Bulletin 2111

Preface

This bulletin presents data from the Current Population Survey (CPS) for States, 30 large metropolitan areas, and 11 central cities. It provides 1980 annual averages for the employed and the unemployed by demographic and economic characteristics which incorporate population counts projected from the 1970 decennial census. The estimates will be revised to incorporate population counts derived from the 1980 census and will be published as they become available.

Data for earlier years were published in the following reports: *Geographic Profile of Employment and Unemployment, 1975* (Report 481) and *1976* (Report 504); *State Profile of Employment and Unemployment, 1977* (Report 539); *Geographic Profile of Employment and Unemployment: States, 1978, Metropolitan Areas, 1977-78* (Report 571); and *Geographic Profile of Employment and Unemployment, 1979* (Report 619).

The official BLS estimates presented in section IV are developed from a Federal-State cooperative program and are used in the administration of Federal fund allocation programs. However, the data from the CPS

for metropolitan areas and cities shown in section III are also used in the administration of section 202 (F) (2) (B) of the Comprehensive Employment and Training Act Amendments of 1978.

New data include hours of work and additional detail by sex, race, and marital status. Data for two metropolitan areas, New York and Minneapolis-St. Paul, are now based on the Labor Market Area (LMA) rather than the Standard Metropolitan Statistical Area (SMSA). For further detail, see appendix C.

This bulletin was prepared in the Division of Local Area Unemployment Statistics by Richard Rosen, Anderia Thomas, Paul Hadlock, and Joya Ashe under the supervision of Sylvia Small. The tables were prepared under the direction of Fred Cronkhite. Sandy Grove, Denis Keyes, William L. Salvatore, and George Schreider shared in this effort.

Material in the publication is in the public domain and may, with appropriate credit, be reproduced without permission.

Geographic Profile of Employment and Unemployment, 1980

Data on unemployment in States and sub-State areas are available from two major sources—the Current Population Survey (CPS) and the Federal-State Cooperative Program.

The CPS is the regular monthly survey of about 65,000 households from which the national unemployment rate is derived. (See appendix A for definitions and concepts in the CPS, and appendix B for a description of estimation procedures.) Annual average estimates of the demographic characteristics of the labor force (age, sex, and race) and the economic characteristics of the employed and unemployed are published for the 50 States, 30 large metropolitan areas, and 11 large cities, if they meet BLS standards of reliability for publication. (See appendix B for an explanation of the BLS standard for publication of CPS data.) Estimates for States are shown in section II and for metropolitan areas and cities in section III.

Since these estimates are based on a survey rather than on a complete census of the population, they are

subject to sampling error.¹ Error ranges have been provided, at a 90-percent confidence interval, for the unemployment rates in the first table of sections II and III. In addition, appendix B provides tables from which the sampling error ranges can be obtained for the data in other tables in these sections.

The Federal-State Cooperative Program provides monthly and annual average labor force and unemployment estimates for the 50 States and for 230 major labor market areas (section IV). These estimates are largely based upon administrative statistics from the unemployment insurance system, adjusted to conform to CPS annual estimates for the States. For the 10 largest States, however, both the monthly and annual estimates are obtained from the CPS. Appendix D describes the procedures for estimating employment and unemployment under this program.

¹The CPS estimates in this report do not reflect the 1980 Census results. See appendix B for more details.

Section I. The Employment Situation in the States, 1980

Both labor force and employment growth slowed in 1980 in most States, but the effect of the 1980 recession was most apparent in the North Central industrial States, where 45 percent of the increase in unemployment was concentrated. In four Western States, employment gains continued through the recession—Arizona, California, Colorado, and Nevada. However, of these Western States, only California had significant employment gains for black and other workers. Unemployment rates for black and other workers were higher than for whites in nearly all of the States for which data are published—and higher by 10 percentage points or more in 11 States.

Additional information on the differences in the employment situation among the States is given in the following text and tables, which include several new tables for which data were not available in earlier years. Expanded tables for 30 large metropolitan areas and 11 cities are also presented.

Because of changes in geographic boundary definitions in the Minneapolis-St. Paul and New York areas, users of these data should exercise caution when making over-the-year comparisons. Readers are also encouraged to use the tests of significance and error ranges provided in this and earlier *Geographic Profile* reports in order to assess the importance of changes.

Labor force changes

The rate of growth of the national labor force slowed to 1.8 percent in 1980, as the number of States with statistically significant labor force gains dropped to 14.² In 1979, when the national labor force increased by 2.5 percent, there were 19 States with significant gains. The 14 States where growth was significant in 1980 were primarily in the West and South. However, growth rates in several of the Western States were smaller than they had been a year before.

The labor force increased by nearly 4.5 percent or more in Arizona, Colorado, Nevada, and Oregon in 1980. In the other Western and Southern States where growth was significant, labor force gains were 2-4 per-

²The word "significant" in this report means that a statistical test of significance has been performed on the data and that the year-to-year change in a sample estimate has been found to be "statistically significant." This method takes into account the statistical error (sampling variability) of estimates, based on the sample in each State. See appendix B for further discussion.

cent. Outside these regions, Illinois and New Hampshire were the only two States with significant growth. (See text table 1.) In 1979, eight States in the North Central and Northeastern regions had significant labor force gains.

Not all demographic groups shared equally in these gains. Although the number of men and women in the labor force increased slightly in most States, their gains were not generally large enough to be statistically significant. Labor force gains for men were not significant in any State, while significant gains for women occurred in only three States—Arizona, Colorado, and Oregon.

The white labor force grew sharply (more than 5 percent) in four States—Alaska, Arizona, Colorado, and Mississippi. None of these States had significant labor force gains for black and other workers. However, the black and other labor force grew very sharply—over 20 percent—in Delaware, Nevada, and Oklahoma; and by about 9 percent in California.

Despite the long-term movement of black workers to the more industrialized States, the black and other labor force continued to have a large Southern base, with 46 percent residing in that region. (In 1970, about 50 percent resided in the Southern States.) California and New York had the largest black and other labor force; about 10 percent of the national total were in each of the two States. Additionally, Florida and Texas together accounted for more than 10 percent of the black and other labor force.

The black and other labor force includes, in addition to blacks, American Indians, Alaskan Natives, Asians and Pacific Islanders, and all other races other than white. While a majority of the black and other group is "black" in most States, in several West North Central States and most of the Mountain States, a majority of the black and other population is American Indian. In Alaska, the black and other group is primarily Alaskan Natives, while in Hawaii, Asians and Pacific Islanders constitute the largest share of the population.

Labor force participation rates. The labor force participation rate—the percent of the civilian noninstitutional population 16 years and over who were either employed or unemployed in 1980—ranged from about 55 percent in Florida and West Virginia to 70 percent or more in four Western States—Alaska, Colorado, Nevada, and Wyoming. Nationally, the labor force participation rate

averaged 63.8 percent in 1980. Four North Central farm States (Kansas, Minnesota, South Dakota, and Wisconsin) were among the highest in labor force participation, along with Connecticut and New Hampshire in the Northeast, and Maryland in the South. Labor force attachment was generally lowest in the South, as 7 of the 10 States with the lowest participation rates were in this region. (See text table 2.)

Participation of adult men ranged from a low of 69 percent in Florida—where many retirees reside—up to 86 percent in Wyoming. The labor force attachment of adult women continued to be well below that of adult men in most States but ranged widely, from below 40 percent in West Virginia to over 60 percent in Alaska. Teenage participation rates in the States varied from about 44 percent in Alabama to nearly 72 percent in Minnesota. Regionally, participation of teenagers in the labor force was lowest in the South. (Six of the seven States where participation rates were below 50 percent were in this region.) Participation was highest in the North Central farm States.

