, it must meet the criteria for evaluation set forth in 36 CFR Part 60.4, as follows:

> The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of design, setting, materials, workmanship, feeling, and association and
>
> (a) that are associated with events that have made a significant contribution to the broad patterns of our history; or
>
> (b) that are associated with the lives of persons significant in our past; or
>
> (c) that embody the distinctive characteristics of a type, period, or method of construction or that represent the work of a master or that possess high artistic values or that represent a significant and distinguishable entity whose components may lack individual distinction; or
>
> (d) that have yielded, or may be likely to yield, information important in prehistory or history.

Among other criteria considerations, a property that has achieved significance within the last 50 years is not considered eligible for inclusion in the NRHP unless certain exceptional conditions are met.

State

California Environmental Quality Act

In accordance with Section 21084.1 of CEQA, the proposed Project would have a significant adverse environmental impact if it "causes a substantial or potentially substantial adverse change in the significance of an historical resource."

According to CEQA (Public Resources Code Section 21084.1), *historical resources* include any resource listed or determined eligible for listing in the California Register of Historical Resources (CRHR). Properties listed or determined eligible for listing in the NRHP, such as those identified in the Section 106 process, are automatically listed in the CRHR. Therefore, all *historic properties* under federal preservation law are automatically *historical resources* under state preservation law. Historical resources are also presumed to be significant if they are included in a local register of historical resources or identified as significant in a qualified historical resource survey.

State law in Title 14, California Code of Regulations (CCR) Section 4850, defines *historical resource* as follows:

> Any object, building, structure, site, area, place, record, or manuscript that is historically or archaeologically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural history of California.

For the purposes of CEQA, historical resource is further defined under Public Resources Code Section 15064.5 as a "resource listed, or determined eligible for listing, in the California Register."

Section 15064.5 of the State CEQA Guidelines sets forth the criteria and procedures for determining significant historical resources and the potential effects of a project on such resources. Generally, the lead state agency shall consider a historical resource to be *historically significant* if the resource meets any of the criteria for listing in the CRHR.

The statutes and guidelines specify how historical resources are to be managed in the context of projects such as the proposed Project. Briefly, archival and field surveys must be conducted, and identified historical resources must be inventoried and evaluated in prescribed ways.

California Register of Historical Resources

The NHPA mandated the selection and appointment in each state of a SHPO. Each SHPO is tasked, among other duties, with maintaining an inventory of historic properties. In California, the state legislature established additional duties for the SHPO. These include the maintenance of a CRHR. Established by California Public Resources Code Section 5024.1(a) in 1992, the CRHR serves as "an authoritative guide in California to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent feasible, from substantial adverse change." According to California Public Resources Code Section 5024.1(c), the CRHR criteria broadly mirror those of the NRHP. The CRHR criteria are found at California Public Resources Code Section 5024.1(c) as follows:

> An historical resource must be significant at the local, state, or national level, under one or more of the following four criteria:
>
> 1. It is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States; or
> 2. It is associated with the lives of persons important to local, California, or national history; or
> 3. It embodies the distinctive characteristics of a type, period, region, or method or construction, or represents the work of a master, or possesses high artistic values; or
> 4. It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

The minimum age criterion for the CRHR, as with the NRHP, is 50 years. Properties less than 50 years of age may be eligible for listing in the CRHR if it can be demonstrated that sufficient time has passed to understand its historical importance. In addition to meeting one or more of the historical significance criteria, the resource must possess integrity. Integrity is defined as "the authenticity of an historical resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance."

There are several ways for resources to be included in the CRHR. A resource can be *listed* in the CRHR based upon a nomination and public consideration process. Additionally, a resource that is subject to a discretionary action by a governmental entity will be evaluated for *eligibility* for the CRHR. As previously stated, properties listed in or formally determined eligible for listing in the NRHP are *automatically* listed in the CRHR.

Local

City of Los Angeles Cultural Heritage Ordinance

The City of Los Angeles maintains a list of all sites, buildings, and structures that have been designated through the Cultural Heritage Ordinance as Historic Cultural Monuments (HCMs).

Historic Cultural Monument

Section 22.171.7 of the Cultural Heritage Ordinance states that an HCM is any site (including significant trees of other plant life located on the site), building or structure of particular historic of cultural significance to the City of Los Angeles, including historic structures or sites in which the broad cultural, economic or social history of the nation, state or community is reflected or exemplified; or which is identified with historic personages or with important events in the main currents of national, state or local history; or which embodies the distinguishing characteristics of an architectural type, specimen, inherently valuable for a study of a period, style, or method of construction; or a notable work of a master builder, designer, or architect whose individual genius influenced his or her age.

Any person may apply for the proposed designation of an HCM and the Cultural Heritage Commission determines whether or not the proposed designation merits consideration. If the Commission recommends approval of the application and it is included in the list of HCMs, no permit for the demolition, substantial alteration, or relocation of an HCM may be issued (Section 22.171.14) unless:

1. The Superintendent of Building or City Engineer determines that the demolition, relocation or substantial alteration is necessary in the interest of the public health, safety or general welfare;
2. The substantial alteration complies with the Secretary of the Interior's Standards for Rehabilitation;
3. The substantial alteration protects and preserves the historic and architectural qualities and the physical characteristics that make the site, building, or structure a designated HCM; and
4. The proposed action is in compliance with CEQA PRC Section 21000 et seq.

The following chapters provide the historic context for the project alignment, a discussion of the methodology for identifying and evaluating properties in the project alignment for NRHP and CRHR eligibility, and the application of the criteria of adverse effects.

Historic Context

Early History of Downtown Los Angeles

While the growth of modern Los Angeles and its downtown dates back to the 1880s, the founding of the city goes back almost a century earlier. On September 4, 1781, Spanish governor of California Don Felipe de Neve, along with a handful of soldiers and families, marched from Mission San Gabriel to what is now the northern end of downtown Los Angeles and founded El Pueblo de Nuestra Senora la Reina de Los Angeles de Porciuncula (the Town of Our Lady the Queen of the Angels of Porciuncula). First families were given plots to cultivate adjacent to a central plaza, which operated as the hub of early community activity and included a small adobe church. The village would remain a small agricultural outpost well into the nineteenth century, with residents engaged mainly in raising grain and cattle. By the outbreak of the Mexican-American War in 1846, the village still only numbered 3,000 residents. In comparison to its northern neighbor San Francisco, which boomed in the early years of the gold rush era, Los Angeles saw little development and gained a reputation as a remote, uncultivated, and lawless town. With the completion of the Southern Pacific Railroad in 1876 and the Santa Fe Railroad in 1885, the city encountered its first land boom and reached a population of 50,000 by 1892, more than doubling in two short years. Land speculation and building construction reached a frenzied pace during this period, almost all of which occurred in the boundaries of the current downtown (Works Progress Administration 1939: 208–213). While early commercial and residential growth first emerged on Main and Temple Streets, it would quickly expand to streets to the south and west. This set the stage for the formation of the earliest neighborhoods and commercial districts. Some of the early growth was intertwined with the introduction of streetcars to the city, particularly in the less established neighborhoods just outside the city's historic core, like Bunker Hill, Lincoln Heights, Boyle Heights, and Angelino Heights (Los Angeles Conservancy 1990).

Downtown Development and the Streetcar

The development of downtown and Greater Los Angeles was inexorably linked to the early transportation systems in the city. Although the historic core of downtown (streets like Temple, Main, Spring, Broadway, and Hill) was not as dependent on streetcar lines for residential growth as outlying areas, the streetcar played an important role in transporting the necessary workers and retail consumers from distant areas to downtown. Early subdivision activity adjacent to the pueblo and Main Street expanded outward along horse car, cable car, and electrified streetcars in the 1870s and 1880s. Cable cars and electric streetcars had the greatest impact on neighborhoods just outside the historic core. Although topography became an early impediment to the development of areas like Bunker Hill, Boyle Heights, and Angelino Heights, the cable and electric streetcars provided the crucial transportation connection to fuel their growth (Los Angeles Conservancy 1990: II-11–II-12).

***Photo 1**. Looking south down Broadway at the intersection of 5th Street in 1926. Streetcars proceed down the center of Broadway. Source: Los Angeles Public Library*

By the mid-1890s, electrified interurban streetcars connected downtown to cities as far as Pasadena and Santa Monica. With a downtown now conveniently accessible to outlying areas, department stores on 7th Street and theaters on Broadway could draw enough people to create a major hub of business, retail, and entertainment activity. After consolidation of the streetcar lines in 1911, the region had a streamlined system that focused on downtown, making it the single most accessible point in Southern California. The completion of the Subway Terminal Building (listed in the NRHP and CRHR, HCM #177) at 417 South Hill Street in 1925 would help shift the center of downtown activity farther to the west from the traditional Main Street corridor. The terminal's completion coincided with the growth of retail stores on 7th Street that were west of Broadway. At the peak of the Pacific Electric's Red Car expansion into the far reaches of Southern California, downtown could be accessed from cities as far east as San Bernardino and Redlands and as far south as Newport Beach in Orange County (Roseman 2004: 7–11).

Downtown Neighborhoods

Bunker Hill and Angels Flight

Of the neighborhoods directly adjacent to the historic core of downtown Los Angeles, Bunker Hill (originally called "Olive Hill") was among the first to have its initial development tied directly to the expansion of the streetcar system in Los Angeles. The modern boundaries of Bunker Hill consist of Temple Street to the north, 5th Street to the south, Olive Street to the east, and the Harbor Freeway to the west (Comer 1996: 16–18).

Early Los Angeles developer Prudent Beaudry purchased the land that constitutes Bunker Hill in 1867 with the intent of creating a residential subdivision. Although some residences dotted the landscape of Bunker Hill prior to the 1880s, the development of the area was hindered by steep topography. The hill proved especially inaccessible to early horse-drawn streetcars, which were prevalent in downtown during the 1870s and 1880s. When cable car technology was introduced to Los Angeles by the late 1880s, streetcars could finally travel the steep terrain of Bunker Hill. By 1889, two cable car enterprises, the Temple Street Cable Railway and the 2nd Street Cable Railroad, both traversed the peripheries of Bunker Hill making the neighborhood more attractive to future development. The Temple Street Cable Railway ran 3 miles from Main Street to the Dayton Heights neighborhood along Temple Street, while the 2nd Street Cable Railroad ran along 2nd Street from Spring Street to Texas Street. Streetscapes, water systems, and other infrastructure improvements also made the area more attractive to investment. Bunker Hill would soon experience an intensive residential building boom, which resulted in a number of fashionable Queen Anne and Eastlake style dwellings at the crown of the hill (Post 1989: 49–52).

The construction of the Angels Flight Railway (listed in the NRHP and CRHR, HCM #4) in 1901 provided a method for traveling the steepest portion of Bunker Hill, near 3rd Street, which had no streetcar access at the time. Although the 3rd Street tunnel was constructed under Bunker Hill in 1901, it did not provide access to the top of the hill. Angels Flight was the inspiration of entrepreneur Colonel J. W. Eddy who aimed to build a short but direct line that connected the residential Bunker Hill neighborhood to the growing business district below. Increased housing density in Bunker Hill, along with development of the commercial core to the east and south of the line, helped ensure strong patronage. Part of the Los Angeles City Council's condition for approval of the Project included an adjacent landscaped park and a stairway that paralleled the line. After opening in December 1901, the railway became an important connection between the residential hillside and the commercial core to the east. Development of Bunker Hill would continue to intensify as stately hotels and apartment buildings would be added to the existing fabric of single-family dwellings (Comer 1996: 35–42).

Beginning in the 1920s, the neighborhood would face a steady deterioration as it became associated with overcrowding, crime, and an aging housing stock. The area was often bypassed by new development in the adjacent flatlands of downtown that had topography more suitable for new construction. Despite extensive redevelopment of Bunker Hill after World War II and the loss of many early buildings, Angels Flight provides a historical link not only to early streetcar expansion in Los Angeles but to the residential character of Bunker Hill that had largely been lost by the middle of the twentieth century (Comer 1996: 85–95).

Broadway Theatre and Commercial District

The Broadway Theatre and Commercial District[1] (listed in the CRHR, HCM #2306) was listed on the NRHP on May 9, 1979. The original NRHP district, which encompassed 300 to 939 South Broadway, was expanded on April 12, 2002 to now encompass 242 to 947 South Broadway. A list of the contributors and non-contributors to the Broadway Theatre and Commercial District is located in Appendix D. Character-defining features can be found in Appendix E.

The Broadway District is highly representative of a commercial and entertainment center in downtown Los Angeles that emerged principally in the first quarter of the twentieth century. The area is located on a six-block thoroughfare on Broadway, between 2nd Street and Olympic Boulevard. The area consists of a collection of large office buildings, department stores, and theaters designed in traditional architectural styles, such as Beaux Arts. Construction of the new city hall on Broadway during the 1890s was a primary impetus for changing the neighborhood from a residential to a commercial district. Large business structures, such as the Bradbury Building (1893, National Historic Landmark [NHL], listed in the NRHP and CRHR, HCM #6), the Grand Central Market (1897, National Register Historic District [NRHD] contributor), the Nelson Building (1893, NRHD contributor), and the Jacoby Brothers Store (1900) began to change the Broadway skyline and pulled the downtown business center farther to the south from 3rd Street. The population influx and real estate boom in Los Angeles helped fuel this southward development in downtown as businesses and institutions were in need of available land to expand operations (Roseman 2004: 61–63).

[1] Also known as the Broadway Theater and Commercial District

Photo 3. *Crowds crossing the intersection of 7th Street and Broadway, looking north on Broadway in 1928.*
A Yellow Car is seen in the foreground on Broadway while a Red Car (on the right side) is about to cross Broadway along 7th Street. Source: Los Angeles Public Library

During the first half of the twentieth century, the Los Angeles streetcar system made the district accessible to patrons throughout Los Angeles. By the early 1900s, the Los Angeles Railway Yellow Cars became a familiar sight along Broadway as they carried shoppers, theatergoers, and workers to their desired destinations with regular stops along the route. The interurban Red Cars also played a role by transporting people to Broadway from outlying suburban locations in Southern California. Before the widespread use of automobiles and the development of the freeway system, the streetcars provided an important link between downtown commerce and the greater Los Angeles region (Los Angeles Conservancy 1990: II-25–II-28).

The theaters on Broadway are of particular historical importance because they provided a center for drama, comedy, and vaudeville presentations in Los Angeles before the advent of motion pictures. A number of Broadway's theaters from this period continue to convey cultural and architectural significance. Among the earliest theaters built on Broadway are the Cameo at 528 South Broadway (1910, NRHD contributor, HCM #524), the Arcade at 534 South Broadway (1910, NRHD contributor, HCM #525), and the Palace at 630 South Broadway (1911, NRHD contributor, HCM #449). The modest, Renaissance Revival style Cameo Theatre was the oldest continuously operating theater in California until its closure in 1991. The Arcade was designed in the then ubiquitous Beaux Arts style, while the Palace featured Italian Renaissance influences on its exterior façade (California Office of Historic Preservation 1977a).

Photo 4. *Looking north on Broadway from 7th Street during the Armistice Day parade in 1944.*
Yellow Cars are seen in the center of the street. Source: Los Angeles Public Library

Movie palaces in the district reached an even more elevated level of grandeur with the construction of the Million Dollar Theater at 307 Broadway in 1918. Albert C. Martin designed the richly detailed Churrigueresque style building for the legendary showman Sid Grauman. The theater also helped usher in an era of increasingly grand theaters along Broadway in the 1920s. The 2,190-seat Orpheum (842 South Broadway) was constructed in 1926 in the Beaux Arts style and would play host to many of the biggest names in show business. A year after the construction of the Orpheum, the Gothic-themed United Artist Theatre opened (933 South Broadway, determined eligible for the NRHP, listed in the CRHR, HCM #523). The building was the product of the prolific Los Angeles-based architects Walker and Eisen, who designed other noteworthy buildings downtown. Theater construction in the district reached its apex in 1931 when the last of the great movie palaces, the Los Angeles Theatre (NRHD contributor, HCM #225), was opened at 615 South Broadway. Designed by Charles Lee, the lavish French Baroque-inspired building is distinguished by its huge accented columns on the primary façade. Other theaters from the period include the Roxie at 518 South Broadway (1932, NRHD contributor, HCM #526), the Globe at 744 South Broadway (1913, NRHD contributor), the Tower at 802 South Broadway (1927, NRHD contributor, HCM #450), and the Rialto at 812 South Broadway (1917, NRHD contributor, HCM #472) (Gebhard and Winter 2003: 249–251).

Spring Street Financial District

The Spring Street Financial District was listed on the NRHP on September 12, 1978, and is located from 354 to 704 South Spring Street.[2] For most of the twentieth century, Spring Street served as the business center of Los Angeles. Once known as the "Wall Street of the West" for its concentration of banks and other financial institutions, the district consists of an architecturally homogeneous collection of buildings along Spring Street, from 7th Street north to 4th Street. Architecturally, Neo-Classical, Commercial, and Art Deco buildings with grand terra cotta façades define this neighborhood.

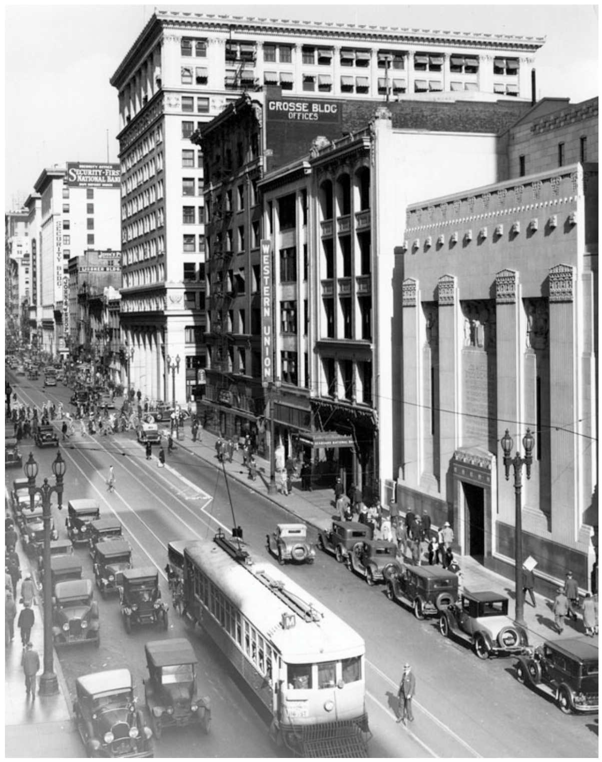

Photo 5. *View of Spring Street looking north between 6th and 7th Streets in 1932. On the right is the Los Angeles Stock Exchange building (later the Pacific Coast Stock Exchange). A Yellow Car is traveling south down Spring Street. Source: Los Angeles Public Library*

Like Broadway to the west, Spring Street had been a predominantly residential neighborhood prior to 1900, although some banks had been built on the street as early as the 1880s. By 1900, commercial structures were being built to the south and west of the traditional financial center along North Main Street. Spring Street and Broadway were two of the main recipients of this commercial expansion (Roseman 2004: 35).

[2] Although the Spring Street Financial District is east of the Area of Potential Effects for the Project, it is discussed as part of the historic context because the Spring Arcade Building, which is listed as a contributor to both the Spring Street Financial District and the Broadway Theatre and Commercial District, is in the study area. The address for the Spring Arcade Building is 538-544 Broadway and 531-545 Spring Street.

The 12-story, John Parkinson-designed Continental Building (determined eligible for the NRHP, listed in the CRHR, HCM #730) at 408 South Spring Street stands as one of the earliest remaining buildings in the area and was considered the first skyscraper in Los Angeles upon its completion in 1902. The height and restrained style of the Continental provided a glimpse into the type of buildings that would later come to dominate Spring Street. The Italianate-influenced Van Nuys Building (NRHD contributor, HCM #898) at 210 West 7th (corner of 7th and Spring Streets) was another notable addition to the corridor when it opened in 1911. Other early 1900s additions to Spring Street included the Commercial-style Bartlett Building at 651 South Spring Street (1911, NRHD contributor), the Parkinson and Bergstrom-designed Pacific Southwest Bank at 6th and Spring Street (1910, NRHD contributor), and the Hellman Annex at 410 South Spring Street (1913, NRHD contributor, HCM #729) (California Office of Historic Preservation 1977b).

Spring Street experienced another wave of development following World War I as local financial activity accelerated. Workers who lived outside downtown could reach Spring Street via the Los Angeles Railway (LARy) Yellow Cars, which ran up and down the street. Both the Financial Center Building (704 South Spring Street, NRHD contributor) and the California-Canadian Bank (625 South Spring Street, NRHD contributor) were completed in 1923, both featuring extensive use of terra cotta ornamentation. The following year, the double-winged Spring Street Arcade Building was erected at 541 South Spring Street (this property is a contributor to the Broadway and Spring Street NRHP Historic Districts, HCM #525). By the end of the 1920s, the massive Title Insurance and Trust Building (433 South Spring Street, NRHD contributor, HCM #772) symbolized the later Art Deco buildings found on Spring Street. The Pacific Stock Exchange at 618 South Spring Street (1929, NRHD contributor, HCM #205), the Banks & Huntley Building (1930, NRHD contributor, HCM #631), and the E. F. Hutton Building (1931, NRHD contributor) were some of the last contributing financial buildings in the district. The onset of the Great Depression would bring an abrupt end to most commercial construction in the area. By the 1960s, the corridor would lose its status as the financial epicenter of Southern California as banking institutions relocated to the Gold Coast area around Wilshire Boulevard and Figueroa Street. Nevertheless, the Spring Street corridor continues to convey the financial history and architectural evolution of commercial building in Los Angeles (Gebhard and Winter 2003:252–253).

7th Street

During the 1910s and 1920s, 7th Street developed as a commercial district noted for its upscale retail and distinctive office architecture, which continues to define its modern built environment. The area is roughly a mile south of the original pueblo and had been agricultural land until the first residences began to appear in the late 1870s. Due to the commercial expansion of downtown in the early 1900s, the street continued to evolve from residential to commercial uses. The growth of the area by the 1910s represented a transition in downtown commercial retailing from turn of the century, mixed-use buildings to the larger, single-use, specialized buildings. By 1920, 7th Street featured a number of major retailers and attracted thousands of shoppers, many of which arrived on streetcars. The Yellow Cars provided many stops along the street and became a popular mode of transportation for downtown visitors. Both the Yellow Car and Red Car systems, and their extensive rail network, would allow downtown businesses to draw patrons from throughout Southern California. The corner of 7th and Broadway would soon become one of the most bustling intersections in the City due to a plethora of nearby retail and entertainment establishments. The 7th Street corridor continued to grow throughout the 1920s with the addition of several large-scale office buildings. The architectural character of the street was typified by Beaux Arts style buildings constructed in the early twentieth century. Several of these buildings had undergone façade makeovers in the Art Deco style by the 1930s (Los Angeles Conservancy 1990: II-26–II-28).

Both the Bullock's Department Store and the J. W. Robinson Company served as two of the early catalysts for retail growth along the 7th Street corridor. John Bullock set the tone for the area's specialized, upscale department store theme when he opened his flagship Bullock's store at the corner of Broadway and 7th (319 West 7th Street) in 1906. The store would experience continued expansion at the location and eventually occupy six adjoining structures. In 1915, J. W. Bullocks Company opened the first major department store on 7th Street to the west of Broadway. Located at 600 West 7th Street, the store became an immediate success and spurred a westward expansion of commercial business along the street in an area that had been previously been considered the outskirts of the downtown retail core. Encompassing almost nine acres of floor space, the building was originally designed in the Beaux Arts style but underwent a 1934 remodel, which resulted in its current Moderne façade. Additional retail buildings from the period include the Coulter Dry Goods Company Building at 518 West 7th Street (1917), Ville de Paris at 420 West 7th Street (1917), and later the Barker Bros. Building at 818 West 7th (1926, determined eligible for the NRHP, listed in the CRHR, HCM #356). The Renaissance Revival styled Barker Bros. Building is of particular significance because it was among the largest furniture stores in the country and features a remarkable exterior façade that remains in nearly original condition (Los Angeles Conservancy 2010: 1–6).

Photo 6. *A view of the intersection of Broadway and 7th St., looking west on 7th in 1926. On the corner is the Loew's State Theatre. Streetcars are seen at the center of the street. Source: Los Angeles Public Library*

The construction of single-use office buildings added another component to the architectural fabric of 7th Street. Between 1920 and 1928, 13 large office buildings were constructed on 7th Street alone. Built in 1911, the Union Oil Building at 215 West 7th Street represents one of the earliest examples of this large, spacious type of office construction. The Beaux Arts style building had a Moderne facelift to its first three floors in 1937. Office buildings from the 1920s include the Romanesque style Fine Arts Building at 811 West 7th Street (1926, determined eligible for the NRHP, listed in the CRHR, HCM #125), the Bank of Italy at 505 West 7th Street (1922, HCM #354), the Financial Center Building at 140 West 7th Street (1924, listed in the NRHP and CRHR), the Transportation Building at 122 East 7th Street (1924), and the Roosevelt Building at 727 West 7th Street (1927, listed in the NRHP and CRHR, HCM #355). The massive Renaissance Revival style Roosevelt Building was said to have been the largest office building in Southern California upon its opening. Its architects, Curlett and Beelman, designed six buildings on 7th Street alone. The Financial Center Building stands as yet another example of Beaux Arts style along the street and is listed on the NRHP. Both the Fine Arts Building and the Transportation Building display the stylish and artistic work of architects Walker and Eisen (Gebhard and Winter 2003: 238, 252).

Photo 7. *Northeast corner of Flower and 7th Streets looking at the south and west elevations of the Roosevelt Building circa 1940.*
A streetcar is traveling east on 7th Street. Source: Los Angeles Public Library

In addition to retail and office buildings, 7th Street was also home to theater venues near Broadway and the Los Angeles Athletic Club (determined eligible for the NRHP, HCM# 69). Two theaters of particular note are the Pantages Theatre at 401 West 7th Street (1920, determined eligible for the NRHP) and the Loew's State Theatre (listed in the NRHP and CRHR, HCM #522) at 300 West 7th Street. The Loew's Theatre was especially popular in its heyday because it offered both live performances and MGM films. The Los Angeles Athletic Club, a local institution, moved to its current location at 431 West 7th Street in 1912 with a layout that included a clubhouse, athletic facility, and hotel. It also featured an Olympic-size pool on the sixth floor, which still remains today, and was an engineering feat in its time (Los Angeles Conservancy 2010: 4). The club is also credited with introducing organized track and field competition to California, which would later be adopted into prep and collegiate sports programs in the twentieth century (Starr 2005: 299).

As a result of this study, a historic district designated as the W 7th Street District is being recommended eligible for the NRHP. The boundaries of this district are roughly W 7th Street between South Figueroa Street and South Main Street. The district was determined eligible for the NRHP under Criterion A due to the 7th Street development during the 1910s and 1920s, as a commercial district noted for its upscale retail and distinctive office and retail architecture; it is also eligible for Criterion C of the NRHP due to the architectural character of the street in high academic styles that retain high degrees of integrity. This determination of eligibility is contingent on SHPO concurrence with the finding. The associated California Department of Parks and Recreation (DPR) forms for the proposed district are located in Appendix C.

South Park

The neighborhood commonly referred to as South Park encompasses an area roughly bounded by 8th Street to the north, the Santa Monica Freeway to the south, Main Street to the east, and the Harbor Freeway to the west. The name "South Park" is a fairly recent moniker created for the marketing and redevelopment of the neighborhood; historically, it was not referred to by this name. The neighborhood was first developed as a middle-class residential area during the 1880s and evolved into an area characterized by medical, commercial (especially automotive related), and retail businesses intermixed with residential flats, apartments, and rooming houses during the twentieth century (City of Los Angeles 2001: 2, 7).

South Park was traditionally recognized as the home to two important institutions during the first half of the twentieth century: William Randolph Hearst's Examiner newspaper (later the Herald-Examiner) and the California Hospital. The building formerly occupied by the Herald-Examiner at 1111 South Broadway (determined eligible for the NRHP, listed in the CRHR, HCM #178) was constructed in 1914 and designed by renowned architect Julia Morgan in association with William Dodd and William Richards. The striking Mission Revival style building with Italian Revival and Moorish influences stands as one of Morgan's few works in Los Angeles.

***Photo 8**. Exterior of the Examiner newspaper building at 1111 South Broadway in 1937.*
A Yellow Car can be seen at the bottom of the photo on Broadway.
Source: Los Angeles Public Library

California Hospital represents one of the early hospitals in Los Angeles. First opened at 1414 South Hope in 1898, the hospital rapidly expanded into neighboring buildings to accommodate additional patients. In 1921, the Lutheran Hospital Society of Southern California purchased the hospital and would operate it for several decades. After the original hospital building proved inadequate by the 1920s, the Society built a nine-story hospital in 1926 at the original Hope Street location. The brick hospital would serve Los Angeles until it was severely damaged by the Northridge Earthquake of 1994. The building was demolished in 2000, although California Hospital continues to operate a hospital tower at 1401 South Grand Avenue, which was built in 1987.

The Streetcar in Los Angeles

Horse Car Lines (1873–1901)

While there had been talk of a street railway line in Los Angeles since the 1860s, it was not until the 1870s that there was the necessary economic boom and critical mass of population for its development. Judge Robert M. Widney incorporated the Spring & 6th Street Horse Railroad Co. in February of 1874 and brought the first car line into fruition in the downtown. The line would feature a horse-drawn car on narrow-gauge tracks, which ran from the Plaza to the intersection of 6th Street and Pearl Street (now Figueroa) along Main Street. Funded in part by property owners adjacent to the line, the first phase of the railway was completed by the end of 1874. Widney subsequently sold controlling interest in the rail company to Stephen C. Hubbell, who extended the line east across the Los Angeles River into the East Los Angeles neighborhood of Lincoln Park (Workman 1935: 149–155).

Another horse car railway venture emerged with the chartering of the Main Street & Agricultural Park Street Railroad Co. in November of 1874. By 1876, under the leadership of company president John G. Downey, the traction line extended from the plaza to an early Los Angeles amusement park located at Washington Boulevard named Washington Gardens. A year later, the line was extended farther south to Agricultural Park (now Exposition Park) (Post 1989:41–47).

Two additional horse car lines developed by 1880. The first, Los Angeles & Aliso Avenue Street Passenger Railway connected Main Street to the newly subdivided Boyle Heights neighborhood east of the Los Angeles River. Since the line was initially built for land promotion of Boyle Heights, it gave potential residents from downtown a chance to explore the burgeoning neighborhood across the river. Providing service along Aliso Avenue, the carline's connection to downtown contributed to the rapid growth of Boyle Heights during the 1880s. The second, the East Los Angeles & San Pedro Street Horse Line provided service along San Pedro Street during the late 1870s, but the line was short lived and ended service after only a few short years due to a lack of patronage. Widney incorporated this line in an effort to promote a subdivision in East Los Angeles belonging to the Pioneer Building Association; however, the line did not produce the same impetus for growth seen in Boyle Heights. This line was typical of other lines that were built to promote neighborhoods on the periphery of downtown. If the neighborhood did not develop quickly enough or produce the necessary amount of riders, the ventures would be short lived (Post 1989: 31–38).

The population and economic boom in Los Angeles during the 1880s provided the necessary ridership demand from residents near downtown to warrant aggressive expansion of the street railway system. The convenience provided by street railways often enabled the sale of real estate on the uninhabited peripheries of the city, and in turn, produced a new population of riders desiring access to the downtown business district. After the 1880s, horse cars would be phased out in favor of the new cable car technology, which surpassed horse-drawn cars in safety, operating economy, speed, and cleanliness (Caughey 1977: 192–195; Electric Railway Historical Association n.d.). The final animal-powered line in Los Angeles, the Mateo Street line, ceased operation in 1901 (Caughey 1977: 192–195; Electric Railway Historical Association n.d.).

Cable Car Lines (1885–1902)

For a time, animal traction lines gave way to cars pulled by steel cables beneath the street surface. This was a far more involved and expensive technology than simply putting down two rails and building a horse barn. The huge investment appeared worthwhile as the cable cars could climb the steepest of hills, and suddenly they opened up real estate markets to the west and east of downtown that were previously unreachable due to the hills and the river. The previous horse car lines simply could not operate on the steep grades that hemmed in downtown. Now neighborhoods with hilly terrain, such as Crown Hill and Bunker Hill, could be accessed by cable cars. In 1885, Los Angeles became one of only a handful of American cities with a cable car system thanks to the construction of the 2nd Street Cable Railroad, which ran west from Spring Street. It was privately funded and built with the intent of selling lots in the Crown Hill district. Another cable car enterprise, the Temple Street Cable Railway, would extend three miles from Spring Street to the Dayton Heights neighborhood at the city's western limits (Caughey 1977: 194–197; Electric Railway Historical Association n.d.).

Cable car service in Los Angeles reached its zenith in 1887 with the creation of the costly and extensive Los Angeles Cable Railway Cable Car Line. The railway was capitalized at $2.5 million on June 9, 1887, by directors J. F. Crank and Charles Forman and became the largest such enterprise organized in the city. The line may have been most noteworthy for its accompanying infrastructure investments, which included the construction of three supporting power plants as well as the highly recognizable 1st Street Viaduct, which spanned the Los Angeles River and Santa Fe rail yard. The costly investments of the Los Angeles Cable Railway would quickly create financial difficulty for the company, and it was reorganized as the Pacific Railway in 1889 by Chicago streetcar magnate, Charles B. Holmes (Workman 1935: 203–207).

Cable railway construction involved digging up the street and installing hundreds of heavy cast iron yokes that carried the pulleys and wheels over which the steel cables ran. This construction also had to carry the rails and the weight of regular street traffic. These systems were so expensive that they really could not be cost justified by real estate sales alone, and many investments were lost. Because the City issued franchises to use public streets, several cable operators got into the business by buying failing horse car lines whose primary assets were the franchises, not the rolling stock or the poorly built horse car tracks.

Electric Streetcars and Interurbans (1885–1963)

By the late 1880s, the cable car lines would lose patronage to the fledgling electric streetcars. During this period, electric streetcar technology, and specifically the electric motor, had been refined and successfully introduced in major East Coast cities. While cable cars continued to function in Los Angeles under the Pacific Railway Company, the line would face new competition from an emerging electric streetcar company named the Los Angeles Consolidated Electric Railway (LACE). Under the leadership of land developer Moses Sherman, LACE would rapidly expand throughout the downtown core. While the cable cars of Pacific Railway continued to maintain the largest ridership of the City's streetcar lines in the early 1890s, its finances were precarious and its technology became increasingly antiquated. Pacific Railway struggled to remain solvent and was acquired by LACE by fall of 1893, bringing a precipitous end to horse and cable car lines previously run by Pacific Railway. With a virtual monopoly over streetcars in Los Angeles, LACE electrified all of its remaining horse and cable car lines by the summer of 1896, officially ushering in the era of the electric streetcar (Post 1989:101–111).

Even with near complete control of streetcar lines in Los Angeles, LACE would soon face financial difficulties of its own due in part to a national depression in the 1890s as well as mismanagement of the company. To avoid foreclosure, Moses Sherman relinquished control to company bondholders who formed a new railway corporation called the Los Angeles Railway, which would assume control of the electric streetcar system. By 1900, the yellow and brown cars of the Los Angeles Railway had extensive lines running throughout downtown Los Angeles and into neighborhoods such as Angeleno Heights, East Los Angeles, and Boyle Heights. Real estate mogul and railroad baron Henry E. Huntington gained control of LARy, in 1898. In 1901 Huntington would also begin to assemble the expansive interurban Pacific Electric Red Cars system, which would span multiple counties in Southern California. The entirely separate LARy system would continue to be prevalent in the downtown core (Post 1989: 105–109).

Through intermediaries the Southern Pacific Railroad purchased an ever-increasing amount of the Pacific Electric Company's stock as part of a quiet expansion effort into Southern California. By the 1910s, Huntington proceeded to further loosen his hold on his streetcar empire as he turned his attention to his public utility companies and pursued his passion for collecting rare books and art. In

1911, the Southern Pacific Railway forced Huntington out of the Pacific Electric completely. The companies purchased by Southern Pacific would be combined under the Pacific Electric name. Huntington would still maintain control of the one streetcar system, the Los Angeles Railway, which would remain in the Huntington trust until 1945. This would leave only three streetcar companies operating in Los Angeles after 1911: the Pacific Electric, the Los Angeles Railway, and the small Glendale & Montrose Electric Railway, which consisted of only five cars and two lines operating largely in Glendale and La Canada (Walker 1977: 45).

By the time of the 1911 merger, Pacific Electric Red Cars had become the largest interurban electric railway in the world in terms of miles of tracks (1,200 route miles) throughout Southern California. Nevertheless, Huntington's Yellow Cars, which provided quick, local service in Los Angeles and operated 90 percent of its lines within the city limits, would become the true workhorse of the regional transit system. By 1924, LARy carried about twice as many passengers as the Pacific Electric, serving 255.6 million passengers compared to the Red Cars 100.9 million (Masters 2013).

Both the LARy Yellow Cars and Pacific Electric Red Cars reached the peak of their expansion and usage by the 1920s and 1930s, when they were commonly used to take people to popular shopping and entertainment districts in downtown Los Angeles from outlying suburbs that were not as well served by commercial retail. Despite the widespread use of both streetcar systems, the first indication of their decline began to appear as early as the 1920s. A vibrant automobile culture had entrenched itself in Southern California by the 1920s as car ownership rapidly grew from year to year and became increasingly affordable to a growing middle-class. Where the streetcars had previously been the only connection of outlying areas to central Los Angeles in the pre-automobile era, auto travel provided a desirable alternative and was supported by an expanding publicly funded road network. In the case of the Pacific Electric, real estate development had driven interurban expansion, and passenger operation was typically a loss leader. When most of the real estate holdings had been developed by the 1920s, this primary source of profit began to be depleted, and the least-used Pacific Electric car lines converted to buses as early as 1925 (Crump 1965: 203–209). The real reason Southern Pacific Railway had been so keen to acquire the Pacific Electric routes was that far more profitable freight operation was possible compared to the Pacific Electric's standard gauge long-distance tracks. The Los Angeles Railway, with its tight inner city curves and narrow gauge street operations, never carried more than a token amount of perishable freight. When the Great Depression came in 1930, the management of the Glendale & Montrose begged the Pacific Electric to buy out their operations. When the Pacific Electric refused, the Glendale & Montrose folded, and its tracks were sold to the Union Pacific Railway for freight operations only.

Both remaining rail transit companies experienced a boom in ridership during World War II due to gasoline, oil, and rubber rationing; however, too many forces were working against the sustainability of streetcars and interurbans. Due to high operational costs and anemic ridership, more and more of the underutilized lines to outlying communities were replaced by less costly bus lines during the 1930s and 1940s. In 1940 and 1941 alone, the Pacific Electric discontinued service to Fullerton, Riverside, Manhattan Beach, and Torrance and discontinued two Santa Monica routes in favor of bus service. In addition, the beginning of the freeway system in Southern California in the 1940s would make long distance auto travel even more practical, often to the detriment of streetcar lines to outlying areas (Crump 1965: 206–210).

By the late 1930s, the influential Southern California Automobile Club vigorously lobbied for plans to create a freeway system for the region, which included the dismantling of streetcar lines.

While the LARy did not rely on distant suburban ridership to the degree that the Pacific Electric did, the LARy was suffering similar deterioration in ridership. The Huntington estate sold the Yellow Car system to bus-oriented transit operator, National City Lines (NCL), in 1945. Operating under the name Los Angeles Transit Lines, NCL repainted many streetcars, ordered new modern Presidents Conference Cars and streamlined operations by abandoning a number of rail lines in favor of motor coaches. Likewise, the Pacific Electric sold off its passenger operations to bus operator Metropolitan Coach Lines (MCL) in 1953. MCL converted rail service to bus service in many areas (Walker 1977:14).

Photo 9. *A retired Los Angeles Transit Lines streamliner wearing government Los Angeles Metropolitan Transit Authority's green and white color scheme in 1963.*
Source: Los Angeles Public Library

Beyond the growing dominance of automobile culture, the streetcar's downfall in Los Angeles was further hastened by a reputation for aging infrastructure, frequent delays, and uncomfortable trains. At the same time, growing affluence during the post-World War II era allowed for an even greater expansion of automobile ownership. Public officials failed to integrate streetcar lines into proposed freeway projects, citing cost as the main impediment. A new government agency, the Los Angeles Metropolitan Transit Authority, took over the successors to the Yellow and Red Car systems in 1958 and soon dismantled the last vestiges of the old streetcar lines. The last former Pacific Electric interurban operated from downtown to Long Beach April 8, 1961 and the last five former Los Angeles Railway lines completed service in the early morning hours of April 1, 1963 (Masters 2013).

Current Conditions

The project alignment is in downtown Los Angeles. This is an urban setting, with multi-story civic, commercial, entertainment, and residential buildings interspersed with at-grade parking lots, multi-story parking garages, and eight parks. The project alignment includes portions of several neighborhoods and districts that illustrate the typical uses. For example, the Jewelry District encompasses parts of Hill Street and Broadway between 5th and 8th Streets. This cohesive grouping of buildings demonstrates the growth of Los Angeles during the early 1900s, as well as the popular architectural styles designed by renowned architects of the time period. The DPR forms for the Downtown Hill Street Historic District are located in Appendix C.

In addition to the Broadway theaters, there are two areas that are dominated by entertainment venues: 1st Street and Grand Avenue, which is anchored by the Dorothy Chandler Pavilion and the Walt Disney Concert Hall, and the L.A. Live/Staples Arena grouping along South Figueroa Street and 11th Street/Olympic Boulevard. At the north end of the project alignment is the Civic Center, and at the south end is South Park.

Photo 10. *7th Street, looking east from Figueroa Street, January 25, 2016.*

Photo 11. *Figueroa Street, looking south from Olympic Boulevard, January 25, 2016.*

Most of the geography of the project alignment is flat, with a few exceptions. The north-south Broadway, Hill, and Figueroa Streets are relatively level boulevards in the project alignment, although Hill Street is slightly elevated in comparison to Broadway, and there is a slight rise at the north end of Broadway. Bunker Hill rises up from the west side of Hill Street, north of 6th Street. As a result, 1st Street has a gradual climb from South Broadway to Grand Avenue.

The section of 1st Street between South Broadway and Grand Avenue provides for traffic in both the eastbound and westbound directions using five lanes, except near the intersection with Grand Avenue, where the road widens to eight lanes. Grand Avenue is geographically elevated above most of downtown Los Angeles. It is generally four lanes across, with some widening for turn lanes at intersections, and carries northbound and southbound traffic between 1st and 2nd Streets.

Photo 12. *Broadway, looking north from 9th Street, January 25, 2016.*

Currently, Hill Street is a two-way street with four traffic lanes. Hill Street also includes a center turning lane. Broadway has three lanes: one southbound and two northbound. Between Olympic and 11th Streets, South Figueroa Street has traffic lanes for both northbound and southbound traffic and is seven lanes across. North of Olympic Boulevard, South Figueroa Street becomes a one-way street, with only northbound traffic using four to five lanes. Ninth Street is a one-way street, with only eastbound traffic using four lanes between South Figueroa Street and Grand Avenue and three lanes from Grand Avenue to Broadway in the project alignment. From South Broadway to South Flower Street, 11th Street is a two-lane, one-way western route. At South Flower Street, this road widens to six lanes and includes eastbound traffic. Between South Figueroa Street and South Broadway, 7th Street carries eastbound traffic in one lane and westbound traffic in one to two lanes, with a parking/turn lane on either side and a center turn lane at most intersections.

Photo 13. *Hill Street, looking south from 6th Street, January 25, 2016.*

Today, the corridors in the project alignment are heavily used city streets with both vehicular and bus traffic. There are a few remnants related to the streetcar era, such as Angel's Flight (listed in the NRHP and CRHR, HCM #4) and the Subway Terminal Building (now an apartment building known as Metro 417, listed in the NRHP and CRHR, HCM #177), including the metal anchor hooks on buildings that held cables for the streetcars.

The setting includes sidewalks of various widths, mature and newly planted street trees, various styles of light poles, parking meters, bike racks, trash cans, and other related street furniture. Additionally, traffic lights include signal heads on one-story high poles at corners, as well as two-story elevated arms that hang over the intersections and pedestrian crosswalks. Most buildings have been built out to the public right-of-way/sidewalk.

Methodology

In accordance with 36 CFR Section 800.4(a)(1 through 4), FTA sought consultation with SHPO on the adequacy of the proposed scope of efforts to identify historic properties in the project alignment. Based on a February 14, 2013 phone call, staff from SHPO, FTA, LADOT, and Metro, the study area was preliminarily defined as those parcels adjacent to the project corridor described in the definition of the 7th and 9th Street Alternatives (both with or without the Grand Avenue Extension) and would encompasses all project components, including proposed maintenance and storage facility options and TPSS sites. The study area is shown in Figure 3.

On April 14, 2013, FTA sent a letter initiating consultation with SHPO that reiterated the points established during the February 14, 2013 phone call. On June 19, 2013, SHPO responded to the consultation request letter and concurred with this identification strategy. A copy of both letters can be found in Appendix A.

In accordance with established practice, ICF International staff consulted national, state, and local inventories of architectural and historic resources to determine the location of previously documented historic and architectural resources proximate to the project alignment.

The following standard sources of information were consulted in the process of compiling this report.

- National Register of Historic Places (http://www.cr.nps.gov/nr)
- California Historical Landmarks (California Office of Historic Preservation 1996)
- California Points of Historical Interest (California Office of Historic Preservation 1992)
- California Register of Historical Resources
- California Historical Resources Inventory
- City of Los Angeles Historic Cultural Monuments

On August 23, 2012, a records search was conducted at the South Central Coastal Information Center in Fullerton, California. The research focused on the identification of previously recorded historic built environment, archaeological, and prehistoric resources within a quarter-mile radius of the study area. Research involved a search of records, including historical site inventories, archaeological site records and reports, and historic U.S. Geological Survey topographic maps. National, state, and local inventories of architectural and historic resources were reviewed to determine the location of previously documented historic and architectural resources proximate to the project corridor. These included standard sources of information, such as the NRHP, CRHR, California Historic Landmarks (CHLs), California Points of Historical Interest (CPHI), California Historical Resources Inventory, and City of Los Angeles HCMs.

This records search determined that 82 studies were conducted within a quarter-mile radius of the study area. Of these, 19 studies were previously conducted within portions of the study area. A total of 132 properties and one historic district have been recorded within the boundaries of the APE. Figure 4 provides a visual representation of the properties in the proposed study area that were identified during the records search as NRHP listed or eligible or locally listed.

Ten properties were previously listed on the NRHP and 43 properties were previously determined eligible for the NRHP. Some of the properties are historic districts with multiple contributing buildings, which are not tallied in the above numbers.

One NHL is located within the proposed project study area: the Bradbury Building, 304 South Broadway, listed May 5, 1977 (Los Angeles National Historic Landmarks 2013).

There are eight additional NRHP-listed properties and one NRHP-listed district located within the study area (Table 1). These buildings are colored red on the maps in Figure 4.

One property within the quarter-mile radius of the study area is listed as a CPHI: CPHI-LAN-043/19-166953, Pacific Electric Building at 610 South Main Street. No other properties within a quarter-mile radius of the study area are listed as CHLs or CPHIs. No properties within the study area are listed as a CHL.

Table 1. Properties Included in the NRHP and Listed in the CRHR[a]

Name	Address/ Location	Map Reference Number	Status
Broadway Theatre and Commercial District Boundary increase[b]	242–947 Broadway	7	Increased the boundary of the district and revised contributors/non-contributors.
Bradbury Building	300 S Broadway	9	Listed as an NHL, and included on the NRHP under Criteria A and C, for architecture/engineering. Period of significance is 1893. This property was declared HCM #6.
Broadway Theatre and Commercial District	300–939 S Broadway	7	Listed on the NRHP under Criteria A and C for architecture, commerce, and entertainment/recreation. Period of significance is 1894–1931. There are 60 contributing buildings, 38 non-contributing buildings, and three vacant lots within this district.[c] This district was declared HCM #2306.
Million Dollar Theater/ Edison Building	301 S Broadway	8	Listed on the NRHP under Criteria A and C, for an event and architecture/engineering._ Period of significance is 1916.
Friday Morning Club	940 S Figueroa Street	50	Listed on the NRHP under Criterion C for associations with social/humanitarian activities, theater, and radio. Period of significance from 1923–1924. This property was declared HCM #196.
NY Cloak & Suit House, Brockman Building	708 Grand Avenue & 520 W 7th Street	38	Listed on the NRHP under Criteria A and C, for community planning/development, architecture, and commerce. Period of significance from 1912–1925.
Angels Flight Railway/Angels Flight Railway Station House	S Hill Street, north of W 4th Street	10	Listed on the NRHP under Criteria A and C, for an event and architecture/engineering. _Period of significance is 1905—circa 1950. This property was declared HCM #4.

Name	Address/ Location	Map Reference Number	Status
Subway Terminal Building, 417 Metro	417 S Hill Street	13	Listed on the NRHP under Criteria A and C for transportation and architecture. Period of significance from 1925–1955. This property was declared HCM # 177.
Title Guarantee and Trust Company Building	401–411 W 5th Street/ 425–457 S Hill Street	15	Listed on the NRHP under Criterion C for architecture. Period of significance is 1930–1931. This property was declared HCM # 278.
Roosevelt Building	727 W 7th Street	26	Listed on the NRHP under Criteria A and C for architecture. Period of significance is 1926. This property was declared HCM # 355.
Garfield Building	403 W 8th Street	43	Listed on the NRHP under Criterion C for architecture/ engineering. Period of significance is 1929.

Source: ICF 2013.

[a] California State Historic Preservation Office. *California Historic Resources Inventory System*. Last updated on April 4, 2012.

[b] There was no change in the net number of contributors. Six buildings originally considered to be contributing had their status changed to non-contributing, while six different buildings within the district were determined to be contributors. Two new non-contributing resources were identified within the district. Addresses identifying the current contributors and non-contributors to the historic district can be found in Appendix D. Accessed from http://www.NRHP.com/CA/Los+Angeles/state.html.

