### **Preface**

This bulletin provides data on two BLS measures of employee compensation: The Employment Cost Index (ECI) and Employer Costs for Employee Compensation. The ECI is a fixed-employment-weighted index which tracks quarterly changes in labor costs (wages, salaries, and employer costs for employee benefits), free from the influence of employment shifts among occupations and industries. The second measure uses current employment weights to produce information annually on the cost per hour worked of each component of compensation. Both measures are based on data collected in the same survey of establishments.

This bulletin provides a review of recent trends in compensation cost change and examines the structure of those costs in March 1991. It also includes complete historical data on the ECI from its inception in September 1975 through June 1991. In addition, it provides data on employer costs for employee compensation for private industry workers that relate to March 1987-91 and for State and local government workers that relate to March 1991.

Since 1989, the Bureau has also obtained data on employee benefit provisions from the same sample of establishments as the ECI. The information on benefit provisions is developed for the Bureau's Employee Benefits Survey (EBS) and is published separately. The first release of EBS data collected jointly with the ECI was in *Employee Benefits in Small Private Establishments*, 1990, BLS Bulletin 2388, September 1991. Subsequent bulletins will provide data on medium and large establishments in private industry and State and local governments.

This bulletin was prepared in the Division of Employment Cost Trends, Office of Compensation and Working Conditions, by Albert Schwenk, Mark Brinkley, Charles Heflin, Wayne Shelly, and Brenda Rogers. The Office's Statistical Methods Group was responsible for the survey sample design, nonresponse adjustments, sample error computations, and other statistical procedures. Fieldwork for the survey was directed by the Bureau's Assistant Regional Commissioners for Operations. Collection procedures and systems design were provided by the Division of Directly Collected Periodic Surveys.

Information in this publication will be made available to sensory impaired individuals upon request. Voice phone: (202) 523–3926; TDD Message Referral phone: 1–800–326–2577.

Material in this publication is in the public domain and, with appropriate credit, may be reproduced without permission.

## Chapter I. Introduction

Economic analysis often involves relationships between prices, productivity, employment, and labor costs. Adequate measures of the first three have existed for some time, but it was not until the development of the Employment Cost Index (ECI) that a comprehensive indicator of changes in labor costs became available. The ECI covers all occupations and establishments in both the private nonfarm sector and State and local government, permitting analysis of labor cost changes for a major portion of the U.S. economy.

#### **Background**

The ECI was developed in the early 1970's in response to an expressed need for a timely, accurate, and comprehensive indicator of changes in employers' labor costs, free from the influence of employment shifts among industries and occupations. The objective of measuring change unaffected by employment shifts was accomplished by holding the distribution of employment among industries and occupations fixed over time, and by defining, narrowly enough, the jobs for which data are collected each quarter so that all workers in the job carry out the same task at roughly the same level of skill.

ECI statistics were first published for September-December 1975 and were limited to changes for private industry wage and salary workers. Data were published for major occupational and industry groups, region, union status, and area size. Over the next 14 years, new series were gradually added. In 1980, for example, measures of total compensation cost changes (employer costs for employee benefits in addition to wages and salaries) were developed as the rapid growth of employee benefits made defining the cost of labor in terms of a wage rate alone no longer appropriate.

Benefits covered by the ECI survey are: Paid leave (vacations, holidays, sick leave, and other paid leave); supplemental pay (premium pay for overtime and work on weekends and holidays, shift differentials, and nonproduction bonuses such as lump-sum payments provided in lieu of wage increases); insurance benefits (life, health, and sickness and accident); retirement and savings benefits (pensions and other retirement plans and savings and thrift plans); legally required benefits (Social Security, railroad retirement and supplemental retirement, railroad unemployment insurance, Federal and State unemployment insurance, workers' compensation, and other legally required benefits such as State temporary disability

insurance); and other benefits (severance pay and supplemental unemployment insurance).