The labor force participation rate for black and other workers (61.2 percent) averaged 2.6 percentage points below the average for all workers in 1980. In several States where American Indians or Alaskan Natives constituted a major proportion of the black and other population (Alaska, Montana, North Dakota, Oklahoma, and

South Dakota), participation rates for the black and other group were even lower—less than 55 percent.

Employment changes

Nationally, employment rose 0.3 percent to 97.3 million in 1980, the smallest increase in any year since 1975. In only four Western States were employment gains statistically significant—Arizona, California, Colorado, and Nevada. In 1979, when the increase in national employment was 2.7 percent, there were significant employment gains in 17 States.

Employment fell significantly in 1980 in two States—Michigan (220,000 or 5.6 percent) and Indiana (75,000 or 3.1 percent). No State had a significant employment decline in 1979. About two-thirds of the 1980 employment decline in Michigan was among white workers. In Indiana, nearly all of the decline was among white workers.

Among the States where employment grew sharply, California showed a nearly equal increase for white and black and other workers. In Arizona, however, while gains for white workers were very sharp, employment among black and other workers declined. Employment among white workers also rose significantly (5 percent or more) in Alaska, Colorado, and Mississippi, while changes for black and other workers were not large enough to be significant.

Text table 2. Civilian labor force participation rates for major demographic groups by State, 1980 annual averages

¹ Estimate not sufficiently large to meet BLS standards of reliability for the State, based on the sample in the State.

Employment of men held relatively steady in 1980, except in the three industrial North Central States of Indiana, Michigan, and Ohio, where very sharp employment declines for men reflected the 1980 auto production slowdown. Female employment did not decline significantly in any State, while substantial gains occurred in only two States, Arizona and Colorado—many

fewer than in recent years.

Occupational distribution of employment. White-collar workers outnumbered blue-collar workers in all States except West Virginia in 1980. Among men, craft workers continued to constitute the largest group (about one-fifth), except in four States—Delaware, Maryland,

New Mexico, and New York—where the number of professional and technical workers was greater. Female employment tended to be more concentrated, with one-third of the total in clerical occupations in most States. Service occupations accounted for the next largest category—about one-fifth.

Hours of work and full-time vs. part-time status. Among persons employed in nonagricultural wage and salary jobs, average hours of work ranged from just under 37 in Massachusetts and Rhode Island to 40 in Alaska. On the average, 4 out of every 5 employed persons in most States had full-time jobs in 1980. Among full-time workers, average hours were lowest in New York (41.9) and highest in Alaska (45.4).

The part-time labor force, which consists of persons voluntarily working less than 35 hours per week and those unemployed seeking part-time jobs, constituted about 15 percent of the national labor force in 1980. In six States (Alabama, Alaska, Nevada, South Carolina, Tennessee, and West Virginia), this percentage was smaller (12 percent or less).

States with higher part-time work forces (18 percent or more) were Minnesota, South Dakota, Utah, and Wisconsin.

Unemployment

Unemployment rate increases between 1979 and 1980 were widespread among the States, as the national unemployment rate rose sharply, from 5.8 to 7.1 percent. There were significant increases in 32 States in all regions, although some regions were affected more than others. (See chart 1.)

In nine States, including five industrial North Central States (Illinois, Indiana, Ohio, Michigan, and Wisconsin) where cutbacks were prevalent in transportation equipment and related durable goods manufacturing industries, the increase was more than 2.0 percentage points. These five States accounted for nearly 45 percent of the national increase in unemployment. Unemployment rates also rose sharply in the adjacent States of Kentucky, West Virginia, and Missouri, and in Idaho. In 1979, only Michigan had a significant increase in unemployment, as the automobile production slowdown began.

Hawaii was the only State where unemployment fell significantly during 1980.

Five States had unemployment rates higher than 8.5 percent in 1980: Michigan had the highest rate, 12.6 percent, followed by Alaska, Indiana, West Virginia, and Alabama. (See chart 2.) Only Alaska had a rate as high as 8.5 percent in 1979.

By contrast, there were three Northwestern farm States with unemployment rates lower than 4.5 percent in 1980 (Kansas, Nebraska, and Wyoming), compared with eleven States in 1979. However, even in these

three States, 1980 unemployment rates were about 1.0 percentage point higher than in 1979.

Unemployment by demographic group. Unemployment rates for both white and black and other workers were very high in the States most directly affected by the slowdown in automobile and related manufacturing industries. Unemployment rates were over 7 percent for white workers in most of the industrial North Central States and, in Michigan, over 11 percent. By contrast, unemployment rates for white workers were below 5 percent in the central farm belt States, from North Dakota down to Texas, and in several Southern States.

Unemployment rates for black and other workers were at least 10 percent in 41 of the 44 States where separate rates are published for 1980, including 16 States with rates of at least 15 percent. The highest rates were in Michigan, Montana, and North Dakota (over 20 percent). Only in Hawaii was the unemployment rate for black and other workers under 5 percent. Asians and Pacific Islanders constitute a majority of the black and other population in this State.

Thus, despite increases for whites, unemployment rates for black and other workers continued to be significantly higher than those for white workers in nearly all States. (See chart 3.) Nationally, the 1980 unemployment rate for black and other workers (13.2 percent) was about 7 percentage points higher than for whites. In 11 States, including 8 of 12 in the North Central region, the unemployment rate for black and other workers was at least 10 percentage points higher than for whites. Montana, Tennessee, and Pennsylvania were the other States where the unemployment differential was this large.

Despite the relatively high unemployment rates for black and other workers in the North Central region, 43 percent of their total unemployed were in the South, reflecting the concentration of their population in this region. The black and other group accounted for more than half of the unemployed in Mississippi and more than one-third in seven other Southern States, and in Alaska and Hawaii. (See chart 4.) In most of these States, their share of unemployment was close to double their representation in the labor force.

Duration of unemployment. The rise in unemployment during 1980 was accompanied by an increase in the duration of unemployment—the average length of a continuous period of unemployment during the year. Nationally, 10.8 percent of the unemployed during an average month had been out of work 27 weeks or more in 1980, compared with 8.7 percent in 1979. Such long-term unemployment accounted for more than 10 percent of the total in 17 States in 1980.

There was a sharp drop in the number of States where the duration of unemployment was relatively short. In