[c] Please see Appendix E for a list of character-defining features of the district.

When the Broadway Theatre and Commercial District boundary was increased in 1998, the authors reiterated that the significance of this district was conveyed in part by the cohesive nature of the building setbacks, the materials used in the building façades, and the positioning of storefronts at street level. In addition to the contributing buildings, additional character-defining features of the district were identified in 1998. These are listed in Tables F-1 and F-2 in Appendix E.

Forty-two properties and one historic district were previously determined eligible for the NRHP (Table 2).

Table 2. Properties Previously Determined Eligible for the NRHP and Listed in the CRHR[a]

Name	Address/Location	Map Reference Number	Status
Los Angeles Civic Center Historic District	Various addresses, downtown Los Angeles	1	Determined eligible for the NRHP under Criteria A and C for association and architecture. Period of significance is 1925–1972. It is listed in the CRHR.
Barry's	543–545 S Broadway	20	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1901. It is listed in the CRHR.
Clifton's Cafeteria	648 S Broadway	35	Determined eligible for the NRHP under Criteria A and C for association and architecture. Period of significance is 1935. It is listed in the CRHR.
Clifton's Cafeteria Terrazzo Sidewalk	648 S Broadway	34	Determined eligible for the NRHP under Criterion C for its high artistic qualities. Period of significance is 1935-1939. It is listed in the CRHR.
Wurlitzer Building	818-820 S Broadway	45	Determined eligible for the NRHP under Criteria A and C for association and architecture. Period of significance is 1913–1923. It is listed in the CRHR.
Burgers	828 S Broadway	46	Determined eligible for the NRHP under Criteria A and C for association and architecture. Period of significance is 1927. It is listed in the CRHR.
Western Pacific Building	1023 S Broadway	53	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1925.
LA Transit Building	1050–1070 S Broadway	54	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1920.
Commercial Club, Hotel Case	1100 S Broadway	56	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1925.
Examiner Building/Herald Examiner	1111 S Broadway	55	Determined eligible for the NRHP under Criteria B and C for a significant person and architecture. Period of significance is 1914. It is listed in the CRHR. This property was declared HCM # 178.
Hotel Figueroa	939 S Figueroa Street	51	Determined eligible for the NRHP under Criterion C for architecture. Period of significance is 1925. It is listed in the CRHR.
Blow-Up Boutique	947 S Figueroa Street	52	Determined eligible for the NRHP under Criterion C for architecture. Period of significance is 1939. It is listed in the CRHR.

Name	Address/Location	Map Reference Number	Status
Dorothy Chandler Pavilion	135 N Grand Avenue	2	Determined eligible for the NRHP under Criteria A and C for association and architecture. Period of significance is 1925–1971. It is listed in the CRHR.
Walt Disney Concert Hall	111 S Grand Avenue	6	Determined eligible for the NRHP under Criterion C for architecture. Period of significance is 2003. It is listed in the CRHR.
Los Angeles County Courthouse/Stanley Mosk Los Angeles County Courthouse	111 N Hill Street	3	Determined eligible for the NRHP under Criteria A and C for association and architecture. Period of significance is 1925–1971. It is listed in the CRHR.
The Aldine, The Whipple, Myrick Hotel	324–326 Hill Street	11	Determined eligible for the NRHP under Criterion C for architecture. Period of significance is 1893–1897. It is listed in the CRHR.
The Aldine, Myrick Hotel	342 S Hill Street	12	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1897. It is listed in the CRHR.
Clark Hotel & Beauty School	426 S Hill Street	14	Determined eligible for the NRHP under Criterion C for architecture. Period of significance is 1912. It is listed in the CRHR.
Pershing Square Building	448 S Hill Street	16	Determined eligible for the NRHP under Criterion C for architecture. Period of significance is 1923. It is listed in the CRHR.
William Fox Building	608 S Hill Street	21	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1930.
Sun Reality, Banker's Building	629 S Hill Street	22	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1930.
Bullocks Downtown Department Store	632 S Hill Street	23	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1906. It is listed in the CRHR.
Los Angeles Fur Mart Building	635 S Hill Street	24	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1925.
Great Western Savings Bank	700 S Hill Street	42	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1922.
Foreman & Clark Building	701 S Hill Street	41	Determined eligible for the NRHP under Criterion C for architecture. Period of significance is 1928. It is listed in the CRHR.

Name	Address/Location	Map Reference Number	Status
Union Bank and Trust Company	760 S Hill Street	44	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1921. It is listed in the CRHR.
Biltmore Hotel	515 S Olive Street	17	Determined eligible for the NRHP under Criteria A and C for association and architecture. Period of significance is 1923. It is listed in the CRHR. This property was declared HCM # 60.
Bank of Italy/ A.P. Giannini Building	649 S Olive Street	31	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1922. This property was declared HCM # 354.
Ville De Paris Store, La Merchandise	700–712 S Olive Street	40	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1917.
None	275 W 1st Street	5	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1942. It is listed in the CRHR.
Los Angeles County Law Library/Mildred L. Lillie Building	301 W 1st Street	4	Determined eligible for the NRHP under Criteria A and C for association and architecture. Period of significance is 1925–1971. It is listed in the CRHR.
None	326 W 5th Street	19	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1897. It is listed in the CRHR.
Pantages/Warner Brothers Theatre	401 W 7th Street	33	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1919.
LA Athletic Club	431 W 7th Street	32	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1912. This property is also listed as HCM # 69.
Coulter Dry Goods Co	500 W 7th Street	39	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1917.
Brock & Company Jewelry Store	513-515 W 7th Street	30	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1922. This property was declared HCM # 358.
Brack Shops	527 W 7th Street	29	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1913.
Quinby Building, Japan Airlines	529 W 7th Street	28	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1926.

Name	Address/Location	Map Reference Number	Status
Boston Store, J. W. Robinson Company	600 W 7th Street	37	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1914. It is listed in the CRHR. This property was declared HCM # 357.
Union Oil Building, Kyowa Bank	617 W 7th Street	27	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1922.
Barker Bros.	800 W 7th Street	36	Determined eligible for the NRHP under Criterion C for architecture. Period of significance is 1925. It is listed in the CRHR. This property was declared HCM # 135.
Fine Arts Building, Global Marine Building	807 W 7th Street	25	Determined eligible for the NRHP under Criteria A and C for association and architecture. Period of significance is 1926. It is listed in the CRHR. This property was declared HCM # 125.
Insurance Exchange, Pacific Bell	855 S Hill Street	47	Determined eligible for the NRHP (Criterion N/A). Period of significance is 1924.

Table 3 provides a list of additional properties declared by the City of Los Angeles to be HCMs that were not identified in Table 1 or Table 2.

Table 3. Additional Properties Declared by the City of Los Angeles to Be Historic Cultural Monuments

Name	Address/Location	Map Reference Number[3]	Status
Pershing Square, Spanish-American War Memorial	Northeast corner of W. 5th Street and S. Olive Street	18	Declared on 3/23/1980 as HCM #480.
May Company Garage	9th and Hill Streets	49	Declared on 6/1/2011 as HCM #1001.
Original Pantry	809-817 West 9th Street and 873-877 South Figueroa Street	48	Declared on 10/5/1982 as HCM #255.

Source: ICF 2016.

Office of Historic Resources. Los Angeles Historic Cultural Monuments. Last updated on April 15, 2015.

[3] Properties that have been demolished do not have a corresponding Map Reference Number.

Through this undertaking, the Spanish American War Memorial was determined ineligible for the NRHP. Research into the history of the object did not reveal any association with important persons or events; there is no known sculptor or designer, and it was not found eligible under Criteria A or B. The monument is not in its original location and its design, while displaying a style that was in fashion at the time it was assembled, is not a significant example. Therefore it is not eligible under Criterion C.

The May Company Garage was determined eligible for the NRHP as a contributor to a historic district—the Downtown Hill Street district—and the Original Pantry was determined eligible for the NRHP.

The following properties were either listed as HCMs or previously determined eligible for local listing, but they have been since demolished or destroyed by fire:

- The Salt Box (Former Site of), 339 S. Bunker Hill Avenue (now Hope Street), declared on 8/6/1962 as HCM #5, relocated to Heritage Square in 1969, and destroyed by fire on 10/09/1969.
- Philharmonic Auditorium (Former Site of), 427 W. 5th Street, declared on 7/2/1969 as HCM #61, demolished in 1985.
- Harry M Hoffman/Fleet Services, 928 S Flower Street/ 600 W. 9th Street, determined locally eligible through a historic survey. It appears to have been demolished.
- 807 S. Figueroa Street, determined locally eligible through a historic survey, date of survey unknown. It appears to have been demolished, current building dates from 1991.
- Colombo’s Parking Garage, 815 S. Figueroa Street, determined locally eligible through a historic survey, date of survey unknown. It appears to have been demolished, current building dates from 1991.
- American Baptist Building, 816 S. Figueroa Street, determined locally eligible through a historic survey, date of survey is unknown.
- Colombo’s Restaurant, 821 S. Figueroa Street, determined locally eligible through a historic survey, date of survey unknown. It appears to have been demolished, current building dates from 1976.
- Association Stationers and Printers, 822 S. Figueroa Street, determined locally eligible through a historic survey, date of survey unknown. It appears to have been demolished, current building dates from 1984.
- Brill Building, 834 S. Figueroa Street, determined locally eligible through a historic survey, date of survey unknown. It appears to have been demolished, current building dates from 1984.

Public Participation

In accordance with 36 CFR Section 800.4(a)(3), on April 16, 2013, letters were sent to consulting and interested parties who may have knowledge of or concerns regarding historic properties in the area and to request information regarding any historic buildings, districts, sites, objects, or archaeological sites of significance within the project alignment. Copies of these letters are located in Appendix B. The letters were sent to the following recipients.

Responses Received

As of the completion of this technical report, no responses have been received.

Field Survey

A field survey of the architectural resources in the study area was conducted by the following architectural historians and historians at ICF International who meet the Secretary of the Interior's Professional Qualifications Standards: Jessica B. Feldman, Elizabeth Hilton, and Andrew Bursan. The field survey was conducted on March 13, 15, and 22, 2013. Andrew Bursan was the author of the historic context, Elizabeth Hilton prepared the environmental setting and the inventory forms. Jessica Feldman was responsible for coordination of these activities and the writing of the technical report.

In accordance with 36 CFR 800.4 (b)(2) and the identification strategy agreed upon by the lead agencies and SHPO, the architectural survey included the recordation of pre-1966 properties in the study area, even if they have lost integrity. Properties that are potentially eligible and have not been previously listed in the NRHP (Table 1) or previously identified as NRHP-eligible (Table 2) or locally listed (Table 3) are listed in Table 4. Two buildings, two objects, and two historic districts were identified as eligible for the NRHP as a result of the survey and, pursuant to Section 106, concurrence with this determination would be sought from SHPO.

Table 4. Properties Eligible for the NRHP, Pending SHPO Concurrence Pursuant to Section 106

Name	Address/Location	Date Constructed	Status
Downtown Hill Street District	Hill Street between W. 6th and 8th Streets	1903–1931	Determined eligible for the NRHP under Criterion C for architecture. Period of significance is 1903-1931. This cohesive grouping of buildings demonstrates the growth of Los Angeles during the early 1900s, as well as the popular architectural styles designed by renowned architects of the time period. Therefore, this historic district is eligible for the NRHP under Criterion C at the local level of significance. Currently, several of the buildings are already listed on the NRHP, CRHR, and as local landmarks.
Air Raid Siren Discontiguous District: Air Raid Sirens #00, and 011	West side of Hill Street, south of 7th Street; south side of Olympic Boulevard, west of Broadway	c. 1950	Determined eligible for the NRHP under Criterion A for its association with World War II Safety in Los Angeles as a contributor to a district. Period of significance is circa 1950. The Air Raid Sirens appear to be contributors to a larger discontiguous district that once consisted of 225 objects; evaluating such a district is beyond the scope of this Project.
W 7th Street District	W 7th Street between South Figueroa Street and South Main Street	1903–1936	Determined eligible for the NRHP under Criteria A and C. Period of significance is 1903–1936. The 7th Street development during the 1910s and 1920s has been noted for its upscale retail and distinctive office skyscrapers, which continues to define its modern built environment. The district is also eligible due to the architectural character of the street in high academic styles that retain high degrees of integrity. Furthermore, well-known architects during the period of significance designed these iconic buildings, especially as large commercial blocks. Currently, several of the buildings are already listed on the NRHP, CRHR, and as local landmarks.

Name	Address/Location	Date Constructed	Status
Insurance Exchange Building Company	318 W 9th Street	1924	Determined eligible for the NRHP under Criterion C for architecture. Period of significance is 1924. This building was previously determined eligible for the NRHP as a result of the 1983 Community Redevelopment Agency Central Business District Survey. This building retains a high degree of integrity and is a distinguished example of this style as a commercial building.
Original Pantry	809-817 West 9th Street and 873-877 South Figueroa Street	1917	Determined eligible for the NRHP under Criterion A for its association with downtown Los Angeles as an early diner still in existence. Period of significance is 1924. With its relatively unmodified interior and traditional menu, the Pantry retains a high level of integrity despite the evolution of restaurant décor and food trends of the past half century. As such, the restaurant is eligible for the NRHP for its important association with Los Angeles restaurant history from the 1920s to the present day.
Source: ICF 2013.			

Two buildings, two objects, and two historic districts were identified as potentially eligible for the NRHP as a result of the survey. The Air Raid Sirens appear to be contributors to a larger discontiguous district; evaluating such a district is beyond the scope of work for this Project. Air Raid Sirens #008 and 093 were determined eligible for the NRHP as contributors to the Los Angeles Civic Center District, concurred by SHPO, setting the precedence for NRHP eligibility for existing Air Raid Sirens.

For pre-1966 properties in the study area that were determined to be ineligible for the NRHP as a result of the survey, a California Department of Parks and Recreation Primary Record (DPR 523A) form was prepared. A list of those properties follows Table 3. Post-1966 properties were not identified during the survey unless they meet NRHP Criteria Consideration G.

Properties in Table 4 have been evaluated in accordance with 36 CFR 800.4(c) and both DPR 523 A and Building, Structure, Object (DPR 523 B) forms have been prepared for each resource. Copies of the DPR 523A and DPR 523B forms for these properties are in Appendix C.

The following is a list of properties that have been determined ineligible for the NRHP as a result of this undertaking. None of these properties were determined eligible for the NRHP under Criteria A, B, C, and/or D. Copies of the DPR 523A forms for these properties are in Appendix C.

- South Broadway: 205, 207, 233, 237, 248, 318, 341, 347, 353, 425, 445, 450, 523, 525, 535, 543, 621, 629, 725, 730, 735, 749, 900, 913, 950, 960, 1014, 1051, and 1053
- 1020 South Figueroa Street
- 1100 South Flower Street
- 1100 South Grand Avenue
- South Hill Street: 208, 222, 332, 338-348, 606, 607, 628, 645, 734, 901, and 1101–1111
- 655 South Hope Street
- South Olive Street: 643, 1057, and 1060
- 316 West 2nd Street
- 315 West 6th Street
- West 7th Street: 219, 316, 410–418 (3 parcels, 1 building; 410, 412, 418), and 801
- West 8th Street: 313 and 317
- 425 West 11th Street
- Spanish-American War Memorial

This page intentionally left blank.

Proposed Project and Potential Effects

The following section addresses the proposed Project and its potential effects on historical resources.

Project components include the construction of guideway and trackwork, paving, streetcar platforms, relocation of parallel utilities in conflict with the trackway, encase utilities crossing under the trackway, construction of track drains, and an MSF. It would also include installation of specialty system work such as TPSS, overhead contact wire, communications, and train/traffic signaling.

A temporary laydown area for construction would be located in the vicinity of the project study area. Three alternative sites have been identified preliminarily.

City of Los Angeles Significance Thresholds

A project would normally have a significance impact on historical resources if it would result in a substantial adverse change in the significance of a historical resource. A substantial adverse change in significance occurs if the project involves:

- Demolition of a significant resource;
- Relocation that does not maintain the integrity and significance of a significant resource;
- Conversation, rehabilitation, or alteration of a significant resource that does not conform to the Secretary of the Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings; or
- Construction that reduces the integrity or significance of important resources on the site or in the vicinity.

Overall Assessment

Traction Power Substations and Overhead Contact System

The proposed TPSS would typically be located outside of street rights-of-way. None are proposed at locations where there are historical resources. Within the Broadway Theatre and Commercial District, TPSS would be located in non-contributing parking lots or within non-contributing or non-historic parking garages. None of the TPSS sites would be located on or in the immediate vicinity of either the Dorothy Chandler Pavilion or the Walt Disney Concert Hall, two buildings that did not have these types of structures as part of their historic setting.

TPSS construction at any of the 12 potential sites would not cause substantial adverse change in the significance of a historical resource. TPSS will be built with Sustainability elements and be designed to be consistent with the area's historic fabric. See Table 5 for the proposed locations of the TPSS sites.

As stated earlier, streetcars operated along the streets in the study area historically, and a system of poles and overhead wires existed for many decades, including during the period of significance for many of the NRHP-listed and eligible properties previously identified or identified during the intensive survey. Overhead cables were part of the historic setting. The integrity of the setting or the character of the properties would not be altered in such a manner as to diminish the relationship of those properties to their historic setting. Overhead cables would be installed to enhance and replicate the character of the historic district. The visual impacts analysis did not identify the OCS as a potentially adverse visual impact to the settings of any historic property. The specific locations of the poles have not been identified, but poles would be located within several feet of the existing curb. No poles would be installed where there is historic terrazzo in the Broadway Theater and Commercial District. The catenary poles and catenary wires would not cause a substantial adverse change in the significance of a historical resource because wires and poles were a part of the historic setting, and therefore, the integrity of the setting would not be altered. No HCM would be demolished, substantially altered, or relocated.

Table 5. Traction Power Substation Locations

Priority for Location	Address	Assessor's Identification Number (AIN)	Parcel Square Footage	Acquisition Type	Description
Recommended	Within public ROW Grand Ave and 2nd Street	--	--	--	This recommended site is at the north end of lower Grand Avenue. Large areas are available where a TPSS could be placed without interfering with loading docks or parking structure entrances.
Alternative	Northeast Corner of Grand Avenue and 2nd Street	5149-010-949	192,480	Partial	TPSS would be below street elevation and hidden behind an existing landscaped fence.
Recommended	208 S Broadway	5149-008-030	8,540	Partial	The Regional Connector lot is currently being designed to accommodate the Regional Connector Station. The opportunity to include the TPSS on the lot should be assessed with Metro and property owner to determine feasibility and capacity.
Alternative	229 S Broadway	5149-009-014	18,960	Partial	The parking lot on the west side of Broadway has the possibility of serving both the Broadway and Hill Street alignments.
Alternative/ Temporary	213 S Spring St	5149-008-029	471,443	Partial	Parking structure.
Recommended	826 S Broadway	5144-016-062	8,179	Partial	The property is categorized as a privately owned parking lot and has a small structure, Two Boots Pizza, on the site. It is recommended to place the TPSS directly behind the pizza stand.

Priority for Location	Address	Assessor's Identification Number (AIN)	Parcel Square Footage	Acquisition Type	Description
Alternative	913 S Broadway	5139-003-003	7,661	Partial	The property is categorized as a privately owned parking lot and has a small structure, Tacos Mexican Food, on the site. It is recommended to place the TPSS unit directly behind the food stand to prevent the unit from being an obstruction.
Alternative	951 S Broadway	5139-003-009	4,766.10	Partial	Located on the northwest corner of Broadway and Olympic Boulevard, categorized as a privately owned parking lot.
Recommended	833 S Flower St	5144-021-041	180,458	Partial	Located within the rear area of a parking structure adjacent to the alley between Figueroa and Flower Street and 8th and 9th Streets.
Alternative	928 S Figueroa St	5138-002-029	8,325	Partial	On Figueroa Street, south of 9th Street, there is a small parking lot, which is recommended for a TPSS.
Recommended	431 S Hill St	5149-027-013	32,460	Partial	Located west of Hill Street between 4th and 5th Streets.
Alternative	628 S Hill St	5144-003-024	1,225	Partial	A privately owned small parking lot on the east side of Hill Street, south of 6th Street. There is a small jewelry store on the site. The TPSS would be built behind the store, which would prevent the unit from being an obstruction.

Maintenance and Storage Facility

Four locations have been proposed for the MSF. The proposed locations for the MSF are identified in Table 6. There are no historical resources in the immediate vicinity of the following MSF Sites: Broadway and 2nd Street, 11th and Olive Streets (East), and 11th and Olive Streets (West).

The Hill and 5th Streets MSF site includes seven parcels used for surface parking that surround two sides of the Title Guarantee and Trust Building, located at 401–411 West 5th Street (425–457 South Hill Street), which is listed in the NRHP. The period of significance for this building is 1930–1931 and the setting of the building has been altered since that time; historically, W. 5th Street to the west of the building contained numerous buildings. Currently, this building is surrounded on the west and north by surface parking lots. The east and south façade, the primary elevations that convey its significance under Criterion C as one of the two best examples of a commercial building designed in the Art Deco style in Los Angeles, face Hill and 5th Streets, respectively. The Title Guarantee and Trust Building was declared HCM #278.

On the north side of the Hill and 5th Streets MSF site is the Subway Terminal Building (417 Metro) at 415-425 S. Hill Street/416-424 S. Olive Street. This Italian Renaissance building is eligible for the NRHP under Criterion A for its association with the Pacific Electric interurban railway system and under Criterion C at the local level as an excellent example of the work of the architectural firm Schultze & Weaver. The period of significance is 1925–1955. The primary elevation faces east toward S. Hill Street. The south elevation, a secondary façade, faces the proposed MSF site. Previously, the old Hill Street Terminal, which was a Pacific Electric facility, was located at this location, and it was later occupied by a grocery store when the Subway Terminal opened. Although the setting of this building has been altered over time, it still conveys its significance under both Criterion A and Criterion C. The Subway Terminal Building was declared HCM #177.

The current setting for both buildings is urban and vehicle-related, and the parking lots abut secondary, and less significant, elevations. Although the proposed MSF site is now occupied by surface parking lots, historically there were streetcar related-structures and tracks, as well as other commercial buildings, on these parcels. The placement of an MSF site on these parcels would not change the character of the property's use and would not alter the setting such that it could no longer convey its historic significance. The Hill and 5th Streets MSF site would not demolish or materially alter in an adverse manner those physical characteristics of the Title Guarantee and Trust Building and the Subway Terminal Building that convey their historical significance and justify their inclusion, or eligibility for inclusion, in the CRHR; therefore, construction of a maintenance and storage facility would not cause substantial adverse change in the significance of a historical resource. Neither of these two HCMs would be demolished, substantially altered, or relocated.

Table 6. Potential MSF Locations

Potential MSF Locations	Address	Assessor's Identification Number (AIN)	Parcel Square Footage	Existing Use
Broadway and 2nd Street Total acreage: Approx. 57,719SF	233 S Broadway	5149-009-018	18,960	Unoccupied single-story commercial building (former Goodwill)
	229 S Broadway	5149-009-014	18,960	Surface parking lot
	236 S Hill St	5149-009-011	14,168	Surface parking lot
	240 S Hill St	5149-009-025	5,631	Surface parking lot
Hill Street and 5th Street Total acreage: 98,690SF	431 S Hill St	5149-027-013	32,460	Surface parking lot
	440 S Olive St	5149-028-003	9,900	Surface parking lot
	427 W 5th St	5149-028-012	29,040	Surface parking lot
	441 S Hill St	5149-028-013	11,130	Surface parking lot
	415 W 5th St	5149-028-011	4,760	Surface parking lot
	447 S Hill St	5149-028-009	5,040	Surface parking lot
	437 S Hill St	5149-028-004	6,360	Surface parking lot
11th Street and Olive Street (East) Total acreage: 51,197SF	1124 S Olive St	5139-019-011	10,138	Surface parking lot
	218 W 11th St	5139-019-015	4,759	Surface parking lot

Platforms/Streetcar Stops

Streetcar stops would be placed approximately every block in the north-south direction and approximately every other block in the east-west direction. Approximately 25 platforms would be located along the streetcar route.

As discussed in the Historic Architectural Survey and Evaluation Report and Finding of No Adverse Effect for the Broadway Streetscape Improvement Project (HRG 1998), the concrete sidewalks within the Broadway Theatre and Commercial District are not character-defining features; however, some terrazzo designs embedded in the sidewalks are character-defining features of the district. Other historic sidewalk features, including vault lights, basement vault hatch doors, flagpole holders, and utility and ventilation covers are also considered character-defining features of the Broadway Theater and Commercial District. Individually significant historical resources may include these historic sidewalk features, along with brass or ceramic inserts that are unique to that resource. There is also a possibility that historic sidewalk features may be discovered during construction because they have been obscured over time by a layer of asphalt or concrete. It is not anticipated that construction would damage historic terrazzo or other historic sidewalk features,; however, where construction of platforms and station stops would take place near historic sidewalk features, conditions would be required to protect and preserve the material in place during construction. These measures would reduce the potential for an adverse effect to the historic district. Should incidental damage occur during construction, the historic sidewalk feature would be replaced in kind by a qualified contractor in a manner consistent with the Standards.

Some platforms would be constructed adjacent to existing sidewalks, but within the road right-of-way, putting more distance between the platforms and historic properties. Therefore, construction of sidewalk extensions would not cause an adverse change in the significance of a historical resource. No HCM would be demolished, substantially altered, or relocated.

Findings

Within the study area, there are 10 properties listed in the NRHP and 43 properties that were previously determined eligible for listing on the NRHP. Two buildings, two objects, and two historic districts were identified as potentially eligible for the NRHP as a result of the field survey of the study area.

Vibration that could occur during the construction of the Project could have the potential to damage historical resources, as could construction activities near historic sidewalk features on Broadway. The Noise and Vibration Technical Report includes mitigation measures to avoid damage and potential adverse changes to historical resources due to vibration during construction. As with the conditions proposed for the location of a construction yard, conditions are proposed for construction activities near the historic sidewalk features, which would reduce the potential for substantial adverse change to historical resources.

Under the City of Los Angeles thresholds, there would be no substantial adverse change to historical resources. The Restoration of the Historic Streetcar Service Project in Downtown Los Angeles would not result in the conversion of or rehabilitation to CRHR-listed or eligible properties that would not conform to the Secretary of the Interior' Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings. No HCMs would be demolished, substantially altered, or relocated as a result of the Project.

Therefore, although the study area contains a total of 59 NRHP-listed and eligible properties, there is no adverse effect anticipated from the construction and operation of the Project in downtown Los Angeles.

1. EXECUTIVE SUMMARY

This report documents the noise and vibration study performed for the Restoration of Historic Streetcar Service in Downtown Los Angeles (Project). The study evaluates the potential noise and vibration impacts from construction and operation of the streetcar alignments under consideration.

1.1 Summary of Noise Impact Analysis

The streetcar noise impact analysis is based on the Federal Transit Administration (FTA) Guidance Manual (Ref. 1). The FTA noise assessment procedures include impact criteria for three types of land uses: Category 1 includes recording studios and concert halls; Category 2 includes residences, hotels and hospitals where people sleep; and Category 3 includes institutional land uses such as schools, libraries, theaters and churches. The construction noise evaluation is based on the City of Los Angeles (City) regulations (Ref. 2-5). Potential noise impacts were assessed for streetcar operations and construction. Key assumptions for the noise impact assessment are:

- Streetcar audible warnings: The noise impact analysis of the streetcar operations includes audible warning device (AWD) sounds at streetcar stops and stop lights but does not include warning horns. The warning horns would be used at operators' discretion to alert pedestrians and motor vehicle drivers of potential safety risks, which is the same way that horns are used on buses.

- The maximum speed for the streetcars would be 30 mph on Figueroa and 25 mph on the rest of the alignment. The speed would be 20 mph as streetcars approach stations and stops.

- The streetcar would operate up to every 7 minutes during the peak hours (6 AM to 9 AM and 3 PM to 6 PM), approximately 10 minutes between 9 AM and 3 PM, and approximately 15 minutes from 6 PM to 2:30 AM.

- The noise from the streetcar operations would be similar to what has been observed at modern streetcar systems in Portland, OR and Seattle, WA.

The results of the FTA noise analysis for Alternatives 2 and 3 (7th Street with and without the Grand Avenue Extension) and Alternatives 4 and 5 (9th Street with and without the Grand Avenue Extension) are shown in Table 1-1. Since a substantial portion of the Project alignment is common to all four build alternatives, the analysis is presented for the Project as a whole. Where differences pertain to specific locations (i.e., 7th Street, 9th Street, Grand Avenue) they are called out as such. The locations of the receivers are shown in Figure 1-1 through Figure 1-3. The key conclusions of the noise impact assessment are:

- **Operations, Disney Concert Hall.** Moderate noise impact is predicted outside the Disney Concert Hall (T2) associated with the Grand Avenue Extension (Alternatives 2 and 4). The higher noise levels are due to wheel impact at the frog of the turnout track (the track insert used where two rails cross) and the potential for squeal noise on the Grand Avenue/First Street. Use of a "low impact" frog such as a well-designed flange-bearing frog would minimize the wheel impact noise. Use of one of several rail lubricants is usually sufficient to control wheel squeal. However because of the steep grade of the track there is concern with the use of a lubricant at this location. If wheel squeal occurs at this location during pre-revenue service, it would be addressed by the use of wheel dampers that would control the wheel squeal without using a lubricant. A wheel damper consists of metal plates that are attached to the outside of the streetcar wheel that are designed to change the natural frequency of the wheel to reduce wheel squeal.

Source: ATS Consulting, January 2016.

Notes:

(a) See Figure 1-1, Figure 1-2, and Figure 1-3 and Appendix F for the receiver locations.
(b) Represents the number of residential units (Category 2 land uses) where impact is predicted.
(c) The amount that predicted noise levels exceed the FTA moderate impact thresholds. At receiver R33 the predicted noise level is the same as the FTA threshold which is considered by FTA as an impact.
(d) Mitigation Option 1 is the use of a "low impact" frog at the nearest turnout.
Mitigation Option 2 is a combination of wheel damper and optimization of profiles to minimize wheel squeal.
Mitigation Option 3 is the use of wheel lubrication at tight radius track within the MSF yards.
Mitigation Option 4 is the use of "low impact" frogs at all turnouts within the MSF yards.
(e) Mitigation is not feasible at this receiver.

- **Operations, Residential and Hotel.** Moderate noise impacts are predicted at two multi-family residence (MFR) buildings (Site R23) on West 11th Street between Grand Avenue and Hope Street, which is associated with all four build alternatives and at the Kawada Hotel, which is also associated with all four build alternatives. Both MFR buildings are at least 10 stories in height. Only the residential units on the 5th floor and lower would be affected, which includes 24 residential units with balconies. At the Kawada Hotel (Site R35) the affected units would be 15 hotel rooms without balconies. These two apartment buildings and the Kawada Hotel are the only residential land uses (FTA Category 2) where potential for noise impact from streetcar operations were identified.

- **Operations, Court House.** Moderate noise impacts are predicted at the future Federal Courthouse to be located on 1st Street between Hill Street and Broadway, which is associated with all four build alternatives. The higher noise levels are due to potential for squeal noise on the Hill Street/First Street curve and the diamond crossing. As discussed below, mitigation is available to eliminate the potential noise impact to the Federal Courthouse.

- **Maintenance and Storage Facilities (MSF)**. Moderate impacts are predicted for the MSF sites at receiver I3, R22, and R33. The higher noise levels are due to wheel squeal and turnout frog impacts in the storage yards. Rail lubrication for the tight radius tracks within the rail yards and the use of "low impact" frogs at the yard turnouts would mitigate the impact to these receivers.

- **Traction Power Substations (TPSS).** There are no noise impacts predicted at the five TPSS sites. Noise measurements of the TPSS units would be conducted during pre-revenue service to confirm that noise impacts would not occur. If exceedance of the FTA noise thresholds, City of Los Angeles CEQA thresholds or the *Los Angeles Municipal Code* Sections 112.04 and 112.05 occurs mitigation would be provided before revenue service begins.

- The Project would comply with the *City of Los Angeles Municipal Code* Section 112.04, Powered Equipment Intended for Repetitive Use in Residential Areas and Other Machinery, Equipment, and Devices, and Section 112.05 112.05, Maximum Noise Level of Powered Equipment or Powered Hand Tools.

A predicted Project noise level in the severe noise impact range is considered significant for both *National Environmental Protection Act* (NEPA) and *California Environmental Quality Act* (CEQA), thereby requiring mitigation. Sensitive receivers that show FTA moderate impacts are not considered to be severely or significantly adversely impacted under NEPA and CEQA. When the predicted Project noise level is in the FTA moderate noise impact range, FTA allows more discretion for mitigation. For moderate noise impacts, FTA guidance is that mitigation measures should be considered and other factors need to be taken into account to determine the magnitude of the impact and the need for mitigation. The following measures are recommended to mitigate potential noise impacts at the Disney Hall and the Federal Courthouse:

1. **Disney Concert Hall (Receiver T2):** The predicted streetcar noise level outside Disney Concert Hall (T1) exceeds the FTA moderate noise impact threshold. The reasons for the noise impact is the potential for wheel impacts at the turnout trackwork on Grand Avenue and wheel squeal noise on the sharp radius curve at the Grand Avenue and First Street intersection. Wheel impacts at frogs can increase noise levels by up to 6 decibels at 50 feet from the turnout track and according to FTA wheel squeal noise can increase streetcar noise by 10 decibels at a distance of 100 feet from a curve. Use of a "low impact" frog such as a well-designed flange-bearing frog would minimize the wheel impact noise. Use of one of several rail lubricants is usually sufficient to control wheel squeal. However because of the steep grade of the track there is concern with the use of a lubricant at this location. If

wheel squeal occurs at this location during pre-revenue service, it would be addressed by the use of wheel dampers that would control the wheel squeal without using a lubricant.

2. **Federal Courthouse (Receiver I2A):** The predicted streetcar noise level outside the future Federal Courthouse (I2A) exceeds the FTA moderate noise impact threshold. Similar to Disney Concert Hall noise impacts, the impacts at the Federal Courthouse are due to the potential for squeal noise on the sharp curve at the Hill Street and First Street intersection and wheel impacts at the diamond crossing on 1st Street. Use of wheel dampers and the use of a “low impact” frog such as a well-designed flange-bearing frog would eliminate the FTA moderate noise impact at the courthouse.

No mitigation is recommended for the residential land receivers affected by the streetcar operations and the reasons are summarized below:

1. **Multi-Family Buildings on 11th Street between Grand and Hope (Residential Receiver R23):** *No noise mitigation is recommended for these two multi-family residential buildings* because:
   - The only outdoor areas of human activity exposed to streetcar noise would be the balconies of the residential units.
   - Mitigation measures such as sound walls at the edge of the trackwork are not feasible for this receiver because the sound walls would impede the flow of traffic.
   - Since this multi-family residence is sound insulated with double pane windows there is no other mitigation that would be feasible for this receiver.
2. **Kawada Hotel Receiver (Receiver R35)**: *No mitigation is recommended for the Kawada Hotel* for the same reasons as for Receiver R23:
   - There are no outdoor areas of frequent human activity exposed to streetcar noise.
   - Mitigation measures such as sound walls at the edge of the trackwork are not feasible for this receiver because the sound walls would impede the flow of traffic.
   - Since this hotel is sound insulated with double pane windows there is no other mitigation that would be feasible for this receiver.

1.2 Summary of Traffic Noise Analysis

The traffic circulation and the peak hour traffic volumes in the study area would change in the future with and without the Project. The details of the study area are discussed in Section 1. A negative change indicates a decrease in future traffic noise and a positive change indicates an increase in future traffic noise. The predicted change in peak hour traffic noise levels in 2040 compared to the existing levels in 2014/2015 for the Category 1 land uses in the AM peak hour are in the range of an increase of 0.7 dBA to

2.0 dBA. In the PM peak hour the increase is in the range of 0.7 dBA to an increase of 1.4 dBA. For Category 2 land uses in the AM peak hour is an increase in the range of 0.7 dBA to 1.9 dBA over the future 2040 Project traffic. In the PM peak hour the increase is 0.7 dBA to an increase of 1.8 dBA. The change in peak hour traffic noise levels in 2040 compared to the existing levels in 2014/2015 for the Category 3 land uses in both the AM and PM peak hour is an increase of 0.7 dBA to 1.4 dBA. The change in traffic noise is not considered a significant impact under CEQA because neither the future 2020 Year traffic nor the 2040 Year traffic results in a 3 dBA or more increase over the existing conditions. It is not a significant impact under NEPA because neither the future 2020 Year traffic nor the 2040 Year traffic results in a 3 dBA or more increase over the future No Build conditions.

1.3 Summary of Vibration Impact Analysis

The streetcar vibration impact analysis is based on the Federal Transit Administration (FTA) Guidance Manual (Ref. 1). Potential vibration impacts were assessed for streetcar operations and construction. Key points from the impact assessment are:

- The vibration that would be generated by the operation of the LA streetcar vehicle was assumed to be similar to what was observed for the modern streetcar systems in Portland, OR and Seattle, WA.
- The maximum speed for the streetcars was assumed to be 30 mph on Figueroa Street and 25 mph on the rest of the alignment. The speed would be 20 mph as it approaches stations and stops.
- The ground propagation characteristics used for the predictions are based on four vibration propagation tests conducted in the Project corridor. Three of the test sites were at theaters or concert halls. The fourth test site was performed at a parking lot on 9th Street.

The conclusions of the groundborne vibration impact assessment are:

- No groundborne vibration impacts are predicted at Category 1, 2 or 3 receivers.
- No groundborne noise or groundborne vibration impacts are predicted at buildings that FTA defines as "special". This includes the Disney Concert Hall, the Colburn School, and the historic theaters in the corridor.

Because of the number of underground structures in the Project area such as basements, loading docks, and parking garages, there is some potential for vibration to be transmitted efficiently into structures because of the close proximity of underground structures to the concrete slab for the streetcar track. Mitigation measures such as a resilient mat to break the direct connection may be required if there are locations where the track structure would be less than one foot from any part of a building foundation.

Further detailed review of potential vibration impacts is recommended for theaters on Broadway that are currently unoccupied if they are renovated and revived in the future. Depending upon the structure and the planned future use of the building, further modeling analyses or a site-specific vibration test may be required during Final Design to more accurately specify potential impacts.

1.4 Summary of CEQA Analysis

The traffic noise analysis for each of the Project alternatives (see Section 7.9 CEQA Noise and Vibration Impacts) was prepared for the following scenarios:

- Existing Year (2014/2015)
- Opening Year (2020)
- Horizon Year (2040)

1.4.1 Future Noise with and without the Streetcar Project

The Opening Year condition would include the existing projects and improvements committed to be implemented by the first year of operation, 2020. The 2040 Horizon Year would include projects and improvements committed to be implemented by 2040.

The noise levels due to the Project were added to the existing noise levels to determine the cumulative effect of the Project for the 2014/2015 Year. The Project noise levels for the assessment of the Category 1 land uses range from an Ldn of 58 to 61 dBA with the exception of Site T2, Disney Concert Hall where the Project noise level is 67 dBA due to the streetcar passby noise, noise squeal, and turnout impact noise. The Category 1 Project noise levels at Sites T1, and T3 through T8 are less than the existing traffic noise. At Site T2, Disney Concert Hall, the Project noise level is the same as the existing traffic noise.

The Project noise levels at the Category 2 land uses range from an Leq of 56 to 63 dBA which are less than the existing traffic noise. The Project noise levels at the Category 3 land uses range from an Leq of 56 to 63 dBA which are less than the existing traffic noise.

The Project noise levels were also added to the future traffic noise for the 2020 Opening Year and the 2040 Horizon Year. The increase in existing noise levels with the Project would be less than 3 dB at all the noise sensitive receivers with the exception of the following receivers:

T2 - Disney Concert Hall: Existing noise levels would increase in the range of 3.1 to 4.7 dBA.

T7 – Belasco Theater: Existing noise levels would increase in the range of 3.1 to 3.8 dBA.

T8 – Dorothy Chandler Pavilion: Existing noise levels would increase in the range of 3.0 to 3.1 dBA

R21 – Apartments at Broadway and 11th Street: Existing noise levels would increase by 3.0 dBA.

R23 – Apartments at Hope and 11th Streets: Existing noise levels would increase in the range of 3.1 to 3.8 dBA.

R24 - Metlofts: Existing noise levels would increase in the range of 3.2 to 3.8 dBA.

R35 – Kawada Hotel: Existing noise level would increase in the range of 3.0 to 3.1 dBA.

R36 – Apartments: Existing noise level would increase in the range of 3.0 to 3.6 dBA.

R37 – Skyline Apartments: Existing noise level would increase in the range of 3.0 to 3.5 dBA.

I1 – Mosk Courthouse: Existing noise level would increase in the range of 3.0 to 3.1 dBA.

I2A – Federal Court House: Existing noise level would increase in the range of 3.8 to 4.5 dBA.

I13 – Grand Hope Park: Existing noise levels would increase by 3.3 dBA.

I14 – Fashion Institute of Design and Merchandising (FIDM) School: Existing noise levels would increase by 3.3 dBA.

The exceedance of the existing noise levels at Receiver T2, Disney Concert Hall is due to the operation of the streetcar, specifically wheel squeal and impact noise from special trackwork. At Receiver T8, Dorothy Chandler Pavilion, the exceedance is due to wheel squeal. These impacts can be mitigated as discussed in Section 7.3.1. The exceedances of the existing noise levels at the other receivers is due to the projected increase in future traffic with the proposed Project. Traffic noise mitigation would not be feasible or reasonable at any of these receivers.

1.4.2 Traction Power Substation

The noise from the traction power substation (TPSS) units would not cause significant CEQA noise impacts at any of the sensitive receivers in the Project area.

1.5 Summary of Construction Noise and Vibration Impacts

The construction of the streetcar Project would be sequenced over several stages (Ref. 6). At the first stage of construction it may be necessary to prepare the site and relocate, modify, or protect in place all utilities and underground structures that would conflict or interfere with excavation for street level concrete pavement and trackwork. This would include several noisy activities including excavation, backfill of soil and reconstruction of pavement. Equipment typically used for utility relocation work includes diamond saws, pavement breakers, excavators, cranes, generators, rollers, compactors, dump trucks, concrete trucks, welding machines and other construction equipment.

Construction staging areas would be located on or near the work zone and would be used to store approximately 80 -foot long rail sticks. The primary activity would be to facilitate welding of the rail sticks into strings.

Track construction would involve demolition of the roadway sections being displaced by the guideway, preparation of the track bed, construction of the supporting track slab, laying of the rails, and installation of rebar and pouring of concrete. For special trackwork, welding would be an added step. Typical equipment employed in track construction include rubber-tired excavators, loaders, graders, bulldozers, concrete trucks, compactors and water trucks. Construction of station platform foundations, restoration of pavement, and reconstruction of any sidewalks and ramps would begin simultaneously or immediately following the track slab within each segment.

Construction of TPSS begins with each site cleared and graded. Underground utility connections would be dug and installed, followed by the grounding mat. The foundation would be poured once the utility connections were completed. The TPSS building would be delivered, mounted on the foundation, and connected to the incoming power supply conduits and outgoing feeder conduits.

The construction of the MSF generally follows the same sequencing as for the TPSS. The site would be cleared and graded, and underground utility connections would be installed. Following the underground work and site preparation, the pit and foundation would be installed. Structural walls and heavy industrial equipment such as shop cranes would be installed on the foundation. Once the structure is enclosed, the shop would be finished with mechanical and electrical equipment, plumbing, and furnishings. Construction of the storage area for streetcars entails placing tracks and turnouts, paving, installation of OCS poles and construction of security fencing and walls.

The installation of OCS generally follows the completion of track construction. Finishing for platforms usually overlaps with systems work and is completed prior to final testing and pre-revenue operations.

The use of this equipment during Project construction has the potential to result in substantial, yet temporary, increases in local noise levels along the Project alignments. The City of Los Angeles noise ordinance, Section 41.40(a) of the *Los Angeles Municipal Code,* normally allows construction only between 7 AM to 9 PM on any weekday, unless permission to operate during other hours is requested and approved. Construction noise levels depend on the number of pieces and type of equipment, their general condition, the amount of time each piece operates per day, the presence or lack of noise attenuating features such as walls, and the location of the construction activities relative to the sensitive receivers.

Nighttime construction activities may include but not be limited to the following:

- Concrete pouring which includes concrete trucks entering and leaving the work site.

- Field welding of track and special trackwork.
- Underground utility work in a trench.

These nighttime activities would require a variance to Section 41.40 of the *Los Angeles Municipal Code* for nighttime work scheduled after 9 PM and before 7 AM weekdays, after 6 PM and before 8 AM on Saturdays, and anytime on Sunday.

Some activities, such as compaction, pavement breaking, and the use of excavators, could result in perceptible levels of groundborne vibration. However, these activities would be limited in duration and the vibration levels are likely to be well below thresholds for minor cosmetic building damage. However, because the Project study area has numerous historic buildings that may be well over 100 years old, further analysis would be required to manage structural and architectural damage risk to these buildings. Potential for interference inside sensitive spaces at the “special” land uses from high-vibration construction activities would have to be addressed by the contractor.

1.5.1 Construction Noise Mitigation

The following best construction practices are recommended as noise mitigation measures to ensure that there are no significant impacts from construction activities:

- Minimize nighttime construction activities.
- Use specialty equipment with enclosed engines and/or high-performance mufflers.
- Locate equipment and staging areas as far from noise-sensitive receivers as practicable.
- Limit unnecessary idling of equipment.
- Install temporary noise barriers where site conditions permit. This approach can be particularly effective for stationary noise sources such as compressors and generators.
- Route construction related truck traffic away from residential buildings to the extent possible.
- Sequence the use of equipment such that the simultaneous use of the loudest pieces of equipment are avoided as much as practicable.
- Avoid the use of impact equipment and where possible, use non-impact equipment.
- If a noise variance from Section 41.40(a) of the *Los Angeles Municipal Code* is required the contractor should employ noise control measures subject to approval by the appropriate agency reviewing the variance request.
- Use portable noise control enclosures for welding in the construction staging area.

- The contractor should develop a detailed Noise Control Plan with specific measures to be employed to mitigate construction noise impacts. The Noise Control Plan should be submitted for review and approval to the Bureau of Engineering before the beginning of construction activities. Because many of the construction activities would be located in close proximity to noise sensitive receivers, staging the construction to minimize the amount of time that noise producing activities affect specific receivers may be an alternative to using quieter equipment that may extend the exposure to construction activities.

1.5.2 Construction Vibration Mitigation

Construction related vibration activities are unlikely to exceed the FTA impact thresholds for structural damage. However, the following vibration mitigation strategies are recommended to minimize the potential for damage to any structures in the corridor:

1. Pre-Construction Survey: The survey may include inspection of building foundations and taking photographs of pre-existing conditions. The survey can be limited to the first row of buildings along the selected alignment. The only exception is if an important and potentially fragile historic resource is located within approximately 200 feet of the construction zone, in which case it should be included in the survey.

2. Vibration Limits: As per the FTA Guidance Manual, the construction vibration shall be limited to the peak particle velocity (PPV) ranging from 0.12 in/sec for "buildings extremely susceptible to vibration damage" to 0.5 in/sec for "Reinforced-concrete, steel or timber" buildings. The contract specifications should establish appropriate damage risk vibration limits for each of the historic properties that are within 200 feet of the construction.

3. Vibration Monitoring: The contractor may be required to monitor vibration at any buildings where the lower vibration limit is applicable and at any location where complaints about vibration are received from building occupants. This shall include "special" land uses such as the Disney Concert Hall.

4. If the contractor's plan calls for high-vibration construction activities being performed close to structures, it may be necessary for the contractor to use alternative procedures that produce lower vibration levels. Examples of high-vibration construction activities include the use of pavement breakers, vibratory compaction, and hoe rams next to sensitive buildings. Alternative procedures would be to use non-vibratory compaction in limited areas and concrete saws in place of jackhammers or pavement breakers for demolition. To avoid potential interference to the "special" land uses from construction vibration, the contractor should be required to coordinate with the building owners to limit the high vibration activities to the duration of the day so as to avoid affecting sensitive activities inside the building. For example, the contractor may avoid the use of high-vibration equipment during a scheduled performance or recording at the Disney Concert Hall and at the Dorothy Chandler Pavilion.

2. PROJECT DESCRIPTION

2.1 Introduction

The Project consists of the construction and operation of streetcar service in downtown Los Angeles, California, along an up to 3.8-mile route. The Project alignment would begin at Hill and 1st Streets, run east along 1st Street, south along Broadway, west along 11th Street, north along Figueroa Street, east along 7th Street or 9th Street, and north along Hill Street, back to its beginning at 1st Street. Potential inclusion of a Grand Avenue Extension would also provide a two-way alignment spur west along 1st Street, beginning at Hill Street, and continuing south along Grand Avenue to a stop north of 2nd Street. The Project route would cover an area composed primarily of commercial land uses with a mix of residential, public, and entertainment land uses. The Project would link several neighborhoods or districts within the Central City Community Plan Area of the City of Los Angeles: Civic Center, Bunker Hill, Historic Core, Jewelry District, Financial Core, South Park, Fashion District, and LA Live/Convention Center.

Figure 2-1 depicts the regional location of the Project. Figure 2-2 shows the Project's routing within Downtown Los Angeles.

