1.0 SUMMARY

The Ridership by Line Segment Program (RBLIS) is a computer program which is used to summarize the data regarding ridership on lines operated by SCRTD.

The RBLIS Program is a powerful and useful tool. It features interactive on-line processing; it interacts with the ride check processing database and facilitates quick and easy access to vital stop-by-stop ridership statistics such as passengers on, passengers off, passengers on-board, in-service bus hours and bus miles of service on any selected segment of a bus line. The user can further constrain the desired statistics by time-of-day and selected services available on a line, such as local vs limited operation, short lines etc. Another feature of the RBLIS Program is that it is geared towards non-data processing oriented personnel. It can be used by planners, schedule makers, etc. The program is menu driven. A series of prompts guide the user through various operations until the final output, a summary report of ridership data by stops, is produced. This version of RBLIS Program allows the user to generate a computer plot showing the ridership statistics on the selected segment. It is also possible to save the final summary report for subsequent downloading to a Personal Computer (PC).

This manual includes step-by-step instructions for executing the RBLIS Program, samples of each screen that are included in the program, and examples of program execution. Those wishing to implement this package on their computing system can obtain the Source Code by contacting:

Mr. Keith Killough
Manager, Planning Systems
Planning Department
SCRTD
425 South Main Street
Los Angeles, CA 90013
Telephone (213) 972-3469

2.0 LOGON SEQUENCE

In this and subsequent sections, it has been assumed that the user has a basic knowledge of the IBM 3279 keyboard, Program Function (PF) keys and Edit Function of the IBM TSO/ISPF.¹

The steps involved in invoking the Ridership by Line Segment Program are as follows:

1. The user should obtain a valid Logon Identification Code and a Password and should logon to the District's IBM computing facilities.
2. After logon is complete the system will respond with a READY prompt. The user should then type SVP and press the enter key.
3. The Service Analysis Programs Master Menu Panel will now appear. On this panel, Option Number 20 should be selected by typing a "20" at the designated location and then pressing the enter key.

This completes the Logon Sequence and access to the RBLS package.

¹A document entitled: TSO/ISPF FOR THE END USER provides a good working knowledge of these topics. This document can be obtained from Service Analysis staff.

3.0 LINE SEGMENT SPECIFICATION

3.1 Specifying the Line Number and Day-of-Week to be Analyzed.

The purpose of the first data entry panel is to designate the line to be analyzed and the day-of-week (i.e., Daily, Saturday, Sunday) for analysis. The return key is used to move the cursor to locations where the data is to be entered. (See the Data Entry Panel Number 1). After entering the data at specified locations, the enter key should be pressed.

If the desired day-of-week for the requested line is not available, a message panel will appear that states that "THE DAY OF THE WEEK REQUESTED IS NOT CURRENTLY AVAILABLE. PLEASE CONTACT THE SERVICE ANALYSIS STAFF FOR INFORMATION". (See the Message Panel Number 1). This completes specification of the Line Number and day-of-week to be analyzed.

3.2 Specifying the Line Direction to be Analyzed.

The purpose of the second data entry panel is to select the direction of the line to be analyzed (i.e. north, east, south, west, round trip) (See Data Entry Panel Number 2). The return key is used to move the cursor to locations where data is to be entered. The enter key should be pressed after data has been entered.

If one or more of the data elements for the desired line direction are missing in the database, a message panel will appear that states that "ONE OR MORE OF THE DATA ELEMENTS (HEAD, ROUT, DATA) ARE MISSING - PLEASE CONTACT THE SERVICE ANALYSIS STAFF FOR HELP". (See the Message Panel Number 2). This completes specification of the line direction to be analyzed.

3.3 Specifying the PC Download Option.

The purpose of the third data entry panel is to specify whether the final ridership report should be saved as a data file on the mainframe computing system for subsequent downloading to a PC for spread sheet analysis. The default option is NO. If a user desires to save the final report, the yes option should be specified at the cursor location. This completes the PC Download Option. After the enter key has been pressed, a message panel will appear that states "LOADING FILES. PROCESSING PLEASE WAIT". After a few seconds "PRESS ENTER" prompt will appear. The enter key should then be pressed.