Chart 1. Changes in State unemployment rates, 1979-80

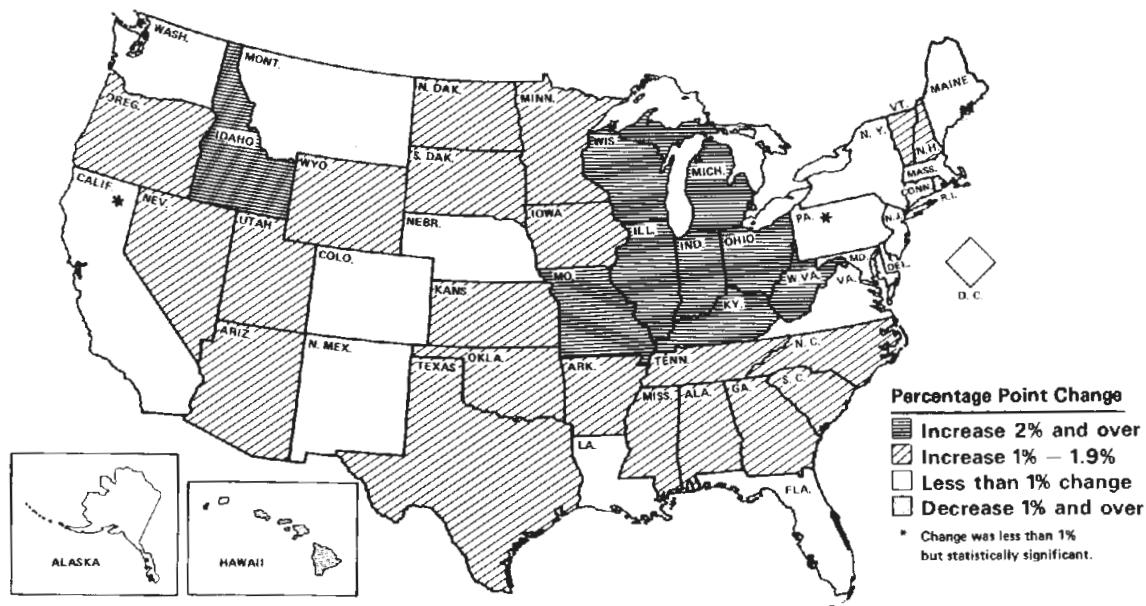

Chart 2. Unemployment rates by State, 1980 annual averages

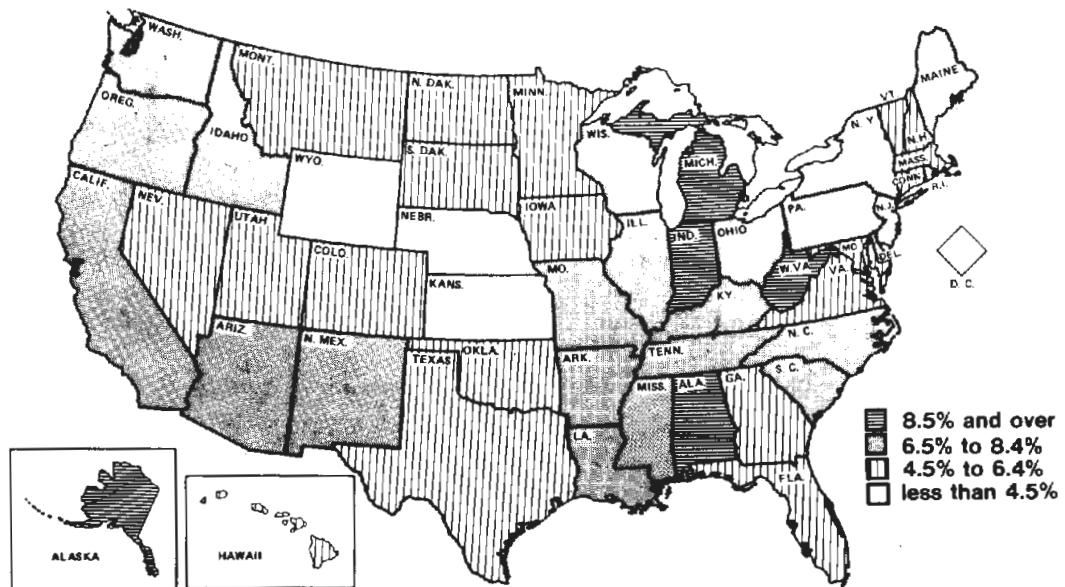

Chart 3. Unemployment rate differences: Black and other vs. white, 1980 annual averages

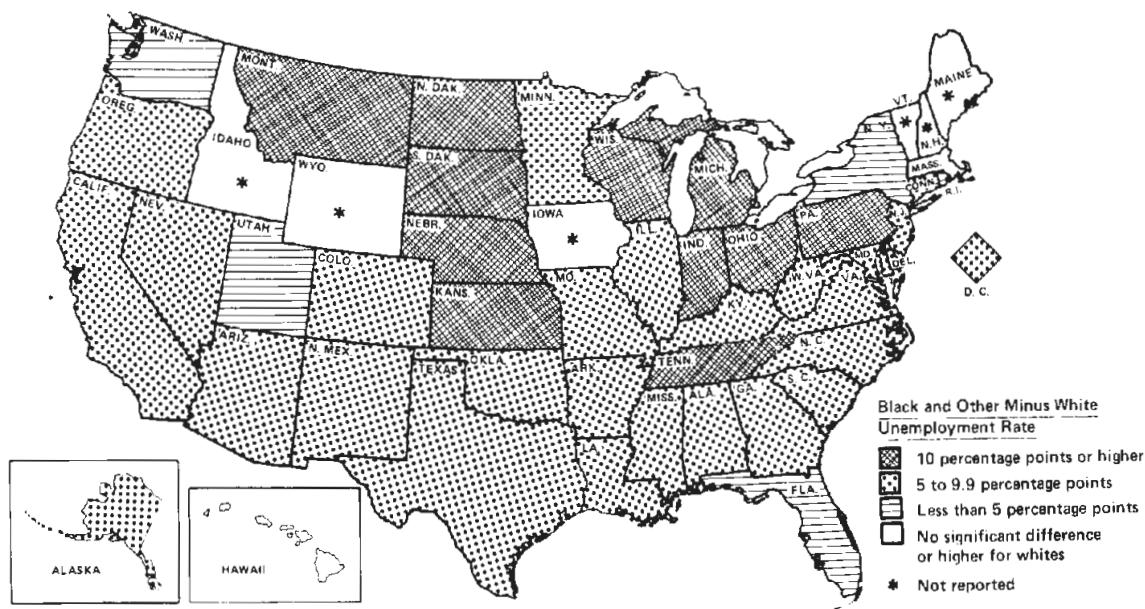

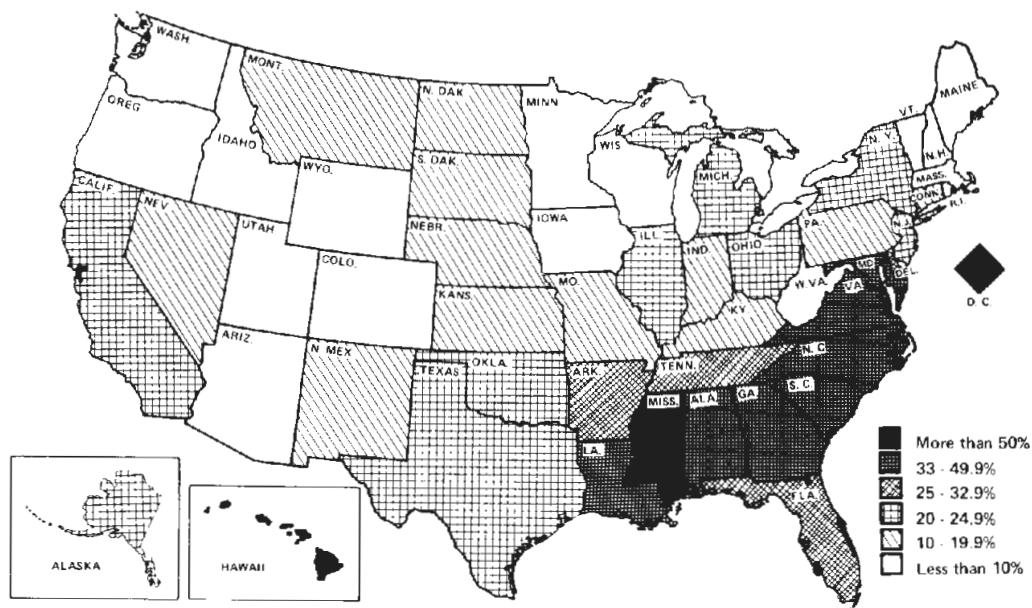

Chart 4. Percent black and other of total unemployment in the State, 1980 annual averages

1980 there were 11 States, primarily in the South and West, where duration of unemployment averaged less than 5 weeks, compared with 26 States in 1979:

State	<i>Percent unemployed less than 5 weeks, 1980 annual averages</i>
Wyoming	61.8
Texas	58.4
Oklahoma	55.0
Utah	54.4
Hawaii	53.2

Florida	50.2

Unemployment by reason. The number of job losers—persons who were laid off or those whose employment was otherwise terminated involuntarily—rose markedly from 1979 to 1980, from 2.6 to 3.9 million nationwide. Job losers accounted for 52 percent of total unemployment in 1980, compared with 43 percent in 1979. While there were slight increases in the num-

ber of persons who voluntarily left their previous job (job leavers), or who were entering the labor market for the first time or reentering after a period of separation (new entrants and reentrants), each of these groups represented smaller shares of the Nation's unemployment in 1980 than in 1979.