In June 1981, the State and local government sector was added, and by June 1991, over 90 percent of all civilian wage and salary workers were covered. (See chart 1.)

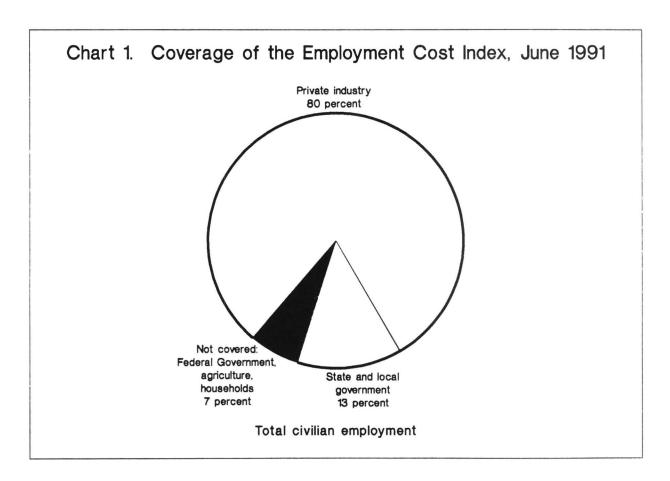

Beginning in 1987, a new measure based on data from the ECI survey—Employer Costs for Employee Compensation—became available annually for private industry. These compensation cost levels are calculated by applying current, rather than fixed, employment weights to wage and salary and benefit cost data collected from the establishments in the survey. The cost levels are obtained with no additional burden on respondents and are published once a year with a March reference period. (Compensation cost levels for State and local government workers became available in 1991.)

In March 1989, the Bureau began publishing detailed ECI data for the aerospace manufacturing industries, with funds provided by the Aerospace Industries Association (AIA). The new series, published in this bulletin for the convenience of all users, include compensation cost levels in those industries as well as measures of change in total compensation, wages and salaries, and benefits.

In addition to the aerospace industries, a number of new series have been published since 1981. Among these are wage and compensation cost changes for hospitals and all health services, as well as business services, communications, food stores, and insurance. Because the new series were made possible by a much larger sample size, indexes could not be extended back to 1981. Therefore, in March 1990 the ECI changed to a new base, June 1989 = 100. This change permitted publication of indexes for all ECI series.<sup>1</sup>

Beginning with the December 1990 ECI news release, seasonally adjusted data became available for the major ECI industry and occupational series. Seasonally adjusted data are useful in identifying underlying trends because they eliminate the effect of changes that normally occur at the same time and in about the same magnitude every year. Compensation cost changes for State and local government workers, for example, are heavily concentrated in the June-September period of every year, whereas those for private industry workers are spread throughout the year. Also, health insurance premium increases typically are concentrated in the January-March period.

<sup>&</sup>lt;sup>1</sup> See Albert E. Schwenk, "ECI Rebased to June 1989," *Monthly Labor Review*, April 1990, pp. 38-39.

#### Uses

Analysts and policymakers, including the Federal Reserve Board, use the ECI to formulate monetary policies and to monitor the effects of those policies. The ECI is also used to forecast wage trends and facilitate wage and benefit cost planning. Another use is in collective bargaining in private industry and the public sector, both as a wage escalator in union contracts and as a guide in negotiations. Several health cost containment laws, including one for Medicare, use the ECI as an adjustment factor to determine the allowable increases in hospital charges. In addition, the ECI is increasingly being used as a labor cost escalator in long-term purchasing and service contracts in both the private and public sectors in the United States as well as in other countries.

The ECI is also used in the Federal pay-setting process. For example, the Ethics Reform Act of 1989 specifies that the pay of Congress, Federal judges, and top government officials is to be increased each year by the change in wages and salaries for private industry workers (less 0.5 percentage point).<sup>2</sup> The Federal Employees Pay Comparability Act of 1990 specifies that the ECI will be used to adjust pay for General Schedule employees.<sup>3</sup>

The cost levels series is used by the U.S. Department of Labor in administering the Service Contract Act. The cost levels are also examined by employers who want to compare their own compensation costs with those of a broader group of employers. The costs for specific benefit categories such as insurance and Social Security are analyzed by government agencies and private organizations to determine the effect those costs have on employers and on the economy.