SELECT SEGMENT DEFINITION OPTION ==> _

THE FOLLOWING SEGMENT SELECTION OPTIONS ARE AVAILABLE:

- 1 = DEFINE STOP RANGE (PRESENT - START STOP = ____ END STOP = ____)
- 2 = SELECT SERVICE TYPES
- 3 = DEFINE TIME RANGE (START TIME = ____ END TIME = ____)
- 4 = DISPLAY/PRINT REPORT

Please note that Defaults are All Stops, All Services, All Trips

PRESS ENTER TO PROCESS OR SELECT OPTION 4 TO CONTINUE TO NEXT
PANEL OR PRESS PF3/15 TO EXIT RBLS

DATA ENTRY PANEL NUMBER 4

3.4.1 Option 1 - Define Stop Range.

The purpose of Option 1 is to designate the range of bus stops to be analyzed. This option is selected by entering a "1" in Data Entry Panel Number 4 and then pressing the enter key. An instruction panel will appear. (See Instruction Panel Number 1).

After reading the instructions, the enter key should be pressed. A panel for stop selection will appear. (See Stop Selection Data Entry Panel Number 5).

After specifying the first (F) and last (L) stop, as instructed on the preceding screen, the PF3 key should be pressed. It should be noted that the first and the last stop are specified one at a time. That is, after selecting the first stop, enter key should be pressed. The last stop is specified on the second panel that appears after enter key has been pressed. After specifying the last stop, the PF3 key should be pressed. The segment selection option menu (Data Entry Panel Number 4) will re-appear. This completes the selection of stops on the line segment to be analyzed. If a Stop Range is not selected, the system assumes that the entire line needs to be analyzed.

DATA ENTRY PANEL NUMBER 5

(SAMPLE DATA HAS BEEN INCLUDED IN THIS PANEL)

3.4.2 Option 2 - Select Service Types.

The purpose of Option 2 is to specify service types for the segment to be analyzed (i.e., limited, express).

This option is selected by entering a "2" in Data Entry Panel Number 4 and then pressing the enter key. An instruction panel will appear that explains service restriction instructions. (See Instruction Panel Number 2).

After reading instructions, the enter key should be pressed. A panel will appear that shows header cards (or different service types). (See Data Entry Panel Number 6). The return key is used to move cursor to a specified service types and a "S" is input in the left most column as instructed in the preceding panel. The enter key is then pressed. The process is repeated for each service type to be included in the analysis. The process is terminated by pressing the PF3 key. If services are not selected using this method, the system assumes that all services need to be analyzed.

This completes selection of the service types to be analyzed.

DATA ENTRY PANEL NUMBER 6

(SAMPLE DATA HAS BEEN INCLUDED IN THIS PANEL)

3.4.3 Option 3 - Define the Time Period for Analysis.

The purpose of Option 3 is to specify the time period for analysis. This option is selected by entering a "3" in Data Entry Panel Number 4 and pressing the enter key. A panel will appear that offers two choices for this option. (See Data Entry Panel Number 7). Choice 1 is to select trips within time slice and Choice 2 is to select stops within time slice. The implications of selecting Choice 1 vs. Choice 2 are as follows: If Choice 1 is selected then a bus trip is qualified for reporting purposes as long as it crosses the first selected stop within the time period of analysis. If Choice 2 is selected then elapsed time at each and every stop within the segment is analyzed in determining whether the ons/offers should be accumulated for reporting purposes. After choice is specified by inputting a "1" or a "2" at the designated location, the return key is used to move the cursor to the point where designated start time should be entered. After start time is input, the cursor will move to the point where designated end time should be entered. Now the end time should be input. The enter key should then be pressed. The segment selection options menu will re-appear. (Data Entry Panel Number 4). This completes specification of time period for analysis. The default to this option is the entire day, that is, all trips are selected for reporting purpose. Please note that starting and ending times on Data Entry Panel Number 7 are specified as military times. Military time is expressed as hours and minutes and is extended to thirty hours to cover service which begins before midnight and continues until 6am the following day.