Job losers constituted at least 55 percent of the unemployed in 11 States, primarily in the North Central and Northeastern part of the Nation. In 1979, only Rhode Island had as high a proportion.

By contrast, in many of the rapidly growing Southern and Mountain States, job leavers and reentrants constituted a larger-than-average share of unemployment. For example, job leavers were 12 percent of total unemployment nationally in 1980, but accounted for at least 18 percent in each of seven Southern and Mountain States—Arizona, Colorado, Nevada, Oklahoma, Texas, Utah, and Wyoming. Reentrants, about 25 percent of unemployment nationally, accounted for over one-third of the total in seven States, primarily in the Mountain and Pacific regions—Alaska, Colorado, Montana, New Mexico, Oklahoma, Utah, and Wyoming.

Section II. State Estimates from the Current Population Survey

Table 1. Labor force status of the civilian noninstitutional population 16 years and over by State, sex, age, race, and marital status, 1980 annual averages

Single (never married)	72	55	76.7	51	71.1	4	7.3	5.9 - 8.7
Married, spouse present	218	152	69.8	148	68.0	4	2.6	2.1 - 3.1
Men, spouse present ²	109	95	87.3	94	85.9	2	1.6	1.1 - 2.1
Women, spouse present ²	109	57	52.2	54	50.0	2	4.3	3.2 - 5.4

¹ Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

² Differences in population levels occur because of independent estimation of males

and females.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular State based on the sample in that State. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

¹ Employed persons with a job but not at work are distributed proportionately among the full- and part-time employed categories.

² Less than 500 persons or less than 0.05 percent.

³ Data are not shown when the labor force base does not meet BLS publication

standards of reliability for the particular State, based on the sample in the State. See appendix B.

NOTE: Numbers may not add to totals because of rounding.

Washington	6.9	4.1	2.8	3.2	4.4	6.0	10.8	9.3	11.5	8.6	15.3	8.7	(?)
West Virginia	8.3	4.5	2.1	3.1	6.2	6.3	11.3	8.5	10.9	11.6	18.1	10.4	(?)
Wisconsin	6.3	3.4	2.6	3.0	3.7	4.1	10.5	6.1	12.9	10.4	15.1	6.1	3.5
Wyoming	3.8	2.8	1.8	1.7	5.6	3.7	4.8	3.2	5.7	3.5	10.2	5.9	.8

¹ Excludes persons with no previous full-time work experience.

² Data are not shown when they do not meet BLS publication standards of reliability for the particular State, based on the sample in the State. See appendix B.

³ Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to subtotals because of rounding.

Table 4. Occupational distribution of employment by State, sex, and race, 1980 annual averages

(Percent of total employment)

Population group and State	Total employment		White-collar workers					Blue-collar workers					Service workers	Farm workers
	Number (thousands)	Percent	Total	Profes-sional and technical workers	Manag-ers and adminis-trators, except farm	Sales workers	Clerical workers	Total	Craft and kindred workers	Opera-tives, except transport	Trans-port equip-ment opera-tives	Nonfarm laborers

¹ Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Items may not add to total because of rounding. Data are not shown separately for black and other races when the employment estimate for black and

other races is not sufficiently large to meet BLS publication standards of reliability for the particular State, based on the sample size in that State. See appendix B.

¹ Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular State based on the sample in that State. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

¹ Employed persons with a job but not at work are distributed proportionately among the full- and part-time employed categories.

² Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for a particular State based on the sample in that

State. See appendix B.

NOTE: Items may not add to totals or compute to displayed rates because of rounding.

¹ Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

² Differences in population levels occur because of independent estimation of males and females.

³ These data are for the Labor Market Area (LMA) rather than the Standard

Metropolitan Statistical Area for which estimates were published in earlier years. The significance of the difference is discussed in appendix C, "Geographic Boundary Definitions".

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

Table 14. Full- and part-time status of the civilian labor force 16 years and over in 30 large metropolitan areas and 11 large cities by sex, age, and race, 1980 annual averages

St. Louis	69	53	4	12	17.1	(3)	(3)	(3)	(3)	

¹ Employed persons with a job but not at work are distributed proportionately among the full- and part-time employed categories.

² All are Standard Metropolitan Statistical Areas except those labeled Labor Market Area (LMA). The significance of the difference is discussed in appendix C, "Geographic Boundary Definitions".

³ Data are not shown when the labor force base does not meet BLS publication standards of reliability for the particular area, based on the sample in the area. See appendix B.

⁴ Less than 500 persons or less than 0.05 percent.

NOTE: Numbers may not add to totals because of rounding.

¹ Excludes persons with no previous full-time work experience.

² All are Standard Metropolitan Statistical Areas except those labeled Labor Market Area (LMA). The significance of the difference is discussed in appendix C, "Geographic Boundary Definitions".

³ Data are not shown when they do not meet BLS publication standards of reliability

for the particular area, based on the sample in the area. See appendix B.

⁴ Less than 500 persons or less than 0.05 percent.

NOTE: Items may not add to subtotals because of rounding or because farm workers are included in totals but not shown separately.

¹ All are Standard Metropolitan Statistical Areas except those labeled Labor Market Area (LMA). The significance of the difference is discussed in appendix C, "Geographic Boundary Definitions".

² Less than 500 persons employed or less than 0.05 percent of total employed.

NOTE: Items may not add to total because of rounding or because farm workers

are included in totals but are not shown separately. Data are not shown separately for black and other races when the employment estimate for black and other races is not sufficiently large to meet BLS publication standards of reliability for the particular area, based on the sample size in that area. See appendix B.

Table 17. Nonagricultural wage and salary employment by hours of work in 30 large metropolitan areas and 11 large cities, 1980 annual averages

¹ Error ranges are calculated at the 90-percent confidence interval, which means that if repeated samples were drawn from the same population and an error range constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges.

² All are Standard Metropolitan Statistical Areas except those labeled Labor Market Area (LMA). The significance of the difference is discussed in appendix C.

"Geographic Boundary Definitions".

NOTE: Data for demographic groups are not shown when they do not meet BLS publication standards of reliability for the particular area based on the sample in that area. See appendix B. Items may not add to totals or compute to displayed rates because of rounding.

Section IV. Unemployment Estimates for States and Large Labor Market Areas

The tables that follow provide monthly unemployment rates for States and the District of Columbia, and annual average labor force and unemployment estimates for States and 230 Labor Market Areas (LMA's). These estimates are produced for use in the administration of the Comprehensive Employment and Training Act of 1973, as amended (CETA), the Public Works and Economic Development Act of 1965, as amended, the Buy American Act (Executive Order 10582), and Defense Manpower Policy No. 4A.