#### Limitations

Like other statistical series, the ECI has limitations. Currently, it does not cover all employers and employees, although it does cover nearly all workers in the civilian (non-Federal) economy. It excludes the self-employed and farm, household, and Federal Government employees. Because it is based on a probability sample, the ECI survey is subject to sampling errors that may cause the estimates to deviate from the results that would be obtained if the records of all establishments could be used in the calculations. Since probability samples are used, standard errors can be calculated and are presented in the appendix to this bulletin. Standard errors can be used to obtain a measure of the precision of the estimates.

<sup>&</sup>lt;sup>3</sup> See Public Law 101–509—November 5, 1990.

## Chapter II. Employment Cost Index: Trends in Compensation

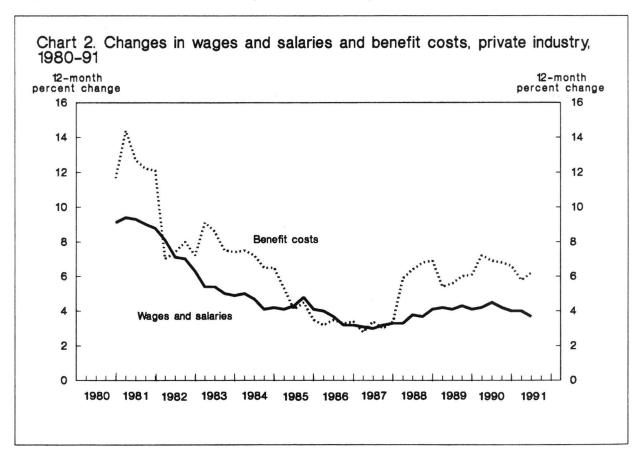

The Employment Cost Index for total compensation increased 64.0 percent from June 1981 to June 1991 for civilian (non-Federal) workers. From June 1981 to June 1982, compensation costs increased 7.4 percent. Over the ensuing 5-year period, June 1982-87, the annual rate of increase slowed steadily. For the 12 months ended in June 1987, the increase was 3.4 percent, the lowest in the June 1981-87 period. This pattern was reversed with the year ended June 1988, as the growth in compensation costs began to accelerate. By June 1990, the annual rate of increase had climbed to 5.4 percent. Over the most recent 12-month period, June 1990-91, costs rose 4.6 percent.

Complete historical data for all ECI series are presented in tables 1-12.<sup>4</sup> The tables include data for civilian, private

industry, and State and local government workers by occupational and industry group. The tables also include data by region, bargaining status, and area size for private industry workers. Table 13 provides separate data for selected aerospace manufacturing industries.

#### Wages and salaries compared with benefits

Wage and salary advances in private industry moved sharply downward from 1981 to 1985, while the rate of increase for benefit costs decelerated at a more moderate pace. (See chart 2.) Factors such as the 1981-82 recession, foreign competition, and smaller price increases contributed to the rapid slowdown in wage gains. The relatively faster growth rate for benefit costs was influenced by yearly boosts in employers' Social Security tax rate and a steady rise in health insurance costs.

<sup>&</sup>lt;sup>4</sup> Beginning with the release of ECI data for March 1990, ECI indexes were rebased to June 1989=100. Previously, the base was June 1981=100. Indexes on the old base (June 1981=100) will be available upon request from the Bureau of Labor Statistics until April 1992.