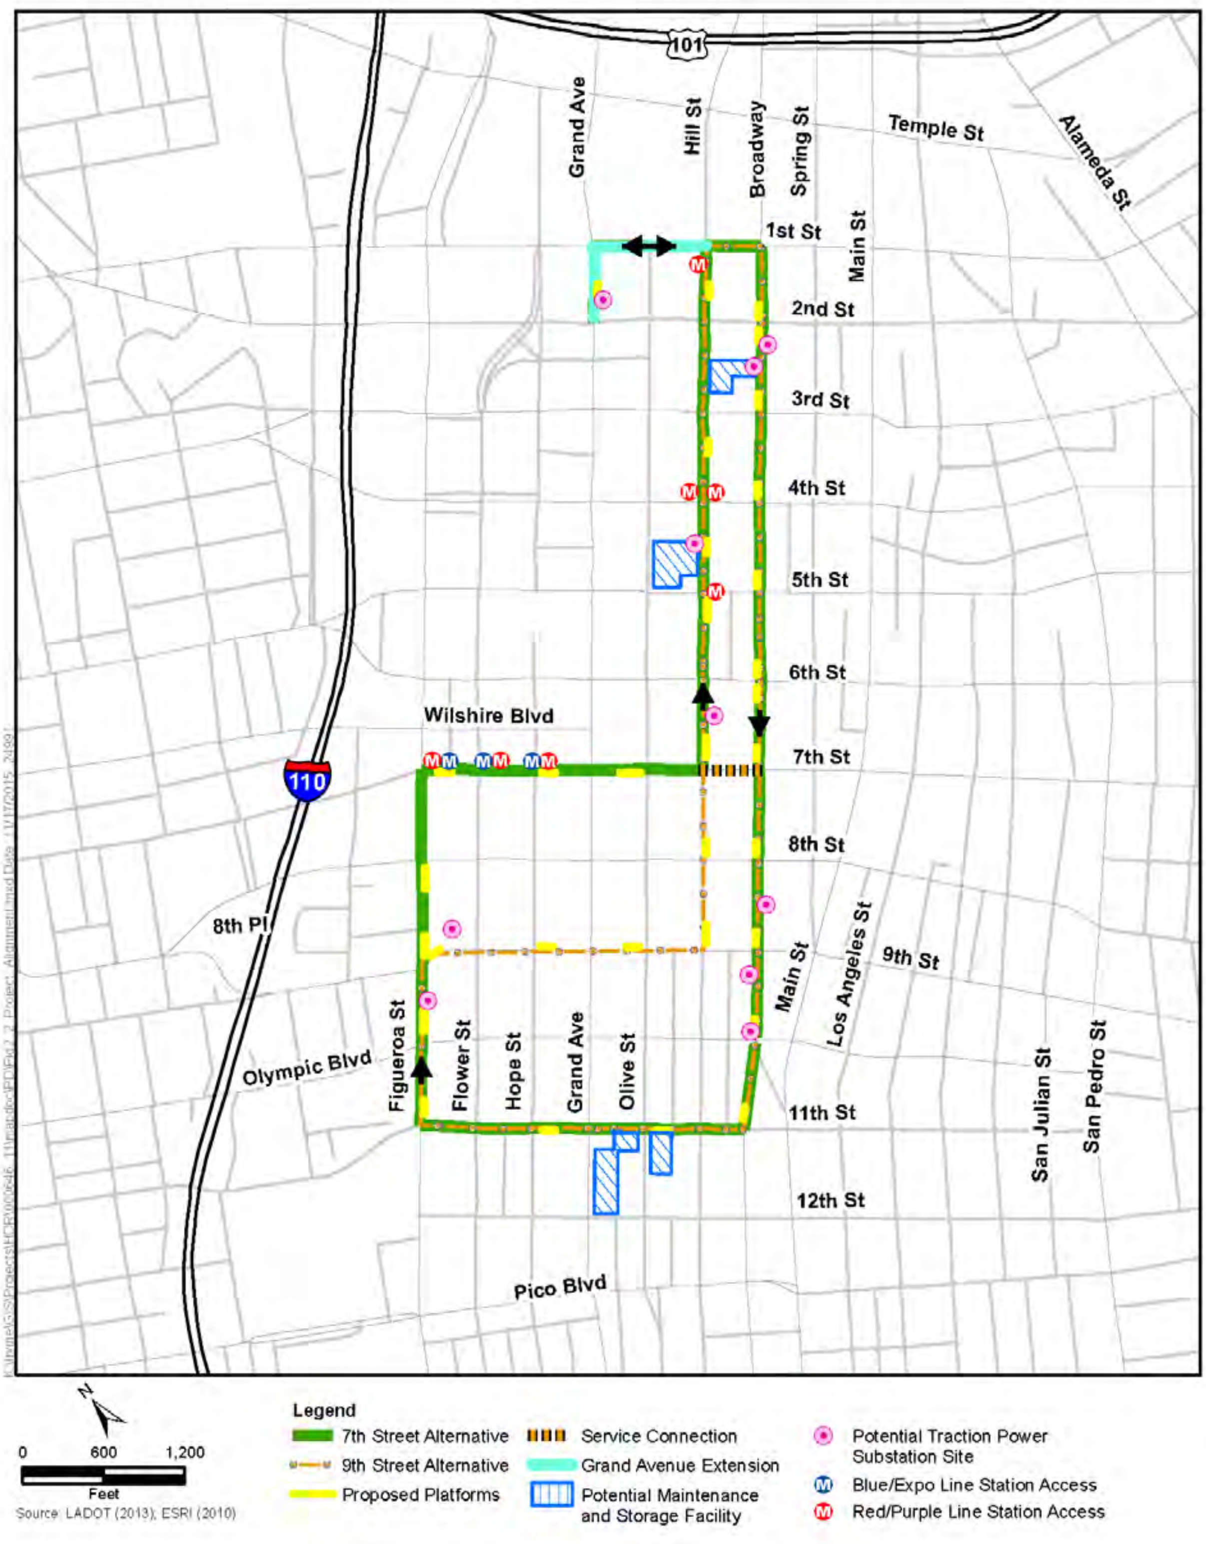
Figure 2-2: Proposed Downtown Los Angeles Streetcar Route



The track and roadway configuration would allow for a mixed flow of vehicles and a fleet of electrically powered streetcars. Power to the streetcar vehicles would be provided by approximately five traction power substations (TPSSs) and an overhead contact system (OCS), with the potential for wireless service for one or more sections of the route. A maintenance and storage facility (MSF) site would also be constructed as part of the Project.

2.2 Project Alternatives

Five Project alternatives are being considered; these include four build alternatives for the proposed Project and a No Project Alternative.

2.2.1 Alternative 1 – No Project Alternative

The No Project Alternative, which is required by Section 15126.6(e) of the State CEQA Guidelines, represents conditions in the Project study area that would remain if the proposed Project would not occur.

2.2.2 Alternative 2 – 7th Street with Grand Avenue Extension

The 7th Street with Grand Avenue Extension Alternative would construct and implement streetcar service along an alignment that would begin on Grand Avenue north of 2nd Street adjacent to the Disney Concert Hall, then continue northward until turning east on 1st Street. From 1st Street, the streetcar would turn south on Broadway, traveling to 11th Street where it would turn west and continue on to Figueroa Street. The streetcar would then turn north on Figueroa Street and travel to 7th Street, where it would turn east. From 7th Street, the streetcar would turn north on Hill Street, then continue back to 1st Street, completing the circuit by turning west on 1st Street to return to the streetcar stop on Grand Avenue.

2.2.3 Alternative 3 – 7th Street without Grand Avenue Extension

Alternative 3 would follow the same alignment as Alternative 2, with the exception that the Grand Avenue Extension would not be incorporated. Therefore, Hill and 1st Streets would be the terminal point, rather than Grand Avenue north of 2nd Street.

2.2.4 Alternative 4 – 9th Street with Grand Avenue Extension

The 9th Street with Grand Avenue Extension Alternative would follow the same alignment as the 7th Street with Grand Avenue Extension Alternative, but it would run eastbound on 9th Street between Figueroa Street and Hill Street, rather than 7th Street, and the Project alignment would still begin and terminate on Grand Avenue, north of 2nd Street.

2.2.5 Alternative 5 – 9th Street without Grand Avenue Extension

Alternative 5 would follow the same alignment as Alternative 4, with the exception that the Grand Avenue Extension would not be incorporated. Therefore, Hill and 1st Streets would be the terminal point, rather than Grand Avenue north of 2nd Street.

2.3 Elements of the Streetcar Alternatives

A brief overview of the elements common to all build alternatives of the Project is presented below.

2.3.1 Vehicles

The Project's operating plan calls for 7-minute headways (i.e., time spacing between vehicles) during peak periods. A fleet of six electrically powered streetcars is currently estimated to be needed to operate on the system. An estimated two additional streetcars would serve as backup vehicles to the operating fleet, for a total estimated fleet size of eight vehicles. Each vehicle would measure approximately 80 feet long and be approximately 13 feet high. The streetcars would be articulated to make tight turns and have a capacity of approximately 100 passengers. The streetcars would be similar to the modern streetcar models that are currently used in other cities in the United States. Examples of similar streetcars can be found in Portland, Oregon; both Tacoma and Seattle, Washington; Tucson, Arizona; Dallas, Texas; Atlanta, Georgia; and Charlotte, North Carolina. The streetcars would be designed with low floors to be compliant with the *Americans with Disabilities Act* (ADA). Operating speeds would be at the maximum posted downtown speed limit, which is currently 25 mph on all streets other than Figueroa Street, between 5th Street and Pico Boulevard, where it is 30 mph. Power for the streetcars would be transmitted by overhead catenary wires supported by poles along the streetcar tracks, or power delivery may be wireless in some segments.

2.3.2 Platforms

The streetcars would make stops at approximately 25 platforms along the alignment; the number of platforms is subject to change based upon further design of the Project. With varying configurations, the platforms would generally consist of a raised concrete pad approximately 8 feet wide by 70 feet long. Some of the streetcar platforms would be shared by buses operated by Metro, LADOT DASH, and other regional operators. Shared platforms would generally be approximately 120 feet long, though physical constraints on some street segments could limit them to shorter lengths. The maximum curb height would be approximately 8 to 14 inches. Platforms could be located either in the center of the roadway or adjacent to the sidewalk, along the curb. Platforms would transition from the sidewalk to match or nearly match the floor height of the streetcar vehicles. Platforms would be designed and constructed to connect to the sidewalk in a way that meets ADA and building access requirements.

2.4 Support Facilities

2.4.1 Overhead Contact System

There are two potential configurations for the OCS contact wires, which would supply electrical power to the streetcar vehicles. One configuration would be to support the contact wire with a span wire between two poles located on either side of the street, perpendicular to the streetcar track. Another configuration would support the contact wire from cantilever arms connected to single poles. Configurations would be site-specific and be made based upon engineering design. Either of these configurations could use decorative poles chosen to be consistent with the streetscape along the Project alignment. It is possible that poles used for delivering streetcar power could also be integrated with other streetscape infrastructure such as street lighting, traffic signals, or traffic signs. OCS suspension at corner turning locations (e.g., Hill/1st Streets, 1st Street/ Broadway, Broadway/11th Street, 11th/Figueroa Streets, Figueroa/9th or /7th Streets, 9th/ or 7th/Hill Streets) would be more specialized and tailored to each location, possibly requiring a combination of wire-mounting configurations. OCS poles would be approximately 25 to 30 feet tall and would be typically installed at intervals of about 80 to 120 feet, with added poles at turns. Wire heights above the tracks would typically range between approximately 18 and 19 feet in the public right-of-way.

2.4.2 Traction Power Substations

The streetcars would be powered by an estimated five TPSS units spaced relatively evenly throughout the alignment to provide Direct Current (DC) power for the streetcars; the final number and placement will be determined by further Project design. Each unit would be a durable structure containing electrical and electronic equipment. Based on typically-sized equipment used in other cities, the TPSS units would most likely measure approximately 17 feet long by 11 feet wide by 11 feet high, although these dimensions could vary. The footprint needed for the TPSS installations could be up to approximately 250 square feet. The substations, typically rated at 350 kilowatts, would convert 480-volt commercial Alternating Current [AC] power to 750-volt DC power for the streetcars.

Each TPSS would typically be placed in an off-street location, such as a parking lot or other suitable site. At one location, 2nd Street and Grand Avenue, the currently recommended potential TPSS site may need to occupy space in the public right-of-way. A number of potential TPSS locations and alternate sites are being evaluated in the event that primary sites are found to be infeasible.

2.4.3 Maintenance and Storage Facility

The Project would require an MSF to provide a location for secure storage of streetcar vehicles when they are not in operation, and regular light maintenance of the vehicles to keep them clean and in good operating condition.

Four sites are currently being considered as a potential location for the MSF: (1) the southwest corner of 11th and Olive Streets; (2) the southeast corner of 11th and Olive Streets; (3) the northwest corner of Hill and 5th Streets; or (4) the west side of Broadway between 2nd and 3rd Streets. All four candidate sites are currently being used as parking lots. The MSF would consist of an enclosed building and an outdoor area where routine inspections, maintenance work, and light repairs could be performed. The facility would have sufficient storage capacity to handle the needs of the streetcar system, with paved maintenance aisles, a pit track, overhead crane, paved truck access, staff offices, parts storage areas, and a machine shop. An employee parking area may also be provided. A maintenance building for a system of the size of the Project would generally be 12,000 to 18,000 square feet, approximately two to three stories tall, contain tracks inside a garage enclosure for maintenance of the vehicles, and be constructed to comply with the City's Green Building Code and also meet minimum Leadership in Energy & Environmental Design (LEED) certification requirements. Acquisition of private property for the MSF site would be required. Streetcars would gain access to the facility from a short segment of track that would be connected to the mainline. A storage area outside of the maintenance facility would provide an area for overnight cleaning (i.e., wash facility with clarifier) and storing of streetcar vehicles.

2.4.4 Signaling

Streetcar movement would be governed by "line-of-sight" operations, with passage through intersections controlled by traffic signals. "Line-of-sight" operations means that streetcars would be controlled by an operator who would proceed when traffic signals and traffic allow, and who would stop for traffic signals, station stops, pedestrians, bicycles, and other vehicles. A separate signal head may be provided at intersections for streetcar control. The streetcar control signal would be interconnected with the traffic signals and would clearly indicate to the streetcar operator when it is clear for the streetcar to move or required to stop.

Transit signals (i.e., special signals separated from the general purpose signal system) would be necessary where the streetcar would require a special traffic signal phase to maneuver so as to avoid conflicts with general traffic. These signals are also required at locations where a track switch is used by the streetcar operator to choose between different paths. Most of the route for the proposed Project would not have separate transit signals. Where they are needed, operation of transit signals would be separated from the normal traffic signals in order to not confuse the general public.

2.4.5 Potential Layover Locations

Locations on the streetcar route are needed to provide space for a streetcar to layover out of traffic, to allow dispatch according to a regular schedule, or to provide space for a streetcar to be temporarily taken out of service. In addition, these locations would allow the streetcar operator to take a short break. For the route currently proposed, two such locations would be desirable.

Under the Grand Avenue Extension (Alternatives 2 and 4), at the stop on Grand Avenue north of 2nd Street, a single track in an exclusive median is currently proposed. This configuration would allow the streetcars to complete their round trip and layover out of traffic for several minutes until the next scheduled departure. The streetcar vehicles would have operator cabs on both ends of the cars so that they would be able to operate in either direction of travel.

In addition to the Grand Avenue location, four other locations have currently been identified as potential second layover sites. Should Alternative 3 or 5 be ultimately selected, two of these locations may be needed. At each of these locations, a short section of parallel track would need to be provided to allow space for the streetcar to move off the main line while the layover is taking place. These sites include (a) Broadway, near-side at 2nd Street; (b) Broadway, far-side at 2nd Street; (c) Broadway, mid-block between 2nd and 3rd Streets; and (d) 11th Street, near-side at Hill Street.

All of the above currently considered layover locations are being evaluated as part of further design advancement of the Project, and are therefore subject to change with regard to location and/or track layout.

2.5 Construction Activities

Construction activities associated with the Project may affect portions of Grand Avenue, 1st Street, Broadway, 11th Street, Figueroa Street, 7th Street or 9th Street, and Hill Street, depending on the Alternative selected, as well as the selected MSF and TPSS sites. Construction activities would include: (a) pavement removal, (b) utility relocation, (c) excavation, (d) construction of track drains, (e) installation of concrete track slab and rails, (f) construction of station platforms, (g) installation of special track work units, (h) reconstruction of ramps and sidewalks, (i) paving, and (j) striping. Other activities would include installation of specialty system work, such as traction power, overhead contact wire, communications systems, train/traffic signaling, and OCS pole foundations.

Laydown and storage area(s) for construction would be established near the Project alignment and would be used for storage of equipment and materials. The laydown and storage area(s) could be located within the right-of-way, in parking lots, or on vacant land, and would be used to store equipment and materials. Four potential laydown and storage areas have currently been identified for evaluation: (1) the southeast corner of 3rd Street and Main Street; (2) northeast corner of 3rd Street and Spring Street; (3) 243 S. Spring Street; and (4) Grand Avenue to Olive Street, between 8th and 9th Streets. These should be regarded as example sites; other locations within the study area may become available and could also be chosen. All four example locations are currently being used as parking lots adjoining City streets within one block of the Project alignment.

Project construction activities would typically take place on weekdays between 7 a.m. and 9 p.m., in accordance with *Los Angeles Municipal Code* (LAMC) 41.40(a). To expedite construction, certain construction activities may be permitted to occur during nighttime, weekend, and holiday periods with the approval of the Board of Police Commissioners pursuant to LAMC Section 41.40(j). In addition, construction within City roadways may occur during peak periods (i.e., 6 a.m. to 9 a.m. and 3:30 p.m. to 7 p.m.) in accordance with Mayor's Executive Directive No. 2 and Bureau of Engineering Special Order No. 001-0406, which provide an exemption to the rush hour roadway construction prohibition for major public works projects having traffic mitigation plans. Construction activities will be required to follow the City Planning Department's new policy (in effect June 2015) to maintain safe adjacent pedestrian access at all times during construction.

The analysis in this document assumes that, unless otherwise stated, the Project would be designed, constructed, and operated following all applicable laws, regulations, ordinances, and formally adopted City standards, including but not limited to the LAMC; LADOT design standards and special provisions; *California Manual on Uniform Traffic Control Devices;* and all City bureaus' design manuals, special provisions, and standard plans, including the latest *Standard Specification for Public Works Construction* (SSPWC or Greenbook); the City of Los Angeles Department of Public Works, Bureau of Engineering

(LABOE) Brown Book; the *Work Area Traffic Control Handbook*; and any Federal Transit Agency (FTA) requirements.

3. NOISE AND VIBRATION ASSESSMENT METHODOLOGY

3.1 Noise Assessment Approach

The basic approach used to identify potential noise impacts is:

1. **Identify sensitive receivers**. Noise-sensitive land uses along the corridor were identified first using aerial photography followed by field visits to confirm land uses and the presence of any features, such as intervening structures, that may provide acoustic shielding. Sensitive receivers were grouped based on their land use and location relative to the tracks.

2. **Determine existing conditions**. As discussed in Section 5, existing noise levels were measured along the Project corridor at 15 sites. The measurements are important because the FTA noise impact thresholds are on a sliding scale that is a function of existing noise levels (Ref. 1). The FTA noise and vibration impact criteria applicable to streetcar operations are summarized in Section 1.

3. **Develop prediction models**. The noise prediction models use standard formulas to characterize noise from rail transit vehicles and measurements of noise at existing streetcar and light rail systems. The prediction models incorporate the forecasted future number of streetcar operations per day, the distribution of these operations throughout the daytime, and nighttime, the distance from the tracks, the streetcar speed, and the presence of walls, berms, or structures that provide acoustic shielding for the receivers. The predictions of noise from streetcar operations include the additional noise from the use of the streetcar audible warning devices to alert passengers and patrons in stations that a streetcar is approaching. Audible warning devices are used at streetcar stops and stoplights. Audible warning devices would be used at the operators' discretion to alert pedestrians and motor vehicle drivers to potential safety risks, the same way that horns are used on buses. It was assumed that the audible warning device would have a noise level of 80 dBA at a distance of 50 feet,[1] which is a similar noise level as a bus horn. It was conservatively assumed that the audible warning device would be sounded at every stop, and at approximately half of the intersection crossings.

4. **Estimate future noise exposure at the representative receivers**. The prediction models were used to estimate future streetcar noise for each sensitive receiver. Predictions for each receiver are based on the distance from the proposed Project to the closest sensitive receiver and the expected streetcar and traffic parameters. The predicted levels of noise from streetcar operations and vehicular traffic were compared to the applicable FTA impact thresholds to identify potential noise impacts (see

---

[1] The California Public Utilities Commission General Order 143-B, Section 3.04, requires that each streetcar vehicle be equipped with an audible warning device capable of producing a warning of at least 75 dBA at a distance of 100 feet from the vehicle. Section 7.09 requires the audible warning device to be sounded at locations identified in the system's operating rules, or when the operator believes it is necessary.

Section 1). It is noteworthy that the City CEQA noise thresholds for railroad noise are also based on the FTA criteria.

5. **Evaluate mitigation options**. Mitigation options were evaluated for all locations where the predicted noise levels exceed the applicable FTA threshold for moderate or severe noise impact (see Section 7.6).

3.2 Vibration Assessment Approach

The approach for the vibration assessment was basically the same as for the noise assessment. The primary differences are:

- The propagation of vibration through the ground must be based on measurements while the propagation of noise through air can be characterized using standard formulas.
- Existing vibration is not a consideration when assessing vibration impacts. This is because everyone is exposed to some audible environmental noise while it is relatively rare for people to be exposed to perceptible groundborne vibration unless they are located near a construction site or near roadways with potholes, wide expansion joints, or other irregularities in the roadway surface.
- Outdoor spaces are not considered sensitive to groundborne vibration. In contrast, outdoor spaces where quiet is important for their intended function are considered noise sensitive. This includes spaces intended for meditation or study associated with cemeteries, monuments, or historical spaces.

3.3 Sources of Streetcar Noise

Following is an overview of the primary noise sources that may be associated with construction and operation of new streetcar systems:

Streetcar Operations: This is the normal noise from streetcars operating on city streets. At higher speeds the operational noise is dominated by the noise from steel wheels rolling on the steel rails (wheel/rail noise). At lower speeds, both the wheel/rail noise and the noise from the vehicle traction motors and the auxiliary equipment on the vehicle (e.g. air conditioning, compressors, and motor controllers) are important factors in the overall operational noise levels. The levels of wheel/rail noise are strongly dependent on the condition of the operating surfaces of the wheels and the rails. An important assumption in the noise assessment is that the wheels and rails would be maintained in good condition through periodic truing of the wheels and grinding of the rails. Therefore, a maintenance program to maintain the rails and wheels in good condition would be implemented as part of the Project.

Traffic Noise: Sometimes the introduction of a new rail transit system would result in substantial changes in traffic patterns and volumes. For example, traffic may be shifted from the streetcar route to parallel roads, which would reduce levels of traffic noise along the streetcar route but increase noise levels along the parallel routes. Existing noise levels in the Project corridor are dominated by noise generated by traffic. Based on the traffic studies, the proposed Project would result in only minor changes in traffic patterns in the Project area (ref. 8). As a result, the Project is anticipated to change the levels of traffic noise by less than 3 dB at any sensitive receiver. A change in traffic noise greater than 3 dB is necessary before the change is considered significant by CEQA.

Audible Warnings: The streetcars would be equipped with an audible warning device. The primary purpose of the audible warning device is to alert pedestrians and patrons at streetcar stops that a streetcar is approaching. The audible warning devices are expected to be used on a regular basis as streetcars approach, stop to load or unload patrons, and when starting from stoplights to signal that the streetcar is moving. In other locations audible warnings would be used occasionally to alert pedestrians and motor vehicle drivers of a potential safety risk, which is the same way that horns are used on buses.

Special Trackwork: The streetcar alignment would be constructed of continuously welded track, which eliminates the "clickety-clack" noise associated with older rail systems. The one exception is the special trackwork for turnouts and crossovers where two rails must cross. A fixture called a "frog" is used where rails must cross. The wheel impacts at the gaps in the rails of a standard frog cause noise levels near special trackwork to increase by approximately 6 dB. It is common for streetcar systems to use "flange-bearing" frogs. That is, there are ramps before and after the gap where the load is transferred from the wheel tread to the wheel flange. The ramps on typical streetcar flange-bearing frogs are short enough that the load transfer is quite abrupt and generates substantial noise.

The additional noise generated by the frogs can be reduced by increasing the length of the ramp so that the load transfer is more gradual. A "well-designed" flange-bearing frog with a ramp angle of at least 1:20 and preferably 1:100 would minimize and may eliminate the 6 dB increase in noise caused by the rapid load transfer.

Wheel Squeal: Wheel squeal may be generated when steel-wheel transit vehicles including streetcars traverse tight radius curves. It is very difficult to predict when and where wheel squeal would occur. A general guideline is that there is the potential for wheel squeal at any curve with a radius that is less than approximately 400 feet.

Sensitive receivers that are located within 150 feet of these curves could be affected by wheel squeal noise. Common approaches to controlling wheel squeal include (1) using resilient wheels with wheel dampers, (2) applying a friction modifier to the railhead and/or the wheel tread, (3) applying lubricant to the gauge face of the rail or the wheel flange, and (4) optimizing the wheel and rail profiles. Maintaining the tracks would help control wheel squeal; also, periodically truing wheels would maintain an optimum profile and can help minimize wheel squeal. It is expected that either on-vehicle or wayside applicators of lubricant or friction modifier would fully control wheel squeal.

Ancillary Equipment: Ancillary equipment is defined as the wayside equipment needed to support the proposed streetcar transit system. The only ancillary equipment likely to generate noticeable noise is the traction power substation (TPSS) units, although modern TPSS units are relatively quiet. Five TPSS units are planned for this Project. The key guidelines to avoid impacts from TPSS units are:

1. Include noise limits in the specifications when purchasing the TPSS units,
2. Locate TPSS units at least 50 feet from sensitive receivers,
3. Direct cooling fans installed on the TPSS units aimed away from the receivers, and
4. Use of sound walls or partial enclosures.

Construction: All the sources discussed above are associated with the operation of the proposed Project. Although construction of a streetcar project entails relatively limited use of heavy equipment compared to other rail projects, construction activities nevertheless would generate relatively high noise levels. Measures recommended for mitigating construction noise impacts include: (1) require all construction to be in compliance with City of Los Angeles limits and that variances be obtained for nighttime construction, (2) require use of specialty equipment with enclosed engines and high-performance mufflers, (3) install temporary barriers, and (4) locate equipment and staging areas as far from noise-sensitive receivers as possible. In addition, the contractor would be required to develop and implement a Noise Control Plan to mitigate potential construction noise impacts at the sensitive receivers.

3.4 Sources of Streetcar Vibration

Both the construction and operation of a modern streetcar system would generate vibration that is transmitted through the ground and into nearby buildings. It is very rare for the vibration to be high enough for there to be any risk of even minor cosmetic damage to fragile structures. However, it is possible for construction vibration to approach risk thresholds for minor cosmetic damage, and both construction and streetcar operations have the potential to generate vibration that may be intrusive to building occupants. Following is a list of vibration sources associated with the proposed streetcar system.

Streetcar Operations: Streetcar operations create groundborne vibration that can be intrusive to occupants of buildings that are located close to the tracks. This is particularly important for residential land uses that are located within 40 feet of streetcars operating at speeds exceeding 25 mph.

Special Trackwork: Wheel impacts at special trackwork such as turnouts and crossovers can increase vibration levels by approximately 10 dB unless special fixtures are used that minimize the magnitude of the wheel impacts.

Construction: Construction of a streetcar project entails relatively limited use of heavy equipment compared to other rail projects. Nevertheless, construction activities including demolition, excavation, and soil compaction can generate relatively high vibration levels. Measures that would be required by the

City to control construction-related vibration are: (1) a pre-construction survey of important and potentially fragile historic resources in the Project area, (2) construction vibration limits for all buildings in the corridor, (3) vibration monitoring at buildings that require lower vibration limits such as fragile historic buildings that are located within 200 feet of heavy construction activities and at any locations where there are complaints about construction vibration, and (4) use of alternate construction procedures to minimize vibration.

4. REGULATORY FRAMEWORK

The noise and vibration impact criteria for use on federally financed transit projects are defined in the FTA manual *Transit Noise and Vibration Impact Assessment* (Ref. 1), which is commonly referred to as the FTA Guidance Manual. The FTA guidelines, analysis methods, and criteria reflect the best available research on the topic. The State of California uses the FTA impact criteria to determine acceptable levels of noise and groundborne vibration (Ref. 2). As part of the *California Environmental Quality Act* (CEQA) the City of Los Angeles has established impact threshold of significance for all non-streetcar noise sources such as changes in traffic noise with the proposed Project compared to without the proposed Project. The City of Los Angeles Noise Ordinance limits the hours of construction. These limits apply to the construction of the proposed Project. There are no City of Los Angeles vibration regulations that are applicable to the proposed Project. The details of all the applicable noise and vibration regulations for the proposed Project are discussed below.

4.1 FTA Noise Impact Criteria

Table 4-1 lists the three land-use categories that FTA uses for noise assessments along with the noise metric that is used for each category. For Category 2 land uses, noise exposure is characterized using Ldn, while for Category 1 and Category 3 land uses, noise exposure is characterized using the maximum one-hour Leq. It is noteworthy that Category 2 land uses (residential) include residences, motels, hotels, and any other place where people typically sleep. Appendix A provides background information on noise and vibration including definitions of the Ldn and Leq noise descriptors.

The basic concept of the FTA noise impact criteria is that more project noise is allowed in areas where existing noise is higher, but that the decibel increase in total noise exposure (the decibel sum of existing noise and project noise) decreases. For example, the existing noise level in downtown areas are higher than in suburban neighborhoods that are not close to loud noise sources such as freeways. Therefore, more project noise is allowed by FTA in noisier downtown areas compared to relatively quieter suburban areas.

FTA defines two levels of noise impact: ***moderate*** and ***severe*** (Table 4-2). In accordance with the FTA Guidance Manual, mitigation to eliminate noise impacts must be investigated for both degrees of impact. The manual also states that for severe impacts "…there is a presumption by FTA that mitigation is incorporated into the Project unless there are truly extenuating circumstances which prevent it." In considering mitigation for severe impacts in this study, the goal has been to reduce noise levels to below the moderate impact threshold.

FTA allows more discretion for mitigation of moderate impacts based on the consideration of factors including cost, number of sensitive receivers affected, community views, the amount by which the predicted levels exceed the impact threshold, and the sensitivity of the affected receivers. The FTA noise impact criteria are given in tabular format in Table 4-2 with the thresholds rounded up to the nearest decibel. The criteria are shown graphically in Figure 4-1 for the different categories of land use along with an example of how the criteria are applied. The left two graphs are for nonresidential land uses where Leq(h) is the metric used to define noise exposure, and the top right graph is for residential land uses where Ldn is the noise exposure metric. As shown in Figure 4-1, the impact threshold is a sliding scale and the threshold typically increases with an increase in existing noise exposure. The existing noise appears on the horizontal axis, and the amount of new noise that the Project can create is on the vertical axis. The lower curve (blue) defines the threshold for moderate impact and the upper curve (red) defines the threshold for severe impact. Figure 4-2 shows the mathematical equations for the curves shown in Figure 4-1.

Table 4-1. FTA Land Use Categories and Noise Metrics

Land Use Category	Noise Metric (dBA)	Description of Land Use Category
1	Outdoor Leq (h)[a]	A tract of land where quiet is an essential element of their intended purpose. This category includes lands set aside for serenity and quiet and such land uses as outdoor amphitheaters and concert pavilions, as well as national historic landmarks with significant outdoor use. Also included are recording studios and concert halls.
2	Outdoor Ldn	Residences and buildings in which people sleep. This category includes homes, hospitals, and hotels, where a nighttime sensitivity to noise is assumed to be of utmost importance.
3	Outdoor Leq (h) [a]	Institutional land uses with primarily daytime and evening use. This category includes schools, libraries, and churches, where it is important to avoid interference with such activities as speech, meditation, and concentration on reading material. Places for meditation or study associated with cemeteries, monuments, museums, campgrounds, and recreational facilities can also be considered to be in this category. Certain historical sites and parks are also included.

Source: FTA Guidance Manual, May 2006 (Ref. 1).
Notes:
(a) Leq for the noisiest hour of transit-related activity during hours of noise sensitivity.

The sample graph located in the bottom right corner of Figure 4-1 may help clarify the concept of a sliding scale for noise impact. Assume that the existing noise has been measured at 60 dBA Ldn. This is the total noise from all existing noise sources over a 24-hour period: traffic, aircraft, lawn mowers, children playing, birds chirping, etc. Starting at 60 dBA on the horizontal axis, follow the vertical line up to where it intersects the moderate and severe impact curves. Then refer to the left axis to see the impact thresholds. An existing noise of 60 dBA Ldn gives thresholds of 57.8 dBA Ldn for moderate impact and 63.4 dBA Ldn for severe impact. Note that the values are given in tenths of a decibel to avoid confusion from rounding off; in reality, one cannot perceive a tenth of a decibel change in sound level.

In the example discussed above, the Project noise has thresholds of 57.8 dBA Ldn and 63.4 dBA Ldn. This is the new noise generated by operating the transit project. If the predicted Project noise is greater than 57.8 dBA Ldn, there is moderate impact and noise mitigation must be considered. If the predicted Project noise exceeds 63.4 dBA Ldn, then there is severe impact and, as discussed above, noise mitigation must be included in the Project unless there are compelling reasons why mitigation is infeasible.

Notes:

(a) Ldn is used for land uses where nighttime sensitivity is a factor; maximum one hour Leq is used for land use involving only daytime activities. All values in this table are rounded up to the nearest integer.

(b) Impact thresholds are rounded up to the nearest decibel.

4.2 California State and City of Los Angeles Noise and Vibration Limits

The City of Los Angeles (City) uses the impact criteria developed by the FTA to determine acceptable levels of noise and groundborne vibration for the proposed Project (Ref. 2).

California Environmental Quality Act

The *California Environmental Quality Act* (CEQA) of 1970 requires state, local, and other agencies to evaluate the environmental implications of their decisions and to avoid or reduce, when feasible, the significant environmental impacts of their decisions (Ref. 5). The CEQA guidance applicable to the proposed Project is provided in the City CEQA Thresholds Guide (Ref. 2).

CEQA Guidance

CEQA identifies specific issues to be addressed when determining whether a project could have a significant noise impact.

- Would the Project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?
- Would the Project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?
- Would the Project result in a substantial permanent increase in ambient noise levels in the Project vicinity above levels existing without the Project?
- Would the Project result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the Project?

City of Los Angeles Impact Significance Thresholds for Construction (Ref. 2)

A Project would normally have a significant impact on noise levels from construction if:

- Construction activities lasting more than one day would exceed existing ambient exterior noise levels by 10 dBA or more at a noise sensitive use;

- Construction activities lasting more than 10 days in a three month period would exceed existing ambient exterior noise levels by 5 dBA or more at a noise sensitive use; or
- Construction activities would exceed the ambient noise level by 5 dBA at a noise sensitive use between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturday, or at any time on Sunday.

City of Los Angeles Impact Significance Thresholds for Project Operation (Ref.2)

A streetcar Project would normally have a significant impact on noise levels from project operations if the Project causes the ambient noise level measured at the property line of affected uses to increase by 3 dBA in CNEL to or within the "normally unacceptable" or "clearly unacceptable" category, or any 5 dBA or greater noise increase (see Table 4-3).

Except on W 11th Street and Hill Street, the existing noise level on the proposed Project corridor was Ldn 67 dBA or higher (see Section 6.1). The Ldn, like CNEL, measures noise exposure over a 24-hour period and adds a penalty based on the time of day. The Ldn adds a 10-decibel penalty for nighttime noise (10 PM to 7 AM). The CNEL adds a 5- decibel penalty for noise generated during evening time (7 PM to 10 PM), in addition to the 10-decibel penalty for nighttime. Therefore, the Ldn measurement is slightly less sensitive than CNEL, but it results in very similar noise ratings for most community settings, usually differing by less than 1 dBA (Ref. 2). For the current Project corridor, CNEL was approximately 0.3 dBA higher than Ldn at all 24-hour noise measurement sites. Therefore, the two metrics are virtually the same. The details of CNEL and Ldn are given in Appendix Section A.1. Based on Table 4-3 and the relation between CNEL and Ldn, it can be interpreted that the Project would result in significant noise impact at residential and institutional land uses if:

- The Project causes the existing noise level measured at the property line of affected uses to increase by 3 dBA in CNEL or Ldn to or within the 'normally unacceptable' or 'clearly unacceptable" categories presented in Table 4-3. A significant noise impact would occur if the existing Ldn is 67 dBA or greater at residential and institutional land uses and the Project would cause noise at the property line of the noise sensitive receptor to increase by 3 dBA or more.

- The Project causes the existing noise level measured at the property line of affected uses to increase by 5 dBA in CNEL or Ldn. A significant impact would occur if the existing Ldn is 65 dBA or lower at residential and institutional land uses and the Project would cause noise at the property line of the noise sensitive receptor to increase by 5 dBA or more.

In addition, when the existing Ldn is between 65 and 67 dBA at residential and institutional land uses and the allowed noise increase due to the Project at the property line of the noise sensitive receptor ranges from 5 dBA to 3 dBA there is significant noise impact. For example, when the existing Ldn is 66 dBA, the allowed noise increase is 4 dBA before there is significant noise impact. Therefore, there should be at least 3 dBA increase in noise at the receivers before there is a CEQA impact from a new project. The LA CEQA Guidelines also states that "the FTA regulates noise generated by moving trains (e.g. whistles, warning signals, wheels on rails), rail maintenance yards, and activity associated with rail facilities" (Ref. 2).

CEQA thresholds of significance for noise and vibration from operations of the streetcar are based on the FTA criteria. Exceedance of the FTA severe noise impact criteria and/or depending on existing noise level Ldn of an increased range by at least 3 dBA to 5 dBA at sensitive receivers, is considered a significant impact under CEQA for this Project. This approach would ensure that the noise generated by the streetcar operations do not exceed the standards established by either the City CEQA guidelines or FTA impact thresholds. Exceedance of the FTA vibration impact criteria is considered a significant impact for this Project under CEQA.

A substantial increase in Project traffic noise is considered a significant impact by the City of Los Angeles. A doubling of traffic volume is defined as a substantial increase in Project noise (Ref. 2).

There are no vibration limits stipulated by the City of Los Angeles. Therefore, the FTA vibration thresholds discussed in Section 4.4 is used for the purposes of CEQA analysis.

Table 4-3. CEQA Noise Limits for Land Uses				
Land Use	**Community Noise Exposure – CNEL, dBA**			
	Normally Acceptable	**Conditionally Acceptable**	**Normally Unacceptable**	**Clearly Unacceptable**
Single Family, Duplex, Mobile Homes	50-60	55-70	70-75	Above 75
Multi-Family Homes	50-65	60-70	70-75	Above 75
Schools, Libraries, Churches, Hospitals, Nursing Homes	50-70	60-70	70-80	Above 80
Transient Lodging – Motels, Hotels	50-65	60-70	70-80	Above 80
Auditoriums, Concert Halls, Amphitheaters	-	50-70	-	Above 65
Sports Arena, Outdoor Spectator Sports	-	50-75	-	Above 70
Playgrounds, Neighborhood Parks	50-70	-	67-75	Above 72
Golf Courses, Riding Stables, Water Recreation, Cemeteries	50-75	-	70-80	Above 80
Office Buildings, Business and Professional Commercial	50-70	67-77	Above 75	-
Industrial, Manufacturing, Utilities, Agriculture	50-75	70-80	Above 75	-

Source: LA CEQA Thresholds Guide (Ref 2), 2006.

(a) Normally Acceptable: Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.

(b) Conditionally Acceptable: New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning would normally suffice.

(c) Normally Unacceptable: New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

(d) Clearly Unacceptable: New construction or development should generally not be undertaken.

4.3 Local Construction Noise Limits

City of Los Angeles

The noise ordinance for the City of Los Angeles does not apply to "any vehicle which is operated upon any public highway, street or right-of-way" Section 114.02(a) (Ref. 3). Section 41.40 of the *Los Angeles Municipal Code* states that engaging in construction, repair, or excavation work with any construction type device or job-site delivering of construction materials without a Police Commission approved variance would constitute a violation (Ref. 4):

- Between the hours of 9 PM and 7 AM.
- In any residential zone, or within 500 feet of land so occupied, before 8 AM or after 6 PM on any Saturday, or at any time on any Sunday.
- In a manner as to disturb the peace and quiet of neighboring residents or any reasonable person of normal sensitiveness residing in the area.

Therefore, a variance would be required to perform construction activities during the restricted hours of the weekdays and on Saturday and Sundays.

4.4 FTA Impact Criteria for Groundborne Vibration

As discussed in Appendix A.2, the potential adverse effects of rail transit groundborne vibration include perceptible building vibration, rattle noises, reradiated noise (groundborne noise), and cosmetic or structural damage to buildings. The vibration caused by the operation of typical modern streetcar vehicles is well below what is considered necessary to cause even minor cosmetic damage to buildings. Therefore, the criteria for building vibration caused by transit operations are only concerned with potential annoyance of building occupants.

One potential concern is historic buildings and other cultural resources that may be fragile and particularly susceptible to damage from ground motions caused by potential construction vibration. Several historic buildings and other resources have been identified in the study area. However, none of the structures appear to be unusually fragile. Therefore, the vibration assessment of these structures is based on the current use of the building. The potential for construction vibration to damage structures during construction is covered in Section 8.2 Construction Vibration.

The FTA vibration impact criteria are based on the maximum indoor vibration level as a streetcar passes. There are no impact criteria for outdoor spaces such as parks. The FTA Guidance Manual provides two sets of criteria: one based on the overall vibration velocity level for use in a “General Vibration Impact Assessment” and one based on the maximum vibration level in any 1/3 octave band (the band maximum level) for use with a “Detailed Vibration Assessment”, which was performed for this Project.

Table 4-4 shows the FTA General Assessment criteria for groundborne vibration from rail transit systems. As with the FTA noise criteria, there are three categories of sensitive land uses. However, the category definitions for vibration are different for those for noise. The primary difference is in Category 1. For a noise assessment, Category 1 applies to land uses “…where quiet is an essential element of their intended purpose.” For a vibration assessment, Category 1 applies to “Buildings where vibration would interfere with interior operations...,” which primarily applies to spaces that house sensitive research and laboratory equipment such as scanning electron microscopes. There are no buildings in the proposed Project corridor that qualify as Category 1 vibration sensitive land uses.

Unlike the FTA noise criteria, the vibration criteria do not incorporate any factor to account for the number of vibration events per day with one exception. The exception is that for “occasional service,” the FTA impact thresholds are 3 VdB higher than for “frequent service” and for “infrequent service,” the FTA impact thresholds are 8 VdB higher than for frequent service. FTA defines occasional service to be between 30 and 70 events per day and infrequent service to be less than 30 events per day. The frequent criteria are applicable to the proposed Project as there would be more than 70 streetcar trips per day.

The FTA vibration thresholds do not specifically account for existing vibration. Although downtown Los Angeles has substantial volumes of vehicular traffic including buses and trucks, it is relatively rare that rubber-tired vehicles would generate perceptible ground vibration unless there are irregularities in the roadway surface such as potholes or wide expansion joints.

The refined criteria for use with Detailed Vibration Assessments are shown in Figure 4-3. For the Detailed Assessment, the predicted vibration levels in terms of the 1/3 octave band spectra are compared to the curves shown in Figure 4-3 to determine whether there is impact and the frequency range over which vibration mitigation is required. Impact occurs when any spectral value exceeds the applicable curve. The FTA interpretation of how each of the curves shown in Figure 4-3 should be applied is given in Table 4-5. The VC-A through VC-E curves are used to specify acceptable vibration limits for sensitive equipment such as electron microscopes. Which curve to use depends on the sensitivity of the specific equipment that would be affected. With the exception of a few particularly sensitive pieces of equipment such as Transmission Electron Microscopes (TEM) or Atomic Force Microscopes (AFM), the VC-C curve is generally considered adequate to avoid interfering with the operation of most sensitive equipment.

The use of the Detailed Vibration Assessment criteria is illustrated by the example vibration spectrum (the blue dashed line) shown in Figure 4-3. The maximum level of the vibration spectrum exceeds the “Residential (Night)” curve in the 50 and 63 Hz 1/3 octave bands. For this example, impact would be predicted for residential land uses and vibration mitigation would need to be evaluated, even though all of the 1/3 octave band levels fall below the “Residential (Day)” curve. Typical sensitive equipment and their appropriate VC-curves are listed in Table 11.

The FTA Manual does not provide a Detailed Vibration Assessment criteria for institutional land uses. However, where the General Assessment threshold is exceeded and the predicted vibration spectrum at an institutional land use is available, it is reasonable to apply the Residential (Day) curve of the Detailed Vibration Assessment criteria to assess impacts. This is a valid approach because institutional land uses are used primarily during the day and the vibration level for annoyance would not be more stringent than residential land use.

The approach used for this Project are the General Assessment criteria of Table 4-4 to identify potential vibration impacts. Then the Detailed Assessment criteria were applied to determine whether vibration mitigation would be warranted. The Detailed Vibration Assessment curve for Residential (Day) was applied for institutional land uses and the Residential (Night) curve was used for residential land uses.

There are some buildings, such as concert halls, recording studios, and theaters, which can be very sensitive to vibration but do not fit into any of the three categories listed in Table 4-4 and cannot be associated with the curves in Figure 4-3. Due to the sensitivity of these buildings, they usually warrant more detailed vibration assessment during the environmental evaluation of a transit project. Table 4-5 gives the FTA criteria for acceptable levels of groundborne noise and vibration for various categories of “special” buildings. The five theaters on Broadway, the Belasco Theater on 11th Street, Colburn School, and Disney Concert Hall are “special” buildings that have been identified in the Project corridor. Disney Concert Hall and the Belasco Theater were evaluated as concert halls. The Orpheum Theater was evaluated as a TV recording facility/performance space. The Colburn School is a performance school and a conservatory of music with music recording facilities. This school was evaluated as a recording facility. The Million Dollar Theater, and Los Angeles Theater are located on Broadway and are currently unoccupied, but could potentially be revived in the future. These theaters were evaluated as concert halls. The United Artist Theater has been renovated and opened as the Theatre at Ace Hotel. The appropriate FTA thresholds that were applied for the groundborne noise and vibration impact assessment from the various “special” buildings are listed in Table 4-6.

Table 4-4. FTA Impact Thresholds for Groundborne Vibration, General Impact Assessment

Land Use Category	Groundborne Vibration (VdB re 1 micro inch/sec)		
	Frequent Events	Occasional Events	Infrequent Events
Category 1. Buildings where vibration would interfere with interior operations. Typically land uses include vibration-sensitive research and manufacturing, hospitals with vibration-sensitive equipment, and university research operations.	65	65	65
Category 2. Residences and buildings where people normally sleep.	72	75	80
Category 3. Institutional land uses with primarily daytime use.	75	78	83

Source: FTA Guidance Manual, May 2006 (Ref. 1).

Notes:

(a) Frequent events defined as more than 70 vibration events per day.
(b) Occasional events are defined as between 30 and 70 events per day.
(c) Infrequent events defined as less than 30 events per day.
(d) Vibration sensitive equipment is not sensitive to groundborne noise.

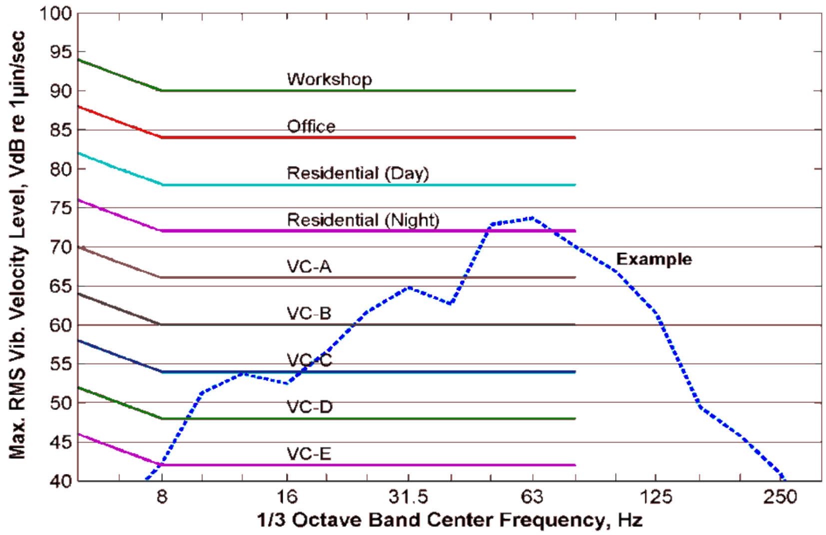

Figure 4-3: FTA Criteria for Detailed Vibration Analysis

Table 4-5. Interpretation of Vibration Criteria for Detailed Analysis		
Criterion Curves	**Max Lv[a] (VdB)**	**Description of Uses**
Workshop	90	Distinctly feelable vibration. Appropriate to workshops and non-sensitive areas.
Office	84	Feelable vibration. Appropriate to offices and non-sensitive areas.
Residential Day	78	Barely feelable vibration. Adequate for computer equipment and low-power optical microscopes (up to 20X).
Residential Night, Operating Rooms	72	Vibration not feelable, but groundborne noise may be audible inside quiet rooms. Suitable for medium-power optical microscopes (100X) and other equipment of low sensitivity.
VC-A	66	Adequate for medium- to high-power optical microscopes (400X), microbalances, optical balances, and similar specialized equipment.
VC-B	60	Adequate for high-power optical microscopes (1000X), inspection and lithography equipment to 3 micron line widths.
VC-C	54	Appropriate for most lithography and inspection equipment to 1 micron detail size.
VC-D	48	Suitable in most instances for the most demanding equipment, including electron microscopes operating to the limits of their capability.
VC-E	42	The most demanding criterion for extremely vibration-sensitive equipment.