DISPLAY STOPS PANEL

(SAMPLE DATA HAS BEEN INCLUDED IN THIS PANEL)

4.3 Option 3 - Display Report.

This option provides the ridership statistics (in a report form) for the segment requested for analysis. The Display Report Option is selected by entering a "3" in Data Entry Panel Number 9 and then pressing the enter key. A message will appear that states "Report Processing. Please Wait". This process usually takes one or two minutes. The enter key should be pressed at the prompt and a Ridership by Line Stop Report is displayed for the user specified segment. (See Display Report Panel).

The report will show the stop number, the stop location, the number of passengers boarding and alighting at each stop, the number of passengers on board and number of bus trips serving each stop. The maximum load point is indicated by an asterisk. The total ons and total offs, total in-service bus hours and total in-service bus miles operated on the segment are displayed as last three rows in the table. Please note that bus hours and bus miles are displayed in tenths of hours and miles.

This completes the discussion on how to display the selected data and final report for the line segment to be analyzed.

Printing Summary Report

A hard copy of the report, as shown on the screen, can be printed by pressing the appropriate key. This key has the following symbol: 

After viewing the summary report, PF3/15 key should be pressed.

PRESS ENTER TO CONTINUE OR PF3/15 TO RETURN TO TSO

DATA ENTRY PANEL NUMBER 9

5.0 PLOTTING CAPABILITIES

Using the RBLS package, it is possible to summarize the selected segment data in a graphical form as well. Instructions for generating the plot data set are provided in the following sections.

5.1 Specifying the Continue Option.

At the conclusion of viewing the Ridership by Line Stop Report, the user has options to: (1) create a plot on a Calcomp Plotter (2) analyze a different segment on the selected line (3) exit the RBLS Package and return to TSO and (4) return to Main Menu (Data Entry Panel Number 1) to analyze a different line.

If a plot of the ridership data for the selected segment is desired, a "1" should be entered at the designated location in Data Entry Panel Number 10 and the enter key should then be pressed.

If the user wishes to analyze a different segment on the selected line, a "2" should be specified in the Data Entry Panel Number 10 and the enter key should be pressed. The Data Entry Panel Number 4 will re-appear for the segment specification.

If the user wishes to exit RBLS then a "X" should be specified in the Data Entry Panel Number 10 and the enter key should be pressed.

The user can return to the Main Menu, in order to analyze a new line, by simply pressing the PF3/15 key.

At the conclusion of the execution of Data Entry Panel Number 10, if the user had previously specified saving the Ridership by Line Stop Report for subsequent down loading to a PC, the following messages will be displayed:

>>>> NOTE DOWN THE NAME OF THE FOLLOWING LOTUS FILES <<<<

Userid.Lnnn.LOTUS.TEXT.Shhmmss
Userid.Lnnn.LOTUS.DATA.Shhmmss

Where Userid is the logon ID of the user and hhhmmss is the time in hours: minutes: seconds format when the files were created. These files can then be down loaded to a floppy diskette for subsequent spread sheet analysis.

- 2 = ANALYZE A DIFFERENT LINE SEGMENT
- X = EXIT RBLS AND RETURN TO TSO

PRESS ENTER TO PROCESS OR PF3/15 TO RETURN TO MAIN MENU

DATA ENTRY PANEL NUMBER 10

5.2 Specifying the Plotting Options.

If the plot option was selected by entering a "1" in the Data Entry Panel Number 10 or a "4" in the Data Entry Panel Number 9, the system will display Data Entry Panel Number 11. Using this data entry panel, the user specifies the type of plot and the choice of plotting medium. The RBLS package can generate two types of plots, namely: (1) Plot showing Passengers On, Passengers Off, Passengers On-board and Transit Capacity² at each stop in the selected segment, (2) Plot showing, by 15 minute intervals, Passengers On, Passengers Off, Passengers On-board and Transit Capacity. The choice is specified by entering a "1" or a "2" in the Data Entry Panel Number 11. There are two choices of plotting medium as well. The user can either generate a plot on a continuous roll or the plots can be drawn as a series of 8.5" x 11" sheets. This choice is also specified by entering a "1" or a "2" in the Data Entry Panel Number 11. After specifying the choices on Data Entry Panel Number 11, the enter key should be pressed.