These data are the product of a Federal-State cooperative program in which State employment security agencies prepare labor force and unemployment estimates under concepts, definitions, and technical procedures established by the Bureau of Labor Statistics.

In 10 large States (California, Florida, Illinois, Massachusetts, Michigan, New Jersey, New York, Ohio, Pennsylvania, and Texas) and two areas (New York City and the Los Angeles-Long Beach LMA), the monthly estimates are obtained directly from the Current Population Survey (CPS), the monthly survey of households used to measure unemployment nationally. These State and area CPS estimates meet the BLS standard of reliability (10-percent coefficient of variation on the level of unemployment at a 6-percent rate of unemployment at one standard error) on a monthly basis. In the remaining 40 States and the District of Columbia, an initial estimate of employment and unemployment is developed using data from the unemployment insurance (UI) system together with estimates of persons not covered by UI.

A 6-month moving average of the CPS to the UI-based estimate is applied to the current month's estimate to bring the UI-based State estimate more into conformity with national definitions of employment and unemployment.

Estimates for the Labor Market Areas (except for Los Angeles-Long Beach) are obtained from the UI-

based estimates adjusted to the State employment and unemployment totals.

Once each year, the monthly employment and unemployment estimates for the 10 large States and two large areas are adjusted to incorporate revised independent population estimates. The UI-based estimates in the remaining States and the District of Columbia are adjusted or "benchmarked" to annual averages from the CPS, which meet the BLS reliability standard on an annual basis. Estimates for areas within the States are then adjusted so that the sub-State components add to the statewide totals. The LMA estimates in the following tables have been adjusted to State annual average totals from the CPS.

Monthly estimates for the States and LMA's shown here are published as table E-1 in *Employment and Earnings*, and as a monthly BLS news release, "State and Metropolitan Area Unemployment."

Estimates for smaller LMA's, all counties, cities of 25,000 population or more, and other jurisdictions for administrative purposes (prime sponsors, program agents, etc.) are published monthly through the Government Printing Office in *Employment and Unemployment in States and Local Areas*. However, because of the small size of many of the areas, as well as the limitations of the data inputs, users are cautioned that these data should be used only to fulfill the program needs for which the estimates were developed.

Subscription information should be addressed to the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Appendix A provides data mandated under the 1978 Amendments to the CETA Act and under Defense Manpower Policy No. 4A, which require that BLS publish CPS-based data for the 30 large metropolitan areas shown in section III, in addition to estimates for the same areas based on the Federal-State Cooperative Program shown in this section.

statewide totals. See appendix D for a description of the estimating methods.

N.A. = not available.

NOTE: Annual average State data are obtained directly from the Current Population Survey. Estimates for sub-state areas, except New York City and Los Angeles—Long Beach, are based on administrative statistics adjusted to the

SOURCE: Current Population Survey and Cooperating State Employment Security Agencies listed on the inside back cover.

Appendix A. Definitions of Data Derived from the Current Population Survey

Tables showing labor force status in sections I-III include provisional estimates of the civilian noninstitutional population 16 years and over in 1980 as well as data on the civilian labor force (the total of the employed and the unemployed), unemployment rates, and labor force participation rates. Population estimates are revised by the U.S. Bureau of the Census each year. The revised population estimates are incorporated into the CPS labor force levels used in the Federal-State Cooperative Program. This adjustment affects the estimates of labor force, employment, and unemployment but does not affect unemployment rates, participation rates, or employment-population ratios.

Employed persons are all civilians who did any work as paid employees or in their own business during the survey week, or who worked 15 hours or more as unpaid workers in an enterprise operated by a family member. Persons temporarily absent from a job because of illness, bad weather, a strike, or for personal reasons are counted as employed whether they were paid by their employer or were seeking other jobs.

Unemployed persons are all civilians who did not work during the survey week, made specific efforts to find a job in the prior 4 weeks, and were available for work during the survey week (except for temporary illness). Persons waiting to be recalled to a job from which they had been laid off, and those waiting to report to a new job within the next 30 days, are also counted as unemployed.

Duration of unemployment represents the length of time (through the current survey week) during which persons classified as unemployed had been continuously looking for work. For persons on layoff, duration of unemployment represents the number of full weeks since the termination of their most recent employment. A period of 2 weeks or more during which a person was employed or ceased looking for work is considered to break the continuity of the present period of jobseeking.

In this report, the percent of the unemployed with short-term unemployment—less than 5 weeks or about 1 month—is contrasted with the percent unemployed 5-14 weeks, 15-26 weeks, 27-51 weeks, and 52 weeks and over. Data are available by sex, age, and race in

States, metropolitan areas, and large cities. However, because of the small size of the teenage and black and other population in many areas, estimates of the duration of unemployment for these demographic groups are available only for a limited number of areas. Estimates are not published for categories in which there are fewer than 500 persons unemployed.

Reasons for unemployment are divided into four major groups: (1) Job losers—persons whose employment ended involuntarily who immediately began looking for work, and persons on layoff; (2) Job leavers—persons who quit or otherwise terminated their employment voluntarily and immediately began looking for work; (3) Reentrants—persons who previously worked at a full-time job lasting 2 weeks or longer but were out of the labor force before looking for work; and (4) New entrants—persons who never worked at a full-time job lasting 2 weeks or longer.

The full-time labor force consists of persons working on full-time schedules, persons involuntarily working part time (employed part time for economic reasons), and unemployed persons seeking full-time jobs. "Economic reasons" include: Slack work, material shortages, repairs to plant or equipment, start or termination of job during the week, and inability to find full-time work.

The part-time labor force consists of persons working part time voluntarily (1-34 hours), and unemployed persons seeking part-time work. Persons with a job but not at work are classified according to their usual full- or part-time status.

Estimates for the full-time and part-time labor force are shown for the States and 30 metropolitan areas. However, because of the small numbers involved, reliable data for the black and other population are not available for all areas.

Occupational data for the employed refer to the job held during the survey week. Persons with two or more jobs are classified according to the job in which they worked the most hours during the survey week. The unemployed are classified according to the last full-time civilian job held for 2 weeks or more. The classifications of occupations used in data derived from the CPS are as defined in the 1970 Census.

Employment, unemployment, and the unemployment rate are shown for each of the States and the 30 large metropolitan areas for each occupational category. Data are not shown where the numbers are too small to yield reliable estimates. In tables showing data for cities, occupational groups have been combined in order to improve the quality of the estimates.

Hours of work statistics relate to the actual number of hours worked during the survey week. For example, persons who normally work 40 hours a week but who were off on the Columbus Day holiday would be reported as working 32 hours even though they were paid for the holiday.

For persons working in more than one job, the figures relate to the number of hours worked in all jobs during the survey week. However, all the hours are credited to the major job.

The distribution of employment by hours worked relates to persons "at work" during the survey week. At-work data differ from data on total employment because the latter include persons in the zero-hours-worked category, "with a job but not at work." Included in this latter group are persons who were on vacation, ill, involved in a labor dispute, or otherwise absent from their jobs for voluntary, noneconomic reasons.

White and *black and other* are terms used to describe the race of workers. The "black and other" category includes all persons who identified themselves in the enumeration process to be other than white. At the time of the 1970 Census of Population, 89 percent of the black-and-other population group were black; the remainder were primarily American Indians, Alaskan Natives, and Asians and Pacific Islanders. The term "black" is used in this report when the relevant data are provided exclusively for the black population.