5. INVENTORY OF NOISE AND VIBRATION SENSITIVE LAND USES

Noise and vibration sensitive receivers in the proposed Project corridor were identified using aerial photographs and site visits. These receivers consist of multi-family residences, theaters, concert halls, parks, medical facilities, training institutes, a school, two courthouses, a library, a museum, and a church. Most of the sensitive receivers are located in buildings with mixed land uses. The land use categories used by FTA for noise and vibration are discussed in Section 1. Restaurants, businesses, warehouses and manufacturing facilities are not considered noise and vibration sensitive by FTA. The majority of the sensitive receivers are common to both Project Alternatives.

The inventories of the sensitive receivers in the Project corridor are grouped according to the FTA land use categories and shown in Table 5-1 through Table 5-3.

Some key points from the inventory of the sensitive receivers are:

- **FTA Noise Category 1-Special Buildings, Theaters and Concert Halls**: There are theaters, concert halls, and a music school in the Project corridor (see Table 5-1). These receivers are common to both Project Alternatives. The concert halls along the alignment that are currently in use are the Disney Concert Hall and the Belasco Theater. The Orpheum Theater is a performance space on Broadway that is currently used for TV recordings, film shootings, theatrical productions, and other special events that are sensitive to background noise and vibration. The Million Dollar Theater and Los Angeles Theater are not currently used as theaters or performance spaces; however, they were evaluated as concert halls because of potential future plans for their renovation and revival. The United Artists Theater has been renovated and opened as the Theatre at ACE Hotel. So this building was evaluated for both theater (Site T6) and residential land use (Site R19A). The Colburn School is located at the southeast corner of Grand Avenue and 2nd Street at a distance of 180 feet away from the proposed tail tracks on Grand Avenue. It is considered a Category 1 land use because it is a performance school and a conservatory of music with recording facilities.

- **FTA Category 2 - Residential land uses**: There are a number of multi-family residential buildings in the Project corridor. Adjacent residential buildings that would be exposed to the same levels of streetcar noise and vibration have been combined into one receiver. The locations and groupings of the residential land uses are shown on aerial photographs in Appendix E and listed in Table 5-2. As shown in Table 5-2, 36 residential receivers were identified for the Alternatives 2 and 3 of which 33 are common with Alternatives 4 and 5. There are four additional residential receivers for Alternatives 4 and 5. All residential receivers in the Project corridor are multi-family in mixed land use areas. The multi-family residential dwelling units are located typically on the second floor and above in the Project corridor. Units that are located on the lower floors of the building are the closest to the streetcar alignment. The distance for noise propagation from the streetcar to the upper floor units have been assessed separately from units on the lower floors.

There are only limited residential units that have balconies and hence outdoor areas with frequent human activity that would be exposed to streetcar noise. The residential receivers for Alternatives 2 and 3 represent 574 dwelling units located between the second and fifth floor, and 937 dwelling units located above the fifth floor. The residential receivers for the 9th Street Alternative represent 516 dwelling units located between the second and fifth floor, and 955 dwelling units located above the fifth floor.

- **FTA Category 3 - Institutional and Recreational Land Uses**: There are 15 institutional land uses along Alternatives 4 and 5 that include parks, a school, a courthouse, a library, training institutes, a museum, medical facilities, and a church (Table 5-3). It also includes the future Federal Courthouse on 1st Street between Hill and Broadway. Thirteen of the institutional land uses are common with Alternatives 2 and 3. There are no additional institutional land uses for these alternatives.

There are many historic buildings in the Project corridor including 50 properties that are listed in the national register, approximately 50 properties listed as Historic Cultural Monuments (HCM) and more than 10 properties that are eligible for the local register. The historic properties have been evaluated for noise and vibration impacts based on their current use.

Table 5-1. Inventory of Theaters and Concert Halls

Notes:

(a) FTA land use category for noise. Details of the FTA land use categories are discussed in Section 1.

(b) FTA land use category for vibration. Details of the FTA land use categories are discussed in Section 1.

6. AFFECTED ENVIRONMENT

The following sections document the ambient noise and vibration and present the details of the vibration propagation tests. Appendix A provides some background on the fundamentals of noise and vibration. Appendix B has photographs and maps of the ambient noise measurement sites and presents the detailed measurement data. Appendix C shows the details of the vibration propagation test procedure and photos of the test sites. Appendix D provides the 1/3 octave “best fit” coefficients for the line source transfer mobility (LSTM) curves derived from the vibration propagation test results. Appendix E shows the locations of the sensitive receivers on Project design drawings.

6.1 Existing Noise Conditions

The existing ambient noise levels along the Project corridor were documented through measurements performed at representative sensitive receivers between September 2012 and March 2013. The noise measurements were performed only during weekdays (Monday through Friday). The primary existing noise source in the Project area is vehicular traffic on the streets in the streetcar alignment: Broadway, Grand, Hill, Figueroa, 1st, 7th, 9th, and 11th Streets. Long term noise measurements were performed at six sites and short term noise measurements were performed at nine sites. Definitions of the noise metrics used in the study are provided in Appendix A.

The locations of the noise measurement sites are shown in Figure 6-1. Photographs from each site are included in Appendix B.

The ambient noise measurement results are summarized in Table 6-1. The 24-hour Day-Night Sound Level exceeded 70 dBA at most locations, which is to be expected from downtown areas where the receivers are very close to primary noise sources such as vehicular and foot traffic combined with intermittent sirens and other loud activities. Except for site LT-2, the measurements at the long term noise sites were performed on the second or third floor balconies of residences or hotels. The only available location for mounting a microphone at site LT-6 was the ledge of a second floor window. Because the microphone was within 12 inches of the building wall, adjustments were made to the measured noise level to account for potential amplification by sound reflections off the wall.

Ldn was estimated at the short term noise sites by adding an adjustment factor to the measured 1-hour Leq. The adjustment factor was based on the difference between the measured Ldn and daytime Leq at the closest long term noise site.

The noise measurement sites are described below:

<u>Long Term Measurement Sites</u>

LT-1: 417 Hill Street: This measurement was made on a second floor balcony of the Metro 417 multi-family residential building. The measurement was performed for 24 hours starting at 2:30 PM on

September 18, 2012. The primary source of noise at this site was from traffic on Hill Street. The measured Ldn at this site was 66 dBA.

LT-2: 330 W. 11th Street: This measurement was made outside the Grand Loft multi-family residential Building at the street level. The measurement was performed for 24 hours starting at 1:10 PM on October 23, 2013. The primary source of noise at this site was traffic on 11th Street. The measured Ldn was 66 dBA.

LT-3: 939 S. Figueroa Street: This measurement was made on a second floor balcony of the Figueroa Hotel. The measurement was performed for 24 hours starting at 11:30 AM on September 20, 2012. The primary source of noise at this site was traffic on Figueroa Street. The measured Ldn was 73 dBA.

LT-4: 711 S. Hope Street: This measurement was made on a third floor balcony of the Sheraton Hotel. The measurement was performed for 24 hours starting at 1:30 PM on March 7, 2013. The primary source of noise at this site was traffic on 7th Street. The measured Ldn was 72 dBA.

LT-5: 901 Broadway: This measurement was made on a second floor balcony of the Blackstone Multi-family residential Building, facing 9th Street. The measurement was performed for 24 hours starting at 10:00 AM on January 24, 2013. The primary source of noise at this site was traffic on 9th Street. The measured Ldn was 72 dBA.

LT-6: 756 Broadway: This measurement was made on a second floor window ledge of the Chapman multi-family residential buildings. The measurement was performed for 24 hours starting at 2:30 PM on March 20, 2013. The primary source of noise at this site was traffic on Broadway. Because the microphone at this location was less than 1 foot from the wall, reflections from the wall could have increased the measured noise levels by as much as 5 decibels over what they would have been without the reflections. To account for this, the measured noise levels have been adjusted by −5 decibels to ensure that the existing noise levels are not overestimated. Note that underestimating the existing noise levels would tend to result in more stringent noise impact criteria. The adjusted Ldn at this site was 76 dBA.

Nighttime Noise Measurements

The existing noise levels during the nighttime hours of 10 PM to 7 AM were measured at Sites LT-1 through LT-6 as part of the 24 hour noise measurements. The nighttime noise measurements are summarized in Table 6-2. This data is a baseline for the existing environment at residential receivers that may be affected by nighttime construction activities.

Short Term Measurement Sites

ST-1: 111 S. Grand Avenue: This measurement was made outside the Disney Concert Hall at the street level. The measurement was for 1 hour starting at 12:10 PM on November 15, 2012. The primary source of noise at this site was traffic on Grand Avenue. The measured Leq was 67 dBA.

ST-2: 111 N. Hill Street: This measurement was made at the Mosk Courthouse on 1st Street. The measurement was for 1 hour starting at 1:20 PM on November 15, 2012. The primary source of noise was traffic on 1st Street. The measured Leq was 71dBA

ST-3: 207 S. Broadway: This measurement was made at 207 South Broadway. The measurement was for 1 hour starting at 2:35 on November 15, 2012. The primary source of noise was traffic on Broadway. The measured Leq at this site was 74 dB.

ST-4: 615 S. Broadway: This measurement was made at the Los Angeles Theatre on Broadway. The measurement was for 1 hour starting at 12:40 PM on January 8, 2013. The primary source of noise was traffic on Broadway. The measured Leq was 71 dBA.

ST-5: 842 S Broadway: This measurement was made at the Orpheum Theatre on Broadway. The measurement was for 1 hour starting at 1:50 PM on January 8, 2012. The primary source of noise was traffic on Broadway. The measured Leq was 73 dBA.

ST-6: 1050 S. Hill Street: This measurement was made at the Belasco Theatre on 11th Street. The measurement was for 1 hour starting at 1:15 PM on March 11, 2012. The primary source of noise was traffic on 11th Street. The measured Leq was 67 dBA.

ST-7: 800 W. Olympic Boulevard: This measurement was made at the LA Live Center outside of the Lawry's Carvery Restaurant. The measurement was for 1 hour starting at 2:30 PM on March 11, 2013. The primary source of noise was from traffic on Figueroa Street. The measured Leq was 68 dBA.

ST-8: 7th Street and Olive Street: This measurement was made at the northwest corner of the intersection of 7th Street and Olive Street. The measurement was for 1 hour starting at 1:50 PM on March 7, 2013. The primary source of noise was traffic on 7th Street. The measured Leq was 73 dBA.

ST-9: 501 Hill Street: This measurement was made in Pershing Square, midway between 5th and 6th Streets. The measurement was for 1 hour starting at 2:00 PM on March 7, 2013. The primary source of noise was traffic on Hill Street. The measured Leq was 69 dBA.

ST-10: This measurement was made at the rear of the Milner Hotel, between Figueroa Street and Flower Street. The measurement was for 1 hour starting at 2:00 PM on November 19, 2015. The primary source of noise was traffic on 8th and 9th Streets. The measured Leq was 65 dBA.

ST-11: This measurement was made on 11th Street midblock between Olive and Hill Streets. The measurement was for 1 hour starting at 2:00 PM on November 19, 2015. The primary source of noise was traffic on 11th Streets. The measured Leq was 69 dBA.

Figure 6-1: Overview of Noise and Vibration Measurement Locations

6.2 Existing Vibration Conditions

Existing vibration sources in the Project area primarily consist of vehicular traffic and intermittent construction activities. Vehicular traffic is the only permanent vibration source that was observed in the

Project area. When vehicular traffic causes perceptible vibration, the source usually is traced to potholes, wide expansion joints, or other "bumps" in the roadway surface. Therefore, the FTA assessment procedures for vibration from rail transit projects do not require measurements of existing vibration levels.

Localized geologic conditions such as soil stiffness, soil layering, and depth to bedrock, have a strong effect on groundborne vibration. Unfortunately, it is difficult to obtain information on subsurface conditions in sufficient detail so that computer models can be used to accurately predict ground vibration. As a result, most detailed predictions of ground vibration are based largely on empirical methods that involve measuring vibration propagation in the soil. The FTA Guidance Manual defines three levels of vibration assessment:

- Screening: Generalized distances of potential impacts are used to quickly determine whether there is any potential for impacts.
- General Assessment: FTA provides a general curve of train vibration vs. distance that is used to estimate the vibration levels. The curve was developed by plotting measured vibration levels from a number of different rail transit systems against distance from the tracks and drawing a line through the top range of the data. The curve provides a conservative (high) estimate of potential vibration impacts. Adjustments are made to the general curve to account for factors such as speed and special trackwork.
- Detailed Assessment: A Detailed Vibration assessment consists of using state-of-the-art tools to characterize how localized soil conditions affect the levels of groundborne vibration. The FTA Guidance Manual recommends using vibration propagation tests to measure how vibration would be transmitted from the streetcar tracks through the ground and into the foundations of nearby buildings.

Because many of the buildings with vibration sensitive land uses are within a few feet of the sidewalks, the streetcar tracks and these sensitive receivers would be relatively close to the buildings. Therefore a Detailed Vibration Assessment including vibration propagation tests was performed for this study. The description of the vibration propagation test is presented in Appendix C.

Vibration propagation tests were performed at three theaters that are currently in use and one surface parking lot. The data derived from the testing are the Line Source Transfer Mobility (LSTM) and the coherence curves for each accelerometer position. As discussed above, LSTM characterizes how vibration changes as it passes through the ground. Coherence is a measure of the "quality" of the LSTM results. A coherence close to 1 indicates that the vibration response and the exciting force from the drop hammer are closely related and that there is a relatively high level of confidence in the LSTM. A coherence less than about 0.2 indicates a relatively weak relationship between the exciting force and the vibration response and that there is a relatively low level of confidence in the measured LSTM. Low coherence would occur when the vibration signal generated by the drop hammer is lower than the ambient vibration, which would happen when ambient vibration is relatively high, when the distance between the drop hammer and the accelerometer is relatively high, or when the soil is a poor transmitter of vibration at a specific frequency.

The test sites and the measurement results are discussed below.

Site V-1, Disney Concert Hall: The impact line at this site was located on Grand Avenue as shown in Figure 6-2. Two accelerometers were mounted outdoors at 25 feet and 50 feet from the impact line. The 25 feet accelerometer was on the sidewalk, and the 50 feet accelerometer was in the Disney patio area. The four indoor accelerometers were located in the lobby (A3), box office (A4), BP Hall (A5) and the Main Concert Hall (A6). The accelerometer in the lobby area was approximately 75 feet from the impact line (The impact line refers to the line of impacts employed in the vibration propagation tests and the details of the test procedure are discussed in Appendix C).

The measured LSTM and coherence curves are shown in Figure 6-3. Between 20 and 63 Hz, the coherence inside BP Hall and the concert hall was in the acceptable range. Coherence was good up to 100 Hz for rest of the accelerometers. The LSTM curves in Figure 6-3 shows about 15 dB vibration attenuation between the 25 and 50 feet measurement positions. The LSTM in the lobby and box office were comparable to the levels at 50 feet. The LSTM inside the auditorium was approximately 5 to 10 decibels lower compared to the levels at the other three indoor measurement positions. Because of the substantial foundation of Disney Concert Hall and the number of underground structures in this area, it is unlikely that the two outdoor measurement positions are representative of propagation through undisturbed soil.

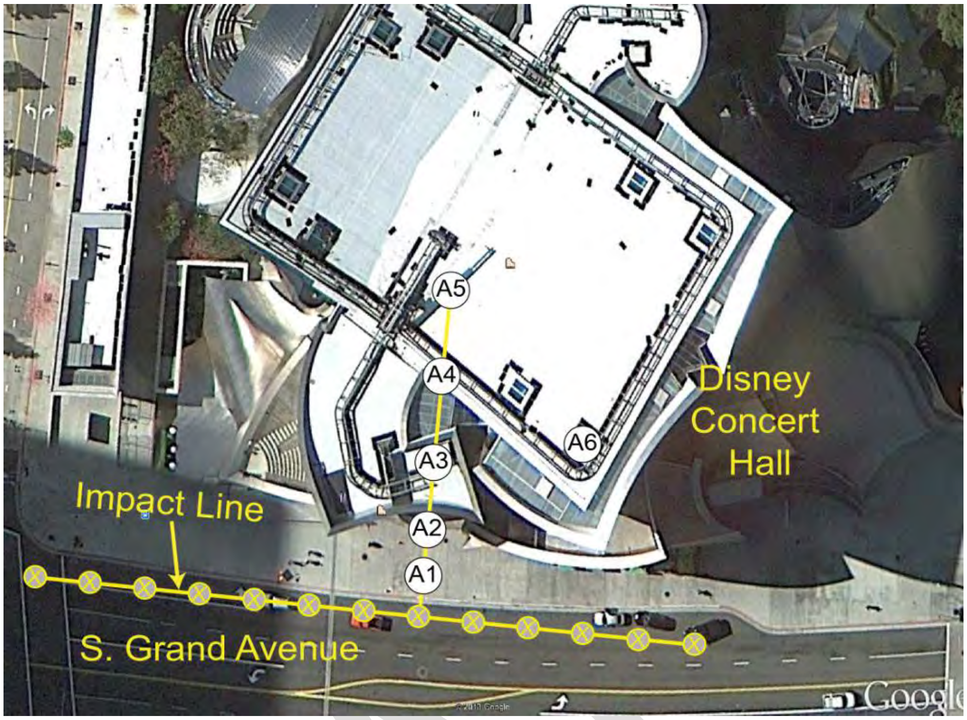

Figure 6-2: Vibration Propagation Test Site V-1, Disney Concert Hall

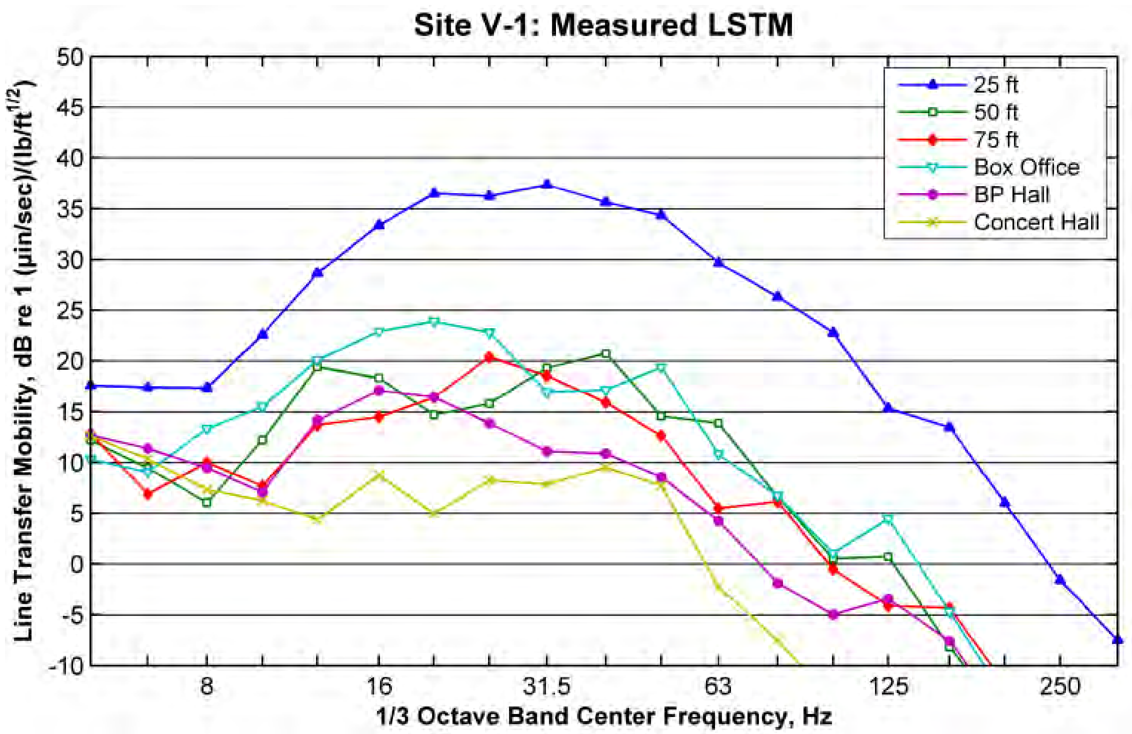

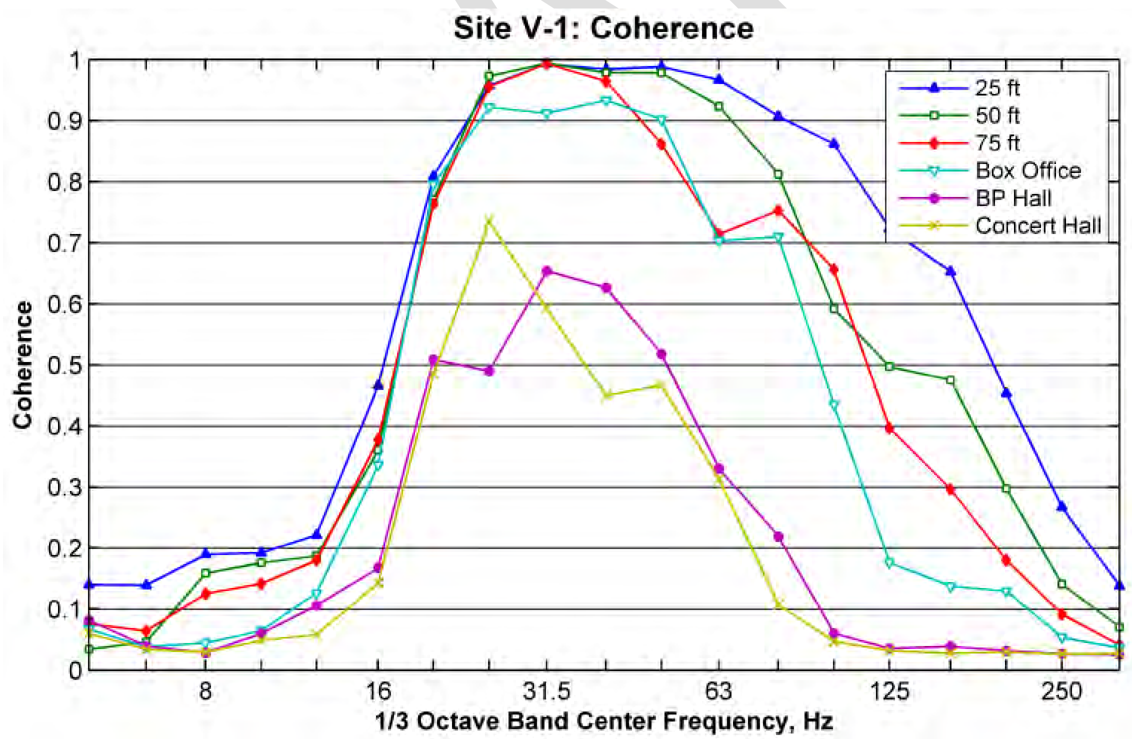

Figure 6-3: Site V-1, Measured LSTM and Coherence

Site V-2, Orpheum Theater: The Orpheum Theater is located on the east side of Broadway north of 9th Street. As shown in Figure 6-4, the impact line was along the east side of Broadway. One accelerometer was located outdoors on the sidewalk, 20 feet from the impact line and the remaining four accelerometers were located inside the theater; two in the lobby area and two under the seats in the theater. For all measurement positions, the coherence was acceptable between 20 and 200 Hz (see Figure 6-5). There is a strong peak at 20 Hz in the measurement results in the front lobby. It is not clear what the source is of this peak. One possibility is that it is caused by a resonance of the floor system. Another possibility is that the background vibration is relatively high at 20 Hz. This peak at 20 Hz would not be an issue because the front lobby is not a sensitive area and because the peak does not appear in the LSTM results at any of the three other indoor measurement positions.

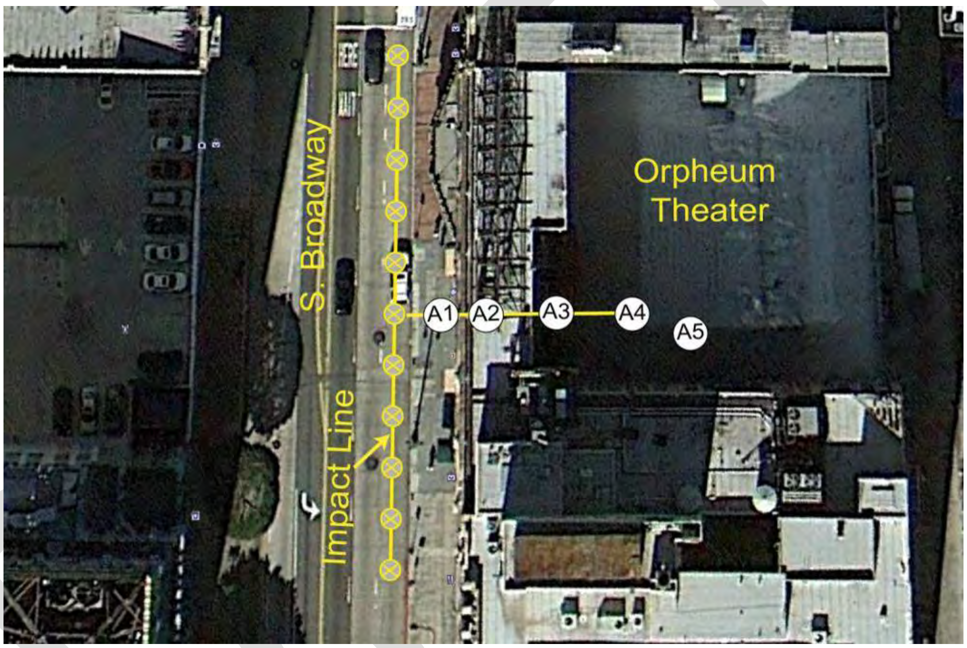

Figure 6-4: Vibration Propagation Test Site V-2, Orpheum Theater

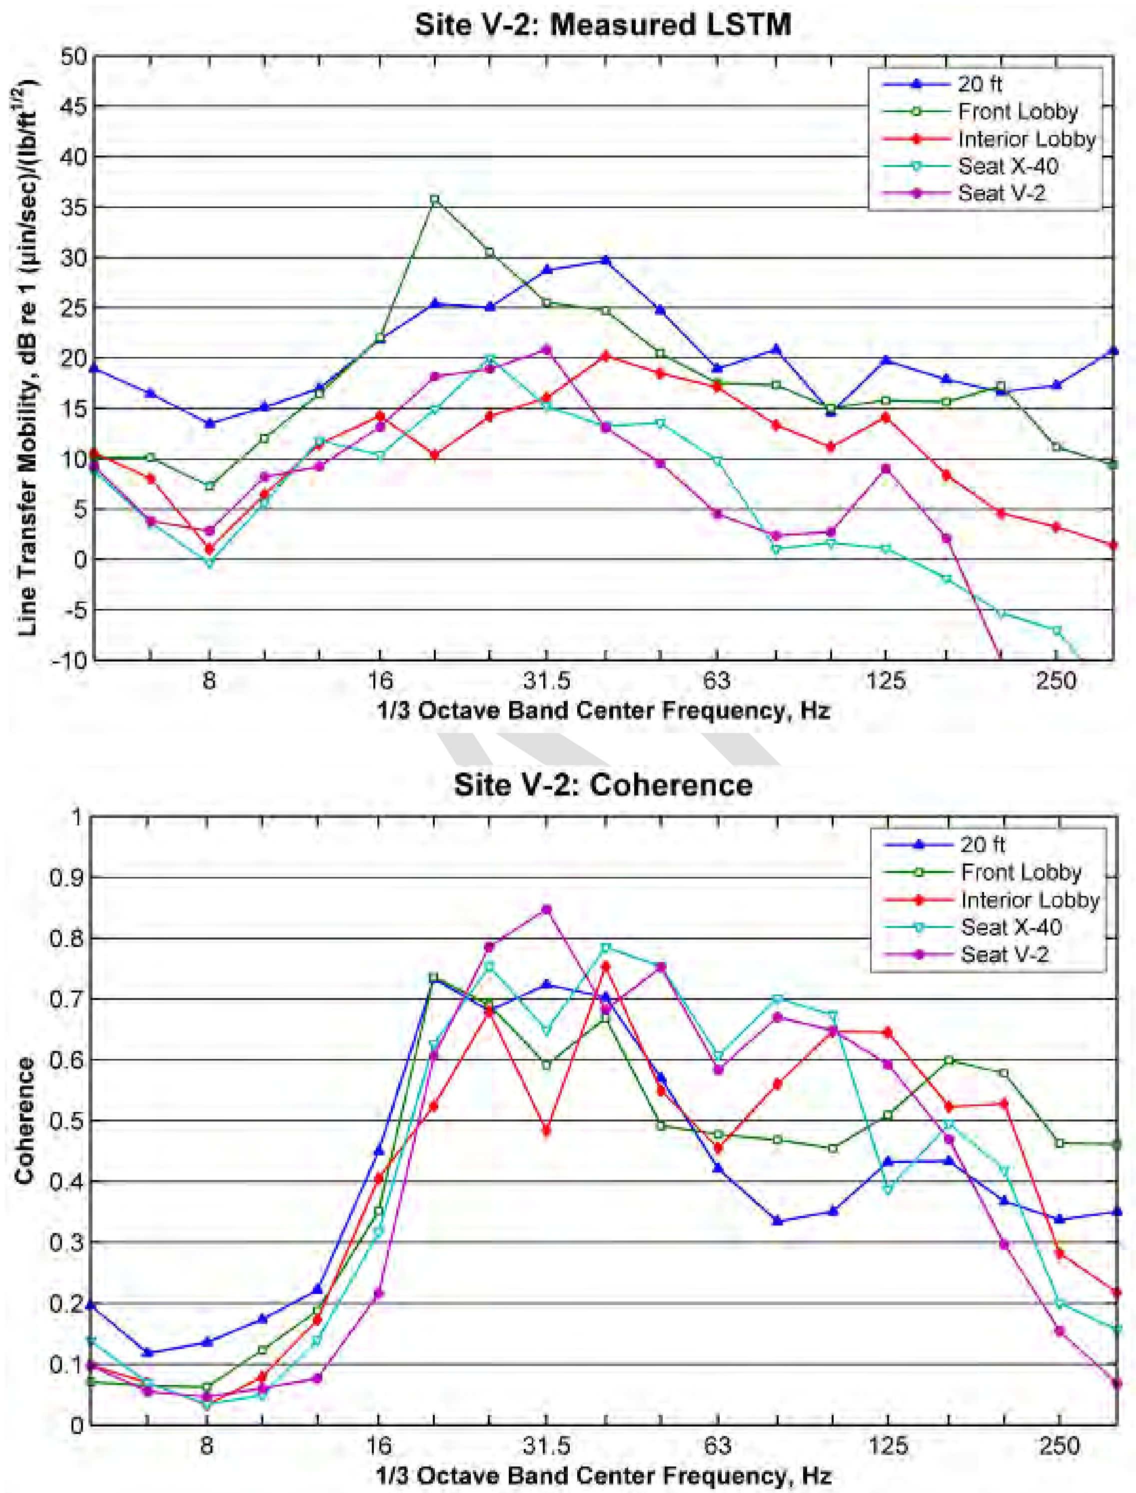

Figure 6-5: Site V-2, Measured LSTM and Coherence

Site V-3, Belasco Theater: This measurement was performed in the side lobby/loading area of the Belasco Theater. The front lobby of the Belasco Theater is on Hill Street and the performance space is 60 feet from the edge of W 11th Street. The impact line for this measurement was located on 11th Street as shown in Figure 6-6. The accelerometers were located:

- In the patio area north of 11th Street at 25, 38 and 50 feet from the impact line.
- Also in the patio area under the stairs. This accelerometer was approximately 75 feet from the impact line.
- Inside the performance space on the floor next to the stage and on the stage.

The measured LSTM and coherence curves are shown in Figure 6-7. Coherence was relatively low at the indoor measurement positions. The LSTM decreases only a few decibels from the 25 feet position to the 50 feet position and there is an approximately 15 dB decrease at key frequencies between the 50 feet and 75 feet positions. It is not clear whether there is a basement or other underground structure under the patio. Based on the measurements, it appears that the 50 feet position was over ground and the 75 feet position was over a basement or other structural part of the building. The large drop in LSTM from the 50 to 75 feet positions probably is an indication of the reduction in vibration as the vibration is transmitted from the street into the building structure. The LSTMs measured in the performance space both have peaks at 20 Hz that are likely to be the result of floor resonances.

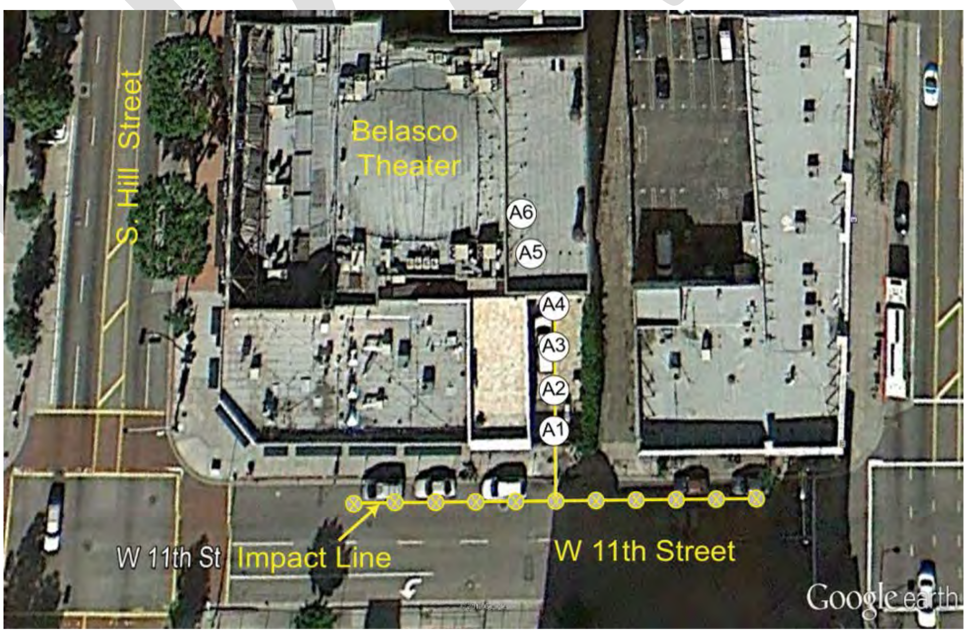

Figure 6-6: Vibration Propagation Test Site V-3, Belasco Theater

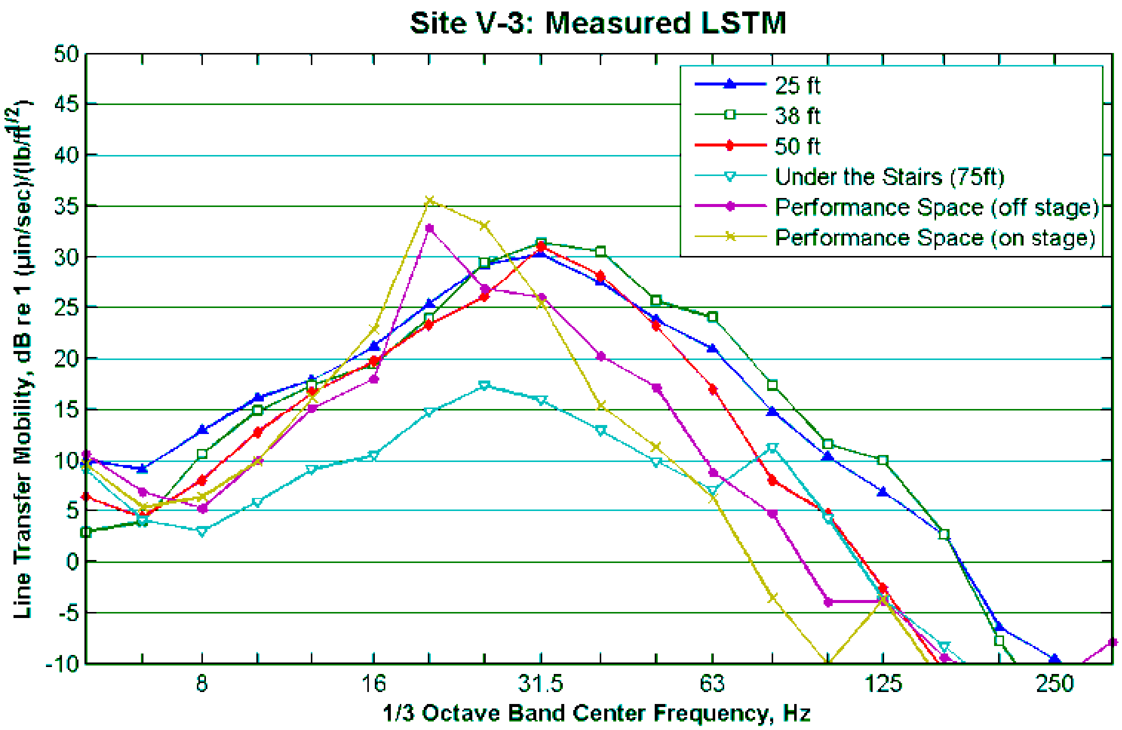

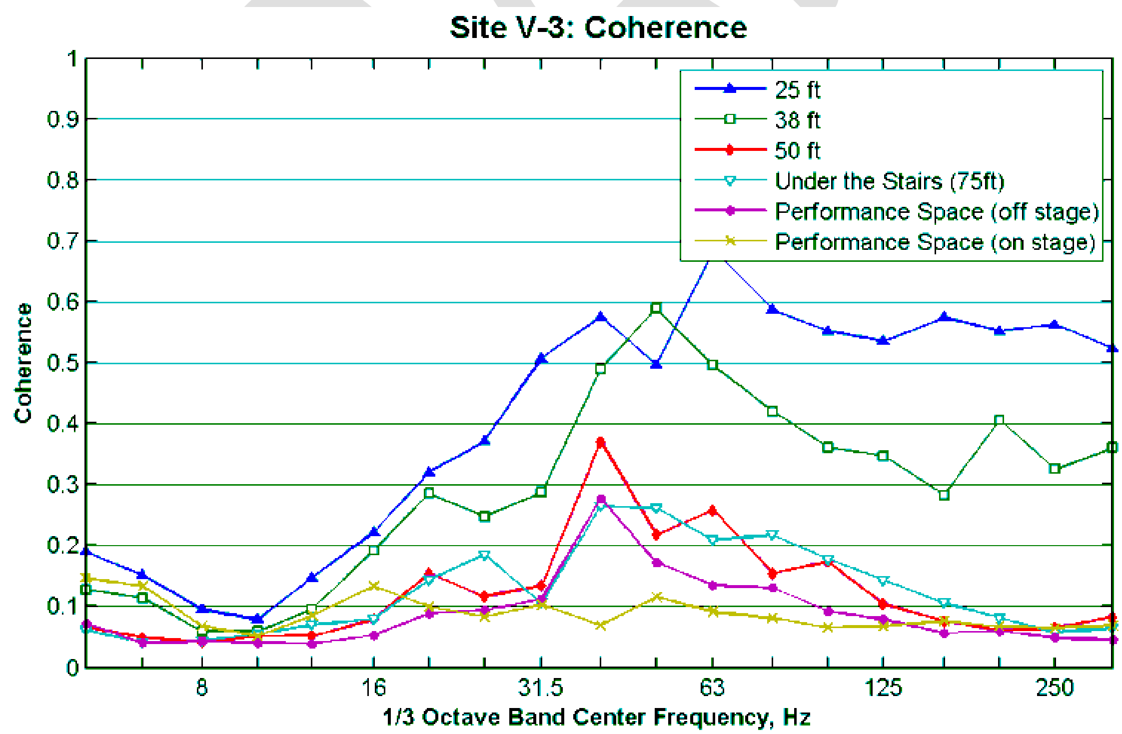

Figure 6-7: Site V-3, Measured LSTM and Coherence

Site V-4: This measurement was performed in a surface parking lot at the intersection of W 9th Street and S Hope Street. The impact line was located on the 9th Street sidewalk as shown in Figure 6-8. The accelerometers were mounted on the pavement of the parking lot at 25, 38, 50, 75, 100 and 150 feet from the impact line. The accelerometers at 25, 38 and 50 feet were located close to the footings of a billboard. The measured LSTM and coherence curves are shown in Figure 6-9. Coherence for all measurement positions was acceptable between 16 and 100 Hz. The LSTM at this site was 3 to 5 decibels higher compared to the outdoor LSTM measured at sites V-1 through V-3. This indicates that the building structures and other underground structures at the three theater measurement sites tended to reduce the levels of vibration at the ground surface and generally impede the transmission of vibration into the theater performance spaces. The measurements in the three theaters provide site-specific information on vibration propagation into the sensitive performance spaces. The measurement in the parking lot (Site V-4) was used with the measurement positions in front of and at the setback distances of the three theaters to develop a general model of how vibration propagates through soil in the Project corridor. The manner that the vibration propagation test results were used to develop predictions for all vibration sensitive land uses in the Project corridor is discussed in Appendix E.2.

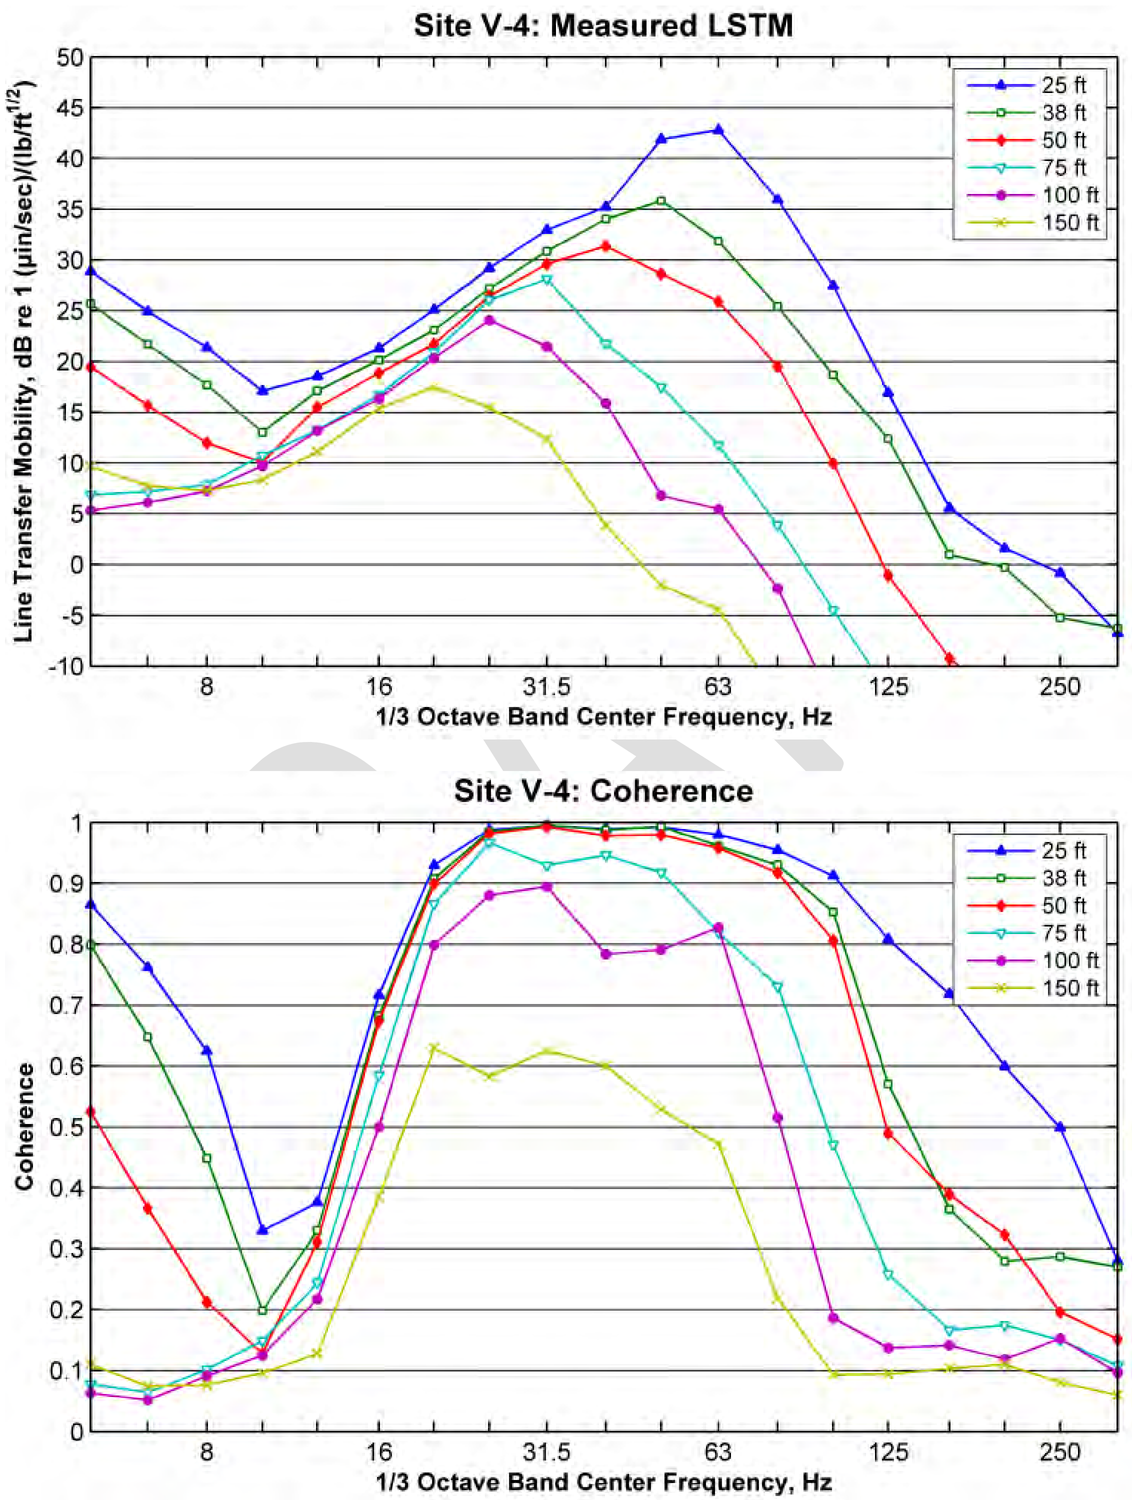

Figure 6-9: Site V-4, Measured LSTM and Coherence

7. POTENTIAL OPERATIONAL NOISE AND VIBRATION IMPACTS AND MITIGATION

7.1 Noise from Streetcar Operations

For a well-maintained streetcar system, the general trend is that at speeds below 20 mph the noise from propulsion motors, air conditioning, and other auxiliary equipment on the vehicles dominates. Above 25 mph, the rolling noise due to metal to metal contact at the wheel-rail interface dominates. This is referred to as wheel/rail noise. The level of wheel/rail noise is generally considered to vary with speed by 30*log(speed). Between 15 and 25 mph, a transition of the dominant noise source from the vehicle equipment to the wheel-rail interface occurs. Therefore, it is reasonable to expect the streetcar noise to have three regimes based on speed: a constant slope for speeds below 15 mph, a lower slope for speeds between 15 and 25 mph, and a higher slope above 25 mph.

Because the proposed vehicle and track design for the Los Angeles Streetcar system will be similar to the modern streetcar systems in Portland, OR and Seattle, WA, the noise predictions for the Los Angeles Streetcar system is based on measurements of the noise generated by the Portland and Seattle Streetcar systems (Ref. 7). Based on measurements in Portland and Seattle, reasonable speed adjustments for the maximum streetcar noise levels (Lmax) are:

- Speed-independent below 15 mph
- 12*log(speed) between 15 and 25 mph
- 30*log(speed) above 25 mph.

At a reference distance of 50 feet from the centerline of the track, the measured Lmax for streetcar noise was:

- 74.7 dBA at 25 mph

Based on the measured Lmax at 25 mph and the 30*log(speed) adjustment, the streetcar Lmax at 30 mph is estimated to be 77 dBA.

The reference levels used for this analysis are:

- Maximum sound level (Lmax) of a one-car streetcar operating at 25 mph on embedded track at a distance of 50 feet: 75 dBA
- Streetcar length: 66 feet
- Noise amplification from crossover trackwork (frogs): +6 dB

The FTA detail noise impact assessment methodlogy used to predict noise and vibration that would result from the Project are presented in Appendix E. The measured streetcar passby noise levels of the Portland and Seattle Streetcar systems were used with formulas included in the FTA Guidance Manual to predict the noise levels at each sensitive receiver.

7.2 Streetcar Operations

The currently proposed operating plan assumes that the streetcar system would operate 7 days a week with three to six streetcars running at any given time. The run time for a round trip would be approximately 35 to 40 minutes for all the Build Alternatives. As shown in Table 7-1, at morning and evening peak hours, six vehicles would be in operation, with headways of approximately 7 minutes at a given location. During non-peak mid-day hours, four vehicles would be in operation, with headways of approximately 10 minutes. During non-peak evening hours, three vehicles would be in operation, with headways of approximately 15 minutes. Hours of operation would be 6 a.m. to 12 midnight, Monday through Thursday; 6 a.m. to 2:30 a.m. on Friday; 9 a.m. to 2:30 a.m. on Saturday; and 9 a.m. to 12 midnight on Sunday and holidays. The maximum operating speed is assumed to be 30 mph on Figueroa Boulevard, and 25 mph or less everywhere else.

Table 7-1. Streetcar Headway Times

Number of Vehicles	Operation Hours	Headway (minutes)	Monday to Thursday	Friday	Saturday	Sunday/ Holidays
6	AM/PM Peak Hour	7	6 a.m.– 9 a.m. 3 p.m.–6 p.m.	6 a.m.–9 a.m. 3 p.m.–6 p.m.	--	--
4	Mid-Day Non-Peak	10	9 a.m.–3 p.m.	9 a.m.–3 p.m.	9 a.m.–5 p.m.	9 a.m.–5 p.m.
3	Evening Non-Peak	15	6 p.m.– 12 midnight	6 p.m.–2:30 a.m.	5 p.m.–2:30 a.m.	5 p.m.– 12 midnight

7.3 Streetcar Related Noise

7.3.1 Operational Noise

This section discusses the noise impacts from streetcar operations at FTA Category 1, 2 and 3 noise sensitive receivers. The FTA Category 2 land uses along the proposed streetcar alignment are all multi-family residential units and hotels. The receivers were grouped together based on their location relative to the proposed alignment and the streetcar operation conditions as discussed in Section 1. All other FTA noise sensitive receivers were numbered individually. Consistent with the FTA Guidelines (Ref. 1), restaurants, bars and other commercial establishments were not evaluated for noise impacts from streetcar operations. Table 7-2, Table 7-3 and Table 7-4 show the predictions of noise from streetcar operations for Category 1, Category 2, and Category 3 land uses, respectively.