Beginning in 1985, however, the deceleration in the rate of increase for benefit costs quickened. Over the 1985-87 period, benefit costs rose at about the same rate as wages and salaries. The slowdown in benefit cost increases was brought about by a decline in the growth of health insurance costs, including cost containment measures, combined with a rapid fall in the growth of retirment plan costs and smaller increases in the Social Security tax rate. <sup>5</sup>

To relieve pressure on their health insurance expenditures, employers undertook several cost containment measures. These included funding insurance plans by the employer, 6 increasing the availability of health plan alternatives, such as health maintenance organizations (HMO's), and cost sharing by employees.

The steep decline in the growth of pension costs reflected a substantial rise in the value of pension fund portfolios over the 1981-87 period. Employer cost containment measures, such as increased numbers of defined contribution pension plans, also were important.

Beginning in 1988, the rate of increase in health insurance costs accelerated. Also, a Social Security tax increase of 5 percent (from 7.15 to 7.51 percent) was instituted in January 1988. Over the year ended in 1988, benefit costs rose 6.9 percent, compared with a rise of 4.1 percent for wages and salaries. Benefit costs have continued to rise more rapidly than wages and salaries; over the year ended in June 1991 benefit costs rose 6.2 percent, while wages rose

3.7 percent. The continued rise in benefit cost increases was due to a 1.9-percent increase in the Social Security tax rate in January 1990 (from 7.51 to 7.65 percent) and rising health insurance and workers' compensation costs.

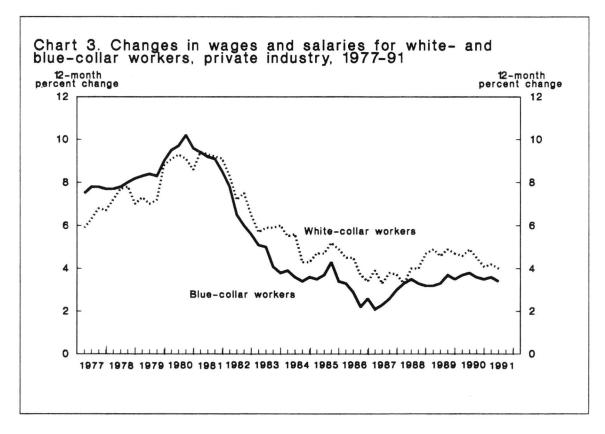

#### Pay changes by occupational group

White-collar wages grew more rapidly than blue-collar wages in private industry from 1981 to 1991. (See text table 1 and chart 3.) This pattern is in contrast to the one prevailing in the late 1970's, when blue-collar pay gains were higher. The slower rate of growth for blue-collar wages since 1981 partly reflects the influence of increased

Text table 1. Average annual percent changes in wages and salaries for selected occupational groups, private industry, selected periods, 1975-91

Occupational group	Sept. 1975- June 1981	June 1981- June 1991	Sept. 1975- June 1991
White-collar occupations Professional specialty	7.7	4.9	5.9
and technical	7.9	5.2	6.2
and managerial	7.0	4.9	5.7
Sales	-	4.2	-
including clerical	7.9	4.8	5.9

and repair	8.3	4.0	5.5
semblers, and inspectors Transportation and	8.8	3.9	5.7
material moving	8.5	3.1	5.1
cleaners, helpers, and laborers	8.7	3.6	5.4
Service occupations	8.2	4.3	5.7

<sup>-</sup> Data not available

<sup>&</sup>lt;sup>5</sup> See Bradley Braden, "Increases in Employer Costs for Employee Benefits Dampen Dramatically," *Monthly Labor Review*, July 1988, pp.

<sup>&</sup>lt;sup>6</sup> See Robert N. Frumkin, "Health Insurance Trends in Cost Control and Coverage," *Monthly L abor Review*, September 1986, pp. 3-8.

foreign competition on manufacturing industries and deregulation of transportation industries. Meanwhile, service occupations (for example, guards and nursing aides) consistently occupied the middle ground between the white-collar and blue-collar groups.