Hispanic origin refers to persons who identified themselves in the enumeration process as Mexican, Puerto Rican, Cuban, Central or South American, or of other Hispanic origin or descent. Hispanics may be of either race; hence, they are included in the data for both the white and the "black and other" population. Estimates of sampling errors in this report for the Hispanic-origin population are based upon those for the black and other population. However, since the Hispanic population is smaller, estimates for this group are likely to have a wider error range. Therefore, caution should be exercised in making comparisons using these data.

A more detailed description of the definitions used in this survey appears in *Concepts and Methods Used in Labor Force Statistics Derived from the Current Population Survey*, BLS Report 463.

Appendix B. CPS Sampling and Estimation Procedures and Sampling Error Tables

The estimates presented in sections I-III of this report are based on annual averages of monthly data obtained from the Current Population Survey (CPS)—a sample survey of the civilian noninstitutional population.¹ The survey is conducted each month by the Bureau of the Census for the Bureau of Labor Statistics, and provides comprehensive data on the labor force, the employed, and the unemployed, including such characteristics as age, sex, race, marital status, and occupation. The survey also provides data on the characteristics of those not in the labor force. The information is collected by trained interviewers from a scientifically selected sample designed to represent the civilian non-institutional population. During 1980, over 71,000 occupied housing units were eligible for interview each month; all but about 6,000 of these units were in the national CPS sample. Respondents are interviewed to obtain information about the employment status of each household member 16 years of age and over for the calendar week, Sunday through Saturday, which includes the 12th of the month. This is known as the survey week. Actual field interviewing is conducted in the following week.

Inmates of institutions, members of the Armed Forces, and persons under 14 years of age are not covered in the regular monthly enumerations; persons under 16 are excluded from the population and labor force statistics shown in this report.

Sampling procedures

The sample design used for the CPS is based to a large extent on the distribution of the population reported in the most recent decennial census. The current sample encompasses 629 sample areas comprising over 1,000 counties and cities, with coverage in every State and the District of Columbia. These areas were selected by dividing the entire area of the United States into 1,931 primary sampling units (PSU's). With some minor exceptions, a PSU consists of a county or a number of contiguous counties. Each of the standard metropolitan statistical areas (SMSA's) defined as of the 1970 Census constitutes a separate PSU.

To improve the efficiency of the sample, the 1,931 PSU's were grouped into strata. PSU's in strata by themselves are self-representing (SR), and generally are the most populated PSU's in each State. Other strata were formed by combining PSU's which were similar in such characteristics as geographic region, population density and growth, proportion nonwhite, principal industry, number of farms, etc. PSU's selected from these strata are non-self-representing (NSR), since each represents the entire stratum.

Within each of the selected PSU's, the number of households to be enumerated each month is determined in two steps. First, a sample of census enumeration districts (ED's) is selected. These are administrative units designated in the 1970 Census and contain, on the average, about 300 households. Second, clusters of approximately four addresses to be enumerated within each designated ED are selected. Whenever possible, the four units are contiguous.

Part of the sample is changed, or rotated, each month. A primary reason for rotating the sample is to avoid the poor cooperation which may result from interviewing a constant panel indefinitely. Another reason for replacing households is to reduce the cumulative effect of response biases which are sometimes observed when the same persons are interviewed indefinitely. The rotation plan provides for three-fourths of the sample to be identical from 1 month to the next and one-half to be identical with the same month a year earlier.

Prior to the State and area sample supplementations in 1976 and 1980, the sampling ratio, or probability of selecting each household, was the same in each State, approximately 1 in 1,500. The sampling ratio is automatically modified over time so that the size of the sample is held relatively constant despite the overall growth of the population. In 1976, the samples in 23 small States and Washington, D.C. were supplemented to improve the reliability of the estimates. In 1980, additional households were added to the samples in selected States and areas for this same purpose. This supplementation affected the sampling ratios in these States. Consequently, the probability of selecting a particular

¹ For a technical description of the CPS sampling and estimation procedures and variance estimation procedures, see Technical Paper 40, *The Current Population Survey Design and Methodology*, January 1978, published by the Bureau of the Census.

household in the sample currently varies considerably from State to State. (See section on reliability standards).

CPS estimating methods

Under the estimating methods used in the CPS, all of the results for a given month become available simultaneously and are based on returns from the entire panel of respondents. The CPS estimation procedure involves the weighting up, or inflating, of the data from each sample person to develop estimates for the entire population from which the sample was drawn.

The basic weights, which are the inverse of the sampling ratios, are adjusted to better reflect the entire population, as described below.

1. *Noninterview adjustment.* The weights for all interviewed households are inflated to the extent needed to account for occupied sample households for which no information was obtained because of absence, impassable roads, refusals, unavailability of the respondent, or other reasons. The proportion of sample households not interviewed generally varies from 4 to 5 percent, depending on weather, vacations, etc.
2. *Ratio estimates.* The distribution of the population selected for the sample may differ somewhat, by chance, from that of the population as a whole in such characteristics as age, race, sex, and residence.

Since these characteristics are closely correlated with labor force participation and other principal measurements made from the sample, the latter estimates can be substantially improved when weighted appropriately by the known distribution of these population characteristics. This is accomplished through two stages of ratio estimation as follows:

- a. *First-stage ratio estimate.* As explained above, NSR areas are chosen to represent not only themselves, but also other unsampled areas. The first-stage ratio adjustment procedure is designed to correct for the differences that existed at the time of the 1970 Census between the distribution of the population by race and residence in the NSR sample areas and the known distribution in the entire area represented by each of these NSR areas. The procedure is performed twice, once for the four census regions and then for each of the 46 States which contain NSR areas.
- b. *Second-stage ratio estimate.* This stage is designed to adjust the first-stage estimates for sample coverage of the population, and is conducted as follows. First, the sample estimates are adjusted within each State and the District of Columbia to an independent estimate of the population 16 years and over for that State. The second step involves persons of black and other races only and is an adjustment to independent estimates of 48 age-sex-race categories for the Nation as a whole. The third step, applied to all sample persons, is used to adjust the State totals to independent population estimates for 68 national age-sex-race groups. When completed, this procedure insures that the sample population estimates, both for the States and the national age-sex-race categories, will be virtually equal to the independent

population estimates in these categories.

The independent State controls for the civilian noninstitutional population 16 years and over are an arithmetic extrapolation of the trend in their growth from the April 1, 1970, census count through the latest available July 1 estimate, adjusted as a last step to a current estimate of the U.S. population. A description of the methodology used to derive the national age-sex-race estimates and State totals may be obtained from the Chief of the Population Division, U.S. Bureau of the Census, Washington, D.C. 20233.

3. *Composite estimate procedure.* In deriving the final statistics for a given month, a composite estimating procedure is used which takes account of net changes in the sample results from the previous month for the continuing households of the sample (75 percent), as well as the sample results from all households for the current month. Almost all estimates of month-to-month change are improved by this procedure, and most estimates of levels are also improved, but to a lesser extent.

Reliability of the estimates

Since the estimates in this report are based upon a sample of the population rather than a complete count, they may differ from the figures that would have been obtained if it had been possible to take a complete census using the same schedules and procedures as are used in the CPS. There are two types of errors in an estimate based on a sample survey—sampling and nonsampling. The sampling error tables in this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumerations but do not measure any systematic biases in data. In general, the error of a sample estimate varies inversely with the size of the sample and directly with the size of the estimate. Hence, an estimate for a subgroup constituting a small proportion of a population will tend to have a smaller absolute (and larger relative) error than an estimate for a subgroup constituting a large proportion of that same population.