The columns in Table 7-2 through Table 7-4 include the following information:

- Receiver ID: This identifies the receiver number. The Category 1 receivers are identified as Txx (Table 7-2), the Category 2 receivers are identified as Rxx (Table 7-3), and the Category 3 receivers are identified as Ixx (Table 7-4). The receiver locations are shown on design drawings in Appendix F.
- Desc. or Receiver Name: The type of land use or name of the receiver.
- Adjacent Street: Identifies the street closest to the receiver for Category 2 land uses.
- Dist from the Track: Distance in feet from the streetcar track centerline to the closest location of the noise sensitive receiver. With the exception of Grand Avenue and 1st Street, there is only one track along the alignment. The only receivers that are exposed to streetcar noise from both inbound and outbound streetcars are Colburn School (T1), Disney Concert Hall (T2), Dorothy Chandler Pavilion (T8), Mosk Courthouse (I1) and the LA Law Library (I2).
- Speed: Maximum expected streetcar speed on the track closest to the receiver. The streetcar speeds would not exceed the posted traffic speed limits, which are 30 mph on Figueroa and 25 mph on all other streets along the alignment. The speed was assumed to be 20 mph near streetcar stops and 15 mph on the tail tracks on Grand Avenue.
- Existing Noise Site: The existing noise measurement site that is representative of the noise sensitive receiver.
- Existing: Existing noise level (Ldn) at each receiver was based on the measured Ldns for Category 2 land uses (Table 7-3). Existing Leq was used at Category 1 and 3 land uses (Table 7-2 and Table 7-4).
- Project: Predicted future noise levels from streetcar operations. This is Ldn for residential land uses and maximum hourly Leq for non-residential land uses. The noise predictions include audible warning device noise from the streetcars for all sensitive receivers that are located within 200 feet of a streetcar stop or an intersection where streetcars would stop.
- Impact Threshold: The FTA impact thresholds for moderate and severe impact based on the existing noise levels.
- Impact (Yes/No): Whether there are noise impacts at Category 1 and 3 land uses (Table 7-2 and Table 7-4).

- Number of Impacts: The number of dwelling units where the predicted levels of streetcar noise exceed the Moderate (Mod) and Severe impact thresholds (Table 7-3).

The noise impact assessment for FTA Category 1 land uses shown in Table 7-2 show that streetcar operations are predicted to exceed the FTA moderate noise impact threshold by 3 dB at Disney Hall and increase the existing noise levels by 1 dB. The predicted noise levels assume +6 dB for the wheel impacts at the turnout track frogs in front of Disney Hall and +10 dB for potential wheel squeal at the tight radii curves located at the intersection of Grand Avenue and 1st Street. It is noteworthy that the noise levels are predicted for the outdoor area in front of the Disney Concert Hall and the sensitive areas of the building are well insulated from exterior noise.

The noise impact assessment for FTA Category 2 land uses in Table 7-3 show two potential impacts:

- **Receiver R23**: There are 24 residential units from the second floor through the fifth floor facing the streetcar alignment along 11th Street where the predicted streetcar noise exceeds the FTA moderate impact threshold. The noise due to the streetcar Project is predicted to result in a 2 dB increase in cumulative noise exposure at this receiver. There are approximately 30 residential units above the fifth floor. Because these units are farther from the streetcar noise, the predicted noise levels are below the threshold for moderate noise impact.

- **Receiver R35 (Kawada Hotel):** At the Kawada Hotel the predicted streetcar noise levels exceed the moderate impact threshold at 15 rooms facing the streetcar alignment on Hill Street. The predicted noise exposure from streetcar operations is below the existing noise exposure from vehicular traffic and is predicted to increase the cumulative noise exposure by less than 1 decibel. A 1 decibel change in noise exposure is generally considered inconsequential.

As shown in Table 7-4, the noise impact assessment for FTA Category 3 land uses show moderate noise impacts at the Federal Courthouse on 1st Street. The predicted noise levels include +6 dB for the wheel impacts from the diamond crossing at the intersection of 1st and Hill Streets, and +10 dB for potential wheel squeal at the tight radii curve located at the same intersection.

Table 7-2. Summary of Noise Impact Assessment for Category 1 Land Uses

Receiver ID	Receiver Name	NT Dist.[a] (feet)	Speed (mph)	Existing Noise Site	Leq [c] (dBA)				Impact (Yes/No)

(c) Project Leq is the additional noise that would be created by the streetcar operations. It includes streetcar AWD noise at stoplights and streetcar stops.

(d) Includes both inbound and outbound tracks.

(e) Includes +10 dB for squeal noise at tight radius curves.

(f) Includes +6 dB for impact noise from the frogs at special trackwork.

7.3.2 Ancillary Equipment

Traction power substation (TPSS) units are the only ancillary equipment associated with the proposed Project that has the potential to cause noise impacts. Five TPSS units are planned for the proposed streetcar alignment. The recommended locations of the TPSS units are:

- A1: North end of Lower Grand Avenue (approximately under 2nd Street and Upper Grand Avenue);
- A2: Southeast corner of Broadway and 2nd;
- A3: Broadway between 8th and 9th Streets (Parking lot behind Two Boots Pizza);
- A4: Alley between 8th and 9th Streets connecting Figueroa and Flower Streets;
- A5: Hill Street between 4th and 5th streets (Parking lot adjacent to Metro 417 Multi-family residential building);

There are also five alternative sites for locating the TPSS;

- B1: Northeast corner of Grand and 2nd Street;
- B2: Southwest corner of Broadway and 2nd Street;
- B3: Southwest corner of Broadway and 9th Street;
- B4: Southeast corner of Figueroa and 9th Street; and
- B5: Southeast corner of Hill and 6th Street.

It is common to include noise limits in the specifications for TPSS units to minimize the potential for noise impacts from TPSS noise. The specifications generally include maximum noise limits for potential noise generators, such as the transformer hum and any cooling systems. The cooling fans are the major noise source on many modern TPSS units and the transformer hum is usually inaudible except very close to the TPSS unit.

The first step in controlling TPSS noise is to include a noise limit for TPSS units that should be met by the contractor. The recommended limit is that the maximum noise level not exceed 50 dBA at a distance of 50 feet from any part of a TPSS unit.

Under the City of Los Angeles CEQA Thresholds' Guide noise levels of a proposed project would have a significant impact if the project causes the existing Ldn ambient to increase by 3 decibels to or within the "normally unacceptable" or "clearly unacceptable" CEQA noise exposure categories (see Table 4-3. Table

7-5 shows the predicted levels of TPSS noise at the residence nearest to each of the sites being considered along with the measured nighttime Leq for the site. A noise impact is indicated when the predicted TPSS Ldn noise level exceeds the existing level Ldn by 3 decibels. This approach for assessing TPSS noise impact is more stringent than the FTA impact criteria and ensures no impacts are overlooked. As seen in Table 7-5, impacts from the TPSS units are not predicted at any of the potential sites.

The noise of the TPSS operations would also comply with the *Los Angeles Municipal Code* Sections 112.04 and 112.05, which restrict the noise from powered equipment located within any residential zone or within 500 feet of a residence to exceed the ambient noise by more than 5 decibels.

If the locations of the TPSS units are revised in final design such that it would result in impacts, mitigation should be considered. The mitigation can be as simple as arranging for the ventilation fans to be on the side of the TPSS building that is farthest from noise sensitive receptors. Other mitigation options include building a sound wall or partial enclosure around the TPSS.

Table 7-5. Predicted TPSS Noise

TPSS Unit Site	Location	Distance to Closest Receiver, feet	Receiver Category	Existing Noise Level, dBA		Predicted TPSS Noise[b], dBA		Impacts (Yes/No)
				Nighttime Leq[a]	Ldn	Leq	Ldn	
A1	Lower Grand	120	1	63	66	42	48	No
A2	Broadway and 2nd	75	3	68	76	46	52	No
A3	Broadway and 8th	25	2	68	76	56	62	No
A4	Figueroa and 8th	100	2	66	73	44	50	No
A5	Hill and 5th	100	2	59	66	44	50	No
B1	Grand and 2nd	125	1	63	66	42	48	No
B2	Broadway and 2nd	40	3	68	76	52	58	No
B3	Broadway and 9th	40	2	68	76	52	58	No
B4	Figueroa and 9th	50	2	66	73	50	56	No
B5	Hill and 6th	40	2	59	66	52	58	No

Source: ATS Consulting, January 2016.

Notes:

(a) Average noise levels (Leq) measured between 10 PM and 7 AM. Daytime Leq used for Category 1 receivers

(b) The predicted TPSS noise levels are based on a maximum noise level of 50 dBA at a distance of 50 feet from any side of the TPSS units.

7.3.3 Maintenance and Storage Facility

There are four potential locations for the streetcar Maintenance and Storage Facility (MSF). Noise sources associated with MSFs include carwashes, blowdown facilities, repair shops, vehicles movements across track switches, potential squeal noise from tight radius curves within the facility and vehicular traffic into and out of the facility. The following are the four locations identified as potential sites for the streetcar MSFs:

- M1, Northside of Broadway between 2nd and 3rd Street;
- M2, Northeast corner of Hill Street and 5th Street;
- M3, Southwest corner of 11th Street and Olive Street; and
- M4, Southeast corner of 11^{th} Street and Olive Street.

As discussed in Section 2.3.3, the MSF would consist of an enclosed building for the maintenance shops and open area for storage. An employee parking lot may be provided. There is potential for the MSF to be housed in the ground floor of a multi-story development. When that happens all noisy activities associated with the MSF would be in enclosed spaces. However, the potential multi-story development is not part of this Project and the building may not be in place during the Opening Year. Therefore, for noise evaluation purposes the MSF is evaluated as a standard facility.

The MSF would have a single ingress/egress point for the streetcars at each of the potential sites. The streetcars would access the facility via a short segment of track connected to the mainline by one or two turnout tracks. The LA Streetcar would consist of a fleet of eight electrically powered streetcar vehicles. Each of the four proposed sites for the MSF would have the capacity to store up to twelve vehicles.

The key noise sources from the MSF activities for the four potential sites are shown in Figure 7-1 through Figure 7-4. Each of the MSF sites have turnout tracks and tight curves that have potential for wheel squeal noise. The turnout track and the tight curves are the potential noise sources from train movement within the storage facility and from ingress and egress of the streetcar vehicles at the lead tracks to the mainline. The maintenance shop noise, the movement of streetcars on the main line adjacent to the facility, the car wash facility and the movement of vehicular traffic in and out of the facility are the other noise sources. The noise sources and the assumptions of the activities at the potential MSF sites are described below:

- Traffic on Lead Tracks: The number of streetcars entering and exiting the storage facility would peak during the hours starting at 6 AM, 8 AM, 3 PM and 5 PM. These are hours when peak operations begin and end. For the 4 hours of peak activity between the main line and the MSF, the number of streetcars that would enter and exit the facility was assumed to be six. In addition, there is potential for the streetcars to enter and exit the facility when there are shift changes and/or streetcars are pulled out or fed into the mainline through the lead tracks. Therefore, we assumed the number of streetcars that would enter and exit the facility to be 2 during each hour when there is no peak activity.
- Turnout tracks: The turnout would be sources of impact noise from the wheel banging on the turnout frogs. The turnouts would experience difference amounts of traffic depending on their

location. We assumed 6 streetcars would pass through the busiest turnout track during the peak hour.

- Maintenance Shops: Noise from the maintenance facility could include hammering for minor body work or repair of other components; noise from machines such as air compressor and metal working equipment; and noise from the HVAC system. Forklift backup alarms and general repair tools could also be intermittent noise sources. The maintenance shops are assumed to be a closed facility that would have its doors open most of the time. The noise contribution from the maintenance shop activities are assumed to be less than the yard activities.

- Car Wash: We assumed that the car wash would include one vehicle wash bay and servicing area for daily cleaning and would be a non-mechanical hand wash system at all four MSFs.

- Vehicular Traffic Into/Out of Facility: A parking facility was assumed for sites M1 and M2. For site M3, the existing parking garage on Olive Street was assumed to be used for parking. We assumed 5 peak hours and 4 off-peak hours for vehicle traffic into and outside the facility. The peak hour traffic assumes 10 motor vehicles during the peak and off-peak hours. In addition, 3 trucks were assumed during the peak hours. Based on the FHWA's algorithm used in the Traffic Noise Model, the reference sound level at 50 feet for autos, SUVs and heavy trucks moving at 30 mph ranges from 65 to 77 dBA. We assumed a reference sound level (Leq) of 77 dBA at 50 feet for vehicles moving at 30 mph. This is a conservative reference level because at low speeds the vehicle noise is dominated by the engine noise, and not the tire-pavement noise.

Table 7-6 shows the noise analysis for MSF at potential site M1. Three residential land use clusters and one institutional sensitive receiver would be exposed to noise from activities related to M1. The locations of the land uses are shown in Figure 7-1. The predicted noise from activities at M1 would not exceed the FTA moderate impact threshold at receiver I3, the Guadalupe Wedding Chapel, during the peak hours of operation.

Table 7-7 shows the noise analysis for MSF at potential site M2. Two residential land use clusters would be exposed to noise from activities related to M2. The locations of the land uses are shown in Figure 7-2. The predicted noise from activities at M2 would exceed the FTA moderate impact threshold at receiver R33, multi-family residences.

Table 7-8 shows the noise analysis for MSF at potential site M3. Three residential land use clusters would be exposed to noise from activities related to M3. Note that residential receivers R22 would shield the potential wheel squeal from the tracks entering the MSF on 11th Street to receivers R23 and R23A. The locations of the land uses are shown in Figure 7-3. The predicted noise from activities at M3 would exceed the FTA moderate impact threshold at receiver R22, Grand Lofts multi-family residences.

Table 7-9 shows the noise analysis for MSF at potential site M4. Two institutional sensitive receivers would be exposed to noise from activities related to M4, Siatech High School at receiver I8 and the YWCA at receiver I9. The locations of the land uses are shown in Figure 7-4. The predicted noise from activities at M4 would not exceed the FTA moderate impact threshold at receivers I8 and I9.

7.4 Traffic Noise

The traffic circulation and the peak hour traffic volumes in the study area would change in the future with and without the Project. An analysis was prepared that compares the existing traffic volumes (2014/2015) with the future 2020 Opening Year and 2040 Horizon Year volumes at each of the noise sensitive receivers assessed for the streetcar operations. Each of the future year scenarios assess the change in traffic volumes without the Project and with the four Build Alternatives. The methodology used to calculate the change in traffic noise is ten times the logarithmic ratio of the future traffic divided by the existing traffic volume for both the AM and PM peak hours. The results of the analysis are presented in Table 7-10 through Table 7-15. The predicted change in peak hour traffic noise levels in 2040 compared to the existing levels in 2014/2015 for the Category 1 land uses in the AM peak hour are in the range of an increase of 0.7 dBA to 2.0 dBA. In the PM peak hour the increase is in the range of 0.7 dBA to an increase of 1.4 dBA. For Category 2 land uses in the AM peak hour is an increase in the range of 0.7 dBA to 1.9 dBA over the future 2040 Project traffic. In the PM peak hour the increase is 0.7 dBA to an increase of 1.8 dBA. The change in peak hour traffic noise levels in 2040 compared to the existing levels in 2014/2015 for the Category 3 land uses in both the AM and PM peak hour is an increase of 0.7 dBA to 1.4 dBA. The change in traffic noise is not considered a significant impact under CEQA because neither the future 2020 Year traffic nor the 2040 Year traffic results in a 3 dBA or more increase over the existing conditions. It is not a significant impact under NEPA because neither the future 2020 Year traffic nor the 2040 Year traffic results in a 3 dBA or more increase over the future No Build conditions.

7.5 Streetcar Operational Vibration

As discussed in Section 4.4, FTA guidelines provide two sets of criteria for assessing vibration impacts. The first is based on the overall vibration velocity level and is intended for use with a general impact assessment. The second is for use with a detailed impact assessment when the predictions include the 1/3 octave band spectra. The approach used for this assessment is:

1. The predicted overall vibration velocity level is compared to the applicable General Assessment threshold. The thresholds are 72 VdB for residential land uses (FTA Category 2) and 75 VdB for institutional land uses (FTA Category 3).

2. If the predicted level is below the General Assessment threshold, no additional analysis is performed.

3. If the predicted level is above the General Assessment threshold, the predicted 1/3 octave band spectrum is compared to the threshold for a Detailed Impact Assessment. Over the 8 to 80 Hz range, the thresholds are a maximum in any 1/3 octave band of 72 VdB for residential land uses and 75 VdB for institutional land uses. This level is referred to as the ***band maximum*** level.

4. Mitigation is evaluated if the predicted vibration levels exceed both the General and Detailed Assessment thresholds.

For "special" land uses such as theaters and concert halls, the FTA impact criteria do not have a separate threshold for detailed impact assessments. Mitigation is evaluated for land uses that fall into one of the FTA special land uses when the predicted vibration level exceeds the applicable General Assessment impact threshold. The streetcar vibration inside the "special" buildings is evaluated individually for each receiver later in this section.

The vibration impact assessment for residential land uses is presented in Table 7-16 and for institutional land uses is presented in Table 7-17. Included in Table 7-17 are land uses such as schools, churches, clinics, and optometrists. However, because outdoor activities are generally not affected by groundborne vibration, land uses such as parks are not included in Table 7-17.

As shown in Table 7-16, there are two receivers in the alignment that are common to all four build alternatives where the predicted vibration levels at residential land uses exceed the General Assessment impact threshold. The predicted vibration levels exceed the General Assessment impact threshold at one additional receiver for the 9th Street Alternatives 4 and 5. The predicted indoor vibration levels do not exceed the Detailed Assessment impact threshold at any of these receivers. The conclusion is that no vibration impacts from the streetcar operations are predicted at any Category 2 land uses.

The predicted vibration levels for Category 3 land uses are shown in Table 7-17, and as can be seen, all of the predicted vibration levels except for the Federal Courthouse are below the General Assessment impact threshold. The predicted indoor vibration levels do not exceed the Detailed Assessment impact threshold at the Federal Courthouse. Therefore no vibration impacts from streetcar operations are predicted at any Category 3 land uses.

Notes:

Receivers I1 through I12 are common to all the build alternatives. There are no additional Category 3 land uses for Alternatives 2 and 3.

(a) Distance to the near track (NT) is rounded off to the nearest 5 feet.

(b) Maximum 1/3 octave band level in 8 to 80 Hz frequency range.

(c) Includes both inbound and outbound tracks.

(d) Includes +10 dB for vibration amplification due to wheel impacts at special trackwork.

In addition to the FTA vibration Category 1 through 3 land uses, FTA provides separate impact thresholds for several types of “special” buildings. The “special” buildings along the streetcar corridor include the Colburn School, Disney Concert Hall, Orpheum Theater, Belasco Theater and the United Artist Theater renovated and opened as the Theatre at Ace Hotel. In addition, there is potential for two other theaters on Broadway that are not currently in use to be restored/revived after the streetcars are in operation. The Million Dollar Theater would undergo its own noise and vibration studies and CEQA analysis when they are renovated. Because the theaters hold concerts and use the space for recording of TV shows and commercials, they were evaluated as concert halls. The vibration predictions for each “special” building are discussed below.

Disney Concert Hall

The predictions for the Disney Concert Hall are based on the measurements at site V-1. The measured LSTMs inside the BP Hall and the concert hall (main performance space) were combined with the force density to predict the levels of groundborne noise and vibration at the Disney Hall. The measurement locations are shown in Figure 7-5. The assumptions used in the prediction are:

Train Speed: 25 mph

Safety Factor: +5 decibels

Adjustment for converting VdB to dBA: 0 decibels

Adjustment for amplification from the turnout track on Grand Avenue: +10 decibels

Adjustment for impact line offset from the track centerline based on the composite curves given in Appendix E.

The predicted groundborne noise and vibration spectra inside the Disney Concert Hall are shown in Figure 7-6. The shaded area in the figure represents the range where the impact thresholds would be approached or exceeded. If the predicted spectrum is below the shaded area it means there would be no impacts. The predicted groundborne noise and vibration spectra in Figure 7-6 show peaks at 125 Hz; however, this seems to be due to background noise because there was very poor coherence at this frequency during the LSTM measurements (Section 6.2). Poor coherence could be caused by a number of factors including higher background vibration and relatively high attenuation of the vibration energy by the building foundation. The predicted levels are well below the shaded area in Figure 7-6 although predictions include a +10 dB adjustment factor for amplification from the turnout track frogs. The predicted overall levels are shown in Table 7-18 and they do not exceed the FTA impact threshold for groundborne noise and vibration. Therefore, no groundborne noise and vibration impacts from the streetcar operations are predicted at the Disney Concert Hall.

Figure 7-5: Measurement Locations Inside Disney Concert Hall Auditorium (Left) and BP Hall (Right)

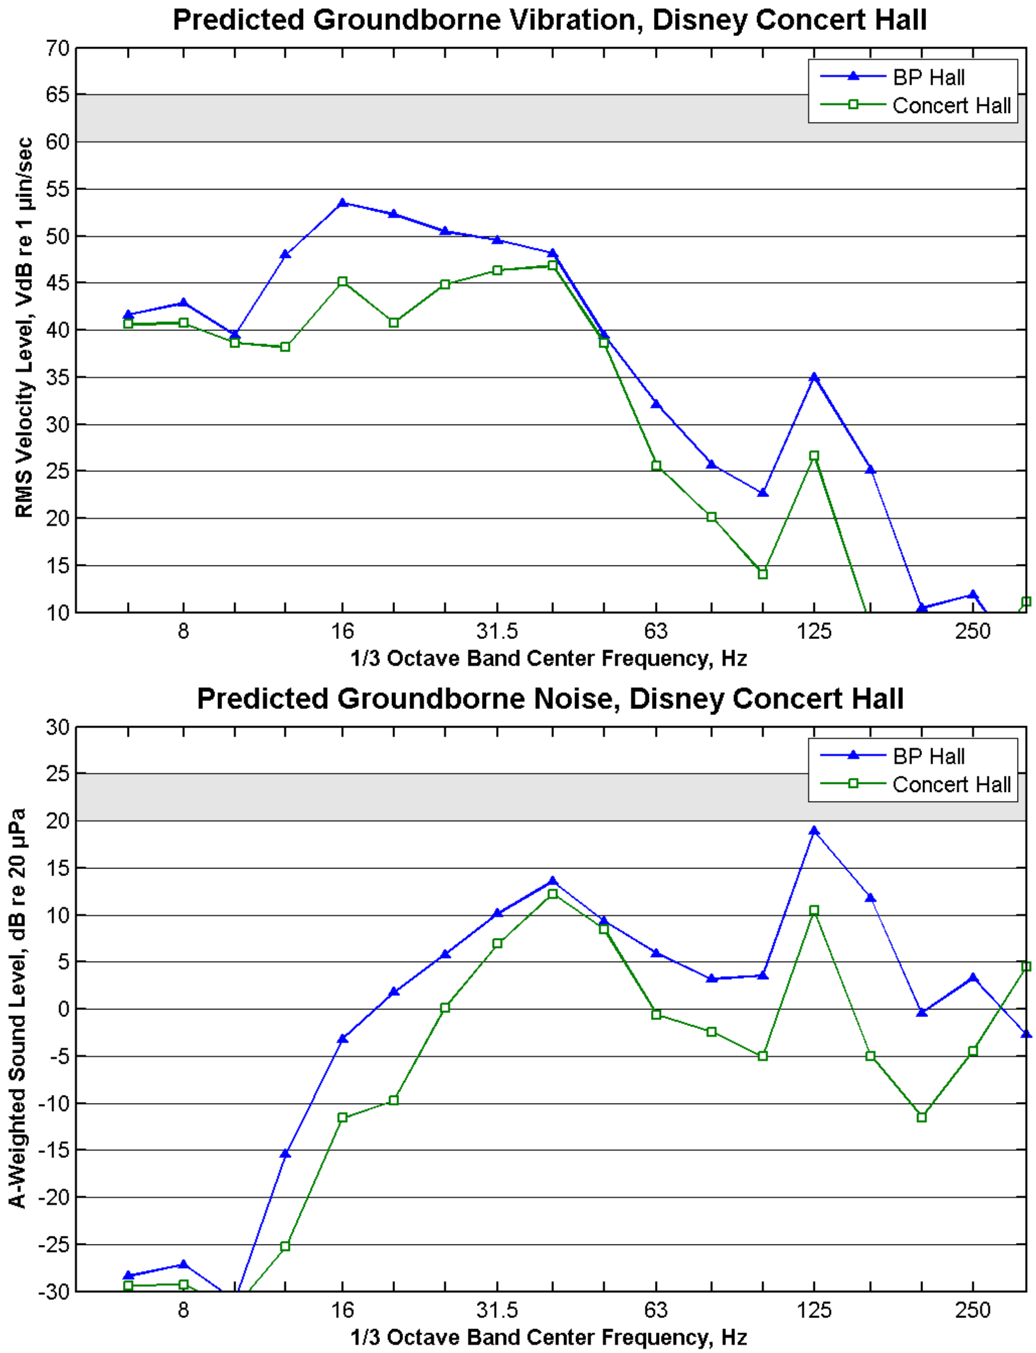

Figure 7-6: Predicted Groundborne Vibration and Groundborne Noise, Disney Concert Hall

(Shaded area indicates range where vibration and noise levels approach and may exceed the FTA impact threshold for concert halls)

Orpheum Theater

The current use of the Orpheum Theater includes vibration-sensitive activities such as TV recordings, film shootings and theatrical productions. The vibration predictions for the Orpheum Theater are based on the measurements at site V-2. The LSTM measurements inside the auditorium area were performed at seats X-40 and V-2 (see Section 6.2). The measurement locations are shown in Figure 7-7. For predicting vibration from streetcar operations, the measured LSTMs were combined with the force density and adjustments based on the following assumptions:

Train Speed: 25 mph

Safety Factor: +5 decibels

Adjustment for converting VdB to dBA: 0 decibels

Adjustment for impact line offset from the track centerline: Based on the composite curves given in Appendix E.

The predicted groundborne noise and vibration spectra inside the Orpheum Theater auditorium are shown in Figure 7-8. Table 7-18 shows the predicted overall levels. The predicted groundborne noise and vibration are well below the shaded area in Figure 7-8 and the overall levels are 10 to 15 decibels below the FTA impact threshold (see Table 7-18). Therefore, no groundborne noise and vibration impacts from the streetcar operations are predicted at the Orpheum Theater.

Figure 7-7: Measurement Locations at the Orpheum Theater Seat X-40 (Left) and Seat V-2 (Right)

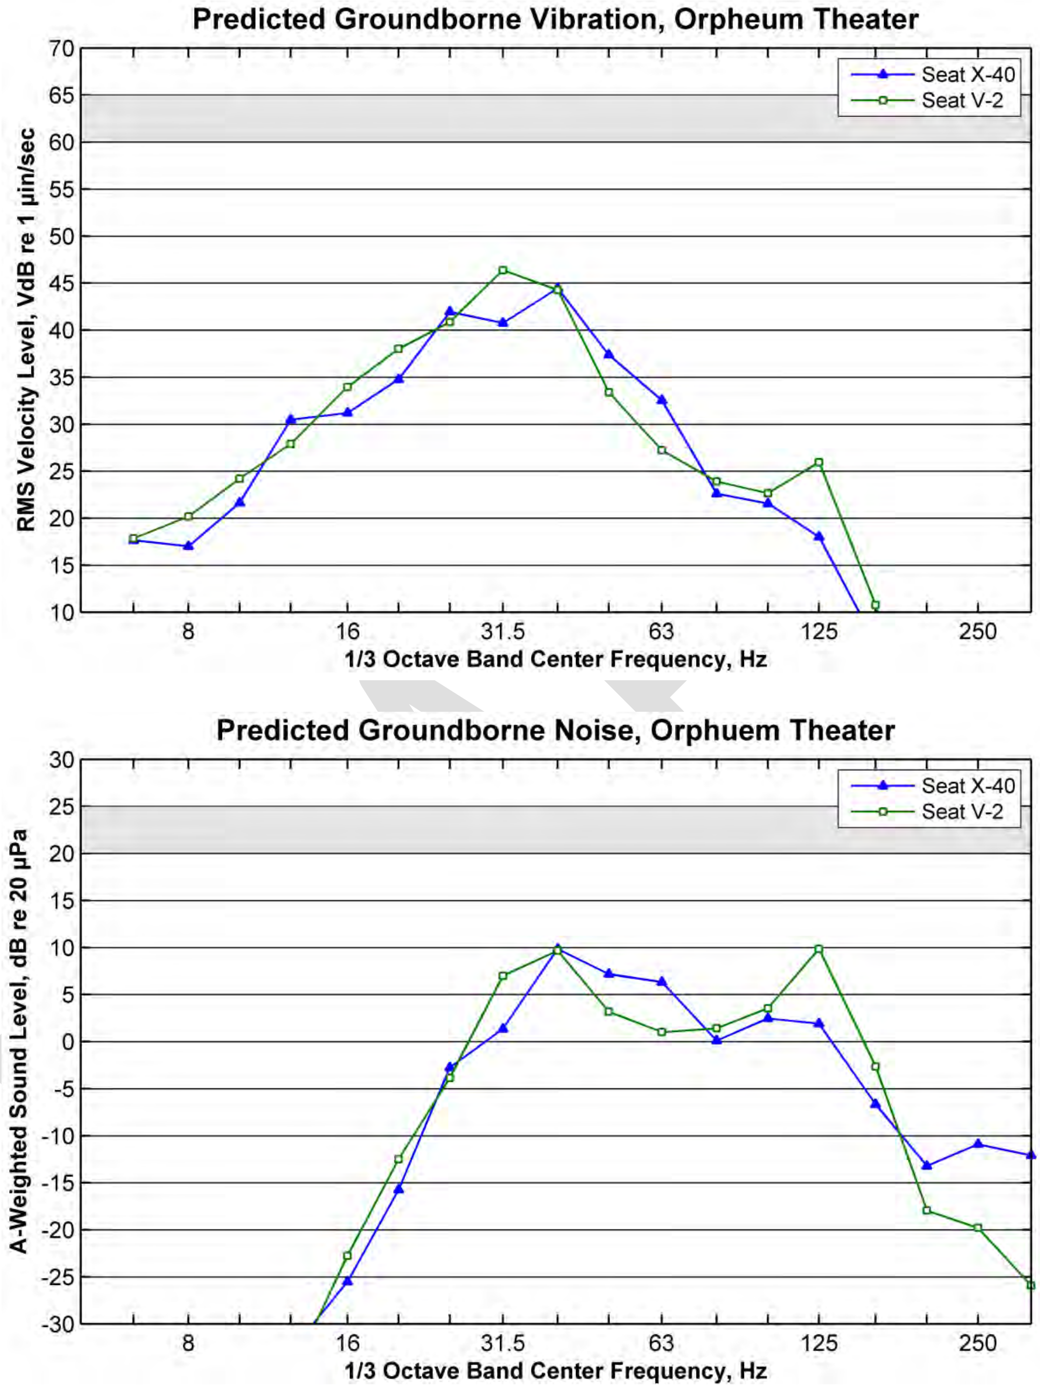

Figure 7-8: Predicted Groundborne Vibration and Groundborne Noise, Orpheum Theater

(Shaded area indicates range where vibration and noise levels approach and may exceed the FTA impact threshold recording studios)

Belasco Theater

The current use of the Belasco Theater includes concerts and performances. The vibration predictions for the Belasco Theater are based on the measurements at site V-3. The LSTM measurements inside the auditorium area were performed on a dance floor (off stage) and on a raised wooden stage (on stage). The details of the test and the LSTM data for this site are discussed in Section 6.2. The measurement locations are shown in Figure 7-9. For predicting vibration from the streetcar operations, the measured LSTMs were combined with the force density and adjustments based on the following assumptions:

Train Speed: 25 mph

Safety Factor: +5 decibels

Adjustment for converting VdB to dBA: 0 decibels

Adjustment for impact line offset from the track centerline: Based on the composite curves shown in Appendix E.

The predicted groundborne noise and vibration inside the Belasco Theater performance area are shown in Figure 7-9. The vibration spectrum shows a peak between 16 and 20 Hz and rolls off after indicating resonance amplification. Because the spectrum both on and off stage behaved similarly, it seems that the floor vibration could be the source of amplification. The predicted groundborne vibration on stage is in the shaded area (Figure 7-10) and the overall vibration level is within 1 decibel of the FTA impact threshold (see Table 7-18). The groundborne noise is about 6 decibels below the FTA impact threshold. Although no groundborne noise and vibration impacts from the streetcar operations are predicted at the Belasco Theater, streetcar operations could be amplified inside this theater because of the characteristics of the floor vibration. Therefore we recommend that the vibration inside the theater be verified after the streetcars are in operation. If the levels exceed the predicted groundborne vibration, mitigation could involve stiffening the floors by reducing the floor joist spacing.

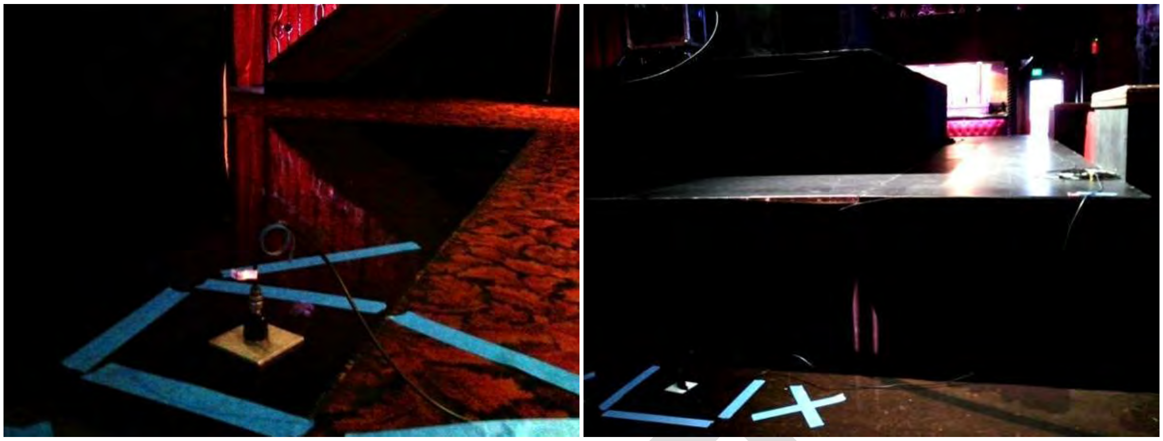

Figure 7-9: Measurement Locations inside Belasco Theater Stage Floor (Left) and On Stage (Right)

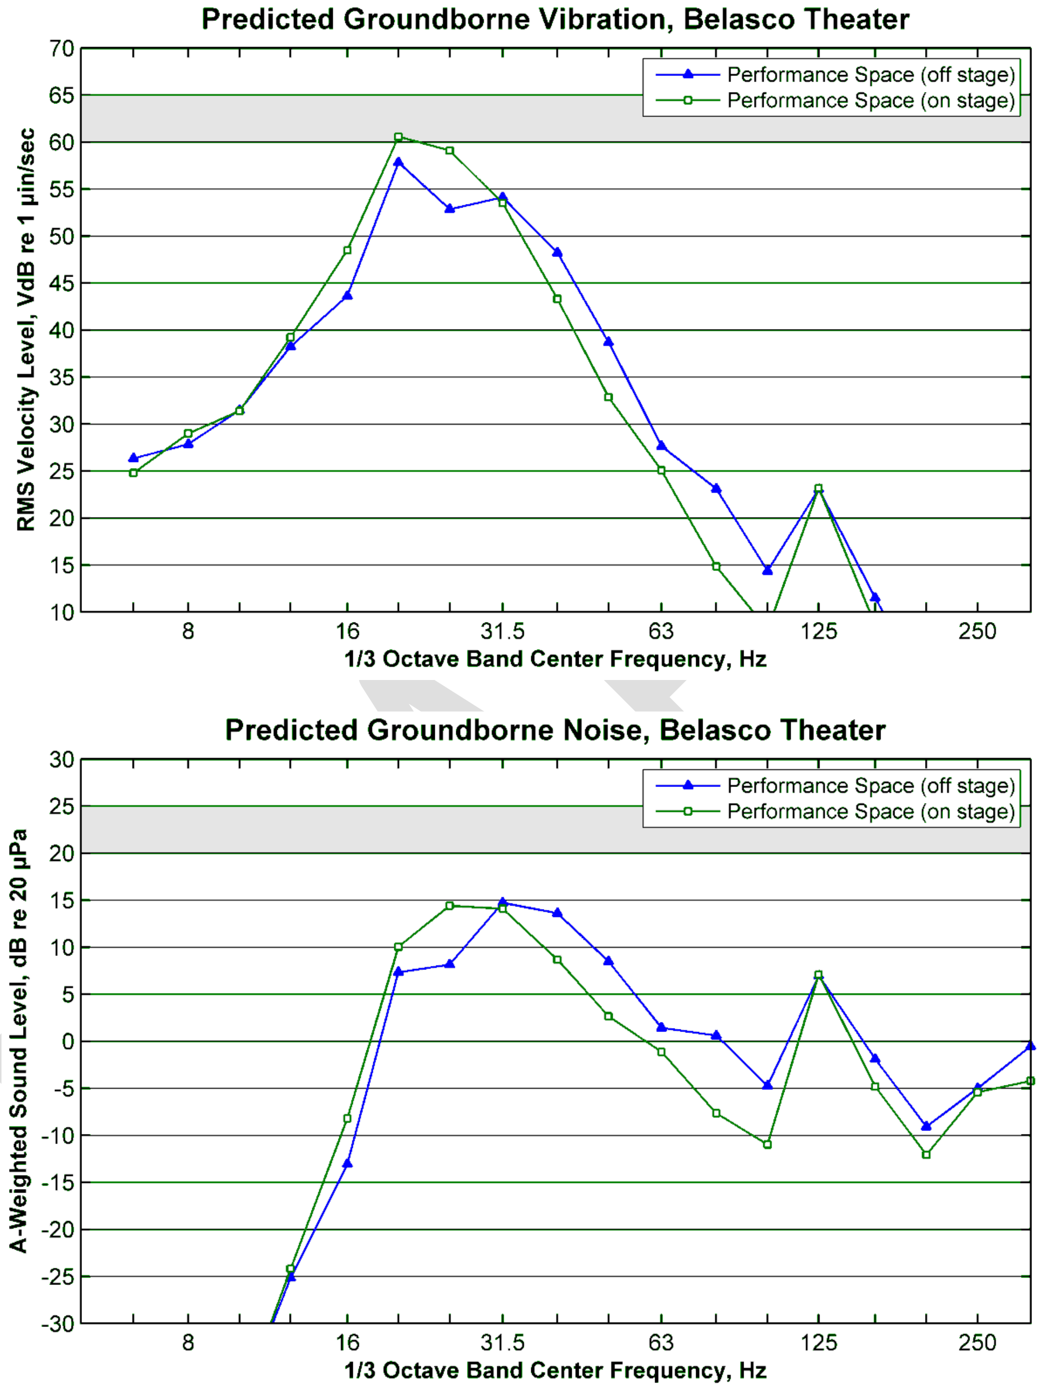

Figure 7-10: Predicted Groundborne Vibration and Groundborne Noise, Belasco Theater

(Shaded area indicates range where vibration and noise levels approach and may exceed the FTA impact threshold recording studios)

Colburn School

The Coburn School is a school of performing arts and a conservatory of music with recording facilities. It is located 180 feet south of the streetcar tail tracks on Grand Avenue and is within 200 feet from Disney Hall. The proposed streetcar tracks are relatively far from the building and streetcar speeds would be only 5 to 15 mph on the tail tracks. Thus, a site-specific test is not required because the groundborne noise and vibration from the streetcars would be substantially lower than the impact thresholds. Groundborne noise and vibration was predicted for this site based on the LSTM measurements in the BP Hall at the Disney Concert Hall after adjusting for the outdoor propagation using the curves shown in Appendix E. No adjustment was used for the turnout track frogs in the tail tracks because amplification of vibration from the wheel impacts is unlikely at 180 feet up to 15 mph. The assumptions used in the predictions include:

Train Speed: 15 mph

Safety Factor: +5 decibels

Adjustment for converting VdB to dBA: 0 decibels

Adjustment for amplification from the turnout track on Grand Avenue: 0 decibels

Adjustment for impact line offset from the track centerline: Based on the composite curves shown in Appendix E.

The predicted groundborne noise and vibration inside the Colburn School are 2 dBA and 41 VdB, respectively (see Table 7-18). These levels are more than 20 dB below the FTA impact threshold. Although variations in outdoor to indoor transmission and floor amplification may be expected between the Disney Concert Hall and the Colburn School, the differences are unlikely to be over 10 dB. Therefore, no groundborne noise and vibration impacts are predicted at the Colburn School.

Theaters on Broadway

There are at least three theaters on Broadway that would be affected by the Streetcar operations. One of these is the United Artist Theater which has been renovated and opened as the Theatre at ACE Hotel was evaluated as both a theater (Site T6) and a residential land use (Site R19A). The groundborne noise and vibration from the streetcar operations were estimated for the Million Dollar Theater and Los Angeles Theater. These theaters were evaluated as concert halls. The setback distance of these theaters from the future streetcar track is 35 feet. It is noteworthy that the streetcar tracks would be closer to these theaters than the Orpheum Theater. The estimated overall groundborne noise and vibration for these theaters are based on measurements at the Orpheum Theater, after adjusting for the setback distance.

Because site-specific tests were not performed at these theaters, the estimates were used as a preliminary screening of the vibration levels. The estimated groundborne noise at the theaters is within 2 decibels of the FTA impact threshold, therefore not a significant impact (see Table 7-18). If there are plans to renovate/revive these theaters in the future, we recommend site-specific vibration tests at these receivers during the Final Design of the Project. In case potential for vibration impacts are identified from the streetcar operations, appropriate mitigation measures should be incorporated in the building renovation plans or in the track design to eliminate the impacts.

Table 7-18. Summary of Vibration Impact Assessment for "Special" Buildings								
Receiver #	Receiver Name	Location	Groundborne Vibration, VdB			Groundborne Noise, dBA

Source: ATS Consulting, January 2013.

Notes:

(a) The predictions are based on LSTM measured at the Disney Concert Hall.

(b) The estimates are based on measurements in the Orpheum Theater and not on site-specific tests at these receivers.

(c) The results need to be confirmed during Final Design.

7.6 Operational Noise Mitigation

The potential for noise impacts along the proposed streetcar alignments are predicted as moderate noise impacts at residential receivers R23 and R35, at the Disney Concert Hall, and at the future Federal Courthouse. A predicted Project noise level in the severe noise impact range is considered significant for both NEPA and CEQA, which would require mitigation. Sensitive receivers that show FTA moderate impacts are not considered to be severely or significantly adversely impacted under NEPA and CEQA. When the predicted Project noise level is in the FTA moderate noise impact range, FTA guidance states that mitigation measures should be considered along with the magnitude of the impact and the need for mitigation. Other factors could include the predicted increase over existing noise levels, the types and number of noise-sensitive land uses affected, existing outdoor-indoor sound insulation, and the cost effectiveness of mitigating noise to more acceptable levels.

It may be noted that the FTA noise impacts are based on outdoor noise levels. The outdoor noise sensitive activities at the Disney Concert Hall are shielded from the streetcar noise and would not be impacted. As an interior land use, Disney Concert Hall building has well designed sound insulation so the indoor noise from traffic and other exterior noise sources meet the very stringent criteria of a world class concert hall. The streetcar noise, which would be no louder than a bus or truck passby on Grand Avenue, would be unlikely to affect the sensitive interior spaces of the building.

At residential receivers R23 and R35, the predicted Project noise level is in the FTA moderate noise impact range. FTA guidance is that mitigation for moderate impact should be based on consideration of factors including the predicted increase over existing noise levels, the types and number of noise-sensitive land uses affected, existing outdoor-indoor sound insulation and the cost effectiveness of mitigating noise to more acceptable levels. Each sensitive receiver where predicted noise levels exceed the applicable impact threshold and potential mitigation measures is discussed below:

- **Receiver R23 (Moderate Impacts)**: This is a multi-family residential receiver located on W 11th Street between S Grand Avenue and S Hope Street. It includes receivers in two high-rise mixed use buildings. The 1st floor land uses include a coffee shop, fitness centers and a salon. There are 24 residential units in these two buildings that would be exposed to the streetcar noise. The predicted streetcar noise level increases from the existing level by only 2 decibels. Moderate noise impact is predicted at the balconies of these residential units, which are the only outdoor noise sensitive areas that would be exposed to streetcar noise. Use of sound walls as mitigation for the balconies is not feasible because these walls would impede the flow of traffic. Since this multi-family residence is sound insulated with double pane windows there is no other mitigation that would be feasible for this receiver. ***Recommendation: No Mitigation***.

- **Receiver R35 (Moderate Impacts)**: This receiver is the Kawada Hotel located on the southeast corner of S Hill Street and 2nd Street. The 1st floor land uses include a cafe, a restaurant and a bakery. There are 15 rooms in the upper levels of this hotel that would be exposed to the streetcar noise. The predicted streetcar noise level increases the existing level by less than 1decibel. Use of sound walls as mitigation is not feasible because these walls would impede the flow of traffic. There are no outdoor noise sensitive areas at this building that would be affected by streetcar noise. Since this hotel is sound insulated with double pane windows there is no other mitigation that would be feasible for this receiver. ***Recommendation: No Mitigation***.

- **Disney Concert Hall T2 (Moderate Impacts)**: The sources of streetcar noise impacts outside the Disney Concert Hall are the combination of: 1) wheel impacts at special trackwork and 2) potential squeal noise from tight curves located on Grand Avenue and 1st Street. The use of a “low impact” frog at the special trackwork would reduce the wheel impact noise. Use of one of several rail lubricants is usually sufficient to control wheel squeal. However because of the steep grade of the track there is concern with the use of a lubricant at this location. The FTA Guidance discusses wheel squeal from LRT vehicles and not from streetcars. It is less likely that wheel squeal would occur with a streetcar which is about 20 feet shorter than an LRT vehicle and 66-foot radii curves that are designed for the LA streetcar. The issue of wheel squeal, if it occurs at this location, would be addressed during pre-revenue operations. If it does occur the use of wheel dampers would control the wheel squeal without using a lubricant. ***Recommendation: Use of "low impact" frog such as a "well designed" flange-bearing frog with a ramp angle of between 1:20 and 1:100 for special trackwork and wheel dampers if wheel squeal occurs.***

- Federal Courthouse I2A (Moderate Impacts): Similar to the Disney Concert Hall, the sources of streetcar noise impacts outside the Federal Courthouse are the combination of: 1) wheel impacts at special trackwork and 2) potential squeal noise from tight curves located on Hill Street and 1st Street. The use of a "low impact" frog at the special trackwork would reduce the wheel impact noise. Wheel squeal can be minimized or avoided by use of wheel dampers. ***Recommendation: Use of "low impact" frog such as a "well designed" flange-bearing frog with a ramp angle of between 1:20 and 1:100 for special trackwork and wheel dampers if wheel squeal occurs.***

7.7 Maintenance and Storage Facility Noise Mitigation

Potential moderate noise impacts were predicted at the Guadalupe Wedding Chapel (I3), multi-family apartments (R33) and the Grand Lofts (R22) for MSF sites M1, M2 and M3, respectively. The mitigation measures recommended for each of these impacts to be implemented at MSF sites M1, M2, and M3 are:

- A "low impact" frog, such as a "well designed" flange bearing frog with a ramp angle between 1:20 and 1:100 for all turnouts within the MSF.
- Rail lubricators at all tight radius curves within the MSF to reduce and control wheel squeal.

7.8 Operational Vibration Mitigation

There are no sensitive receivers in the Project corridor where the predicted vibration levels exceed the FTA General Assessment or Detailed Assessment vibration impact thresholds. Therefore, no mitigation is recommended for vibration from the streetcar operations. However, we recommend that any vibration sensitive facility in the Project corridor such as a theater, concert hall or a recording studio located within 100 feet of the streetcar alignment that has not been evaluated in detail would be studied during Final Design. This includes the currently unoccupied Million Dollar Theater, and Los Angeles Theater and the renovated United Artist Theater opened as the Theatre at Ace Hotel. The four vibration test results for the current Project, although comparable, indicate that the vibration propagation paths in the downtown area are not just in soil but in the numerous underground structures whose transmission efficiencies are not straightforward to predict. Performing site-specific tests at these sensitive spaces would verify whether streetcar operations would result in vibration impacts inside the sensitive spaces and design suitable mitigation.

If the streetcar track would be less than 1 foot from any part of a building foundation, mitigation measures, such as a resilient mat installed under the trackbed or comparable design measure, would be used.

If plans are developed to renovate/revive the unoccupied theaters in the future, site-specific vibration tests shall be conducted at these receivers during final design of the Project. In case potential vibration impacts are identified resulting from streetcar operations, appropriate mitigation measures shall be incorporated in the building renovation plans or in the track design to eliminate the impacts.

If during final design vibration impacts are identified at the unoccupied theaters, a number of different approaches have been used by light rail and streetcar systems to reduce the levels of groundborne vibration. These measures range from very simple approaches such as stiffening the floors at the receivers to the very expensive such as placing the entire track system on a concrete slab that is supported by springs (a floating slab). The most common measure used to mitigate train vibration consists of placing some sort of resilient layer between the track and the soil. Some common approaches for installing standard vibration mitigation measures with embedded track are:

- Isolation mat under Track Slab: Isolation mats are similar to ballast mats that are designed to be placed under ballast and tie track and concrete slab track.
- QTrack Embedded Track: QTrack is a proprietary embedded track system supplied by Pandrol-CDM. It is a fastenerless continuously supported track with rubber profiles decoupling the whole rail from its environment.
- High-resilience boot: A common embedded track system is to place the rails in a rubber "boot", position the rails, and then pour concrete around the boot.

