# SOUTHERN CALIFORNIA RAPID TRANSIT DISTRICT METRO RAIL SYSTEM

### PRELIMINARY HAZARD ANALYSIS

WBS 06

September 1985

Prepared by

BOOZ-ALLEN & HAMILTON Inc. Transportation Consulting Division 523 West Sixth Street, Suite 502 Los Angeles, California 90014

## MTA LIBRARY

### ABSTRACT .....

This document presents the SCRTD Metro Rail Preliminary Hazard Analysis (PHA) performed as part of the Metro Rail Safety and System Assurance Program. The PHA analyzes potentially hazardous conditions that could affect the safe operation of the Metro Rail System. The PHA is a dynamic document to be updated throughout the program and to be used as the basis for performing other safety-related activities and analyses. The initial PHA was performed by Abacus Enterprises Ltd. as part of its FY 1984 subcontract to Booz, Allen & Hamilton Inc. At the end of the final design phase, the PHA has been updated to reflect the SCRTD System Design Criteria and Standards

1.0 INTRODUCTION

### 1.0 INTRODUCTION

This document presents the SCRTD Metro Rail Preliminary Hazard Analysis (PHA). The PHA was performed as part of a comprehensive Metro Rail Safety and System Assurance Program. The program defines an integrated set of safety-related activities and analyses directed towards achieving established Metro Rail safety criteria.\* The remainder of this chapter presents background information on the PHA.

### 1.1 Purpose

The overall purpose of the PHA is to help the SCRTD design a safe and effective rail rapid transit system. Specifically, the PHA addresses potentially hazardous conditions that could affect the safe operation of the Metro Rail System. Identification and analysis of hazards during the design phase has enabled the SCRTD to:

- Design a system that eliminates or mitigates potential hazards and their associated causes and effects
- Document the resolution of potential hazards
- Conduct more detailed hazard analyses and other safety evaluations
- Begin development of coordinated safety-related policies, programs, and procedures.

#### 1.2 Objectives

There are five specific objectives of the PHA. They are to:

 Identify hazardous conditions, their causes, and triggering events that could affect the safe operation of the Metro Rail System

<sup>\*</sup> Metro Rail System Design Criteria and Standards, Volume 1, Chapters 2, 3, 4 and 5.

- Identify the potential accidents and consequences (i.e., loss of life and/or injuries) associated with each hazardous condition
- Identify potential accident prevention measures
- Document the results in a clear, concise manner, facilitating resolution of identified hazardous conditions
- Provide a foundation for conducting other safety analyses, including more detailed subsystem, interface, and operating hazard analyses.

### 1.3 Scope

The PHA addresses broad, top-level hazards, covering all elements of the Metro Rail system. It includes hazards pertaining to the following Metro Rail elements:

- Ways and structures, including tunnels and track.
- Stations, including access and parking; entrances, mezzanines, and platforms; and vertical circulation (i.e., stairs, escalators, and elevators).
- Yards, shops, and facilities, including storage yard, transfer yard area, various maintenance shops, yard tower, and all other facilities.
- Passenger vehicle, including all vehicle subsystems such as body; interior; couplers, draft gear and draw bars; doors; heating, ventilation and air conditioning; lighting; auxiliary electrical; propulsion and braking control; trucks and suspension; and operator controls. (Note: Vehicle communications and ATC equipment are addressed in subsequent system elements.)
- <u>Automatic train control</u>, including wayside equipment, central control equipment, passenger vehicle ATC equipment, and yard equipment.
- <u>Communications</u>, including all voice communications equipment, closed circuit television
   (CCTV) system, and data transmission service.
- Power systems, including traction power substations, auxiliary power, and third rail.

- Fare collection, including all equipment (e.g., gates).
- Auxiliary vehicles, including diesel locomotive, hi-rail vehicle, mobile cranes, etc.

The PHA covers four types of hazards. They are:

- Fire/Life Hazards resulting in accidents, injuries, and/or death due to fire, smoke, explosion, toxic gases, or panic due to these causes.
- <u>Security</u> Hazards resulting in accidents, injuries, and/or death due to acts of crime, violence, and abuse against persons.
- System assurance Hazards resulting in accidents, injuries, and/or death due to system unreliability, maintainability, and lack of quality assurance.
- General safety Hazards resulting in accidents, injuries, and/or death due to system design, equipment, or operations.

The PHA primarily addresses those hazards unique to rapid rail transit equipment and operation. Occupational and industrial safety hazards common to all types of organizations and business environments are not the focus of the PHA. These hazards are addressed in Federal, state, and local occupational health and safety codes and regulations.

### 1.4 Approach

A "bottom-up" approach was employed in conducting the PHA. Bottom or lower-level events (i.e., hazards) were initially identified, followed by a determination of what effect the lower level events (i.e., hazards) would have on the total system. This approach is consistent with UMTA methodologies\* for performing a PHA of fixed guideway transit systems.

<sup>\*</sup> System Safety Analysis: A Description of the Formats and Methodologies for System Safety Analysis of Fixed Guideway Transit Systems; prepared by Booz, Allen & Hamilton for the Office of Safety and Product Qualification, Urban Mass Transportation Administration, 1981.