Reliability standards

As previously mentioned, the proportion of the total population sampled in the CPS differs among the States. In general, the smaller the population, the larger the sampling proportion. For example, in Vermont approximately 1 in every 200 households was sampled in 1980, whereas in New York the sample covered about 1 in every 1,500 households. Nevertheless, the size of the sample in New York is larger than in Vermont because the State CPS data are weighted to produce national estimates, and because New York contains a much larger proportion of the national population than Vermont.

Differences in the probability of selection of households in each area (i.e., sampling ratios) are necessary

to obtain total unemployment levels meeting a minimum level of reliability—a maximum expected annual coefficient of variation of 10 percent, at one standard error, given a 6-percent unemployment rate. Before CPS labor force data for a State or area can be used in the Federal-State cooperative program, the size of the sample for that area must be large enough to produce estimates meeting that minimum standard of reliability. (See section IV.)

Publication standards for State and area

CPS data

The publication of data based on a comparable minimum standard of reliability for all areas, including States, SMSA's, and cities, requires unique standards for minimum labor force, employment, and unemployment levels, based on the known differences in sampling ratios among these areas. To ensure a minimum standard of reliability, BLS requires that at least 30 sample cases be the basis for publication of data below the State or area totals. As a result of these two requirements, minimum bases for publication have been developed for each State. Table B-1 lists the minimum necessary base for publication of data in each of the States, the District of Columbia, and the metropolitan areas and cities appearing in this report.

Estimates are not shown when they do not meet the minimum base for the State or area listed in table B-1. The determining factor for publication is the size of either the denominator of the distribution or the unemployment rate. In tables showing labor force status, the size of the labor force of the particular group determines whether data for that group are published. In all other tables, the determining factor is the base or total of the distribution—which equals 100 percent. Data are not published for any cell with fewer than 500 persons or less than 0.5 percent.

Using the sampling error tables

The sampling error tables (tables B-2 through B-17) can be used directly to develop 90-percent confidence intervals for sample estimates. They indicate the order of magnitude of the sampling error rather than the precise amount of the possible error in an estimate. (A sampling error equals 1.645 times one standard error.)

Table B-2 shows that an estimate of 50,000 unemployed persons (total or white) in Alabama will have an absolute sampling error of 8,000, and a relative sampling error of 16 percent, while an estimate of 100,000 unemployed persons in Alabama has an absolute sampling error of 12,000 and a relative sampling error of 12 percent.

The statement that unemployment in Alabama is between 42,000 and 58,000 in the first instance, and between 88,000 and 112,000 in the second, is made with 90-percent confidence. If repeated samples were drawn from the same population and a confidence interval

constructed around each sample estimate, in 9 out of 10 cases the true value based on a complete census of the population would be contained within these error ranges. Hence we can be 90-percent confident that the interval constructed does, in fact, contain the true value.

To calculate a 68-percent confidence interval (2 chances out of 3), multiply the sampling error shown by 0.6. To convert the sampling error to 95-percent confidence (19 chances out of 20), multiply the sampling error by 1.19. For the example given above, the sampling error at 90-percent confidence was 8,000. At 68-percent confidence, the error would be about 4,800 ($8,000 \times 0.6 = 4,800$). At 95-percent confidence, the error would be about 9,500 ($8,000 \times 1.19 = 9,520$).

To compute the error of a difference from the tables, an additional step is required. If, for instance, one wishes to know whether a change in the unemployment rate from 1979 to 1980 in a particular area is statistically significant, or whether the difference in the unemployment rate between two areas or population groups is statistically meaningful, the significance of the difference needs to be computed.

To test for the significance of a difference, the following formula should be used:

$$\text{where: } E_d = \sqrt{\frac{E_1^2 + E_2^2 - C}{2}}$$

E_1 = the sampling error of one group or year
 E_2 = the sampling error of another group or year
 C = the covariance (or relationship) term
 between E_1 and E_2

E_d = the sampling error of the difference

The E_1 and the E_2 must be found in the appropriate *Geographic Profile* for each year, since the size of the samples and, consequently, sampling errors may differ from year to year. Estimates for the "C" term for areas in this report are not available. (If the relationship between the two groups or years is small, the "C" term may be ignored. If, however, there is a strong positive relationship between the two groups, then the error computed without the "C" term will be overstated.) An example will show how this test is applied. Suppose one wished to know whether a hypothetical change in the CPS unemployment rate in Alaska from 10 percent to 8 percent between 1979 and 1980 was significant. Assume that the labor force was about 100,000 in both years. Table B-8 in the 1979 *Geographic Profile* gives the error for a 10.0 percent unemployment rate as 1.11, and table B-6 in this year's *Geographic Profile* gives the error for an 8.0 percent unemployment rate as 1.07. Using the formula described above, the following would result.

$$E_1 = 1.11$$

$$E_2 = 1.07$$

$$(E_1)^2 + (E_2)^2 = 2.377$$

$$\sqrt{2.377} = 1.54$$

Assuming a negligible "C" term, the error of the difference is about 1.5. Since the actual change (2.0 percent) exceeds the error of the difference, it can be stated, with 90-percent confidence, that the difference in rates is attributable to factors other than sampling error alone.

To derive a sampling error for a given estimate, it may be necessary to use interpolation or extrapolation. For example, table B-2 contains no sampling error for an estimate of 150,000 unemployed persons in Alabama. The following formula shows how to interpolate for an estimate of 150,000 in Alabama:

$$E_S = [(S - G) - (F - G)] \times (X - Y) + Y$$

- where:
F = published size immediately above the size desired (200,000)
G = published size immediately below the size desired (100,000)
S = size desired (150,000)
X = error of the F (16,000)
Y = error of G (12,000)
E_S = error of S (14,000)

If the sample estimate lies outside the boundaries of

the error tables, extrapolation can be used to approximate the sampling error. The formula for extrapolation is the same as that for interpolation; however, the "F" term is the highest value in the table and the "G" term becomes the next highest value.

Derivation of sampling errors

These State and area sampling errors are developed using a generalized procedure and are not based on the sample data for each individual area. As with all sampling error tables produced for CPS State and area data, a number of approximations were required in order to derive sampling errors that would be applicable to a wide variety of items. As a result, these sampling errors provide an indication of the order of magnitude of a sampling error rather than a precise sampling error for any specific item.

The sampling error tables are derived from standard error equations and special parameters developed by the Bureau of the Census. These may be obtained from the Bureau of Labor Statistics on request.

Appendix C. Geographic Boundary Definitions for 30 Large Metropolitan Areas

This appendix lists the boundary definitions of 30 large metropolitan areas using the two methods by which the areas are defined for statistical purposes—Standard Metropolitan Statistical Areas (SMSA's) and Labor Market Areas (LMA's).

The Department of Labor has used LMA's for a number of years for various administrative and program purposes. Designed to measure conditions of the labor force within reasonable commuting distance of a large central city (or cities), the boundaries for almost all LMA's are the same as those for SMSA's as defined by the Office of Federal Statistical Policy and Standards. SMSA boundaries are defined using a set of uniform criteria, while LMA's are defined jointly by the State Employment Security Agencies and the Department of Labor. Since many LMA's were established before they were designated as an SMSA, there are a few areas where boundary differences reflect this initial classification discrepancy.

An SMSA is defined as a county containing at least one city with 50,000 inhabitants or more, or several economically and socially related contiguous counties with at least one city of 25,000 inhabitants or more. In the New England States, where SMSA's are comprised of cities and towns, the minimum population size is 75,000.

The boundaries of SMSA's are occasionally revised. The tables that follow compare the boundaries of 30 large SMSA's in 1970 and 1973 (the current SMSA boundaries) with the current LMA boundaries. With the exception of Minneapolis-St. Paul and New York, estimates in section III refer to SMSA's, while those in section IV refer to LMA's.