7.9 CEQA Noise and Vibration Impacts

The CEQA impact analysis for this Project assesses the:

- the existing conditions without the Project to the future Build conditions with the Project; and
- the future No Build conditions to the future Build conditions with the Project

As part of the CEQA noise analysis the following scenarios were evaluated for the No Project Alternative and the four build alternatives:

- Existing Year (2014/2015)
- Opening Year (2020)
- Horizon Year (2040)

7.9.1 Existing with the Streetcar Project

The noise levels due to the Project were added to the existing noise levels to determine the cumulative effect of the Project for the 2014/2015 Year. The Project noise levels for the assessment of the Category 1 land uses presented in Table 7-19 range from an Ldn of 58 to 61 dBA with the exception of Site T2, Disney Concert Hall where the Project noise level is 67 dBA due to the streetcar passby noise, noise squeal, and turnout impact noise. The Category 1 Project noise levels at Sites T1, and T3 through T8 are less than the existing traffic noise. At Site T2, Disney Concert Hall, the Project noise level is the same as the existing traffic noise.

The Project noise levels at the Category 2 land uses presented in Table 7-20 range from an Leq of 56 to 63 dBA which are less than the existing traffic noise. The Project noise levels at the Category 3 land uses presented in Table 7-21 range from an Leq of 56 to 63 dBA which are less than the existing traffic noise.

The Project noise levels were also added to the future traffic noise for the 2020 Opening Year and the 2040 Horizon Year. Table 7-19 through Table 7-21 present the traffic noise levels, combined traffic plus Project noise, and change in level due to the Project for all noise sensitive receivers (Categories 1, 2, and 3).

The increase in existing noise levels with the Project would be less than 3 dB at all the noise sensitive receivers with the exception of the following receivers:

T2 - Disney Concert Hall: Existing noise levels would increase in the range of 3.1 to 4.7 dBA.

T7 – Belasco Theater: Existing noise levels would increase in the range of 3.1 to 3.8 dBA.

T8 – Dorothy Chandler Pavilion: Existing noise levels would increase in the range of 3.0 to 3.1 dBA

R21 – Apartments at Broadway and 11th Street: Existing noise levels would increase by 3.0 dBA.

R23 – Apartments at Hope and 11th Streets: Existing noise levels would increase in the range of 3.1 to 3.8 dBA.

R24 - Metlofts: Existing noise levels would increase in the range of 3.2 to 3.8 dBA.

R35 – Kawada Hotel: Existing noise level would increase in the range of 3.0 to 3.1 dBA.

R36 – Apartments: Existing noise level would increase in the range of 3.0 to 3.6 dBA.

R37 – Skyline Apartments: Existing noise level would increase in the range of 3.0 to 3.5 dBA.

I1 – Mosk Courthouse: Existing noise level would increase in the range of 3.0 to 3.1 dBA.

I2A – Federal Courthouse: Existing noise levels would increase in the range of 3.8 to 4.5 dBA.

I13 – Grand Hope Park: Existing noise levels would increase by 3.3 dBA.

I14 – FIDM: Existing noise levels would increase by 3.3 dBA.

The exceedance of the existing noise levels at Receiver T2, Disney Concert Hall is due to the operation of the streetcar, specifically wheel squeal and impact noise from special trackwork. At Receiver T8, Dorothy Chandler Pavilion and I2A, Federal Courthouse, the exceedance is due to wheel squeal. These impacts can be mitigated as discussed in Section 7.3.1. The exceedances of the existing noise levels at the other receivers is due to the projected increase in future traffic with the proposed Project. Traffic noise mitigation would not be feasible or reasonable at any of these receivers.

7.9.2 Future No Build without the Streetcar Project

The Opening Year condition would include the existing projects and improvements committed to be implemented by the first year of operation, 2020. The 2040 Horizon Year would include projects and improvements committed to be implemented by 2040. The measured existing noise levels are not expected to increase by more than 2 dB by 2040.

Source: ATS Consulting, January 2016.

Notes:

(a) A positive number indicates that future noise level due to the Project would increase compared to the existing noise level (2014/2015). A negative number indicates the future noise level would decrease relative to the existing noise level.

(b) Bold red fonts indicate that the predicted noise levels exceed the CEQA thresholds.

Notes:

(a) A positive number indicates that future noise level due to the Project would increase compared to the existing noise level (2014/2015). A negative number indicates the future noise level would decrease relative to the existing noise level.

(b) Bold red fonts indicate that the predicted noise levels exceed the CEQA thresholds.

7.10 California Environmental Quality Act (CEQA) Determination

The CEQA determination for this Project compares the cumulative effects of the Project added to the existing conditions and to the Opening Year and the Horizon Year.

Applying CEQA guidelines, any vibration or noise impacts identified as a significant impact must be mitigated unless mitigation is infeasible or no abatement measures are available, due to economic, social, environmental, legal, or technological conditions. For the proposed Project, the noise and vibration impact criterion, as defined by FTA for transit and for construction vibration, and FHWA for traffic, was applied as the CEQA threshold for significance.

In conformance with CEQA, the Project's operational noise and operational vibration were evaluated to determine if the Project would cause significant noise or vibration impacts to the environment. The Project's impact analyses concluded that the Project as described, would result in the following:

- Would not expose persons to or generate noise levels in excess of standards established in the local general plan or noise ordinance or applicable standards of other agencies
- Would not expose persons to or generate excessive ground-borne vibration or would exceed thresholds of significance for ground-borne noise levels.
- Would not result in a substantial permanent increase in ambient noise levels in the Project vicinity above levels existing without the Project
- Would not result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project
- The Project would not expose people residing or working in the Project area to excessive noise level.
- Operational noise levels would exceed the CEQA significance thresholds at the Disney Concert Hall. The noise impact at this receiver can be mitigated to a less than significant level by a combination of "low impact" frogs at the turnout track in front of Disney Hall and wheel dampers that would reduce squeal noise at tight radii curves.
- The future noise from the Project (2040) would result in a significant increase in level of more than 3 dBA over the existing levels (2014/2015) at the Disney Concert Hall. The use of "low impact" frogs at the turnout track in front of Disney Hall and rail lubricant or wheel dampers to reduce the wheel squeal and overall Project noise to levels below the CEQA significance threshold.

The future noise from the Project (2040) would result in a significant increase in level of more than 3 dBA over the existing levels (2014/2015) at the Belasco Theater (T7), Apartments at Hope and

11th Streets (R23), Metlofts (R24), Kawada Hotel (R35), Apartments at 7th and Olive Streets (R36), Skyline Apartments (R37), Grand Park (I13), and FIDM (I14). These exceedances are due to the increase in future traffic with the proposed Project. Traffic noise mitigation is not feasible or reasonable at these receivers.

8. POTENTIAL CONSTRUCTION NOISE AND VIBRATION IMPACTS AND MITIGATION

8.1 Construction Noise

The construction of the Project is expected to last for 24 months and the work is anticipated to be sequenced over several stages (Ref. 6). The key steps are:

- Work Zone Staging
- Rail Storage
- Site Preparation and Utility Construction
- Track Construction
- Station Platform Construction
- TPSS Installation
- OCS Installation
- MSF Construction

All construction materials and construction equipment would be stored in the laydown and staging area. Materials would be moved to the staging area during the workday. Three potential locations for the laydown and staging area have been identified. One of the potential locations is adjacent to noise and vibration sensitive receivers between 8th and 9th Streets from Grand Avenue to Olive Street. The primary activity at the laydown staging area is truck movement. It should be noted that selection of the actual laydown area(s) would be determined by the contractor in consultation with the City's Department of Transportation and Bureau of Engineering.

Construction staging area would be located on or near the work zone and would be used to store estimated 80-foot long rail sticks. The delivery of the rail sticks would occur during the workday, although delivery at night or on weekends may occur after prior authorization. The construction staging area would occupy a space approximately 12 feet wide for the length of a city block. The primary activity at the construction staging area would be to facilitate welding of the rail sticks into strings.

At the first stage of construction it may be necessary to prepare the site and relocate, modify, or protect in place all utilities and underground structures that would conflict or interfere with excavation for street level concrete pavement and trackwork. This would include several noisy activities including excavation, backfill of soil and reconstruction of pavement. Equipment typically used for utility relocation work includes diamond saws, pavement breakers, excavators, cranes, generators, rollers, compactors, dump trucks, concrete trucks, welding machines and other construction equipment.

Track construction would involve demolition of the roadway sections being displaced by the guideway, preparation of the track bed, construction of the supporting track slab, laying of the rails, installation of rebar, and pouring of concrete. For special trackwork, welding would be an additional step. Typical equipment employed in track construction include rubber-tired excavators, loaders, graders, bulldozers, concrete trucks, compactors and water trucks. Construction of station platform foundations, restoration of pavement, and reconstruction of any sidewalks and ramps would begin simultaneously or immediately following the track slab within each segment. Once the track is placed, the pavement is restored, and sidewalks and ramps are reconstructed, the closed roadway lanes can generally be reopened to traffic. Equipment used for station platform construction include backhoes, dump trucks, small cranes and concrete trucks.

Construction of TPSS begins with each site cleared and graded. Underground utility connections would be dug and installed, followed by the grounding mat. The foundation would be poured once the utility connections are completed. The TPSS building would be delivered or constructed on-site, mounted on the foundation, and connected to the incoming power supply conduits and outgoing feeder conduits. Fencing or another type of barrier may be installed around the perimeter of the site, and architectural treatments would be applied as feasible. Graders, bobcats, forklifts, flatbed trucks, heavy cranes, and concrete and materials/equipment trucks would be required.

The installation of OCS generally follows the completion of track construction. Finishing for platforms usually overlaps with systems work and is completed prior to final testing and pre-revenue operations. Systems installation work is significantly less disruptive to communities as compared to track construction work. Construction equipment would include cranes, bucket trucks, and other equipment for installation of the wires from the guideway area.

The construction of the MSF generally follows the same sequencing as for the TPSS. The site would be cleared and graded, and underground utility connections would be installed. Following the underground work and site preparation, the pit and foundation would be installed. Structural walls and heavy industrial equipment such as shop cranes, would be installed on the foundation. Once the structure is enclosed, the shop would be finished with mechanical and electrical equipment, plumbing, and furnishings. Construction of the MSF streetcar storage area entails placing tracks and turnouts, paving, installation of OCS poles and construction of security fencing and walls. The construction equipment would consist of backhoes, dump trucks, concrete trucks, flatbed trucks, cranes, and lifts. Other activities such as overhead contact wire, communications and train/traffic signaling, curb, and wire stringing would use a combination of equipment described above. The use of this equipment during Project construction has the potential to result in substantial, yet temporary, increases in local noise levels along the Project alignments. The City of Los Angeles noise ordinance allows construction only between 7 AM to 9 PM on any weekday. Construction noise levels depend on the number of pieces and type of equipment, their general condition, the amount of time each piece operates per day, the presence or lack of noise attenuating features such as walls, and the location of the construction activities relative to the sensitive receivers.

Nighttime construction activities may include but not be limited to the following:

- Concrete pouring which includes concrete trucks entering and leaving the work site.
- Field welding of track and special trackwork.
- Underground utility work in a trench.

These nighttime activities would require a variance to Section 41.40 of the *Los Angeles Municipal Code* for nighttime work scheduled after 9 PM and before 7 AM weekdays, after 6 PM and before 8 AM on Saturdays, and anytime on Sunday.

Table 8-1 shows the maximum noise generated by the construction equipment at 50 feet during the various stages of construction and the estimated duration of construction. Utility relocation and track construction are anticipated to be the loudest stages of construction. Approaches to mitigating the noise impacts are discussed in Section 8.3.

Table 8-1. Construction Activity and Equipment Typical Noise Levels (dBA) at 50 feet

Activity	Duration (months)	Typical Maximum Noise Levels from Construction Equipment at 50 feet, dBA															
		Dozers	Back hoe	Grader	Excavator	Crane	Pavers	Rollers	Generators	Compactor	Welding Machine	Pavement Breaker	Concrete Diamond Saw	Dump Truck	Utility Truck	Water Truck	Concrete Truck

HDR Inc., July 2013 (Ref 6)

8.2 Construction Vibration

Some activities, such as compaction, pavement breaking, and the use of excavators, could result in perceptible levels of groundborne vibration. However, these activities would be limited in duration and the vibration levels are likely to be well below thresholds for minor cosmetic building damage.

The FTA damage risk vibration limits are shown in Table **8**-**2**. Construction of the Project would not involve the use of sonic or impact pile drivers and vibratory rollers. Typical Streetcar construction activities such as pavement breaking, soil compaction, use of hoe ram and bulldozer are not expected to generate vibration that approaches the limit in Table **8**-**2**. However, if there are fragile building that are extremely susceptible to vibration damage (Category IV) bulldozers and hoe rams may not be used within 21 feet of the building setback distance.

There is no FTA, state, county, or criteria for assessing the potential annoyance from the use of high-vibration construction equipment such as hoe rams, large bulldozers, jack hammers and load trucks. Using the FTA ground-borne noise impact thresholds, which are intended for the assessment of transit operations and not construction, provides some measure of assessment for annoyance. Within 20 feet of Category 2 land uses and 16 feet of Category 3 land uses the operation of high-vibration construction equipment could potentially exceed the FTA ground-borne noise impact thresholds for annoyance for transit operations (Table 4-5 and Table 4-6) inside the sensitive receivers. However the noise from these construction equipment is more likely to be higher than the groundborne noise generated by the vibration at the interior of these land uses. Since noise from these construction activities are limited to the noise level limits of the Los Angeles Noise Ordinance of 75 dBA during the hours of 7 a.m. to 9 p.m. weekdays the vibration effects would be regarded as less than significant.

The use of hoe rams and bulldozers within 50 feet of “special” land uses such as theaters and concert halls may potentially be audible as groundborne noise on the interior of the buildings. Because the high vibration equipment would be used only intermittently, scheduling its use such that it does not overlap with the timings of the sensitive activities inside these buildings would ensure there are no significant impacts. Implementing additional mitigation measures described in Section 8.4 would further reduce the vibration levels from construction activities.

Table 8-2**. FTA Damage Risk Vibration Criteria**

Building Category	Peak Particle Velocity (PPV), in/sec	Approximated Vibration Level, VdB
I. Reinforced-concrete, steel or timber (no plaster)	0.5	102
II. Engineered concrete and masonry (no plaster)	0.3	98
III. Non-engineered timber and masonry buildings	0.2	94
IV. Buildings extremely susceptible to vibration damage	0.12	90

Source: FTA Guidance Manual, 2006 (Ref. 1)

8.3 Construction Noise Mitigation

Listed below are some typical approaches to reducing noise levels associated with the construction phase of major projects and are otherwise called as best construction practices. Requiring the contractor to employ these methods should leave the contractor with enough flexibility to perform the work without undue financial or logistical burdens while protecting adjacent noise sensitive receivers from excessive construction noise levels.

- Limit nighttime construction to activities and equipment that generate lower noise levels, which may include but not be limited to concrete pouring, field welding, and underground utility as discussed in Section 8.1.
- Use specialty equipment with enclosed engines and/or high-performance mufflers.
- Locate equipment and staging areas as far from noise-sensitive receivers as practicable.
- Limit unnecessary idling of equipment.
- Install temporary noise barriers. This approach can be particularly effective for stationary noise sources such as compressors and generators.
- Route construction related truck traffic away from residential buildings.
- Sequence the use of equipment such that the simultaneous use of the loudest pieces of equipment are avoided as much as practicable.
- Avoid the use of impact equipment and where possible, use non-impact equipment.
- Use portable noise control enclosures for welding in the construction staging area.
- For the construction of TPSS and MSF, the contractor should employ best construction practices described above including the use of temporary noise barrier at the site, enclosures for generators and, where possible, sequencing the construction activities such that the simultaneous used of two or more loudest pieces of equipment at the same location are avoided.

If a noise variance from Section 41.40(a) of the *Los Angeles Municipal Code* is required, a noise limit would be specified. The contractor should employ a combination of the above-listed noise reducing approaches to meet the noise limit. Specific measures to be employed to mitigate construction noise impacts would be developed by the contractor and presented in the form of a Noise Control Plan. The Noise Control Plan would be submitted for review and approval before the beginning of construction activities. Because many of the construction activities would be located in close proximity to noise sensitive receivers, staging the construction to minimize the amount of time that noise producing activities affect specific receivers may be an alternative to using quieter equipment that may extend the exposure to construction activities.

8.4 Construction Vibration Mitigation

Construction related vibration activities are unlikely to exceed the impact thresholds shown in Table **8**-**2**. However, the following vibration mitigation strategies are recommended to minimize the potential for damage to any structures in the corridor:

1. Pre-Construction Survey: The survey would include inspection of building foundations and taking photographs of pre-existing conditions of important and potentially fragile historic resources in the Project area. The survey can be limited to (1) the first row of buildings along the selected alignment and would include the locations of the glass blocks and associated subterranean vaults and (2) buildings within approximately 200 feet of the construction zone that are deemed to be extremely susceptible to vibration. These would be included in the survey.

   Glass blocks and associated subterranean vaults have been identified at the following locations:

   - Million Dollar Theater (301–313 Broadway),
   - Palace Theater (626–636 Broadway),
   - Signer Building (806–808 Broadway), and
   - Blackstone’s Department Store (901 Broadway).

   In addition, glass blocks were previously identified at the following two additional locations:

   - Jewelry Trades Building (500–508 Broadway) and
   - 523–525 Broadway.
2. Vibration Limits: As per the FTA Guidance Manual, the construction vibration shall be limited to the peak particle velocity (PPV) ranging from 0.12 in/sec for “buildings extremely susceptible to vibration damage” to 0.5 in/sec for “Reinforced-concrete, steel or timber” buildings. The contract specifications would establish appropriate damage risk vibration limits for each of the historic properties that are within 200 feet of the construction.

3. Vibration Monitoring: The contractor would be required to monitor vibration at any buildings where the lower vibration limit is applicable and at any location where complaints about vibration are received from building occupants. This would include “special” land uses such as the Disney Concert Hall.

4. If the contractor’s plan calls for high-vibration construction activities being performed close to structures, it may be necessary for the contractor to use alternative procedures that produces lower vibration levels. Examples of high-vibration construction activities include the use of pavement breakers, vibratory compaction, and hoe rams next to sensitive buildings. Alternative

procedures would be to use of non-vibratory compaction in limited areas and concrete saws in place of a jackhammers or pavement breakers for demolition. To avoid potential interference to the “special” land uses from construction vibration, the contractor would be required to coordinate with the building owners to limit the high vibration activities to the duration of the day when there are no sensitive activities inside the building. For example, the contractor may avoid the use of high-vibration equipment during a scheduled performance or recording at the Disney Concert Hall.

The above measures would be sufficient to reduce the vibration from construction activities to below significant levels.

Chapter 1 – Introduction

This report, which focuses on the evaluation and analysis of potential impacts to the transportation environment, is one of a series of technical studies prepared in support of the Environmental Impact Report (EIR) for the Restoration of Historic Streetcar Service in Downtown Los Angeles (Project). The analysis evaluates transportation impacts due to the proposed Project on public transit, streets and highways, parking, and other modes such as pedestrians and bicycles. This report summarizes the existing and future conditions of the transportation environment due to the proposed alignment alternatives for the streetcar project. Chapter 1 of this report presents a background of the proposed Project and outlines the alternatives being considered for evaluation. Chapter 2 describes the analysis methodology and criteria of significance. Chapter 3 presents each component of the affected environment. Chapter 4 evaluates the affected transportation environment for each one of its components, which consists of public transit, streets and highways, parking, pedestrians, and bicycles. This chapter also assesses the environmental impacts for each alternative being considered. Chapter 5 describes the proposed project improvements and design elements. Finally, Chapter 6 identifies potential feasible mitigation measures due to significant operational and construction impacts, if any, based on the difference between the No Project and the proposed Project exceeding the significance thresholds criteria.

1.1 BACKGROUND

The Project consists of the construction and operation of streetcar service in downtown Los Angeles, California, along an up to 3.8-mile route. The Project alignment would begin at Hill and 1st Streets, run east along 1st Street, south along Broadway, west along 11th Street, north along Figueroa Street, east along 7th Street or 9th Street, and north along Hill Street, back to its beginning at 1st Street. Potential inclusion of a Grand Avenue Extension would also provide a two-way alignment spur west along 1st Street, beginning at Hill Street, and continuing south along Grand Avenue to a stop north of 2nd Street. The Project route would cover an area composed primarily of commercial land uses with a mix of residential, public, and entertainment land uses. The Project would link several neighborhoods or districts within the Central City Community Plan Area of the City of Los Angeles: Civic Center, Bunker Hill, Historic Core, Jewelry District, Financial Core, South Park, Fashion District, and LA Live/Convention Center.

The proposed project is intended to fulfill the following objectives: (1) support growth and revitalization of downtown Los Angeles; (2) enhance mobility and transit circulation in the downtown Los Angeles area; (3) create pedestrian oriented amenities that are interconnected with sidewalks and public space; and (4) protect and improve aspects of the downtown core.

Figure 1-1 depicts the regional location of the Project. **Figure 1-2** shows the Project's routing within Downtown Los Angeles.

1.2 PROJECT ALTERNATIVES

Five project alternatives are being considered; these include four build alternatives for the proposed Project and a No Project Alternative. The streetcar alignment would run along several downtown streets. Typical conceptual cross-sections at mid-block locations for these streets are shown in **Figure 1-3**. Each of these alternative alignments is described in the following sections below.

1.2.1 Alternative 1 – No Project Alternative

The No Project Alternative, which is required by Section 15126.6(e) of the State CEQA Guidelines, represents conditions in the Project study area that would remain if the proposed Project would not occur.

1.2.2 Alternative 2 – 7th Street Alternative With Grand Avenue Extension

The 7th Street with Grand Avenue Extension Alternative would construct and implement streetcar service along an alignment that would begin on Grand Avenue north of 2nd Street adjacent to the Disney Concert Hall, then continue northward until turning east on 1st Street. From 1st Street, the streetcar would turn south on Broadway, traveling to 11th Street where it would turn west and continue on to Figueroa Street. The streetcar would then turn north on Figueroa Street and travel to 7th Street, where it would turn east. From 7th Street, the streetcar would turn north on Hill Street, then continue back to 1st Street, completing the circuit by turning west on 1st Street to return to the streetcar stop on Grand Avenue.

1.2.3 Alternative 3 – 7th Street Alternative Without Grand Avenue Extension

Alternative 3 would follow the same alignment as Alternative 2, with the exception that the Grand Avenue Extension would not be incorporated. Therefore, Hill and 1st Streets would be the terminal point, rather than Grand Avenue north of 2nd Street.

1.2.4 Alternative 4 – 9th Street Alternative With Grand Avenue Extension

The 9th Street with Grand Avenue Extension Alternative would follow the same alignment as the 7th Street with Grand Avenue Extension Alternative, but it would run eastbound on 9th Street between Figueroa Street and Hill Street, rather than 7th Street, and the Project alignment would still begin and terminate on Grand Avenue, north of 2nd Street.

1.2.5 Alternative 5 – 9th Street Alternative Without Grand Avenue Extension

Alternative 5 would follow the same alignment as Alternative 3, but it would run eastbound on 9th Street between Figueroa Street and Hill Street, rather than 7th Street.

1.3 ELEMENTS OF THE STREETCAR ALTERNATIVES

A brief overview of the elements common to all build alternatives of the Project is presented below.

1.3.1 Vehicles

The Project's operating plan calls for approximately 7-minute headways (i.e., time spacing between vehicles) during peak periods. A fleet of six electrically powered streetcars is currently estimated to be needed to operate on the system. An estimated two additional streetcars would serve as backup vehicles to the operating fleet, for a total estimated fleet size of eight vehicles. Each vehicle would measure between 65 and 85 feet long and be approximately 13 feet high. The streetcars would be articulated to make tight turns and have a capacity of approximately 100 passengers. The streetcars would be similar to the modern streetcar models that are currently used in other cities in the United States. Examples of similar streetcars can be found in Portland, Oregon; both Tacoma and Seattle, Washington; Tucson, Arizona; Dallas, Texas; Atlanta, Georgia; and Charlotte, North Carolina. The streetcars would be designed with low floors to be compliant with the *Americans with Disabilities Act* (ADA). Operating speeds would be at the maximum posted downtown speed limit, which is currently 25 miles per hour (mph) on all streets other than Figueroa Street, between 5th Street and Pico Boulevard, where it is 30 mph. Power for the streetcars would be transmitted by overhead catenary wires supported by poles along the streetcar tracks.

1.3.2 Platforms

The streetcars would make stops at approximately 25 platforms along the alignment; the number of platforms is subject to change based upon further design of the Project. With varying configurations, the platforms would generally consist of a raised concrete pad approximately 8 feet wide by 70 feet long. Some of the streetcar platforms would be shared by buses operated by Metro, LADOT DASH, and other regional operators. Shared platforms would generally be approximately 120 feet long, though physical constraints on some street segments could limit them to shorter lengths. The maximum curb height would be approximately 8 to 14 inches. Platforms could be located either in the center of the roadway or adjacent to the sidewalk, along the curb. Platforms would transition from the sidewalk to match or nearly match the floor height of the streetcar vehicles. Platforms would be designed and constructed to connect to the sidewalk in a way that meets ADA and building access requirements.

1.4 SUPPORT FACILITIES

1.4.1 Overhead Contact System

There are two potential configurations for the OCS contact wires, which would supply electrical power to the streetcar vehicles. One configuration would be to support the contact wire with a span wire between two poles located on either side of the street, perpendicular to the streetcar track. Another configuration would support the contact wire from cantilever arms connected to single poles. Configurations would be site-specific and be made based upon engineering design and aesthetic considerations. Either of these configurations could use decorative poles chosen to be consistent with the streetscape along the Project alignment. It is possible that poles used for delivering streetcar power could also be integrated with other streetscape infrastructure such as street lighting, traffic signals, or traffic signs. OCS suspension at corner turning locations (e.g., Hill/1st Streets, 1st Street/ Broadway, Broadway/11th Street, 11th/Figueroa Streets, Figueroa/9th or /7th Streets, 9th/ or 7th/Hill Streets) would be more specialized and tailored to each location, possibly requiring a combination of wire-mounting configurations. OCS poles would be approximately 25 to 30 feet tall and would be typically installed at intervals of about 80 to 120 feet, with added poles at turns. Wire heights above the tracks would typically range between approximately 18 and 19 feet in the public right-of-way.

1.4.2 Traction Power Substations

The streetcars would be powered by an estimated five TPSS units spaced relatively evenly throughout the alignment to provide Direct Current (DC) power for the streetcars; the final number and placement will be determined by further Project design. Each unit would be a durable structure containing electrical and electronic equipment. Based on typically-sized equipment used in other cities, the TPSS units would most likely measure approximately 17 feet long by 11 feet wide by 11 feet high, although these dimensions could vary. The footprint needed for the TPSS installations could be up to approximately 250 square feet. The substations, typically rated at 350 kilowatts, would convert 480-volt commercial Alternating Current (AC) power to 750-volt DC power for the streetcars.

Each TPSS would typically be placed in an off-street location, such as a parking lot or other suitable site. At one location, 2nd Street and Grand Avenue, the currently recommended potential TPSS site may need to occupy space in the public right-of-way. A number of potential TPSS locations and alternate sites are being evaluated in the event that primary sites are found to be infeasible

1.4.3 Maintenance and Storage Facility

The Project would require an MSF to provide a location for secure storage of streetcar vehicles when they are not in operation, and regular light maintenance of the vehicles to keep them clean and in good operating condition.

Four sites are currently being considered as a potential location for the MSF: (1) the southwest corner of 11th and Olive Streets; (2) the southeast corner of 11th and Olive Streets; (3) the northwest corner of Hill and 5th Streets; or (4) the west side of Broadway between 2nd and 3rd Streets. All four candidate sites are currently being used as parking lots. The MSF would consist of an enclosed building and an outdoor area where routine inspections, maintenance work, and light repairs could be performed. The facility would have sufficient storage capacity to handle the needs of the streetcar system, with paved maintenance aisles, a pit track, overhead crane, paved truck access, staff offices, parts storage areas, and a machine shop. An employee parking area may also be provided. A maintenance building for a system of the size of the Project would generally be 12,000 to 18,000 square feet, approximately two to three stories tall, contain tracks inside a garage enclosure for maintenance of the vehicles, and be constructed to comply with the City's Green Building Code and also meet minimum Leadership in Energy & Environmental Design (LEED) certification requirements. Acquisition of private property for the MSF site would be required. Streetcars would gain access to the facility from a short segment of track that would be connected to the mainline. A storage area outside of the maintenance facility would provide an area for overnight cleaning (i.e., wash facility with clarifier) and secure storage of streetcar vehicles.

1.4.4 Signaling

Streetcar movement would be governed by "line-of-sight" operations, with passage through intersections controlled by traffic signals. "Line-of-sight" operations means that streetcars would be controlled by an operator who would proceed when traffic signals and traffic allow, and who would stop for traffic signals, station stops, pedestrians, bicycles, and other vehicles. A separate signal head may be provided at intersections for streetcar control. The streetcar control signal would be interconnected with the traffic signals and would clearly indicate to the streetcar operator when it is clear for the streetcar to move or required to stop.

Transit signals (i.e., special signals separated from the general purpose signal system) would be necessary where the streetcar would require a special traffic signal phase to maneuver so as to avoid conflicts with general traffic. These signals are also required at locations where a track switch is used by the streetcar operator to choose between different paths. Most of the route for the proposed Project would not have separate transit signals. Where they are needed, operation of transit signals would be separated from the normal traffic signals in order to not confuse the general public.

1.4.5 Potential Layover Locations

Locations on the streetcar route are needed to provide space for a streetcar to layover out of traffic, to allow dispatch according to a regular schedule, or to provide space for a streetcar to be temporarily taken out of service. In addition, these locations would allow the streetcar operator to take a short break. For the route currently proposed, two such locations would be desirable.

Under the Grand Avenue Extension (Alternatives 2 and 4), at the stop on Grand Avenue north of 2nd Street, a single track in an exclusive median is currently proposed. This configuration would allow the streetcars to complete their round trip and layover out of traffic for several minutes until the next scheduled departure. The streetcar vehicles would have operator cabs on both ends of the cars so that they would be able to operate in either direction of travel.

In addition to the Grand Avenue location, four other locations have currently been identified as potential second layover sites. Should Alternative 3 or 5 be ultimately selected, two of these locations may be needed. At each of these locations, a short section of parallel track would need to be provided to allow space for the streetcar to move off the main line while the layover is taking place. These sites include (a) Broadway, near-side at 2nd Street; (b) Broadway, far-side at 2nd Street; (c) Broadway, mid-block between 2nd and 3rd Streets; and (d) 11th Street, near-side at Hill Street.

All of the above currently considered layover locations are being evaluated as part of further design advancement of the Project, and are therefore subject to change with regard to location and/or track layout.

1.5 CONSTRUCTION ACTIVITIES

Construction activities associated with the Project would affect portions of Grand Avenue, 1st Street, Broadway, 11th Street, Figueroa Street, 7th Street or 9th Street, and Hill Street, as well as the selected MSF and TPSS sites. Construction activities would include: (a) pavement removal, (b) utility relocation, (c) excavation, (d) construction of track drains, (e) installation of concrete track slab and rails, (f) construction of station platforms, (g) installation of special track work units, (h) reconstruction of ramps and sidewalks, (i) paving, and (j) striping. Other activities would include installation of specialty system work, such as traction power, overhead contact wire, communications systems, train/traffic signaling, and OCS pole foundations.

Laydown and storage area(s) for construction would be established near the Project alignment and would be used for storage of equipment and materials. The laydown and storage area(s) could be located within the right-of-way, in parking lots, or on vacant land, and would be used to store equipment and materials. Four potential laydown and storage areas have currently been identified for evaluation: (1) the southeast corner of 3rd Street and Main Street; (2) northeast corner of 3rd Street and Spring Street; (3) 243 S. Spring Street; and (4) Grand Avenue to Olive Street, between 8th and 9th Streets. These should be regarded as example sites; other locations within the study area may become available and could also be chosen. All four example locations are currently being used as parking lots adjoining City streets within one block of the Project alignment.

Project construction activities would typically take place on weekdays between 7 a.m. and 9 p.m., in accordance with *Los Angeles Municipal Code* (LAMC) 41.40(a). To expedite construction, certain construction activities may be permitted to occur during nighttime, weekend, and holiday periods with the approval of the Board of Police Commissioners pursuant to LAMC Section 41.40(j). In addition, construction within City roadways may occur during peak periods (i.e., 6 a.m. to 9 a.m. and 3:30 p.m. to 7 p.m.) in accordance with Mayor's Executive Directive No. 2 and Bureau of Engineering Special Order No. 001-0406, which provide an exemption to the rush hour roadway construction prohibition for major public works projects having traffic mitigation plans. Construction activities will be required to follow the City Planning Department's new policy (in effect June 2015) to maintain safe adjacent pedestrian access at all times during construction.

The analysis in this document assumes that, unless otherwise stated, the Project would be designed, constructed, and operated following all applicable laws, regulations, ordinances, and formally adopted City standards, including but not limited to the LAMC; LADOT design standards and special provisions; California Manual on Uniform Traffic Control Devices; and all City bureaus' design manuals, special provisions, and standard plans, including the latest Standard Specification for Public Works Construction (SSPWC or Greenbook); the City of Los Angeles Department of Public Works, Bureau of Engineering (LABOE) Brown Book; the *Work Area Traffic Control Handbook*; and any Federal Transit Administration (FTA) requirements.

Chapter 2 – Methodology

This chapter describes the methodology and assumptions used to evaluate and analyze the potential effect on the transportation environment due to the Restoration of Historic Streetcar Service in Downtown Los Angeles Project. The following sections describe how the proposed Project would affect the various transportation modes including streets and highways, public transit, parking, and other modes such as pedestrians and bicycles.

2.1 STUDY INTERSECTIONS

A list of intersection locations to be studied was identified at the beginning of the proposed Project scoping process and reviewed by LADOT to gain concurrence. The list consisted of 65 intersection locations, which make up the study area for the purposes of this traffic study. These intersections are located along the streetcar alignment and along adjacent parallel roadways that are one block away from the alignment. Intersections located along adjacent parallel roadways that are one block away from the alignment were included to capture potential traffic diversions (as noted in Section 3.2.2) that may occur due to the reduction in roadway capacity along the alignment and the proposed turn restrictions along Broadway due to the implementation of the *Broadway Streetscape Master Plan* (BSMP). It should be noted that the reduction in roadway capacity is due to other programmed public improvement projects that are not a part of this Project and will be in place prior to the construction of this Project. These other programmed public improvement projects and their specific roadway capacity reductions are presented in Section 3.2.2. The study intersections that were evaluated in this traffic study are as follows:

1. Hope Street / 1^{st} Street
2. Grand Avenue / 1^{st} Street
3. Olive Street / 1^{st} Street
4. Hill Street / 1^{st} Street
5. Broadway / 1^{st} Street
6. Spring Street / 1^{st} Street
7. Grand Avenue / 2^{nd} Street
8. Hill Street / 2^{nd} Street
9. Broadway / 2^{nd} Street
10. Spring Street / 2^{nd} Street
11. Grand Avenue / 3^{rd} Street
12. Hill Street / 3^{rd} Street
13. Broadway / 3^{rd} Street
14. Spring Street / 3^{rd} Street
15. Grand Avenue / 4^{th} Street
16. Olive Street / 4^{th} Street
17. Hill Street / 4^{th} Street
18. Broadway / 4^{th} Street
19. Spring Street / 4^{th} Street
20. Grand Avenue / 5^{th} Street
21. Olive Street / 5^{th} Street
22. Hill Street / 5^{th} Street
23. Broadway / 5^{th} Street
24. Spring Street / 5^{th} Street
25. Grand Avenue / 6^{th} Street
26. Olive Street / 6^{th} Street
27. Hill Street / 6^{th} Street
28. Broadway / 6^{th} Street
29. Spring Street / 6^{th} Street
30. Figueroa Street / 7^{th} Street
31. Flower Street / 7^{th} Street
32. Hope Street / 7^{th} Street
33. Grand Avenue / 7^{th} Street
34. Olive Street / 7^{th} Street
35. Hill Street / 7^{th} Street
36. Broadway / 7^{th} Street
37. Spring Street / 7^{th} Street
38. Figueroa Street / 8^{th} Street
39. Hill Street / 8^{th} Street
40. Broadway / 8^{th} Street
41. Spring Street / 8^{th} Street
42. Figueroa Street / 9^{th} Street
43. Flower Street / 9^{th} Street
44. Hope Street / 9^{th} Street
45. Grand Avenue / 9^{th} Street
46. Olive Street / 9^{th} Street
47. Hill Street / 9^{th} Street
48. Broadway / 9^{th} Street

49. Spring Street / 9th Street
50. Figueroa Street / Olympic Boulevard
51. Flower Street / Olympic Boulevard
52. Hope Street / Olympic Boulevard
53. Grand Avenue / Olympic Boulevard
54. Olive Street / Olympic Boulevard
55. Hill Street / Olympic Boulevard
56. Broadway / Olympic Boulevard
57. Main Street / Olympic Boulevard
58. Figueroa Street / 11th Street
59. Flower Street / 11th Street
60. Hope Street / 11th Street
61. Grand Avenue / 11th Street
62. Olive Street / 11th Street
63. Hill Street / 11th Street
64. Broadway / 11th Street
65. Main Street / 11th Street

The location and existing lane configuration for each listed intersection is illustrated in **Figure 2-1**. It should be noted that as part of the Speed Improvement Analysis, field observations were performed over a 2-day period in August 2015 to observe traffic operating conditions and to collect and verify the latest intersection lane configurations. In order to maintain consistency with the collected traffic volume data and recognizing the current lane configuration changes that are continuously taking place within the downtown Los Angeles area, it was assumed that existing lane configurations and associated existing signal timings, as of August 2015, would be used for the existing (2014/2015) traffic operating conditions. Lane configuration changes that take place after August 2015 would be assumed to be in place in the Opening Year (2020) prior to the inclusion of the proposed streetcar project (No Project Alternative).

2.2 REGULATORY SETTING

For this transportation impact analysis, guidelines obtained from the *California Environmental Quality Act* (CEQA), *National Environmental Policy Act* (NEPA), and the Los Angeles Department of Transportation (LADOT), in addition to the *City of Los Angeles Mobility Plan 2035*, and Metro's *2010 Congestion Management Program* (CMP) have been reviewed.

CEQA guidelines define “significant effect” or “significant impact” as a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the proposed Project. There are no federal or state regulations that outline quantitative measures with which the Project must comply because such standards are set at a local or regional level for roadways that are not under the federal or state highway systems. The determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data. There are few quantitative standards of significance related to transportation effects. The measurement and prediction of Level of Service (LOS) at potentially affected intersections is a standard that is used to evaluate the significance of potential traffic impacts. Predicted changes in level of service provide indications of how well road-based movements may function under the different alternatives, which may have implications for vehicular traffic, and certain types of transit and non-motorized transportation, such as pedestrians and bicycles.

Unlike CEQA, NEPA does not determine levels of significance based on quantitative findings, such as LOS. Rather, NEPA guidelines require consideration of both the context and intensity of a given project (*40 CFR part 1508.27*). The following definitions of context and intensity are used to identify significance:

- Context: This means that the significance of an action must be analyzed in several contexts such as society as a whole (human, national), the affected region, the affected interests, and the locality. Significance varies with the setting of the proposed action. For instance, in the case of a site-specific action, significance would usually depend upon the effects in the locale rather than in the world as a whole. Both short- and long-term effects are relevant.
- Intensity: This refers to the severity of impact. Responsible officials must bear in mind that more than one agency may make decisions about partial aspects of a major action. The following should be considered in evaluating intensity as it relates to the transportation environment:
  - Impacts that may be both beneficial and adverse. A significant effect may exist even if the federal agency believes that on balance the effect will be beneficial.
  - The degree to which the proposed action affects public health or safety.
  - The degree to which the effects on the quality of the human environment are likely to be highly controversial.
  - The degree to which the possible effects on the human environment are highly uncertain or involve unique or unknown risks.
  - The degree to which the action may establish a precedent for future actions with significant effects or represents a decision in principle about a future consideration.
  - Whether the action is related to other actions with individually insignificant but cumulatively significant impacts. Significance exists if it is reasonable to anticipate a cumulatively significant impact on the environment. Significance cannot be avoided by terming an action temporary or by breaking it down into small component parts.

With respect to rail safety, the California Public Utilities Commission's (CPUC's) Rail Transit Safety Section prescribes requirements for the design, construction, operation, and maintenance of heavy rail transit, light rail transit, trolleys, and funicular systems. The CPUC ensures that all rail transit system extensions and new construction projects undergo a safety certification review and receive approval.

2.3 ANALYTICAL TOOLS AND DATA SOURCES

2.3.1 Intersection Volumes

Traffic volume data was collected at the 65 study intersections during typical weekday morning and afternoon peak commute periods. These traffic counts were collected pursuant to LADOT guidelines, which recommend that counts be collected on days of good weather, when schools are in session, and not on weeks with a holiday. The traffic counts, which were collected between 2011 and 2015, were compiled from different sources including LADOT's traffic count database and from LADOT approved traffic impact studies for other projects. To check the validity of the older counts and to assess potential changes in travel patterns resulting from the installation of on-street bike lanes throughout downtown, traffic counts were updated in 2012 at a representative set of study intersections. To represent existing conditions, all traffic counts that were older than 2014/2015 were normalized to 2014/2015 by growing them using an annual growth rate of 0.5% per year to reflect existing conditions. The resulting existing (2014/2015) AM and PM peak hour turning movement traffic volumes at the study intersections are shown in Section 3.2.3. The raw peak period traffic volumes are presented in **Appendix A**.

2.3.2 Traffic Analysis Scenarios

Consistent with the CEQA guidelines, a level of service traffic analysis was performed at the 65 study intersections for the following scenarios that are being evaluated.

- Existing (2014/2015) Conditions
- Existing (2014/2015) With 7th Street Alternative, With and Without Grand Avenue Extension
- Existing (2014/2015) With 9th Street Alternative, With and Without Grand Avenue Extension
- Opening Year (2020) Without Project (No Project)
- Opening Year (2020) With 7th Street Alternative, With and Without Grand Avenue Extension
- Opening Year (2020) With 9th Street Alternative, With and Without Grand Avenue Extension
- Horizon Year (2040) Without Project (No Project)
- Horizon Year (2040) With 7th Street Alternative, With and Without Grand Avenue Extension
- Horizon Year (2040) With 9th Street Alternative, With and Without Grand Avenue Extension

These study intersections are located along the proposed streetcar alignment and along adjacent parallel roadways that are one block away from the alignment. The study intersections were selected as the locations most likely to be affected by the Project. This intersection list, which is presented in Section 2.1, was reviewed and concurred by LADOT.

2.3.3 Intersection Level of Service Methodology

Each study intersection was analyzed to determine peak hour operations and levels of service. The LOS for signalized and unsignalized intersections is generally based on delay values using the Transportation Research Board 2010 *Highway Capacity Manual* methodology. These values are calculated using the average delay (in seconds) per approaching vehicle**. Table 2-1** presents the LOS definition for signalized intersections. The *Synchro* software version 8.0 was used to analyze peak hour intersection traffic operating conditions. This is a widely accepted tool used to calculate level of service based on the delay methodology presented in the *Highway Capacity Manual*, which is the industry standard for analyzing traffic intersection operating conditions. It is recognized that this is a planning level analysis and therefore, detailed operational level evaluations are generally performed during the preliminary engineering and final engineering phases of the project. However, in order to replicate real world conditions, the signal timing parameters associated with the current lane configurations (as of August 2015) were collected from LADOT and utilized. This includes the current signal timing information along Broadway due to the implementation of the Broadway Dress Rehearsal project. Furthermore, this methodology approach was reviewed and approved by LADOT prior to initiating the traffic study analysis and evaluation.

Table 2-1: Signalized Intersections – LOS Definitions

Level of Service	Average Vehicle Delay (Seconds)	Definition
A	≤ 10.0	EXCELLENT. No vehicle waits longer than one red light and none of the approach signal phases are fully used.
B	> 10.0 and ≤ 20.0	VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.
C	> 20.0 and ≤ 35.0	GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	> 35.0 and ≤ 55.0	FAIR. Delays may be substantial during portions of the peak hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	> 55.0 and ≤ 80.0	POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	> 80	FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths.

Source: Transportation Research Board, *Interim materials on Highway Capacity,* Transportation Research Circular No. 212, January 1980; and Transportation Research Board, *Highway Capacity Manual (2010).*

2.3.4 Threshold for Significant Impact

The CEQA Guidelines define “significant effect” as a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the proposed Project. The determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data. Under CEQA, every agency in the state "is encouraged to develop and publish thresholds of significance" against which to compare the environmental impacts of projects. Such thresholds are to be published for public review and supported by substantial evidence before their adoption. A lead agency will normally consider the environmental impacts of a project to be significant if and only if they exceed established thresholds of significance.

The *2006 L.A. CEQA Thresholds Guide* provides significance thresholds that address intersection, street segment, freeway, and transit system capacity; neighborhood intrusion; project access; parking; and in street construction impacts. However, Appendix G of the State CEQA Guidelines was recently updated to (1) no longer require the analysis of parking as an environmental impact by a project, and (2) require analysis of conflicts with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including, but not limited to, intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit. The thresholds of significance used to identify significant traffic impacts at signalized intersections under CEQA are based on the latest set of revised guidelines set forth by LADOT in the LADOT *Traffic Study Policies and Procedures* (August 2014). The change in delay threshold at an intersection is classified using LOS, which is defined in **Table 2-2** using the average vehicle delay. Consequently, traffic circulation impacts are evaluated based on the increase in average vehicle delay that a proposed Project Alternative would cause beyond the No Project Alternative condition.

Table 2-2: Intersection Significance Thresholds

Control Type	Final Intersection LOS with Project	Change in Delay (in seconds) from the No Project Alternative
Signalized Intersection	LOS C	≥ 6.0
	LOS D	≥ 4.0
	LOS E/F	≥ 2.5

2.3.5 Streetcar Characteristics

The streetcar vehicle would travel along the proposed alignment with vehicular traffic, predominately in the curb lane of the roadway using a fixed guideway. The fixed guideway would be flush with the roadway surface so that vehicular traffic can also operate in the same lane. A literature review of streetcar studies in other parts of the country was conducted to find out how the physical and operational characteristics of a streetcar would affect roadway capacity. Specifically, the Kansas City Downtown Streetcar Project Transportation Technical Report, the Portland Streetcar Loop Project Traffic Technical Memorandum, the Seattle First Hill-Capitol Hill Streetcar Line, and the Seattle South Lake Union Streetcar Project Transportation Technical Report were reviewed. Based on this review, a streetcar affects roadway capacity and operations in a similar manner as an articulated bus running in the travel lane. Because the streetcar operates on a fixed guideway, safe and reliable operating conditions will be maintained by complying with the applicable California Public Utilities Commission (CPUC) standards and guidelines.

In order to calculate vehicle trips, a streetcar is converted to a type of vehicle in the traffic stream that operates in the same way as a passenger car. The passenger car equivalency factor is used to convert large vehicles in the traffic stream to physical and operational characteristics that are similar to those of a passenger car. The operating characteristics of the streetcar would be similar to that of an articulated bus. The standard streetcar vehicle length is between 65 and 85 feet long. For purposes of the passenger car equivalency calculation, a conservative 85-foot streetcar length is used which is equivalent to approximately 2.13 times the length of a standard bus (40 feet). The operation of a standard bus in the traffic flow is equivalent to 2 passenger cars. Consequently, the operation of a streetcar is equivalent to up to 4.26 passenger cars. The conversion of a streetcar to equivalent passenger cars is used to convert large and slower vehicles in the traffic stream to an equivalent passenger car. This factor is used to reflect large vehicles because they take up more space and they are also slower than a passenger car, so the factor addresses both the physical and operational characteristics of a large vehicle, which includes vehicle length, vehicle weight, start-up lost time, acceleration rate characteristics, headways, speed, and delay.

Based on the proposed approximately 7-minute headway operation of the streetcar during the AM and PM peak periods, a total of 9 streetcar events would pass through a given point along the alignment during each AM and PM peak hour. This is equivalent to approximately 39 additional vehicle trips during each AM and PM peak hour. These additional vehicle trips take into consideration the operating characteristics of a vehicle including start-up delays. These additional vehicle trips were added to the AM and PM peak hour traffic volumes for each intersection approach movement along the streetcar alignment.

The trips generated by streetcar employees, such as operators, supervisors, and maintenance staff working at the MSF site were not included in the estimate of additional trips because it is anticipated that their work hours will be outside of the AM and PM peak hour commute periods. Based on the proposed operating plan, these employees need to be available prior to the beginning of operations, during the non-peak period when some vehicles are taken out of service, and during the end of daily operations. Consequently, the trips generated by the estimated 19 employees at the MSF site would be distributed over the course of the day and would be minimal, if any, during the AM and PM peak hours. The number of trips generated by the employees would also be below the minimum threshold set forth by LADOT for evaluating traffic impacts which is 25 vehicles per hour.

To account for near side stops and the anticipated dwell time for passengers to board and alight, an adjustment factor to reflect this potential blockage along one lane roadways was utilized in the *Synchro* software. The objective of incorporating this blockage adjustment factor is to account for vehicles queued behind the streetcar at a near side station stop along one lane roadway segments. As a result of the previously discussed literature review of other streetcar traffic studies, it was determined that it is standard practice to assume that operation of the streetcar can be treated in the same manner as a bus, including vehicular operating characteristics and blockage due to station dwell time.