Four specific activities were performed. They were to:

- Identify hazards For each system element, hazards likely to result in an accident and/or personal injury or death were identified.
- Assess hazards Each hazard was then examined relative to potential causes and effects. Worst case consequences were identified and documented.
- Identify prevention measures Measures for preventing the potential accident from occurring were identified, including design and/or procedural related solutions.
- <u>Document findings</u> All hazards were organized and compiled according to system elements. They were documented in a consistent format and depth of analysis.

The above activities were performed using information on accidents that have occurred on other systems, PHAs of other transit properties, pertinent SCRTD documents, and sound engineering judgment.

### 1.5 Definitions

The following are definitions of key terms used throughout the PHA, as defined in the UMTA guidelines.

- Hazard An immediate condition which could cause an accident involving personal injuries or death.
- Hazard Causes Those events or conditions that contribute to the existence of the hazard.
- Triggering Events Conditions that taken in combination with a hazard will almost certainly lead to an accident unless some corrective action is taken to prevent it.
- Potential Accident/Injuries The anticipated "worst case" accident and injuries that are expected to occur if both the hazard and the triggering events are left uncorrected.
- Hazard Class An index of the "worst case" potential consequences resulting from the hazard. Indices are as follows:
  - Category I (Catastrophic) A hazard that may result in loss of life

- Category II (Critical) A hazard that may result in severe injury, severe occupational illness, or major system damage
- <u>Category III</u> (Marginal) A hazard that may result in minor injury, minor occupational illness, or minor system damage
- Category IV (Negligible) A hazard that will not result in injury, occupational illness, or system damage.
- Prevention Measures Actions that can be taken to prevent the potential accident from occurring.
- Resolution Changes that are made relative to system design and/or operation to eliminate or control the hazard.

### 1.6 Update Process

This PHA is the initial safety analysis performed as part of the Metro Rail safety and system assurance program. It is a dynamic document designed to be updated throughout the program and to be used as the basis for performing other safety-related activities and analyses.

The document is to be updated by the:

- Addition of other hazards. Other top-level hazards identified throughout the Metro Rail development process should be documented as part of the PHA.
- Documentation of hazard resolution. Action taken to resolve each hazard should be recorded in Section D of the appropriate hazard form.

All updates to the PHA must be processed through the Office of Safety and System Assurance, Systems Design and Analysis Department.

This September 1985 version of the PHA has been updated to reflect hazard resolutions as contained in the SCRTD Metro Rail Project System Design Criteria & Standards (SDCS), Volumes 1 through 5.

### 1.7 Report Organization

The remainder of this report contains PHA forms organized in the following chapters:

- Chapter 2.0 Ways and Structures
- Chapter 3.0 Station

- Chapter 4.0 Yards, Shops and Facilities
  Chapter 5.0 Passenger Vehicle
  Chapter 6.0 Automatic Train Control System
  Chapter 7.0 Communication System
  Chapter 8.0 Power System
  Chapter 9.0 Fare Collection System

- Chapter 10.0 Auxiliary Vehicles.

Each chapter is organized by sequentially numbered subsystems pertaining to each chapter heading. In the beginning of each chapter is a summary of hazards analyzed in the chapter.

### 1.8 Hazard Numbering Scheme

All hazards are numbered according to the following three digit format:

- Chapter number (i.e., 1 through 10)
- Subsystem number (i.e., 1, 2, 3, etc.)
- Subsystem hazard number (i.e., 1, 2, 3, etc.).

2.0 WAYS AND STRUCTURES

### SUMMARY OF WAYS AND STRUCTURES HAZARDS

SYSTEM: Stations SUBSYSTEM: Vertical Circulation

### A. HAZARD IDENTIFICATION

- 1. Type: Fire/Life and General Safety
- 2. Description: Inadequate Lighting on Stairs and Escalators
- 3. Causes(s):
  - · Design oversight
  - Burnt out bulbs/hard to replace.
- 4. Triggering Events:
  - Emergency evacuation.

# B. POTENTIAL ACCIDENT/INJURY (Classification \_\_\_III \_\_\_\_)

 Minor injuries to patrons who trip and fall because of poor lighting.

#### C. PREVENTION MEASURES

- Comply with applicable Fire/Life Safety Criteria regarding emergency lighting
- Provide adequate stair/escalator lighting for normal operations
- Establish maintenance program to replace burnt out bulbs as soon as possible
- Design bulb locations for easy maintenance.

## D. RESOLUTION: ACCOMPLISHED BY:

- Provision for emergency lighting for stairs and escalators (SDCS Vol. 1, 2.2.5.5.5)
- Provision for escalators and stars to be lit to emphasize open circulation wells and transitional components (SDCS Vol. 3, 12.6.3)

HAZARD NUMBER: 3.4.5 (continued)

SYSTEM: Stations \_\_\_\_ SUBSYSTEM: Vertical Circula-

tion

#### D. RESOLUTION: ACCOMPLISHED BY:

• Establishment of SCRTD maintainability requirements including a maintenance program (SDCS Vol. 1, 5.3.1), quantitative and qualitative design requirements (SDCS Vol. 1, 5.3.2), maintainability data (SDCS Vol. 1, 5.3.3), manuals (SDCS Vol. 1, 5.3.4), training (SDCS Vol. 1, 5.3.5) and human factors considerations (SDCS Vol. 1, 5.3.6).