Since 1973, the New York SMSA has consisted of the five counties included in New York City, and Rockland, Westchester, and Putnam Counties in New York State, plus Bergen County, New Jersey. Before 1973, the New York SMSA did not include Putnam or Bergen County. On the other hand, the New York Labor Market (LMA) has, for many years, included Putnam County, but excluded Bergen County. Bergen County had a labor force of 484,000 in 1980, equal to approximately 12 percent of the New York SMSA. However, Putnam County has a labor force comprising less than 1 percent of the total. Thus the current New York LMA is consistent with the 1970 SMSA definition. Data based on the SMSA definition are available upon request.

Estimates for the Minneapolis-St. Paul LMA as published in this year's report are not significantly different from those for the SMSA. Consequently, earlier data based on the SMSA definition may be used in a time series with the current LMA data.

Table C-1. Geographic boundaries of metropolitan areas (SMSA's and LMA's)

Area	SMSA 1970 definition	SMSA 1973 definition	LMA definition ¹
Anaheim-Santa Ana-Garden Grove . . .	Orange County	Same	Same
Atlanta	Counties of Cobb, Clayton, DeKalb, Fulton, Gwinnett	1970 definition plus counties of Butts, Cherokee, Douglas, Fayette, Forsyth, Henry, Newton, Paulding, Rockdale, Walton	1973 definition

	Illinois portion: Counties of Madison, St. Clair		
San Francisco-Oakland	Counties of Alameda, Contra Costa, Marin, San Francisco, San Mateo	Same	Same
San Jose	Santa Clara County	Same	Same
San Diego	San Diego County	Same	Same
Seattle-Everett	Counties of King, Snohomish	Same	Same
Washington, D.C.	District of Columbia	1970 definition plus Charles County, Md.	1973 definition
	Virginia portion: Counties of Arlington, Fairfax, Loudoun, Prince William, Cities of Alexandria, Falls Church, Fairfax, Manassas, Manassas Park		
	Maryland portion: Counties of Montgomery, Prince Georges		

¹ Except for Denver-Boulder, for which the estimates in section III are based on the 1973 SMSA geographic boundaries, all metropolitan area estimates in sections III and IV are based on the LMA boundaries.

Appendix D. Procedures for Estimating Employment and Unemployment Under the Federal-State Cooperative Program

Estimating methods

Employment and unemployment estimates for the 10 largest States (California, New York, Texas, Illinois, Pennsylvania, Ohio, Michigan, Florida, New Jersey, and Massachusetts) and two areas (New York City and the Los Angeles-Long Beach LMA) are taken directly from the Current Population Survey (CPS). For a description of CPS concepts, see the BLS periodical *Employment and Earnings*, Explanatory Note A, "Household Data."

Estimates for the remaining 40 States and the District of Columbia are prepared by State employment security agencies under standardized procedures developed by the Bureau of Labor Statistics. The estimates are prepared in several stages, as explained below.

Labor force and unemployment estimates for States, Labor Market Areas (LMA's), and other areas covered under Federal assistance programs are developed by State employment security agencies under a Federal-State cooperative program. The local unemployment estimates which are derived from standardized procedures developed by BLS are the basis for determining eligibility of an area for benefits under Federal programs such as the Comprehensive Employment and Training Act and the Public Works and Economic Development Act.

Preliminary estimate—employment

The total employment estimate is based primarily on data from the survey of establishments which produces an estimate of payroll employment. This place-of-work estimate must be adjusted to refer to place of residence as used in the CPS. Factors for adjusting from place of work to place of residence have been developed for the major categories of employment by class of worker and industry on the basis of employment relationships which existed at the time of the 1970 Decennial Census. These factors are applied to the payroll employment estimates for the current period to obtain adjusted employment estimates.

Estimates of employment for workers not covered by the payroll survey, such as agricultural workers and self-employed and unpaid family workers, are also developed

using special surveys, national historical relationships, and census data.

Preliminary estimate—unemployment

In the current month, the estimate of unemployment is an aggregate of the estimates for each of three categories: (1) Persons who were previously employed in industries covered by State UI laws; (2) those previously employed in industries not covered by these laws; and (3) those who were either entering the labor force for the first time or reentering after a period of separation. This is referred to below as the UI-based estimate.

An estimate for those previously employed in covered industries is derived from a count of current unemployment insurance claimants, plus estimates of claimants whose benefits have been exhausted, those persons disqualified from receiving benefits for nonmonetary reasons (because they quit, were discharged for cause, etc., but would otherwise have been eligible), and persons who either filed claims late or not at all.

The estimate of those previously employed in industries not covered by UI is derived by applying to the employment estimate for each noncovered industry or class of worker subgroup in the State the ratio of covered unemployment to covered employment, weighted by factors reflecting national historical relationships.

For the third category, new entrants and reentrants into the labor force, a composite estimate is developed from equations that relate the total entrants into the labor force to the experienced unemployed and the experienced labor force. For each month, the estimate of entrants into the labor force is a function of: (a) the month of the year; (b) the level of the experienced unemployed; (c) the level of the experienced labor force; and (d) the proportion of the working-age population that is considered "youth." The composite estimate of total entrants is defined as:

$$U = A(X+E) + BX, \text{ where}$$

U = total entrant unemployment
E = total employment
X = total experienced unemployment

A,B = synthetic factors incorporating seasonal variations and an assumed relationship between the proportion of youths in the working population and the historical relationship of entrants to the experienced unemployed (B factor) or the experienced labor force (A factor)

Correction factors

Correction factors are then applied at the State level to the UI-based estimates obtained above for each of the 40 States and District of Columbia. These correction factors are based on the ratio of the CPS to the UI-based estimates for the 6-month period ending in the current month (e.g., a 6-month moving average).

Sub-State adjustment for additivity

Independent estimates of employment and unemployment are prepared both for the State (obtained directly from the CPS in 10 large States or by the UI-based method in the remaining States), and labor market areas (LMA's) within the State. The total labor force included in the LMA's exhausts the geographic boundaries of the State. A proportional adjustment is applied to all sub-State LMA estimates to ensure that the sub-State estimates of employment and unemployment add to the independent State totals. In California and New York, which also have sub-State areas taken directly from the CPS, the additivity adjustment for the remaining areas is applied to the State total minus the direct CPS area.

Benchmark correction procedures

Once each year monthly estimates prepared by State

employment security agencies using UI-based estimating procedures are adjusted, or benchmarked, by BLS to the annual average CPS estimates for the 40 States for which monthly CPS estimates are not available. This adjustment is necessary because the State-prepared estimates are not as reliable as the CPS annual averages due to differences in State UI laws, the structural limitations of the UI-based estimating method, and errors in the UI data.

The benchmarked estimates are produced in three stages. First, the monthly UI-based estimates are adjusted by the ratio of the CPS to the UI-based annual averages. Second, the difference between the ratio of annual averages for two consecutive years is wedged into the monthly estimates in order to minimize the disturbance to the original series. Finally, the second-stage estimates are forced into agreement with CPS annual averages. In the 10 States which use CPS estimates monthly, no benchmark correction is required, as the average of the 12 monthly State CPS estimates will equal the CPS annual averages.

The CPS estimates in the 10 large States and two large areas are adjusted each year to incorporate revised independent population estimates provided by the Bureau of the Census. These revised population estimates affect the levels of employment and unemployment, but do not affect the unemployment rates.

The estimates for LMA's in section IV have been adjusted to conform to CPS annual averages estimates for the States.