It is also expected that a streetcar operating along the proposed alignment would result in a shift between travel modes for existing patrons. Ridership estimates conducted for the proposed project indicate that between 3,850 and 5,775 daily boardings can be expected in the Opening Year (2020), of which between 1,750 and 3,125 would be new transit riders (see Chapter 2 of the EIR). Riders of the streetcar may shift from the various travel modes in the area such as personal vehicle, bus, rail, bicycle and foot. Although it is recognized that the revitalization of the study area may generate new trips that would utilize the streetcar during the off-peak weekday period and the weekend, it is anticipated that during the AM and PM commute peak hours, the availability of streetcar service would result in a mode shift of existing trips, and attract patrons to use the streetcar instead of making short vehicular trips, walking, bicycling, or taking other forms of public transit.

2.3.6 Background Traffic Forecasts

To determine the Opening Year (2020) and the Horizon Year (2040) traffic volumes, two primary elements that contribute to traffic growth over the years were considered:

1. Ambient traffic growth rate, and
2. Traffic due to other known programmed or planned future (related) development projects

The background traffic forecasts include a determination of the traffic growth rate combined with specific related development projects in the area. The ambient traffic growth rate accounts for population and employment growth due to projects that will occur in the future, but are not yet known, plus smaller projects that are not on the local jurisdiction's list of related projects.

In addition to the ambient background growth, the second potential source of traffic growth in the study area is anticipated to occur from other future development projects in the vicinity of the study area. These "cumulative" or related projects are those developments that are programmed or planned and are expected to be in place within the same timeframe of the proposed project. The related projects information was provided by the City of Los Angeles Planning Department and was included in the determination of the future background volumes at specific areas. The list of related projects is presented in **Appendix B**.

A review of the most recent Congestion Management Program for Los Angeles County (Los Angeles Metropolitan Transportation Authority 2010 CMP) indicates that the traffic volume annual growth rate for the Downtown Los Angeles subarea is estimated at about 0.2 percent per year. Therefore, utilizing a growth rate of 0.5 percent per year would yield conservative results in the traffic analysis. This 0.5 percent annual traffic growth rate was applied to the existing peak hour volumes to establish future volumes for both the opening year of 2020 and the horizon year of 2040.

Also, additional changes to the existing roadway lane configurations (See Section 3.2.2) due to the following projects were reflected and accounted for in the traffic analysis during the Opening Year (2020) and the Horizon Year (2040).

- A combination of the *Broadway Streetscape Master Plan* (BSMP), located from just north of the Broadway and 2nd Street intersection to just south of the Broadway and Olympic Boulevard intersection, and the currently implemented Broadway Dress Rehearsal, which is a partial implementation of the BSMP.
- The *City of Los Angeles 2010 Bicycle Plan*, which includes the 7th Street Reconfiguration Project between Figueroa Street and Main Street. This consisted of the reduction of travel lanes (reducing the street to one travel lane in each direction, with the exception of the segment between Hope Street and Figueroa Street where two westbound travel lanes are retained along with one eastbound travel lane) and the introduction of a continuous center left-turn lane. In addition, one bike lane was installed in each direction.
- The *MyFigueroa Corridor Streetscape Project* (MyFig), which includes roadway improvements, as well as pedestrian and bikeway enhancements, on Figueroa Street and 11th Street. This project would install a one-way westbound bicycle facility on 11th Street and a northbound buffered cycle track on Figueroa Street from 11th Street to 7th Street. The project is currently out for bid and construction is anticipated to start later this year (2016).

- The recently planned protected bicycle lanes on Main and Spring Streets between Cesar Chavez Avenue in Chinatown and Olympic Boulevard in South Park. The protected bicycle lanes would be physically buffered from the traveling vehicles by various treatments. The proposed bike lane on Main Street would run in the northbound direction along the west side of the street. The proposed bike lane on Spring Street would run the southbound direction along the east side of the street.

Chapter 3 – Affected Environment

This chapter of the report presents the existing conditions for each transportation component being evaluated. The transportation environment consists of public transit, streets and highways, parking and other modes such as pedestrians and bicycles.

3.1 PUBLIC TRANSIT

Existing transit services within proximity of the proposed streetcar alignment were identified and tabulated. The downtown area has the highest concentration of transit service of any area in Los Angeles County. At present, ten transit operators provide service within proximity of the proposed streetcar alignment; with the bulk of service provided by Metro. These operators are:

- Antelope Valley Transit Authority (AVTA)
- City of Gardena (Gardena Municipal Bus Lines)
- City of Santa Clarita Transit
- City of Santa Monica (Big Blue Bus)
- Foothill Transit (FT)
- City of Los Angeles Department of Transportation (LADOT)
- Los Angeles County Metropolitan Transportation Authority (Metro)
- City of Montebello (Montebello Bus Lines)
- Orange County Transportation Authority (OCTA)
- City of Torrance (Torrance Transit)

Many of these regional transit operators run mostly peak commute hour, peak-direction commuter bus service in and out of the downtown area. LADOT provides frequent Downtown Area Short Hop (DASH) service along short, mostly circulator shuttle routes within the downtown area. These DASH routes provide connections to different destinations in downtown, including connections to regional transit. In addition to public transit services, several high-rise office tenants within the downtown area offer private shuttle buses for their employees. **Figure 3-1** illustrates the existing bus services in the Downtown Los Angeles area that are currently offered by Metro and the other transit operators.

3.1.1 Metro

This section describes Metro rail and bus service in Downtown Los Angeles, as shown in **Figure 3-1**. Metro provides rail service with the Red Line from Union Station to North Hollywood, the Purple Line from Union Station to Wilshire Center, the Blue Line from the 7th Street/Metro Center to Long Beach, the Expo Line from the 7th Street/Metro Center to Culver City, and the Gold Line from Union Station to Pasadena, East Los Angeles, and Azusa/Glendora.

There are seven Metro rail stations located within the study area. The Red and Purple Line stations are Union Station, Civic Center (Hill Street between Temple Street and 1st Street), Pershing Square (Hill

Street between 4th Street and 5th Street), and 7th Street/Metro Center (7th Street between Figueroa Street and Hope Street). The 7th Street/Metro Center Station serves as a transfer point to the Blue Line and the Expo Line. The Blue Line serves the areas between Downtown Los Angeles and Downtown Long Beach, and includes stations at Pico (Flower Street between Pico Boulevard and 12th Street) and Grand (Washington Boulevard between Flower Street and Grand Avenue). The Expo Line currently serves the areas between Downtown Los Angeles and Culver City, and includes the station at Pico (Flower Street between Pico Boulevard and Grand Avenue). Upon completion of Phase 2, the Expo Line will extend from the Culver City station to Santa Monica. The Gold Line serves the areas between Union Station and Azusa, as well as between Union Station and east Los Angeles.

All Metro rail stations provide connections to additional public transportation options, including bus service provided by Metro and other transit operators as well as Metrolink and Amtrak rail services at Union Station.

The majority of bus transit service in the study area, as well as the Los Angeles region, is provided by Metro, which operates a number of short and long-distance radial lines, as well as cross-town service, express service, and even 24-hour “Owl” service on many routes. Metro’s bus services vary considerably in speed and capacity. The most basic routes provide line-haul service to and from downtown along arterial streets. Heavily-traveled routes often have overlaid limited-stop or Metro Rapid bus service. **Table 3-1** lists the existing (August 2015) bus routes (including the end destinations of their services) within the downtown area.

3.1.2 LADOT

The Los Angeles Department of Transportation (LADOT) provides Downtown Area Short Hop (DASH) and Commuter Express bus service. Downtown DASH includes five local circulation routes connecting the study area with Little Tokyo, Chinatown, the Fashion District, and the University of Southern California (**Figure 3-2**). The service frequencies are high (approximately every 5-10 minutes). Service hours are 6 AM to 7 PM, Monday through Friday, and some limited service on weekends. Commuter Express (**Figure 3-3**) buses provide commuter service from communities in the region to high employment centers. Nine routes connect several suburban communities to Downtown Los Angeles and seven routes connect suburban communities to other high employment areas in the region. Commuter Express operates during weekday peak periods but do not operate weekday midday or during the weekends.

3.2 STREETS AND HIGHWAYS

3.2.1 Roadway Network

The environment in which traffic will be examined includes all major and secondary arterials between and including 1st Street and 11th Street, and Figueroa Street and Spring Street. None of the roadways identified below are part of the Congestion Management Program (CMP) street network. The following sections describe the major arterials in the project area roadway network.

- **Figueroa Street** – This is a Modified Avenue I according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the north and south directions. North of Olympic Boulevard, Figueroa Street is a one-way northbound street. Currently Figueroa Street carries about 19,300 to 32,100 vehicles per day.
- **Flower Street –** This is a Modified Avenue II according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the north and south directions. It is a one-way southbound street south of 4th Street and a two-way street north of 4th Street. The 7th Street Metro Station is located at Flower Street and 7th Street. Currently Flower Street carries about 6,700 to 17,600 vehicles per day.
- **Grand Avenue –** This is a Modified Avenue II according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the north and south directions. It is a one-way southbound street south of 5th Street and a two-way street north of 5th Street. Currently Grand Avenue carries about 12,300 to 22,500 vehicles per day.
- **Olive Street –** This is a Modified Avenue II according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the north and south directions. It is a one-way northbound street south of 5th Street and a two-way street north of 5th Street. Currently Olive Street carries about 13,300 to 17,300 vehicles per day.
- **Hill Street –** This is a Modified Two-Way Avenue II according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the north and south directions. Hill Street carries about 18,200 to 22,100 vehicles per day.
- **Broadway –** This is a Modified Two-Way Avenue II according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the north and south directions. Broadway carries about 9,800 to 14,000 vehicles per day.
- **Spring Street –** This is a Modified Avenue II according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the north and south directions. It is a one-way southbound street that extends north from 9th Street. Spring Street carries about 14,500 to 17,800 vehicles per day.
- **1st Street –** This is a Modified Two-Way Boulevard II according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the east and west directions. 1st Street carries about 14,000 to 23,300 vehicles per day.
- **2nd Street –** This is a Modified Two-Way Avenue III according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the east and west directions. 2nd Street carries about 11,700 to 17,100 vehicles per day.
- **3rd Street –** This is a Modified Avenue III according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the east and west directions. It is a one-way westbound street east of Flower Street and a two-way street west of Flower Street. 3rd Street carries about 17,800 to 20,800 vehicles per day.

- **4th Street –** This is a Modified Avenue III according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the east and west directions. It is a one-way eastbound street. 4th Street carries about 11,500 to 12,700 vehicles per day.
- **5th Street –** This is a Modified Avenue III according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the east and west directions. It is a one-way westbound street. 5th Street carries about 21,200 to 22,200 vehicles per day.
- **6th Street –** This is a Modified Avenue III according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the east and west directions. It is a one-way eastbound street. 6th Street carries about 14,100 to 21,000 vehicles per day.
- **7th Street –** This is a Modified Two-Way Avenue II according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the east and west directions. 7th Street carries about 9,000 to 12,000 vehicles per day.
- **8th Street –** This is a Modified Avenue III according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the east and west directions. It is a one-way westbound street. 8th Street carries about 12,500 to 15,300 vehicles per day.
- **9th Street –** This is a Modified Avenue II according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the east and west directions. It is a one-way eastbound street. 9th Street carries about 13,400 to 21,600 vehicles per day.
- **Olympic Boulevard –** This is a Modified Two-Way Avenue I according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the east and west directions. Olympic Boulevard carries about 20,400 to 32,400 vehicles per day.
- **11th Street –** This is a Modified Avenue III according to the *City of Los Angeles Mobility Plan 2035* and is oriented in the east and west directions. It is a one-way westbound street. 11th Street carries about 4,600 to 10,400 vehicles per day.

3.2.2 Planned Projects Affecting Roadway Capacity

A number of roadway improvements, as well as, bikeway and streetscape projects are anticipated to be completed within the project area. These planned projects would reduce capacity on some of the roadways in the project study area for the Opening Year (2020) and the Horizon Year (2040), **Figure 3-4** provides an illustration of the anticipated future intersection lane configurations. These planned projects are as follows:

- **11th Street** from Broadway to Figueroa Street, part of the *MyFigueroa* Corridor Streetscape Project, would install a one-way westbound bicycle facility; one of the two existing westbound travel lanes would be eliminated from Broadway to Flower Street, thus reducing the roadway to one lane in the westbound direction.
- **Figueroa Street** from 11th Street to 7th Street, part of the *MyFigueroa* Corridor Streetscape Project, would install a buffered cycle track (separated/exclusive bike lane) in the northbound direction; one northbound travel lane would be eliminated.
- **Figueroa Street** at the intersection of 7th Street, consists of the modification of the signal phasing and timing as part of the proposed Wilshire-Grand Redevelopment Project.

- **Broadway between Olympic Boulevard and 2nd Street,** part of the *Broadway Streetscape Master Plan* (BSMP), has reduced Broadway to two travel lanes in the northbound direction and one travel lane in the southbound direction. In addition, southbound motorists would be prohibited from making a left turn at the intersections from Broadway to the cross streets. Currently, right turns are permitted along the southbound direction of Broadway as part of the recently implemented Broadway Dress Rehearsal. The existing lane configuration, which was implemented as part of the Broadway Dress Rehearsal, would be maintained. Southbound right turn movements would be permitted, in an exclusive right turn only pocket lane, at 3rd Street, 5th Street, and 8th Street and at other intersections, if required, as traffic conditions and implementation of the BSMP proceeds. For purposes of this traffic analysis, it is anticipated that southbound right turn movements would be prohibited at 2nd Street, 7th Street, and Olympic Boulevard. As a result of the reduction in the travel lane capacity and the turn prohibitions for the southbound left and right turn movements, traffic was assumed to be diverted to the adjacent roadways. The diversion of traffic to both Hill and Spring Streets was based on the methodology used in the *Broadway Streetscape Plan Traffic Study* that was prepared in November 2010 and accepted by LADOT.

Restoration of Historic Streetcar Service in Downtown Los Angeles

Figure 3-4: Future Intersection Lane Configuration Without Project (continued)

3.2.3 Study Intersections and Existing Levels of Service

Turning movement counts were collected at 65 intersection locations in the project area in order to assess the existing peak hour traffic operating conditions. The selected intersections are located both along the proposed alignments and along adjacent streets. None of the selected intersections are located on a CMP route and thus a focused CMP analysis was not required or undertaken. In addition, the City of Los Angeles Department of Transportation (LADOT) has entered into an agreement with Caltrans that establishes a screening filter used to determine which projects should be directed to Caltrans to potentially prepare a focused Freeway Impact Analysis beyond the CMP analysis. The screening criteria identified in the agreement focuses on a land use development where the project's peak hour trips result in a percentage increase to the freeway mainline capacity. This percentage increase is based on the resulting operating LOS for the freeway segment under consideration. This Project does not require a Freeway Impact Analysis because it is not expected to result in any traffic generated onto the state highway system, therefore, the thresholds listed in the agreement between LADOT and Caltrans would not be triggered by any of the project alternatives. All the study intersections are currently signalized. All traffic count data was taken on a representative weekday (Tuesday, Wednesday or Thursday) when schools were in session, there was no public holiday, and no unusual or adverse weather conditions. Detailed vehicle turning movement data are included in **Appendix A** and are illustrated in **Figure 3-5.**

Each study intersection was analyzed to determine peak hour operations and level of service. The AM peak hour is defined as the one-hour period of time with the highest volume of traffic during the 7:00 a.m. to 10:00 a.m. morning peak period. The PM peak hour is defined as the one-hour period of time with the highest volume of traffic during the 3:00 p.m. to 6:00 p.m. evening peak period. The project area roadway network was developed and created in *Synchro version 8.0* by inputting the physical and operational characteristics of each study intersection. The *Synchro* output provides the level of service results for signalized and un-signalized intersections along with an associated overall average intersection delay in seconds per vehicle. The intersection analysis showed that three of the 65 study locations operate at LOS E or F:

- The Broadway and 3rd Street intersection operates at LOS F during the AM peak hour
- The Olive Street and 9th Street intersection operates at LOS F during the PM peak hour
- The Figueroa Street and Olympic Boulevard intersection operates at LOS E during both the AM and PM peak hours

The remaining 62 intersections operate at LOS D or better during both the AM and PM peak hours. **Table 3-2** presents the results of the existing AM and PM traffic operations and corresponding LOS at each of the study intersections. The detailed Existing (2014/2015) conditions LOS worksheets can be found in **Appendix C.**

3.3 PARKING

A parking inventory and conditions assessment was conducted in 2013 to collect the number of existing on-street parking and loading spaces that may be removed due to the proposed Project. Recently, Appendix G of the State CEQA Guidelines was updated to no longer require the analysis of parking as an environmental impact by a project. Nonetheless, this section provides a quantitative survey of the potential effects of the Project on the availability of on-street parking along the build alternatives' corridors.

Reduction in on-street parking due to the Project is presented in Section 4.4. The results of the existing on-street parking inventory are summarized in **Table 3-3**. Street segments along the proposed project alignment were surveyed to identify the existing number of on-street parking and loading spaces and associated peak period parking restriction information. A total of 435 existing on-street parking and loading spaces were counted.

Table 3-3: Existing On-Street Parking Inventory and Conditions

Street	Segment	Direction	Existing Spaces (Parking and Loading)	Existing Posted Parking / Loading Restrictions
1st Street	Grand Avenue to Olive Street	WB	0	Tow Away No Stopping Any Time

Hill Street	6th Street to 7th Street	SB	6	Tow Away No Stopping (7-9 AM), 1 Hour Parking (9 AM - 6 PM)
Hill Street	7th Street to 8th Street	NB	10	Tow Away No Stopping (4-7 PM), 1 Hour Parking (8 AM - 4 PM)
Hill Street	7th Street to 8th Street	SB	3	Tow Away No Stopping (7-9 AM), 1 Hour Parking (9 AM - 6 PM)
Hill Street	8th Street to 9th Street	NB	6	Tow Away No Stopping (4-7 PM), 1 Hour Parking (8 AM - 4 PM)
Hill Street	8th Street to 9th Street	SB	5	1 Hour Parking (8 AM - 6 PM)

3.4 OTHER MODES

3.4.1 Pedestrians

In urban settings, industry standards recommend that sidewalks be a minimum of six to ten feet wide. The first four feet from the curb allow for a buffer against moving traffic as well as space for street hardware, including light poles and street signs. According to City of Los Angeles' *Downtown Design Guide* and *Downtown Street Standards*, the secondary arterial sidewalk widths along the proposed Project alignment are predominantly fifteen feet but range from twelve to eighteen feet. Because downtown streets are built-out, some sidewalks may not meet recommended dimensions. In addition, most of the signalized intersections along the proposed Project alignments are currently operating pre-timed with countdown pedestrian signals. Although there are no CEQA thresholds available to determine the significance of Project impacts to pedestrian circulation, the City of Los Angeles provides the *L.A. CEQA Thresholds Guide (Thresholds Guide)* as a resource to address project access for planned developments. The *Thresholds Guide* is mostly designed to guide residential and commercial types of developments and specifically looks at access to and from the project site (site access points), that may include safety, operational, or capacity impacts related to vehicular/vehicular, vehicular/bicycle or vehicle/pedestrian conflicts. Aside from the Maintenance and Storage Facility (MSF) and the Traction Power Sub-Stations (TPSS) sites that would require their own site, most of the Project would be implemented within shared traffic lanes in the public right of way. Nonetheless, the Project would be designed to minimize, if not avoid, vehicular/vehicular, vehicular/bicycle and/or vehicle/pedestrian conflicts. Design elements of the streetcar system may include but not be limited to the following: streetcars equipped with lighting, audible warning devices; train to wayside communication (TWC); signage; striping; wayfinding; station accessibility (ADA compliance); and ease of boarding.

The central downtown area experiences heavy pedestrian traffic on weekdays, particularly during the commute and lunch hours. Much of the pedestrian traffic occurs in areas with daytime employment such as Bunker Hill, the Financial District, and the Historic Core. Some pedestrian movement occurs between the Civic Center and Little Tokyo along 1st and 2nd Streets. The Fashion District attracts many pedestrians during both weekdays and weekends, as does Broadway between 2nd and 7th Streets. Due to the location of the Wilshire Grand and Sheraton Hotels, as well as "Restaurant Row," 7th Street often experiences large volumes of pedestrians throughout the day. With the on-going growth due to redevelopment that is taking place in the downtown area, there are also large volumes of pedestrians during the off-peak hours of the day. In general, redevelopment throughout downtown has increased the housing supply and retail services which adds to the increased pedestrian volumes due to the emergence of popular nighttime destinations. In addition, there are regularly scheduled monthly art walks in the Gallery Row and daily events at Staples Center and the LA Live Campus.

3.4.2 Bicycles

The Federal and State transportation system recognizes three primary bikeway facilities; Bicycle Paths (Class I), Bicycle Lanes (Class II), and Bicycle Routes (Class III). Bicycle Paths (Class I) are exclusive car free facilities that are typically not located within a roadway area. Bicycle Lanes (Class II) are designated striped lanes on surface streets. Bicycle Routes (Class III) are unstriped bike routes that are designated by green "bike route" signage. According to the *City of Los Angeles 2010 Bicycle Plan*, the bikeway facilities within the project area, such as 1st Street, Spring Street, Main Street, Grand Avenue (south of Wilshire Boulevard), and Olive Street (South of 7th Street) are identified as Class II bikeways. With the approval of the *City of Los Angeles 2010 Bicycle Plan*, various elements are to be implemented throughout the City, including the downtown area. As noted in the previous section, the Thresholds Guide is mostly designed to guide residential and commercial types of development and specifically looks at access to and from the project site (site access points), that may include safety, operational, or capacity impacts related to vehicular/vehicular, vehicular/bicycle or vehicle/pedestrian conflicts. Aside from the MSF and the TPSS that would require their own site, most of the Project would be implemented within shared traffic lanes in the public right of way. Nonetheless, Project would be designed to minimize, if not avoid, vehicular/vehicular, vehicular/bicycle and/or vehicle/pedestrian conflicts. Design elements of the streetcar system may include but not be limited to the following: streetcars equipped with lighting, audible warning devices; train to wayside communication (TWC); signage; striping; wayfinding; and signage to alert bicyclists to the presence of streetcar tracks with open flangeway areas would also be provided. A comprehensive analysis of this issue is documented in the Alta Planning+Design Report *Bicycle Interactions and Streetcars: Lessons Learned and Recommendations*. The specific design features to reduce conflicts would be identified in the design phase of the project. Available mitigation measures to reduce potential impacts may be limited to signage, pavement marking, and education.

Chapter 4 – Environmental Impacts

4.1 PUBLIC TRANSIT

4.1.1 Existing Conditions

The existing conditions without Project scenario, which is also referred to as the No Project Alternative, is presented in Section 3.1. An analysis of the project under existing conditions is considered a hypothetical condition which assumes the project has been constructed and is operating in the existing environment. The public transit environmental impacts for both the 7th Street and 9th Street Alternatives with and without the Grand Avenue Extension, including the estimated daily streetcar ridership, would be similar to those described in the Opening Year (2020) Alternatives. This is detailed below in Section 4.1.2.

4.1.2 Opening Year (2020)

Opening Year (2020) Without Project

The Opening Year (2020) without Project scenario, which is also referred to as the No Project Alternative, would continue to maintain existing operating conditions and the preservation of the current services provided by the transit operators. However, it is anticipated that Phase 2 of the Metro Exposition Line to Santa Monica will be in service in 2016. This project extends the alignment from its current terminus in Culver City to the proposed new terminus in Santa Monica. Furthermore, by 2020, the Regional Connector project will provide a new seamless connection between the 7th Street/Metro Center Station and Union Station. The Regional Connector will add three new stations, two of which are in close proximity to the streetcar alignment at 2nd Street/Hope Street and 2nd Street/Broadway. The Regional Connector will enable the Blue/Expo Lines to be interlined with the Gold Line and therefore eliminate the need for Gold, Blue, and Expo Line passengers to transfer to the Red and Purple Line at the 7th Street/Metro Center and Union Station to reach their final destination within the downtown area.

Opening Year (2020) With 7th Street Alternatives

The 7th Street Alternative with the Grand Avenue Extension would construct and implement streetcar service along an alignment that would begin on Grand Avenue just north of 2nd Street, then continue northward until turning east on 1st Street. From 1st Street, the streetcars would turn south on Broadway, traveling 1.25 miles to 11th Street, where they would turn west and continue on to Figueroa Street. The streetcars would then turn north on Figueroa Street and travel 0.5 mile north to 7th Street where they would turn east. From 7th Street, the streetcars would turn north on Hill Street, then continue back to 1st Street, completing the circuit by turning west on 1st Street to return to the streetcar stop on Grand Avenue. The 7th Street Alternative without the Grand Avenue Extension would construct and implement streetcar service along a one-way loop that would run from 1st Street on the north, through downtown Los Angeles, to 11th Street on the south. There would be no alignment west of the 1st Street and Hill Street intersection. The primary purposes of the proposed Project are to enhance mobility and transit circulation and support the growth and revitalization of downtown Los Angeles, including its historic districts. The Project will supplement existing transit in the area, including regional transit services and local circulators like DASH. While both the Project and DASH have routes that circulate through the downtown area, DASH service also extends outside the Project study area and covers a larger geographic service area. Along the proposed streetcar alignment, the public transit service identified in the without Project condition would remain unchanged and would operate alongside the proposed Project. However, if any modifications to the bus operations or stop locations are needed, they will be thoroughly evaluated by the appropriate transit agencies and adjusted accordingly. This transit option will increase the frequency of service between downtown origins and destinations, resulting in an added benefit to the traveler. The projected daily ridership for the Opening Year (2020) 7th Street Alternative is expected to range between 4,125 and 5,575 riders.

Opening Year (2020) With 9th Street Alternatives

The 9th Street Alternative with the Grand Avenue Extension would construct and implement streetcar service along a circuit that runs from 1st Street through downtown Los Angeles to 11th Street. The alignment, beginning at its terminus on Grand Avenue, would run northbound and turn eastbound on 1st Street. From 1st Street, the streetcar system would turn southbound down Broadway and travel 1.25 miles to 11th Street, where the streetcar would turn westbound and continue on to the Staples Center and the LA live campus at Figueroa Street. The streetcar would then turn north on Figueroa Street and travel 0.25 mile north to 9th Street, where it would turn east. From 9th Street, the streetcar would turn north onto Hill Street and continue up to 1st Street, completing the circuit and turning westbound on 1st Street to return to the streetcar terminal stop on Grand Avenue just south of 1st Street. The 9th Street Alternative without the Grand Avenue Extension would follow the same one-way loop as the 7th Street Alternative without the Grand Avenue Extension, but it would also run eastbound on 9th Street between Figueroa Street and Hill Street, rather than 7th Street. As noted before, the primary purposes of the proposed Project are to enhance mobility and transit circulation and support the growth and revitalization of downtown Los Angeles, including its historic districts. The Project will supplement existing transit in the area, including regional transit services and local circulators like DASH. While both the Project and DASH have routes that circulate through the downtown area, DASH service also extends outside the Project study area and covers a larger geographic service area. Along the proposed streetcar alignment, the public transit service identified in the without Project condition would remain unchanged and would operate alongside the proposed Project. However, if any modifications to the bus operations or stop locations are needed, they will be thoroughly evaluated by the appropriate transit agencies and adjusted accordingly. This transit option will increase the frequency of service between downtown origins and destinations, resulting in an added benefit to the traveler. The projected daily ridership for the Opening Year (2020) 9th Street Alternative is expected to range between 3,850 and 5,775 riders.

4.1.3 Horizon Year (2040)

Horizon Year (2040) Without Project

Transit service under the without Project condition would be focused on preserving existing services and making expansion of service improvements consistent with ongoing transit provider planning and programming activities. Each transit operator analyzes and evaluates their service periodically and based on the results of their study, they restructure and adjust services accordingly. It is likely that some bus line service would be reorganized and restructured to provide connections with the new rail lines. It is also anticipated that the current bus service would predominantly remain the same with potentially shortened headways for some of the heavily traveled lines. It would be speculative to conjecture exact routing or service changes at this time.

Horizon Year (2040) With 7th Street Alternatives

The proposed Project is intended to enhance mobility and transit circulation and support the growth and revitalization of downtown Los Angeles, including its historic districts. This additional transit service would provide an added incentive for travelers in the downtown area to utilize the various available transit options. On the proposed streetcar alignment, the public transit service identified in the without Project condition would predominantly remain unchanged and would operate alongside the proposed Project. However, the added transit service within the downtown area would result in a benefit to public transit users. In addition, modifications to bus operations or stop locations, if needed, would be evaluated by the appropriate transit agencies and adjusted accordingly. The daily ridership for the streetcar is anticipated to increase above the opening year given these conditions.

Horizon Year (2040) With 9th Street Alternatives

The proposed Project is intended to enhance mobility and transit circulation and support the growth and revitalization of downtown Los Angeles, including its historic districts. This additional transit service would provide an added incentive for travelers in the downtown area to utilize the streetcar. On the proposed streetcar alignment, the public transit service identified in the without Project condition would predominantly remain unchanged and would operate alongside the proposed Project. However, the added transit service within the downtown area would result in a benefit to public transit users. In addition, modifications to bus operations or stop locations, if needed, would be evaluated by the appropriate transit agencies and adjusted accordingly. The daily ridership for the streetcar is anticipated to increase above the opening year given these conditions.

4.2 STREETS AND HIGHWAYS

Project Improvements and Project Design Elements

For future (2020 and 2040) conditions, it is expected that various City improvement projects would be implemented independently of the Project. These major streetscape improvement projects include the Broadway Streetscape Master Plan (roadway configuration between the limits of 2nd Street and Olympic Boulevard); the *MyFigueroa* Corridor Streetscape project, which includes roadway improvements on Figueroa Street and the reconfiguration of 11th Street between Figueroa Street and Broadway; and various segments of the 2010 Bicycle Plan, which includes the reconfiguration of 7th Street between Figueroa Street and Main Street and the protected bike lanes along Main Street and Spring Street.

The following proposed street design elements are to be implemented as part of the Project. Some of these elements would potentially help in minimizing roadway delay and improving streetcar run times.

<u>Project Design Element: Proposed Lane Reconfiguration on Hill Street</u>

In order to accommodate the streetcar, Hill Street would need to be reconfigured, however, the proposed changes would not reduce the existing number of travel lanes along Hill Street. Instead, the removal of on-street parking and/or center turn lanes along certain segments would be needed to accommodate the streetcar alignment, which is located along the curb lane in the northbound direction. A typical mid-block conceptual cross-section for the before and after conditions along Hill Street is shown as part of the project description and was previously presented in **Figure 1-4**. These Hill Street lane reconfigurations are proposed between 1st and 7th Streets for the 7th Street Alternative or between 1st and 9th Street for the 9th Street Alternative. This proposed reconfiguration would include bump outs at some of the street corners to accommodate the station platforms, which would create and allow for full-time on-street parking/loading spaces along the east side of Hill Street. The station platforms are predominantly located on the near side of the intersection.

To confirm the adequacy of Hill Street to accommodate streetcar operations, field observations of current traffic circulation patterns, roadway lane configurations and peak period parking restrictions were conducted during the PM peak period (3:00 p.m. to 6:00 p.m.) on a typical representative weekday. The objective was to determine if the total curb-to-curb width of Hill Street would be adequate to accommodate at least two travel lanes in each direction with the northbound curb lane also being utilized by the streetcar alignment. The proposed reconfiguration would allow for a two-way left turn median between 4th and 6th Streets to provide enhanced driveway access to neighboring businesses and off-street parking lots. As a result of this proposed lane reconfiguration along Hill Street, the proposed conceptual design street dimensions were compared with the *Downtown Street Standards* and it was confirmed that they are within the maximum street dimensions currently shown for Hill Street.

Project Design Element: Proposed Traffic Signal Improvements

Traffic signal improvements are proposed in efforts to maximize efficiencies of the roadway network and operations of the Project. The following traffic signal improvements are recommended at the following locations:

- Protected northbound right-turn phase at the intersection of Grand Avenue / 1st Street for both the 7th Street and 9th Street Alternatives with the Grand Avenue Extension
- Protected northbound left-turn phase at the intersection of Hill Street / 1st Street for both the 7th Street and 9th Street Alternatives with the Grand Avenue Extension
- Protected eastbound left-turn phase at the intersection of Hill Street / 7th Street for the 7th Street Alternative with and without the Grand Avenue Extension
- Redistribute the green time within the existing signal cycle length to provide more green time to the streetcar movement/direction. The amount of green time would range from 5 seconds to up to 10% of the cycle length (7 seconds for the AM peak hour and 9 seconds for the PM peak hour) when the transit vehicle is present and only if the controller has enough time in the cycle to provide it.

Project Design Element: Proposed Right Turn Lanes

In order to improve operations of the streetcar, including its run time, a Speed Improvements Study was conducted to evaluate potential physical and operational treatments along the streetcar alignment. This study, which is attached as an appendix, was initiated in August 2015 and completed in September 2015. Proposed right turn lane improvements were identified at various intersections along Broadway and Hill Street to allow for the flow of vehicles in the through lanes, which would help reduce delay and optimize operating time for the streetcar. The following right turn lanes would be incorporated as part of the project definition:

- A right turn pocket lane for the southbound direction of Broadway at 3rd Street to provide storage and off-set the anticipated vehicular queues during pedestrians crossing the west leg, thus minimizing potential spillover onto the through movement and streetcar tracks
- A right turn pocket lane for the southbound direction of Broadway at 5th Street to provide storage and off-set the anticipated vehicular queues during pedestrians crossing the west leg, thus minimizing potential spillover onto the through movement and streetcar tracks
- A right turn pocket lane for the southbound direction of Broadway at 8th Street to provide storage and off-set the anticipated vehicular queues during pedestrians crossing the west leg, thus minimizing potential spillover onto the through movement and streetcar tracks

- A right turn pocket lane for the southbound direction of Broadway at 11th Street to enhance the streetcar run time by segregating the right turn streetcar movement from the through vehicular traffic movement
- A right turn pocket lane for the northbound direction of Hill Street at 6th Street to enhance the streetcar run time by segregating the right turn vehicular traffic movement from the through streetcar movement and to provide storage so that right turn queues do not spillover onto the northbound Hill Street through movement and the streetcar tracks

The Project will ensure that these proposed lane configurations would be in conformance with applicable City roadway and design standards, such as the *Downtown Street Standards* (DSS) and the *Broadway Streetscape Master Plan* (BSMP).

4.2.1 Existing (2014/2015) Conditions

Existing (2014/2015) – 7th Street Alternative With Grand Avenue Extension

This scenario consists of adding the 7th Street Alternative with the Grand Avenue Extension vehicular trips (as described in Section 2.3.5) to the Existing (2014/2015) AM and PM peak hour intersection and roadway operating conditions. The resulting traffic volumes are illustrated in **Figure 4-1.**

The Existing (2014/2015) with the 7th Street Alternative with the Grand Avenue Extension was analyzed, and the resulting traffic operating conditions and corresponding LOS are provided in **Table 4-1** and also included in **Appendix D**. The intersection analysis showed that three of the 65 locations operate at LOS E or F. The remaining 62 intersections operate at LOS D or better during both AM and PM peak hours. It should be noted that the three locations operating at LOS E or F are the same intersections identified in Section 3.2.3 as part of the Existing (2014/2015) level of service analysis.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Existing (2014/2015) with the 7th Street Alternative with the Grand Avenue Extension were compared with the Existing (2014/2015) to identify significantly (CEQA) affected locations. As shown in **Table 4-2** and **Table 4-3**, three of the intersections are anticipated to be impacted by this alternative of the proposed Project.

The intersections of Hill Street and 1st Street and Hill Street and 7th Street are significantly impacted during the AM peak hour. The intersection of Grand Avenue and 1st Street is significantly impacted during the PM peak hour. The three intersections are significantly impacted due to the addition of a protected signal phase for the streetcar. Although three intersections are significantly impacted per the significance thresholds, they are operating at LOS D or better, which is considered an acceptable level of service.

In addition, the exclusive streetcar track and station platform in the median of Grand Avenue between 1st and 2nd Street shortens the length of the left turn lane from northbound Grand Avenue to westbound 1st Street and from southbound Grand Avenue to eastbound 2nd Street. The queue lengths at these two left turn pocket lanes were reviewed and it was determined that the shortened left turn lane lengths are adequate to accommodate the forecasted traffic volumes without spilling over into the adjacent through lane.

[1] Average vehicle delay in seconds

Existing (2014/2015) – 7th Street Alternative Without Grand Avenue Extension

This scenario consists of adding the 7th Street Alternative without the Grand Avenue Extension vehicular trips (as described in Section 2.3.5) to the Existing (2014/2015) AM and PM peak hour intersection and roadway operating conditions. This alternative eliminates the streetcar alignment on 1st Street west of Hill Street, including the Grand Avenue spur. Consequently, only the intersections located along 1st Street are affected. The results of the remaining intersection locations are the same as the results presented under the 7th Street Alternative with the Grand Avenue Extension. The resulting traffic volumes for the six affected intersection locations are illustrated in **Figure 4-2.** The traffic volumes for the remaining 59 intersection locations did not change and can be found in **Figure 4-1.**

The Existing (2014/2015) with the 7th Street Alternative without the Grand Avenue Extension was analyzed, and the resulting traffic operating conditions and corresponding LOS for the six affected intersection locations are provided in **Table 4-4** and also included in **Appendix D**. The intersection analysis showed that all six locations operate at LOS D or better. The LOS for the remaining 59 intersection locations did not change and is presented in **Table 4-1**.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Existing (2014/2015) with the 7th Street Alternative without the Grand Avenue Extension were compared with the Existing (2014/2015) to identify significantly (CEQA) affected locations. As shown in **Table 4-5** and **Table 4-6**, none of the six intersections affected by this alternative of the proposed Project are anticipated to be significantly impacted.

For the remaining 59 intersections, the comparison results are the same as the 7th Street Alternative with the Grand Avenue Extension. As previously presented in **Table 4-2** and **Table 4-3**, the intersection of Hill Street and 7th Street is significantly impacted during the AM peak hour. This intersection is significantly impacted due to the addition of a protected signal phase for the streetcar. Although this intersection is significantly impacted per the significance thresholds, it is operating at LOS D or better, which is considered an acceptable level of service.

Note: The intersection impacts for the remaining intersections do not change and can be found in Table 4-5

Existing (2014/2015) – 9th Street Alternative With Grand Avenue Extension

This scenario consists of adding the 9th Street Alternative with the Grand Avenue Extension vehicular trips (as described in Section 2.3.5) to the Existing (2014/2015) AM and PM peak hour intersection and roadway operating conditions. The resulting traffic volumes are illustrated in **Figure 4-3.**

The Existing (2014/2015) with the 9th Street Alternative with the Grand Avenue Extension was analyzed, and the resulting traffic operating conditions and corresponding LOS are provided in **Table 4-7** and also included in **Appendix E**. The intersection analysis showed that three of the 65 locations operate at LOS E or F. The remaining 62 intersections operate at LOS D or better during both AM and PM peak hours. As previously noted, the three locations operating at LOS E or F are the same intersections identified in Section 3.2.3 as part of the Existing (2014/2015) level of service analysis.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Existing (2014/2015) with the 9th Street Alternative with the Grand Avenue Extension were compared with the Existing (2014/2015) without Project to identify significantly (CEQA) affected locations. As shown in **Table 4-8** and **Table 4-9**, two of the intersections are anticipated to be significantly impacted by this alternative of the proposed Project.

The intersection of Hill Street and 1st Street is significantly impacted during the AM peak hour and the intersection of Grand Avenue and 1st Street is significantly impacted during the PM peak hour. Both intersections are significantly impacted due to the addition of a protected signal phase for the streetcar to turn left from Hill Street to 1st Street and to turn right across all northbound lanes from Grand Avenue to 1st Street. Although both intersections are significantly impacted per the significance thresholds, they are operating at LOS D or better, which is considered an acceptable level of service.

In addition, the exclusive streetcar track and station platform in the median of Grand Avenue between 1st and 2nd Street shortens the length of the left turn lane from northbound Grand Avenue to westbound 1st Street and from southbound Grand Avenue to eastbound 2nd Street. The queue lengths at these two left turn pocket lanes were reviewed and it was determined that the shortened left turn lane lengths are adequate to accommodate the forecasted traffic volumes without spilling over into the adjacent through lane.

[1] Average vehicle delay in seconds

Existing (2014/2015) – 9th Street Alternative Without Grand Avenue Extension

This scenario consists of adding the 9th Street Alternative without the Grand Avenue Extension vehicular trips (as described in Section 2.3.5) to the Existing (2014/2015) AM and PM peak hour intersection and roadway operating conditions. This alternative eliminates the streetcar alignment on 1st Street west of Hill Street, including the Grand Avenue spur. Consequently, only the intersections located along 1st Street are affected. The results of the remaining intersection locations are the same as the results presented under the 9th Street Alternative with the Grand Avenue Extension. The resulting traffic volumes for the six affected intersection locations are illustrated in **Figure 4-4.** The traffic volumes for the remaining 59 intersection locations did not change and can be found in **Figure 4-3.**

The Existing (2014/2015) with the 9th Street Alternative without the Grand Avenue Extension was analyzed, and the resulting traffic operating conditions and corresponding LOS for the six affected intersection locations are provided in **Table 4-10** and also included in **Appendix E**. The intersection analysis showed that all six locations operate at LOS D or better. The LOS for the remaining 59 intersection locations did not change and is presented in **Table 4-7**.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Existing (2014/2015) with the 9th Street Alternative without the Grand Avenue Extension were compared with the Existing (2014/2015) to identify significantly (CEQA) affected locations. As shown in **Table 4-11** and **Table 4-12**, none of the six intersections affected by this alternative of the proposed Project are anticipated to be significantly impacted. For the remaining 59 intersections, the comparison results are the same as the 9th Street Alternative with the Grand Avenue Extension.

4.2.2 Opening Year (2020)

Opening Year (2020) Without Project

To determine the Opening Year (2020) without Project turning movement intersection traffic volumes, two primary elements that contribute to traffic growth over the years were considered: an ambient traffic rate and traffic due to other known programmed or planned future (related) development projects (as detailed in Section 2.3.6). The resulting traffic volumes are illustrated in **Figure 4-5.**

The Opening Year (2020) without Project scenario, which is also referred to as the No Project Alternative, was analyzed with the assumption that the roadway projects listed in Section 3.2.2 would be in place by year 2020, and the resulting traffic operating conditions and corresponding LOS are provided in **Table 4-13** and also included in **Appendix F**. The intersection analysis showed that 12 of the 65 locations operate at LOS E or F. The remaining 53 intersections operate at LOS D or better during both AM and PM peak hours.

[2] Shading shows intersections that would operate at LOS E or F

Opening Year (2020) – 7th Street Alternative With Grand Avenue Extension

This scenario consists of adding the 7th Street Alternative with the Grand Avenue Extension vehicular trips (as described in Section 2.3.5) to the Opening Year (2020) without Project AM and PM peak hour intersection and roadway operating conditions. The resulting traffic volumes are illustrated in **Figure 4-6.**

The intersection traffic analysis was completed, and the corresponding LOS are provided in **Table 4-14** and also included in **Appendix G**. The intersection analysis showed that 10 of the 65 locations operate at LOS E or F. The remaining 55 intersections operate at LOS D or better during both AM and PM peak hours. It should be noted that the 10 locations operating at LOS E or F are the same as those identified in the Opening Year (2020) without Project level of service analysis.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Opening Year (2020) with the 7th Street Alternative with the Grand Avenue Extension were compared with the Opening Year (2020) without Project to identify significantly (CEQA) affected locations. As seen in **Table 4-15** and **Table 4-16**, three intersections are anticipated to be significantly impacted by this alternative. The three significantly impacted intersections are as follows:

- Grand Avenue and 1st Street
- Hill Street and 1st Street
- Hill Street and 7th Street

It should be noted that although both intersections along Hill Street are significantly impacted per the significance thresholds, they are operating at LOS D or better, which is considered an acceptable level of service. In addition, as described in the project description, the exclusive streetcar track and station platform in the median of Grand Avenue between 1st and 2nd Street shortens the length of the left turn lane from northbound Grand Avenue to westbound 1st Street and from southbound Grand Avenue to eastbound 2nd Street. The queue lengths at these two left turn pocket lanes were reviewed and it was determined that the shortened left turn lane lengths are adequate to accommodate the forecasted traffic volumes without spilling over into the adjacent through lane.

Opening Year (2020) – 7th Street Alternative Without Grand Avenue Extension

This scenario consists of adding the 7th Street Alternative without the Grand Avenue Extension vehicular trips (as described in Section 2.3.5) to the Opening Year (2020) without Project AM and PM peak hour intersection and roadway operating conditions. This alternative eliminates the streetcar alignment on 1st Street west of Hill Street, including the Grand Avenue spur. Consequently, only the intersections located along 1st Street are affected. The results of the remaining intersection locations are the same as the results presented under the 7th Street Alternative with the Grand Avenue Extension. The resulting traffic volumes for the six affected intersection locations are illustrated in **Figure 4-7.** The traffic volumes for the remaining 59 intersection locations did not change and can be found in **Figure 4-6.**

The Opening Year (2020) with the 7th Street Alternative without the Grand Avenue Extension was analyzed, and the resulting traffic operating conditions and corresponding LOS for the six affected intersection locations are provided in **Table 4-17** and also included in **Appendix G**. The intersection analysis showed that only the intersection of Grand Avenue and 1st Street operates at LOS E in the AM peak hour and LOS C in the PM peak hour. The remaining five intersections operate at LOS D or better during both AM and PM peak hours. It should be noted that the LOS for the intersection of Grand Avenue and 1st Street did not change and is the same as that identified in the Opening Year (2020) without Project level of service analysis. The LOS for the remaining 59 intersection locations did not change and is presented in **Table 4-14**.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Opening Year (2020) with the 7th Street Alternative without the Grand Avenue Extension were compared with the Opening Year (2020) to identify significantly (CEQA) affected locations. As shown in **Table 4-18** and **Table 4-19**, none of the six intersections affected by this alternative of the proposed Project are anticipated to be significantly impacted.

For the remaining 59 intersections, the comparison results are the same as the 7th Street Alternative with the Grand Avenue Extension. As previously presented in **Table 4-15** and **Table 4-16**, the intersection of Hill Street and 7th Street is significantly impacted during both AM and PM peak hours. This intersection is significantly impacted due to the addition of a protected signal phase for the streetcar. Although this intersection is significantly impacted per the significance thresholds, it is operating at LOS D or better, which is considered an acceptable level of service.

Note: The intersection impacts for the remaining intersections do not change and can be found in Table 4-18

Opening Year (2020) – 9th Street Alternative With Grand Avenue Extension

This scenario consists of adding the 9th Street Alternative with the Grand Avenue Extension vehicular trips (as described in Section 2.3.5) to the Opening Year (2020) without Project AM and PM peak hour intersection and roadway operating conditions. The resulting traffic volumes are illustrated in **Figure 4-8.**

The intersection traffic analysis was completed, and the corresponding LOS are provided in **Table 4-20** and also included in **Appendix H**. The intersection analysis showed that 10 of the 65 locations operate at LOS E or F. The remaining 55 intersections operate at LOS D or better during both AM and PM peak hours. The 10 locations operating at LOS E or F are the same as those identified in the Opening Year (2020) without Project level of service analysis.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Opening Year (2020) with the 9th Street Alternative with the Grand Avenue Extension were compared with the Opening Year (2020) without Project to identify significantly (CEQA) affected locations. As seen in **Table 4-21** and **Table 4-22**, two intersections are anticipated to be significantly impacted by this alternative. The two significantly impacted intersections are as follows:

- Grand Avenue and 1st Street
- Hill Street and 1st Street

It should be noted that although both these intersections are significantly impacted per the significance thresholds, the intersection of Hill Street and 1st Street is operating at LOS D or better, which is considered an acceptable level of service. In addition, the exclusive streetcar track and station platform in the median of Grand Avenue between 1st and 2nd Street shortens the length of the left turn lane from northbound Grand Avenue to westbound 1st Street and from southbound Grand Avenue to eastbound 2nd Street. The queue lengths at these two left turn pocket lanes were reviewed and it was determined that the shortened left turn lane lengths are adequate to accommodate the forecasted traffic volumes without spilling over into the adjacent through lane.

[1] Average vehicle delay in seconds

Opening Year (2020) – 9th Street Alternative Without Grand Avenue Extension

This scenario consists of adding the 9th Street Alternative without the Grand Avenue Extension vehicular trips (as described in Section 2.3.5) to the Opening Year (2020) without Project AM and PM peak hour intersection and roadway operating conditions. This alternative eliminates the streetcar alignment on 1st Street west of Hill Street, including the Grand Avenue spur. Consequently, only the intersections located along 1st Street are affected. The results of the remaining intersection locations are the same as the results presented under the 9th Street Alternative with the Grand Avenue Extension. The resulting traffic volumes for the 6 affected intersection locations are illustrated in **Figure 4-9.** The traffic volumes for the remaining 59 intersection locations did not change and can be found in **Figure 4-8.**

The Opening Year (2020) with the 9th Street Alternative without the Grand Avenue Extension was analyzed, and the resulting traffic operating conditions and corresponding LOS for the six affected intersection locations are provided in **Table 4-23** and also included in **Appendix H**. The intersection analysis showed that only the intersection of Grand Avenue and 1st Street operates at LOS E in the AM peak hour and LOS C in the PM peak hour. The remaining five intersections operate at LOS D or better during both AM and PM peak hours. It should be noted that the LOS for the intersection of Grand Avenue and 1st Street did not change and is the same as that identified in the Opening Year (2020) without Project level of service analysis. The LOS for the remaining 59 intersection locations did not change and is presented in **Table 4-20**.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Opening Year (2020) with the 9th Street Alternative without the Grand Avenue Extension were compared with the Opening Year (2020) to identify significantly (CEQA) affected locations. As shown in **Table 4-24** and **Table 4-25**, none of the six intersections affected by this alternative of the proposed Project are anticipated to be significantly impacted. For the remaining 59 intersections, the comparison results are the same as the 9th Street Alternative with the Grand Avenue Extension; i.e., no significantly impacted intersections.