While the plot data set is being created, the system also displays at the terminal the data values either by stop or by 15 minute time slice that will be plotted.

²In this version of the RBLS Package, the transit capacity is calculated by assuming 43 seats on each bus serving each stop in the specified segment.

DATA ENTRY PANEL NUMBER 11

5.3 Specifying the Plot Tape Creation Option.

At the completion of plot data set creation, the system will display Data Entry Panel Number 12. In this data entry panel, the user will specify whether the plot data set created in the previous step should be copied to a tape³ for subsequent plotting on a Calcomp Plotter or not. The choice is specified by entering a "yes" or a "no" followed by pressing of the enter key. This completes the selection and creation of RBLs plots. After Data Entry Panel Number 11, the Data Entry Panel Number 1 will again be displayed. The user can then analyze a different line segment or exit the RBLs Package. Samples of plots generated using RBLs are shown in Exhibit 1 and Exhibit 2.

7.0 EXAMPLES

This section presents an example of a line segment analyzed using the RBLIS package. It is assumed that the user has successfully performed the logon sequence and has established the access to the RBLIS package.

The user wishes to analyze a segment of the District's Line 424 during the pm rush hours on a weekday. The sequence of steps carried out to get the desired results are as follows:

- On the first Data Entry Panel, the user types the LINE NUMBER (424) and DAY TYPE (DA). This is followed by pressing the enter key.
- On the second Data Entry Panel, the system displays the day-of-week and date of the latest ride check available for the requested line. The directions of line operation are also displayed. The user specifies a direction code of "1", in order to analyze the northbound movement along this line. This is followed by pressing the enter key.
- On the third Data Entry Panel, the user selects the default option for subsequent downloading of RBLIS Report. This default option is "NO". This is followed by pressing the enter key.
- On the fourth Data Entry Panel, the user first selects the option number 1 in order to select the stops to be included in the analysis. The default to this option is the selection of the entire line, that is, from stop number 400 to stop number 1430. This is followed by pressing the enter key.
- At this stage, the first Instruction Panel appears, which provides the instructions for specifying the first and last stops for the desired segment. The user presses the enter key to continue.
- On the fifth Data Entry Panel, which displays the stops along line 424 in the northbound direction, the user specifies the first stop by typing an uppercase 'F' in column 1. In this example, the first stop for inclusion is stop number 430 (Hill Street stop at Pico Boulevard intersection). This is followed by pressing the enter key.
- The Data Entry Panel Number 5 reappears showing stop number 430 as the first stop. The user specifies the last stop by typing an uppercase 'L' in column 1. In this example, the last stop for inclusion in the analysis is 780 (Ventura Boulevard stop at Dixie Canyon Road). This is followed by pressing the program function key 3 (PF3).
- At this stage, the Data Entry Panel Number 4 reappears. This time the user selects the option number 2, in order to select the service(s) of interest. This is followed by pressing the enter key.
- The system now displays Instruction Panel Number 2, which provides instructions for selecting the services of interest. The user presses the enter key to continue.