4.2.3 Horizon Year (2040)

Horizon Year (2040) Without Project

To determine the Horizon Year (2040) without Project traffic volumes, two primary elements that contribute to traffic growth over the years were considered: an ambient traffic growth rate, and traffic due to other known programmed or planned future (related) development projects (as detailed in Section 2.3.6). The resulting traffic volumes are illustrated in **Figure 4-10.**

The Horizon Year (2040) without Project scenario, which is also referred to as the No Project Alternative, was analyzed with the assumption that the roadway projects listed in Section 3.2.2 would be in place by year 2040, and the resulting traffic operating conditions and corresponding LOS are provided in **Table 4-26** and also included in **Appendix I**. The intersection analysis showed that 16 of the 65 locations operate at LOS E or F. The remaining 49 intersections operate at LOS D or better during both AM and PM peak hours.

[2] Shading shows intersections that would operate at LOS E or F

Horizon Year (2040) – 7th Street Alternative With Grand Avenue Extension

This scenario consists of adding the 7th Street Alternative with the Grand Avenue Extension vehicular trips (as described in Section 2.3.5) to the Horizon Year (2040) without Project AM and PM peak hour intersection and roadway operating conditions. The resulting traffic volumes at the study intersections are illustrated in **Figure 4-11.**

The intersection traffic analysis was completed, and the corresponding LOS are provided in **Table 4-27** and also included in **Appendix J**. The intersection analysis showed that 16 of the 65 locations operate at LOS E or F. The remaining 49 intersections operate at LOS D or better during both AM and PM peak hours. It should be noted that 14 of the 16 locations operating at LOS E or F are the same as those identified in the Horizon Year (2040) without Project level of service analysis. The intersections of Hill Street and 1st Street and Hill Street and 7th Street are the additional locations compared to the without Project condition.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Horizon Year (2040) with the 7th Street Alternative with the Grand Avenue were compared with the Horizon Year (2040) without Project to identify significantly (CEQA) affected locations. As seen in **Table 4-28** and **Table 4-29**, three intersections are anticipated to be significantly impacted by this alternative. The three significantly impacted intersection locations are as follows:

- Grand Avenue and 1st Street
- Hill Street and 1st Street
- Hill Street and 7th Street

As described in the project description, the exclusive streetcar track and station platform in the median of Grand Avenue between 1st and 2nd Street shortens the length of the left turn lane from northbound Grand Avenue to westbound 1st Street and from southbound Grand Avenue to eastbound 2nd Street. The queue lengths at these two left turn pocket lanes were reviewed and it was determined that the shortened left turn lane lengths are adequate to accommodate the forecasted traffic volumes without spilling over into the adjacent through lane.

Horizon Year (2040) – 7th Street Alternative Without Grand Avenue Extension

This scenario consists of adding the 7th Street Alternative without the Grand Avenue Extension vehicular trips (as described in Section 2.3.5) to the Horizon Year (2040) without Project AM and PM peak hour intersection and roadway operating conditions. This alternative eliminates the streetcar alignment on 1st Street west of Hill Street, including the Grand Avenue spur. Consequently, only the intersections located along 1st Street are affected. The results of the remaining intersection locations are the same as the results presented under the 7th Street Alternative with the Grand Avenue Extension. The resulting traffic volumes for the six affected intersection locations are illustrated in **Figure 4-12.** The traffic volumes for the remaining 59 intersection locations did not change and can be found in **Figure 4-11.**

The Horizon Year (2040) with the 7th Street Alternative without the Grand Avenue Extension was analyzed, and the resulting traffic operating conditions and corresponding LOS for the six affected intersection locations are provided in **Table 4-30** and also included in **Appendix J**. The intersection analysis showed that the intersections of Hope Street and 1st Street and Grand Avenue and 1st Street operate at LOS E in the AM peak hour and LOS D in the PM peak hour. The remaining 4 intersections operate at LOS D or better during both AM and PM peak hours. It should be noted that the LOS for the intersection of Hope Street and 1st Street and Grand Avenue and 1st Street did not change and is the same as that identified in the Horizon Year (2040) without Project level of service analysis. The LOS for the remaining 59 intersection locations did not change and is presented in **Table 4-27**.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Horizon Year (2040) with the 7th Street Alternative without the Grand Avenue Extension were compared with the Opening Year (2020) to identify significantly (CEQA) affected locations. As shown in **Table 4-31** and **Table 4-32**, none of the six intersections affected by this alternative of the proposed Project are anticipated to be significantly impacted.

For the remaining 59 intersections, the comparison results are the same as the 7th Street Alternative with the Grand Avenue Extension. As previously presented in **Table 4-28** and **Table 4-29**, the intersection of Hill Street and 7th Street is significantly impacted during AM and PM peak hours. This intersection is significantly impacted due to the addition of a protected signal phase for the streetcar. Although this intersection is significantly impacted per the significance thresholds, it is operating at LOS E in the AM peak hour and LOS D in the PM peak hour.

Note: The intersection impacts for the remaining intersections do not change and can be found in Table 4-31

Horizon Year (2040) – 9th Street Alternative With Grand Avenue Extension

This scenario consists of adding the 9th Street Alternative with the Grand Avenue Extension vehicular trips (as described in Section 2.3.5) to the Horizon Year (2040) without Project AM and PM peak hour intersection and roadway operating conditions. The resulting traffic volumes at the study intersections are illustrated in **Figure 4-13.**

The intersection traffic analysis was completed, and the corresponding LOS are provided in **Table 4-33** and also included in **Appendix K**. The intersection analysis showed that 15 of the 65 locations operate at LOS E or F. The remaining 50 intersections operate at LOS D or better during both AM and PM peak hours. It should be noted that 14 of the 15 locations operating at LOS E or F are the same as those identified in the Horizon Year (2040) without Project level of service analysis. The intersections of Hill Street and 1st Street is the additional location compared to the without Project condition.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Horizon Year (2040) with the 9th Street Alternative with the Grand Avenue Extension were compared with the Horizon Year (2040) without Project to identify significantly (CEQA) affected locations. As seen in **Table 4-34** and **Table 4-35**, two intersections are anticipated to be significantly impacted by this alternative. The two significantly impacted intersection locations are as follows:

- Grand Avenue and 1st Street
- Hill Street and 1st Street

As described in the project description, the exclusive streetcar track and station platform in the median of Grand Avenue between 1st and 2nd Street shortens the length of the left turn lane from northbound Grand Avenue to westbound 1st Street and from southbound Grand Avenue to eastbound 2nd Street. The queue lengths at these two left turn pocket lanes were reviewed and it was determined that the shortened left turn lane lengths are adequate to accommodate the forecasted traffic volumes without spilling over into the adjacent through lane.

[1] Average vehicle delay in seconds

Horizon Year (2040) – 9th Street Alternative Without Grand Avenue Extension

This scenario consists of adding the 9th Street Alternative without the Grand Avenue Extension vehicular trips (as described in Section 2.3.5) to the Horizon Year (2040) without Project AM and PM peak hour intersection and roadway operating conditions. This alternative eliminates the streetcar alignment on 1st Street west of Hill Street, including the Grand Avenue spur. Consequently, only the intersections located along 1st Street are affected. The results of the remaining intersection locations are the same as the results presented under the 9th Street Alternative with the Grand Avenue Extension. The resulting traffic volumes for the six affected intersection locations are illustrated in **Figure 4-14.** The traffic volumes for the remaining 59 intersection locations did not change and can be found in **Figure 4-13.**

The Horizon Year (2040) with the 9th Street Alternative without the Grand Avenue Extension was analyzed, and the resulting traffic operating conditions and corresponding LOS for the six affected intersection locations are provided in **Table 4-36** and also included in **Appendix K**. The intersection analysis showed that the intersections of Hope Street and 1st Street and Grand Avenue and 1st Street operate at LOS E in the AM peak hour and LOS D in the PM peak hour. The remaining four intersections operate at LOS D or better during both AM and PM peak hours. It should be noted that the LOS for the intersections of Hope Street and 1st Street and Grand Avenue and 1st Street did not change and is the same as that identified in the Horizon Year (2040) without Project level of service analysis. The LOS for the remaining 59 intersection locations did not change and is presented in **Table 4-33**.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Horizon Year (2040) with the 9th Street Alternative without the Grand Avenue Extension were compared with the Horizon Year (2040) to identify significantly (CEQA) affected locations. As shown in **Table 4-37** and **Table 4-38**, none of the six intersections affected by this alternative of the proposed Project are anticipated to be significantly impacted. For the remaining 59 intersections, the comparison results are the same as the 9th Street Alternative with the Grand Avenue Extension.

4.3 PARKING

Appendix G of the State CEQA Guidelines was recently updated to no longer require the analysis of parking as an environmental impact by a project. Nonetheless, this section provides a quantitative assessment of the potential effects of the Project on the availability of on-street parking along the build alternatives' corridors.

A parking inventory was compiled for existing conditions, future conditions, without and with the proposed Project. In general, the without Project condition will result in an increase of on-street parking and/or loading spaces due to the proposed projects that were identified in Section 2.3.6. For the proposed Project condition, a number of parking and loading spaces will be removed to accommodate the proposed station platforms and the transitioning of the streetcar tracks. However, a number of full time on-street parking spaces will be gained along Hill Street due to the proposed bump-outs that are being implemented as part of the project in order to create a location for the station areas. Based on the current station location placement, the 7th Street Alternatives would both result in an approximate loss of up to 19 on-street parking spaces and the 9th Street Alternatives would both result in an approximate loss of up to 41 on-street parking spaces. This loss, as a result of the proposed Project, is an estimate and may change once the exact station locations are defined. A block-by-block estimate of the on-street parking spaces that would be lost or gained is presented in **Table 4-39**. Since, this is a transit project that aims to support non-motorized modes of travel in the area, the Project is also consistent with LADOT's policies in developing transportation demand management (TDM) measures that reduce single occupancy vehicle (SOV) trips and encourage ridesharing and transit use.

In the assessment of off-street parking, the four potential Maintenance and Storage Facility sites were assessed as they are currently utilized as privately-operated off-street parking facilities. The first site is bound by Grand Avenue to the west, 11th Street to the north, Olive Street to the east, and 12th Street to the south. Currently, this site accommodates about 350 off-street parking spaces, however, a small portion of these parking spaces are covenanted to the Grand Lofts. Because no final designs have been produced for the MSF locations, it is unknown at this time how much of the site will be utilized and how many parking spaces will be permanently displaced due to the proposed Project. Once built, the facility would provide adequate parking spaces to accommodate its employees that are working on site per the requirements set forth in the *Los Angeles Municipal Code* (LAMC).

The second MSF site is proposed at the southeast corner of 11th and Olive Streets. Currently, this site accommodates about 140 off-street parking spaces. Some or all of these spaces would be removed if this site is selected for the MSF. It should be noted that it has not been determined if the proposed MSF footprint will be utilizing all or part of the site. Once the facility is built on the selected site, the Project would provide adequate parking spaces to accommodate its employees that are working on site.

The third MSF site is proposed along 5th Street between Olive and Hill Streets. Currently, this site accommodates about 430 off-street parking spaces. Some or all of these spaces would be removed if this site is selected for the MSF. It should be noted that it has not been determined if the proposed MSF footprint will be utilizing all or part of the site.

The fourth and final MSF site is proposed along 3rd Street between Hill Street and Broadway. Currently, this site accommodates about 240 off-street parking spaces. Some or all of these spaces would be removed if this site is selected for the MSF. It should be noted that it has not been determined if the proposed MSF footprint will be utilizing all or part of the site. Once built on the selected site, the Project would provide adequate parking spaces to accommodate its employees that are working on site.

4.4 PEDESTRIAN AND BICYCLE FACILITIES

A number of bikeway and streetscape projects are planned within the project area (detailed in Section 3.2.2) to enhance the pedestrian environment and support bicycle use. Implementation of the streetcar alignment on those streets for which bicycle facilities are either currently in place or programmed will be completed so as to accommodate those facilities. Consequently, the proposed Project is not anticipated to have any adverse impact within the project area on any of the existing or planned pedestrian and bicycle facilities. The proposed Project is expected to create a pedestrian friendly environment, support walking and transit use, and result in an increase in pedestrian traffic along the alignment streets such as Broadway, Hill Street, 11th Street and Figueroa Street. Generally, streetcar systems serve relatively short trips in dense urban corridors. Therefore, the streetcar would improve and benefit the pedestrian environment and enhance connectivity for those who walk in the downtown area. However, by 2040, increased traffic congestion and the deterioration of operating conditions (LOS) for traffic segments and intersections may result in an overall performance deterioration for bicycle and pedestrian movements at intersections located within the project study area. Consequently, the proposed Project would be designed to maximize pedestrian safety and accessibility through the implementation of measures that would minimize, if not avoid, vehicular/pedestrian and vehicular/bicycle conflicts. Design elements of the streetcar system may include but not be limited to the following: streetcars equipped with lighting, audible warning devices; train to wayside communication (TWC); signage; striping; and wayfinding. In order to provide for a safe and reliable operation, the Project will comply with but not be limited to improvement programs by LADOT, other City departments, and the applicable CPUC regulations. In summary, the project will result in no negative effects to the pedestrian environment.

Bicyclists traveling along the streetcar alignment, for the streets on which bicycle lanes are not designated, would need to be aware of potential conflicts between bicycle tires and the rail flangeway. A grooved section which includes a formed steel flangeway (groove), is the desired rail section for areas subject to bicycles and other narrow-tired vehicles. Bicycle safety will remain an important design consideration requiring further investigation in the design phase of the project. Implementation of the Project would involve the installation of a fixed guideway within the roadway, which may present hazards for cyclists traveling parallel to, or across, the railway. Although the rail itself would be vertically flush with the road surface, there would be a horizontal gap between the track and the surrounding pavement, which is known as the flangeway. The flangeway is oftentimes wider than a bicycle tire, particularly the tires of road bicycles, and tires can become wedged in the flangeway if the bicycle is traveling parallel, or close to parallel, to the flangeway. This "tire-in-track" issue is a potential hazard of the Project with respect to cyclists. In all instances in which the fixed guideway would occupy the same roadway as an existing or planned bike lane (and cyclists would be traveling parallel to the fixed guideway), designated bike lanes and the guideway would be separated. Roadways with bicycle lanes are expected to experience the highest volume of cyclists, but implementation of the Project would not prohibit cyclists from using any part of the alignment. For the roadways on which the fixed guideway and the travel lane closest to the sidewalk coincide, the potential for "tire-in-track" hazards would be greater than along the portions of the alignment with designated bicycle lanes. With the implementation of MM-TRAF-O1, which would include signage and pavement markings instructing cyclists how to cross the tracks safely, safety hazards for cyclists would be considered potentially significant.

[1] Approximate counts based on a field survey conducted in 2013
[2] Includes the BSMP (per conceptual plans) and all other planned related projects

4.5 CONSTRUCTION PHASE

Project construction activities would typically take place between the hours of 7:00 a.m. and 9:00 p.m. in accordance with LAMC Section 41.40(a). To expedite construction activities, certain construction activities may occur during nighttime, weekend, and holiday periods with the approval of the Board of Police Commissioners pursuant to LAMC Section 41.40(j). In addition, construction within City roadways may occur during peak hours (i.e., 6:00 a.m. to 9:00 a.m. and 3:30 p.m. to 7:00 p.m.) in accordance with the Mayor's Executive Directive No. 2 and Bureau of Engineering Special Order No. 001-0406 which contain an exemption to the rush hour roadway construction prohibition for major public works projects with traffic mitigation plans.

4.5.1 Public Transit

Bus lines that would be affected by lane closures due to construction activities would continue to operate where feasible in the remaining traffic lanes. A minimum of one traffic lane in each direction will be provided during the AM and PM peak periods, and left turn pockets will be provided where room is available. During the off-peak periods and night hours when temporary full lane closures are anticipated, bus lines would be re-routed to adjacent streets in a manner that minimizes the inconvenience to bus passengers. If a block is closed that includes a bus stop, the bus stop would be temporarily relocated to the portion of the street segment that is still open to bus service.

4.5.2 Streets and Highways

A minimum of one traffic lane in each direction will be provided during the AM and PM peak periods, and left turn pockets will be provided where room is available. Access to homes and businesses will be maintained throughout the construction period. This can be ensured by leaving at least one business access point open to traffic. For businesses with single access points, the access point may be maintained through the use of temporary detours, steel plates, and half-closures of driveways. To the extent feasible full lane closures are anticipated to take place during the off peak periods and night hours. To minimize traffic impacts, LADOT guidelines require that all construction related traffic, such as those generated by construction workers, should avoid peak commute hours. A summary of the construction activities is presented in Section 1.5.

Designated haul routes for trucks will be identified during final design. These routes will be situated to minimize noise, vibration, and other possible impacts to adjacent residential areas. Since construction work is in the downtown area, it is anticipated that trucks would travel from the excavation site to the nearest freeway ramp and use the adjacent freeways to haul the excavated material. During the construction period, approximately 10 to 15 trucks per day will be utilized to haul away the materials from track, utility relocation and maintenance facility excavation.

The Streetcar Construction Methods report presents sketches of typical work zone and traffic control cross sections along various roadways of the alignment. As noted earlier, a minimum of one traffic lane in each direction will be provided during the AM and PM peak periods. Based on the typical cross-sections proposed during the construction period, at least one traffic lane will be lost in each direction on Grand Avenue, Broadway, Hill Street, Figueroa Street, 7th Street, and 9th Street during the AM and PM peak hours. This loss in lane capacity at the intersections, would most likely result in an increase in delay and a decrease in the level of service. It is highly likely that some of the intersections along the streetcar alignment construction work zone area operating at LOS D or worse during the opening year (2020) without Project condition will be significantly impacted due to the construction activity. Although this is a short term impact that may be in place for a duration of two to three weeks, mitigation measures would be identified and implemented as part of the traffic management plan discussed in Section 6.2.2.

4.5.3 Parking

It may be necessary to prohibit on-street curb parking when traffic lanes are closed or eliminated due to construction activities. Existing parking meters affected by construction, within the traffic control zone of influence, would be removed or covered as directed by the City of Los Angeles parking division.

4.5.4 Pedestrian and Bicycle Facilities

During construction, at least one travel lane will be maintained in each direction and the sidewalks will be open to pedestrians. Pedestrian access will remain open along the sidewalk, and temporary ramps and walkways will be provided by the contractor to maintain ADA accessibility at intersections and crosswalks. In addition, dedicated bicycle lanes potentially affected by work zones, such as along 7th Street for the 7th Street Alternative and along Figueroa and 11th Streets, may operate along the open traffic lane or require temporary detours.

Chapter 5 – Project Improvements and Design Elements

As discussed earlier in Section 4.2, there are various project improvements and design elements that would either serve to avoid or minimize effects on the roadway network and its users if not increase efficiencies of the network and operations of the streetcar system.

5.1 PROJECT IMPROVEMENTS AND PROJECT DESIGN ELEMENTS

PDE-TRAF-1: Lane Reconfiguration on Hill Street

In order to accommodate the streetcar, Hill Street would need to be reconfigured, however, the proposed changes would not reduce the existing number of travel lanes along Hill Street. Instead, the removal of on-street parking and/or center turn lanes along certain segments are needed to accommodate the streetcar alignment, which is located along the curb lane in the northbound direction. A typical mid-block conceptual cross-section for the before and after conditions along Hill Street is shown as part of the project description and was previously presented in **Figure 1-4**. These Hill Street lane reconfigurations are proposed between 1st and 7th Streets for the 7th Street Alternative or between 1st and 9th Street for the 9th Street Alternative. This proposed reconfiguration would include bump outs at some of the street corners to accommodate the station platforms, which would create and allow for full-time on-street parking/loading spaces along the east side of Hill Street. The station platforms are predominantly located on the near side of the intersection.

To confirm the adequacy of Hill Street to accommodate streetcar operations, field observations of current traffic circulation patterns, roadway lane configurations and peak period parking restrictions were conducted during the PM peak period (3:00 p.m. to 6:00 p.m.) on a typical representative weekday. The objective was to determine if the total curb-to-curb width of Hill Street would be adequate to accommodate at least two travel lanes in each direction with the northbound curb lane also being utilized by the streetcar alignment. The proposed reconfiguration would allow for a two-way left turn median between 4th and 6th Streets to provide enhanced driveway access to neighboring businesses and off-street parking lots. As a result of this proposed lane reconfiguration along Hill Street, the proposed conceptual design street dimensions were compared with the *Downtown Street Standards* and it was confirmed that they are within the maximum street dimensions currently shown for Hill Street.

PDE-TRAF-2: Traffic Signal Improvements

Traffic signal improvements are proposed in efforts to maximize efficiencies of the roadway network and operations of the Project. Traffic signal improvements that would be part of the Project include the following:

- Protected northbound right-turn phase at the intersection of Grand Avenue / 1st Street for both the 7th Street and 9th Street Alternatives with the Grand Avenue Extension
- Protected northbound left-turn phase at the intersection of Hill Street / 1st Street for both the 7th Street and 9th Street Alternatives with the Grand Avenue Extension
- Protected eastbound left-turn phase at the intersection of Hill Street / 7th Street for the 7th Street Alternative with and without the Grand Avenue Extension

- Redistribute the green time within the existing signal cycle length to provide more green time to the streetcar movement/direction. The amount of green time would range from 5 seconds to up to 10% of the cycle length (7 seconds for the AM peak hour and 9 seconds for the PM peak hour) when the transit vehicle is present and only if the controller has enough time in the cycle to provide it

PDE-TRAF-3: Right Turn Lane Improvements
In order to improve operations of the streetcar, including its run time, a Speed Improvements Analysis was conducted to evaluate potential physical and operational treatments along the streetcar alignment. This study was initiated in August 2015 and completed in September 2015. Proposed right turn lane improvements were identified at various intersections along Broadway and Hill Street to allow for the flow of vehicles in the through lanes, which would help reduce delay and optimize operating time for the streetcar. The following right turn lanes would be incorporated as part of the project definition:

- A right turn pocket lane for the southbound direction of Broadway at 3rd Street to provide storage and off-set the anticipated vehicular queues during pedestrians crossing the west leg, thus minimizing potential spillover onto the through movement and streetcar tracks
- A right turn pocket lane for the southbound direction of Broadway at 5th Street to provide storage and off-set the anticipated vehicular queues during pedestrians crossing the west leg, thus minimizing potential spillover onto the through movement and streetcar tracks
- A right turn pocket lane for the southbound direction of Broadway at 8th Street to provide storage and off-set the anticipated vehicular queues during pedestrians crossing the west leg, thus minimizing potential spillover onto the through movement and streetcar tracks
- A right turn pocket lane for the southbound direction of Broadway at 11th Street to enhance the streetcar run time by segregating the right turn streetcar movement from the through vehicular traffic movement
- A right turn pocket lane for the northbound direction of Hill Street at 6th Street to enhance the streetcar run time by segregating the right turn vehicular traffic movement from the through streetcar movement and to provide storage so that right turn queues do not spillover onto the northbound Hill Street through movement and the streetcar tracks

The Project would ensure that these proposed lane configurations would be in conformance with applicable City roadway and design standards, such as the *Downtown Street Standards* (DSS) and the *Broadway Streetscape Master Plan* (BSMP).

5.2 ADDITIONAL DESIGN ELEMENTS

The proposed Project is expected to create a pedestrian friendly environment and support walking and transit use. Implementation of the following project design elements will result in no negative effects to the pedestrian and transit environment.

PDE-TRAF-4: Rider/Pedestrian/Bicyclist Safety Elements
The Project would be designed to maximize pedestrian safety and accessibility through the implementation of measures that would minimize or avoid vehicular/pedestrian and vehicular/bicycle conflicts. Design elements of the streetcar system may include, but would not be limited to, the following: streetcars equipped with lighting, audible warning devices; train to wayside communication (TWC);

signage; striping; and wayfinding. In addition, specific measures will be implemented to reduce potential impacts affecting bicycle use. Please see Section 6.2.4. Mid-block pedestrian signals shall be provided on Grand Avenue and Hill Street, between 1st Street and 2nd Street. In order to provide for a safe and reliable operation, the Project will comply with, but would not be limited to, improvement programs of LADOT, other City departments, and applicable CPUC regulations.

PDE-TRAF-5: Bus Service Coordination
The City would coordinate with local and regional bus operators prior to implementation of designs that could result in necessary rerouting of buses.

PDE-TRAF-6: Traffic Rerouting Notifications
Before any major rerouting changes are made as a result of the Project, fliers would be provided on buses at least 2 weeks in advance notifying riders of route modifications. In addition, hoods would be placed over bus-stop signs, also notifying riders of what modifications have been made to the bus route.

PDE-TRAF-7: Streetcar Vehicles Safety Elements
Streetcar vehicles would be equipped with audible warning devices, a TWC system, and safety and wayfinding signs. Operators would undergo extensive training and continuing evaluation to ensure safety. The City would also develop transit safety programs, with the goal of raising streetcar safety awareness in the community.

Chapter 6 – Mitigation Measures

6.1 MITIGATION MEASURES

6.1.1 Existing (2014/2015) With Project

Existing (2014/2015) – 7th Street Alternative With Grand Avenue Extension

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Existing (2014/2015) with the 7th Street Alternative with the Grand Avenue Extension were compared with the Existing (2014/2015) without Project to identify significantly (CEQA) affected locations. As seen in **Table 4-4** and **Table 4-5**, three intersections are anticipated to be significantly impacted by the 7th Street Alternative with the Grand Avenue Extension. Physical traffic mitigation improvement options at the significantly impacted intersections were evaluated in an attempt to fully mitigate the impacts; however, no feasible measures to fully mitigate these impacts were identified due to the constraints of the existing physical conditions. With the adoption of the Downtown Design Guide and new street standards, the roadway width has been set along the majority of streets in downtown. Therefore, street widening is not an option either due to these new standards, or because it was not considered practical nor desirable to widen the street at the expense of reduced sidewalk widths.

Although still significantly impacted, as shown in **Table 6-1**, the three significantly impacted intersections would operate at LOS D or better, which is considered an acceptable level of service in urban areas. Although no feasible measures may fully mitigate these intersections, there are other improvements that may be considered to address the residual impacts which may include, but not limited to, the implementation of the following additional improvements to reduce intersection impacts:

- on-going signal timing modifications, as needed, after the project is operational and traffic operating conditions shall be monitored.
- vehicle trip reduction measures (this could include encouraging walkability, supporting the use of alternative transportation modes, enhancing pedestrian crossings through curb extensions, first/last mile connections afforded by the streetcar, bike parking on widened sidewalks, bike share kiosks, pedestrian wayfinding signage program, and real time information at stations).

Table 6-1: Existing (2014/2015) – 7th Street Alternative With Grand Avenue Extension Mitigated Intersection Level of Service

#	Intersection	AM		PM		Significant Impact
		Delay[1]	LOS	Delay[1]	LOS	
2	Grand Avenue / 1st Street	51.7	D	39.0	D	YES
4	Hill Street / 1st Street	35.8	D	34.3	C	YES
35	Hill Street / 7th Street	45.6	D	33.9	C	YES

[1] Average vehicle delay in seconds

The numerical benefits of these proposed improvements cannot be determined or quantified. However, these enhancements would result in additional benefits that were not factored in the analysis, so the impacts presented in this section are likely overstated.

Existing (2014/2015) – 7th Street Alternative Without Grand Avenue Extension

This alternative eliminates the streetcar alignment on 1st Street west of Hill Street, including the Grand Avenue spur. Consequently, only the intersections located along 1st Street are affected.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Existing (2014/2015) with the 7th Street Alternative without the Grand Avenue Extension were compared with the Existing (2014/2015) to identify significantly (CEQA) affected locations. As shown in **Table 4-7** and **Table 4-8**, none of the six intersections affected by this alternative of the proposed Project are anticipated to be significantly impacted. For the remaining 59 intersections, the results are the same as the 7th Street Alternative with the Grand Avenue Extension. Consequently, the intersection of Hill Street and 7th Street is the only significantly impacted location for this alternative. The result of this location was previously presented in **Table 6-1**.

Existing (2014/2015) – 9th Street Alternative With Grand Avenue Extension

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Existing (2014/2015) with the 9th Street Alternative with the Grand Avenue Extension were compared with the Existing (2014/2015) without Project to identify significantly (CEQA) affected locations. As seen in **Table 4-10** and **Table 4-11**, two intersections are anticipated to be significantly impacted by the 9th Street Alternative with the Grand Avenue Extension. Physical traffic mitigation improvement options at the significantly impacted intersections were evaluated in an attempt to fully mitigate the impacts; however, no measures to fully mitigate these impacts were identified due to the constraints of the existing physical conditions. With the adoption of the Downtown Design Guide and new street standards, the roadway width has been set along the majority of streets in downtown. Therefore, street widening was not an option either due to these new standards, or since it was not considered practical nor desirable to widen the street at the expense of reduced sidewalk widths.

Although still significantly impacted, as shown in **Table 6-2**, the two significantly impacted intersections at Grand Avenue and 1st Street as well as Hill Street and 1st Street would operate at LOS D or better, which is considered an acceptable level of service in urban areas. Although no feasible measures may fully mitigate these intersections, there are other improvements that may be considered to address the residual impacts which may include, but not limited to, the implementation of the following additional improvements to reduce intersection impacts.

- on-going signal timing modifications, as needed, after the project is operational and traffic operating conditions shall be monitored.
- vehicle trip reduction measures (this could include encouraging walkability, supporting the use of alternative transportation modes, enhancing pedestrian crossings through curb extensions, first/last mile connections afforded by the streetcar, bike parking on widened sidewalks, bike share kiosks, pedestrian wayfinding signage program, and real time information at stations).

The numerical benefits of these proposed improvements cannot be determined or quantified. However, these enhancements would result in additional benefits that were not factored in the analysis, so the impacts presented in this section are likely overstated.

Table 6-2: Existing (2014/2015) – 9th Street Alternative With Grand Avenue Extension Mitigated Intersection Level of Service

#	Intersection	AM		PM		Significant Impact
		Delay[1]	LOS	Delay[1]	LOS	
2	Grand Avenue / 1st Street	51.7	D	39.0	D	YES
4	Hill Street / 1st Street	35.8	D	34.3	C	YES

[1] Average vehicle delay in seconds

Existing (2014/2015) – 9th Street Alternative Without Grand Avenue Extension

This alternative eliminates the streetcar alignment on 1st Street west of Hill Street, including the Grand Avenue spur. Consequently, only the intersections located along 1st Street are affected.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Existing (2014/2015) with the 9th Street Alternative without the Grand Avenue Extension were compared with the Existing (2014/2015) to identify significantly (CEQA) affected locations. As shown in **Table 4-13** and **Table 4-14**, none of the six intersections affected by this alternative of the proposed Project are anticipated to be significantly impacted. For the remaining 59 intersections, the results are the same as the 9th Street Alternative without the Grand Avenue Extension. Consequently, none of the remaining 59 intersections are anticipated to be significantly impacted by this alternative.

6.1.2 Opening Year (2020) With Project

Opening Year (2020) – 7th Street Alternative With Grand Avenue Extension

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Opening Year (2020) with the 7th Street Alternative with the Grand Avenue Extension were compared with the Opening Year (2020) without Project to identify significantly (CEQA) affected locations. As seen in **Table 4-17** and **Table 4-18**, three intersections are anticipated to be significantly impacted by the 7th Street Alternative with the Grand Avenue Extension. Physical traffic mitigation improvement options at the significantly impacted intersections were evaluated in an attempt to fully mitigate the impacts; however, no measures to fully mitigate these impacts were identified due to the constraints of the existing physical conditions. With the adoption of the Downtown Design Guide and new street standards, the roadway width has been set along the majority of streets in downtown. Therefore, street widening was not an option either due to these new standards, or since it was not considered practical nor desirable to widen the street at the expense of reduced sidewalk widths.

Although still significantly impacted, as shown in **Table 6-3**, two of the significantly impacted intersections (Hill Street/1st Street and Hill Street/7th Street) would operate at LOS D, which is considered an acceptable level of service in urban areas. The intersection of Grand Avenue/1st Street would continue to be significantly impacted. Although no feasible measures may fully mitigate these intersections, there are other improvements that may be considered to address the residual impacts which may include, but not limited to, the implementation of the following additional improvements to reduce intersection impacts.

- on-going signal timing modifications, as needed, after the project is operational and traffic operating conditions shall be monitored.

- vehicle trip reduction measures (this could include encouraging walkability, supporting the use of alternative transportation modes, enhancing pedestrian crossings through curb extensions, first/last mile connections afforded by the streetcar, bike parking on widened sidewalks, bike share kiosks, pedestrian wayfinding signage program, and real time information at stations).

The numerical benefits of these proposed improvements cannot be determined or quantified. However, these enhancements would result in additional benefits that were not factored in the analysis, so the impacts presented in this section are likely overstated.

Table 6-3: Opening Year (2020) – 7th Street Alternative With Grand Avenue Extension Mitigated Intersection Level of Service

#	Intersection	AM		PM		Significant Impact
		Delay[1]	LOS	Delay[1]	LOS	
2	Grand Avenue / 1st Street	62.0	E	56.8	E	YES
4	Hill Street / 1st Street	41.2	D	40.8	D	YES
35	Hill Street / 7th Street	48.6	D	40.3	D	YES

[1] Average vehicle delay in seconds

Opening Year (2020) – 7th Street Alternative Without Grand Avenue Extension

This alternative eliminates the streetcar alignment on 1st Street west of Hill Street, including the Grand Avenue spur. Consequently, only the intersections located along 1st Street are affected.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Opening Year (2020) with the 7th Street Alternative without the Grand Avenue Extension were compared with the Opening Year (2020) to identify significantly (CEQA) affected locations. As shown in **Table 4-20** and **Table 4-21**, none of the six intersections affected by this alternative of the proposed Project are anticipated to be significantly impacted. For the remaining 59 intersections, the results are the same as the 7th Street Alternative with the Grand Avenue Extension. Consequently, the intersection of Hill Street and 7th Street is the only significantly impacted location for this alternative. The result of this location was previously presented in **Table 6-3**.

Opening Year (2020) – 9th Street Alternative With Grand Avenue Extension

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Opening Year (2020) with the 9th Street Alternative with the Grand Avenue Extension were compared with the Opening Year (2020) without Project to significantly (CEQA) affected locations. As seen in **Table 4-23** and **Table 4-24**, two intersections are anticipated to be significantly impacted by the 9th Street Alternative with the Grand Avenue Extension. Physical traffic mitigation improvement options at the significantly impacted intersections were evaluated in an attempt to fully mitigate the impacts; however, no measures to fully mitigate these impacts were identified due to the constraints of the existing physical conditions. With the adoption of the Downtown Design Guide and new street standards, the roadway width has been set along the majority of streets in downtown. Therefore, street widening was not an option either due to these new standards, or since it was not considered practical nor desirable to widen the street at the expense of reduced sidewalk widths.

As shown in **Table 6-4**, the significantly impacted intersections Hill Street/1st Street would operate at LOS D, which is considered an acceptable level of service in urban areas. The intersection of Grand Avenue/1st Street would continue to be significantly impacted. Although no feasible measures may fully mitigate these intersections, there are other improvements that may be considered to address the residual impacts which may include, but not limited to, the implementation of the following additional improvements to reduce intersection impacts.

- on-going signal timing modifications, as needed, after the project is operational and traffic operating conditions shall be monitored.
- vehicle trip reduction measures (this could include encouraging walkability, supporting the use of alternative transportation modes, enhancing pedestrian crossings through curb extensions, first/last mile connections afforded by the streetcar, bike parking on widened sidewalks, bike share kiosks, pedestrian wayfinding signage program, and real time information at stations).

The numerical benefits of these proposed improvements cannot be determined or quantified. However, these enhancements would result in additional benefits that were not factored in the analysis, so the impacts presented in this section are likely overstated.

Table 6-4: Opening Year (2020) – 9th Street Alternative With Grand Avenue Extension Mitigated Intersection Level of Service

#	Intersection	AM		PM		Significant Impact
		Delay[1]	LOS	Delay[1]	LOS	
2	Grand Avenue / 1st Street	62.0	E	56.8	E	YES
4	Hill Street / 1st Street	41.2	D	40.8	D	YES

[1] Average vehicle delay in seconds

Opening Year (2020) – 9th Street Alternative Without Grand Avenue Extension

This alternative eliminates the streetcar alignment on 1st Street west of Hill Street, including the Grand Avenue spur. Consequently, only the intersections located along 1st Street are affected.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Opening Year (2020) with the 9th Street Alternative without the Grand Avenue Extension were compared with the Opening Year (2020) to identify significantly (CEQA) affected locations. As shown in **Table 4-26** and **Table 4-27**, none of the six intersections affected by this alternative of the proposed Project are anticipated to be significantly impacted. For the remaining 59 intersections, the results are the same as the 9th Street Alternative without the Grand Avenue Extension. Consequently, none of the remaining 59 intersections are anticipated to be significantly impacted by this alternative.

6.1.3 Horizon Year (2040) With Project

Horizon Year (2040) – 7th Street Alternative With Grand Avenue Extension

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Horizon Year (2040) with the 7th Street Alternative with the Grand Avenue Extension were compared with the Horizon Year (2040) without Project to identify significantly (CEQA) affected locations. As seen in **Table 4-30** and **Table 4-31**, three intersections are anticipated to be significantly impacted by the 7th

Street Alternative with the Grand Avenue Extension. Physical traffic mitigation improvement options at the significantly impacted intersections were evaluated in an attempt to fully mitigate the impacts; however, no measures to fully mitigate these impacts were identified due to the constraints of the existing physical conditions. With the adoption of the Downtown Design Guide and new street standards, the roadway width has been set along the majority of streets in downtown. Therefore, street widening was not an option either due to these new standards, or since it was not considered practical nor desirable to widen the street at the expense of reduced sidewalk widths.

As shown in **Table 6-5**, all three intersections would continue to be significantly impacted. Although no feasible measures may fully mitigate these intersections, there are other improvements that may be considered to address the residual impacts which may include, but not limited to, the implementation of the following additional improvements to reduce intersection impacts.

- on-going signal timing modifications, as needed, after the project is operational and traffic operating conditions shall be monitored.
- vehicle trip reduction measures (this could include encouraging walkability, supporting the use of alternative transportation modes, enhancing pedestrian crossings through curb extensions, first/last mile connections afforded by the streetcar, bike parking on widened sidewalks, bike share kiosks, pedestrian wayfinding signage program, and real time information at stations).

The numerical benefits of these proposed improvements cannot be determined or quantified. However, these enhancements would result in additional benefits that were not factored in the analysis, so the impacts presented in this section are likely overstated.

Table 6-5: Horizon Year (2040) – 7th Street Alternative With Grand Avenue Extension Mitigated Intersection Level of Service

#	Intersection	AM		PM		Significant Impact
		Delay[1]	LOS	Delay[1]	LOS	
2	Grand Avenue / 1st Street	80.2	F	73.6	E	YES
4	Hill Street / 1st Street	59.1	E	56.9	E	YES
35	Hill Street / 7th Street	63.3	E	51.1	D	YES

[1] Average vehicle delay in seconds

Horizon Year (2040) – 7th Street Alternative Without Grand Avenue Extension

This alternative eliminates the streetcar alignment on 1st Street west of Hill Street, including the Grand Avenue spur. Consequently, only the intersections located along 1st Street are affected.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Horizon Year (2040) with the 7th Street Alternative without the Grand Avenue Extension were compared with the Horizon Year (2040) to identify significantly (CEQA) affected locations. As shown in **Table 4-33** and **Table 4-34**, none of the six intersections affected by this alternative of the proposed Project are anticipated to be significantly impacted. For the remaining 59 intersections, the results are the same as the 7th Street Alternative with the Grand Avenue Extension. Consequently, the intersection of Hill Street and 7th Street is the only significantly impacted location for this alternative. The result of this location was previously presented in **Table 6-5**.

Horizon Year (2040) – 9th Street Alternative With Grand Avenue Extension

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Horizon Year (2040) with the 9th Street Alternative with the Grand Avenue Extension were compared with the Horizon Year (2040) without Project to identify significantly (CEQA) affected locations. As seen in **Table 4-36** and **Table 4-37**, two intersections are anticipated to be significantly impacted by the 9th Street Alternative. Physical traffic mitigation improvement options at the significantly impacted intersections were evaluated in an attempt to fully mitigate the impacts; however, no measures to fully mitigate these impacts were identified due to the constraints of the existing physical conditions. With the adoption of the Downtown Design Guide and new street standards, the roadway width has been set along the majority of streets in downtown. Therefore, street widening was not an option either due to these new standards, or since it was not considered practical nor desirable to widen the street at the expense of reduced sidewalk widths.

Although still significantly impacted, as shown in **Table 6-6**, both intersections would continue to be significantly impacted. Although no feasible measures may fully mitigate these intersections, there are other improvements that may be considered to address the residual impacts which may include, but not limited to, the implementation of the following additional improvements to reduce intersection impacts.

- on-going signal timing modifications, as needed, after the project is operational and traffic operating conditions shall be monitored.
- vehicle trip reduction measures (this could include encouraging walkability, supporting the use of alternative transportation modes, enhancing pedestrian crossings through curb extensions, first/last mile connections afforded by the streetcar, bike parking on widened sidewalks, bike share kiosks, pedestrian wayfinding signage program, and real time information at stations).

The numerical benefits of these proposed improvements cannot be determined or quantified. However, these enhancements would result in additional benefits that were not factored in the analysis, so the impacts presented in this section are likely overstated.

Table 6-6: Horizon Year (2040) – 9th Street Alternative With Grand Avenue Extension Mitigated Intersection Level of Service

#	Intersection	AM		PM		Significant Impact
		Delay[1]	LOS	Delay[1]	LOS	
2	Grand Avenue / 1st Street	80.2	F	73.6	E	YES
4	Hill Street / 1st Street	59.1	E	56.9	E	YES

[1] Average vehicle delay in seconds

Horizon Year (2040) – 9th Street Alternative Without Grand Avenue Extension

This alternative eliminates the streetcar alignment on 1st Street west of Hill Street, including the Grand Avenue spur. Consequently, only the intersections located along 1st Street are affected.

Using the threshold criteria presented in **Table 2-2**, intersection operating conditions under the Horizon Year (2040) with the 9th Street Alternative without the Grand Avenue Extension were compared with the Horizon Year (2040) to identify significantly (CEQA) affected locations. As shown in **Table 4-39** and **Table 4-40**, none of the six intersections affected by this alternative of the proposed Project are anticipated to be significantly impacted. For the remaining 59 intersections, the results are the same as the 9th Street Alternative without the Grand Avenue Extension. Consequently, none of the remaining 59 intersections are anticipated to be significantly impacted by this alternative.

6.2 CONSTRUCTION PHASE MITIGATION

MM-TRAF-C1: Construction Mitigation Monitoring. A construction mitigation program shall be established with the participation of LABOE Environmental Management, Bureau of Contracts Administration, and the construction contractor. A community affairs entity will be established to administer the construction mitigation program for the benefit of the community. All mitigation measures shall be monitored and reported to LABOE on a quarterly basis. The program will keep the community informed of all construction activities, with special emphasis for activities that affect the public. The program will also create a hotline number for a direct connection to staff familiar with the community and the Project. This entity will offer individual consultation for residents, facilities, and businesses for remedies appropriate to the impacts. It will identify community/business needs prior to and during the construction period through the use of surveys and community meetings.

6.2.1 Public Transit

Before any significant rerouting changes are made due to the construction of the proposed Project, fliers will be provided on buses at least two weeks in advance notifying riders of route modifications. In addition, hoods will be placed over bus-stop signs, also notifying riders of what modifications have been made to the bus route and guiding them to the nearest adjacent bus-stop. Construction impacts to public transit would be mitigated by implementation of the aforementioned measures. However, during the night hours some of the impacts may potentially not change from the level initially identified during construction due to the possibility of increased bus travel times.

6.2.2 Streets and Highways

During final design, site and street specific Worksite Traffic Control Plans will be developed in cooperation with LADOT to accommodate required pedestrian and traffic movements during the construction phase and minimize potential short term impacts to the environment. Designated haul routes for trucks will be identified during final design. During the construction period, the loss in lane capacity at the intersections would most likely result in an increase in delay and a decrease in the level of service. It is highly likely that some of the intersections along the streetcar alignment construction work zone area operating at LOS D or worse during the Opening Year (2020) without Project condition will be significantly impacted due to the construction activity. Although this is a short term impact that may be in place for a duration of two to three weeks, mitigation measures would be implemented.

During the design phase of the project a traffic management plan (TMP) would be prepared to address construction related concerns and provide short term mitigation measures. The TMP would be used to manage construction activities through the implementation of a traffic control plan to mitigate the impact of traffic disruption and to ensure the safety of all users of the affected roadway. With the implementation of Mitigation Measure TRAF-C2, construction-related traffic impacts on neighborhoods/communities, and emergency and utility services would be less than significant under CEQA.

MM-TRAF-C2: Develop a Traffic Management Plan. The Los Angeles Department of Transportation shall develop and implement a Traffic Management Plan (TMP) to reduce construction-related traffic impacts on public services, community facilities, utilities, bicycle circulation and pedestrian circulation. The TMP shall be prepared during final design for implementation during construction to mitigate the traffic impacts caused by construction of the Project. The TMP shall identify potential measures such as public awareness and changeable message signs (CMS). The TMP shall be developed in consultation with emergency service providers (i.e., local police and fire departments).

The TMP shall address construction duration and activities and include measures such as operating a temporary traffic signal, bicycle lane detours, or using flagmen adjacent to construction activities, as appropriate. The TMP shall also coordinate review of construction activities along cross and parallel streets accordingly. A community affairs entity shall be established to administer a construction impact mitigation program for the benefit of the community. This program shall keep the community informed of all construction activities, with special emphasis on activities that affect the public. The program shall also set up a hotline number with a direct connection to staff familiar with the community and the Project. This entity shall offer individual consultation for residents, facilities, and businesses for remedies appropriate to the impacts encountered. The program shall identify community/business needs prior to and during the construction period through the use of surveys and community meetings.

Construction impacts affecting traffic for the proposed Project would be mitigated to a level of insignificance by implementation of the aforementioned measures for the short term construction duration.

6.2.3 Parking

As noted earlier, it may be necessary to prohibit on-street curb parking when traffic lanes are closed or eliminated due to construction activities. In order to mitigate the short term loss of on-street parking supply, contractors will be required to have all employees park off-street at City approved locations to minimize impacts due to the loss of crucial commercial on-street parking.

6.2.4 Pedestrian and Bicycle Facilities

During construction, the work zone area will be protected by pedestrian fencing on the sidewalk side. Temporary ramps and walkways will be provided by the contractor to maintain ADA accessibility at intersections and crosswalks. In addition, bicycles may operate along the open traffic lane or require temporary detours when a dedicated bicycle lane is affected by work zones. These issues will be discussed as part of community outreach activities prior to the initiation of construction work zones. The following measure would reduce operational impacts of the Project related to bicycle safety.

MM-TRAF-O1: Signage and pavement markings shall be implemented to:

- Alert bicyclists to the presence of streetcar tracks.
- Instruct cyclists to cross tracks perpendicular to the direction of the rails. For left turning cyclists, pavement markings shall be provided to encourage perpendicular bicycle turning movements, such as "Copenhagen Left" turns. The signage and/or pavement markings would also clearly identify the presence of the flangeway to cyclists traveling parallel to the fixed guideway. A Copenhagen Left turn is a two-stage movement wherein the bicyclist crosses the intersection ahead, stops on the

opposite side in the direction he/she wishes to turn, awaits a green light, and crosses the intersection to complete the left turn movement.

- Alert bicyclists to use parallel bike routes (or Class II bike facilities) where available, such as Spring Street as an alternative route to southbound Broadway.

6.3 IMPACTS REMAINING AFTER MITIGATION

As indicated in Section 6.1, the intersections could not be mitigated to a level below significance although some of the impacted locations do operate at LOS D, which are generally considered acceptable operating levels of service for urban areas. In summary, the following impacts remain after mitigation.

Mitigation measure TRAF-O1 would reduce potential impacts affecting bicycle use along the project route. However, despite the actions identified in the mitigation measure, a potentially significant hazard for bicyclists would remain.

Summary of Existing (2014/2015) With Project Significantly Impacted Locations

- Grand Avenue and 1st Street – for both the 7th and 9th Street Alternatives with the Grand Avenue Extension, and operating at acceptable levels of service in both the AM and PM peak hours
- Hill Street and 1st Street – for both the 7th and 9th Street Alternatives with the Grand Avenue Extension, and operating at acceptable levels of service in both the AM and PM peak hours
- Hill Street and 7th Street – for the 7th Street Alternative with and without the Grand Avenue Extension, and operating at acceptable levels of service in both the AM and PM peak hours

Summary of Opening Year (2020) With Project Significantly Impacted Locations

- Grand Avenue and 1st Street – for both the 7th and 9th Street Alternatives with the Grand Avenue Extension
- Hill Street and 1st Street – for both the 7th and 9th Street Alternatives with the Grand Avenue Extension, and operating at acceptable levels of service in both the AM and PM peak hours
- Hill Street and 7th Street – for the 7th Street Alternative with and without the Grand Avenue Extension, and operating at acceptable levels of service in both the AM and PM peak hours

Summary of Horizon Year (2040) With Project Significantly Impacted Locations

- Grand Avenue and 1st Street – for both the 7th and 9th Street Alternatives with the Grand Avenue Extension
- Hill Street and 1st Street – for both the 7th and 9th Street Alternatives with the Grand Avenue Extension
- Hill Street and 7th Street – for the 7th Street Alternative with and without the Grand Avenue Extension

Although the measures identified in Section 6.1 may not quantitatively reduce the impacts below the level of significance, they are recommended to optimize operating time for the Project and to maximize efficiency for the roadway network. These proposed enhancements would result in additional benefits that cannot be quantified and were not factored in the analysis.