- On Data Entry Panel Number 6, the user types an uppercase 'S' in column 1 against service number 1. This is followed by pressing the enter key. Data Entry Panel Number 6 reappears. This time the user types an uppercase 'S' in column 1 against service number 2. This is allowed by pressing the enter key. The process is repeated until all desired services have been selected. The service selection sequence is terminated by pressing the PF3 key.
- The Data Entry Panel Number 4 reappears. This time the user selects the option number 3, in order to define the time period of interest. This is followed by pressing the enter key.
- On Data Entry Panel Number 7, the user first selects the time constraint option number 2. That is, trips are qualified if scheduled times at selected stops fall within the time slice of interest. The time slice is specified by typing in the starting and ending time. The times are entered as military times in hours:minutes format. This is followed by pressing the enter key.
- The Data Entry Panel Number 4 again reappears. Since the segment has been fully defined, the user now selects option number 4, in order to generate the desired report. This is followed by pressing the enter key.
- On Data Entry Panel Number 8, the user selects the option number 2, in order to generate the reports on-line (at the time of writing of this manual, only Option 2 was available). This is followed by pressing the enter key.
- On Data Entry Panel Number 9, the user first specifies the Option 1, in order to browse the trip level data which will be aggregated in generating the desired report. This is followed by pressing the enter key.
- At this stage, the Display Data Panel appears. This panel shows for each selected trip, the on/off and on-board activity by stop. In addition, the service number and scheduled time at each stop are also displayed. The scheduled times are displayed in hours:minutes format. The user can use PF keys 7 and 8 to browse the file. The browsing mode is terminated by pressing the PF3 key.
- The Data Entry Panel Number 9 reappears. By selecting option 2 on this panel, the user can browse the stops in the line segment for which the data will be summarized. This is followed by pressing the enter key.
- Now the Display Stop Panel appears which shows the stop number and location of the stop. In addition, a 1,0 flag is used to designate whether a specific service serves this stop or not. A code of '1' means that a service does serve this stop. By pressing the PF3 key, the user can terminate the browse mode and return to Data Entry Panel Number 9.

- On Data Entry Panel Number 9, the user specifies option number 3, in order to browse the final report. This is followed by pressing the enter key.
- At this stage, the Display Report Panel appears. This panel shows the on/off activity, passengers on-board and number of bus trips serving each stop within the selected segment. The stop having the maximum accumulation on-board is marked with an asterisk (*). The total on/off activity along the segment, in-service bus hours and bus miles along the segment are reported in the last three rows of the report. The user can use PF keys 7 and 8 to browse this report. The browsing mode is terminated by pressing the enter key.
- At this stage, the Continue Option Panel (Panel Number 10) appears. The user specifies option number 1, in order to plot the data shown in the previous report. This is followed by pressing the enter key.
- On Data Entry Panel Number 11 (Plotting Options), the user selects plot type 1 to generate the plot of passengers on/off, on-board by stop. On this panel, the user also specifies plot paging option as 2. This will generate the plot as a sequence of 8.5 x 11 inch sheets. This is followed by pressing the enter key.
- The system displays the data that will be included in the plot. The user should press the enter key at the end of the screen data display.
- At this stage, the Data Entry Panel Number 12 (CALCOMP tape job option) appears. The user wants to create a plot tape for subsequent plotting on a CALCOMP Plotter, therefore, he specifies "YES" as the selected option. This is followed by pressing of the enter key.
- At this stage, the Data Entry Panel Number 1 reappears. The user now has the option to either analyze a different line segment or terminate the dialog with RBLS by pressing the PF3 key.
- The CALCOMP plot generated for the segment selected in this example is shown at the end of the sample panels.

SEGMENT SELECTED IN THE PREVIOUS EXAMPLE

ROUTE 424 NORTHBOUND

CHECK DATE: WED 3/12/86

SCHEDULE TIME: 1430 THRU 1830
STOPS: PICO TO DIXIE CYN

TRIPS: 2410, 2430, 2450, 2470, 2490, 2530, 2570, 2610, 2650, 2790
BOARDINGS ▲ ALIGHTINGS ● — ONBOARD — CAPACITY

8.0 FUTURE ENHANCEMENTS

The future enhancements to the RBLS package will incorporate the following:

- Capability to compute and report farebox revenue for the selected segment.
- Capability to report both scheduled and actual time at each selected stop for the qualified bus trips.
- Capability to generate the reports under the "batch" option.
- Implementation of the RBLS package under CICS to improve the system response time. The current version operates under TSO with system response time slower than possible under CICS. On-line applications are better suited under CICS.