Over the 1975-81 period, the largest pay gains for any of the white-collar occupations were smaller than those for the blue-collar group registering the lowest gains. In contrast, since June 1981, white-collar workers have had the biggest pay gains. Over the entire 1975-91 period, white-collar pay rose faster than blue-collar pay (5.9 percent a year, on average, compared with 5.5 percent, respectively).

#### Pay changes by industry group

During the 1980's, pay rose faster in service-producing than in goods-producing industries in the private sector. (See chart 4.) Average pay gains for the broad industry groups, however, mask wide differences among industries within these groups, as text table 2 shows:

Text table 2. Average annual percent changes in wages and salaries by private industry group, June 1981-91

Industry group		
Private industry	4.4	
Goods- producing industries	4.0	
Construction	3.4	
Manufacturing	4.2	
Service-producing industries	4.7	
Transportation and public utilities	3.7	
Wholesale trade	5.0	
Retail trade	3.9	
Finance, insurance, and real estate	4.8	
Service industries	5.7	

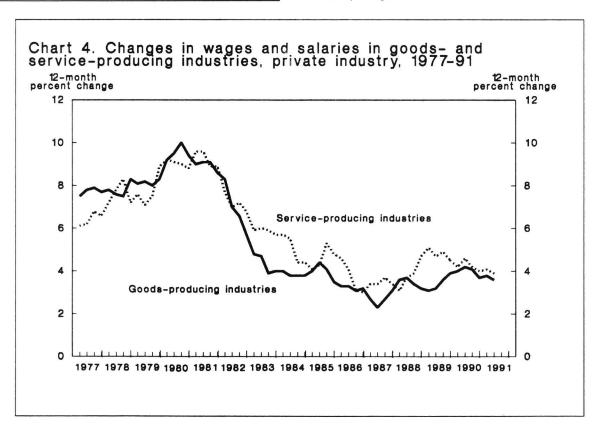

The biggest wage advances were made by workers in the services industries, including health care, education, business services, and personal services. Increases for workers in wholesale trade, though relatively high, were well behind those in services. In contrast, the increase in pay in the construction industry was only slightly more than half that in the services industries.

## Private industry compared with State and local government

Over the past 10 years, total compensation has risen more rapidly in State and local governments than in private industry. (See chart 5.) This can be explained in part by the different occupational distributions of the two sectors. For example, professional specialty and technical occupations, which experienced above-average pay gains in both the private and public sectors, are more prevalent in State and local governments. These workers accounted for over three-eights of State and local government compared with only one-quarter of private industry employment.

The pattern of more rapid compensation cost increases in State and local governments also is related to the different industry distributions of the two sectors. For example, services activities account for nearly two-thirds of State and local government employees compared with only one-quarter of private industry employees, and in both the public and private sectors pay gains in those industries were above average from June 1981 to June 1991.

<sup>&</sup>lt;sup>7</sup> See Richard E. Schumann, "State and Local Government Pay Increases Outpace Five-Year Rise in Private Industry," *Monthly Labor Review*, February 1987, pp. 18-20. Schumann based his analysis on wage and salary changes.

## Wage and salary changes for union and nonunion workers

Pay for nonunion workers rose faster than pay for union workers in private industry from December 1982 to June 1991. (See chart 6.) This is in contrast to the 1975-82 period, when pay for union workers rose faster than for nonunion workers. Over the entire period (September 1975 to June 1991), pay rose slightly faster for nonunion than for union workers, as shown below:

Average annual percent changes

	Sept. 1975-	Dec. 1982-	Sept. 1975-
	Dec. 1982	June 1991	June 1991
Union workers		3.1 4.3	5.6 5.7

The dampening of pay gains for union workers from December 1982 to 1991 reflects, among other factors, deregulation in the transportation industry and the growth of foreign competition in manufacturing industries. The increasing number of union contracts stipulating lumpsum payments in lieu of wage increases has also contributed to the smaller pay gains. (The ECI defines lump-sum

payments as a benefit.) For the year ended June 1991, both union and nonunion workers had pay gains of 3.7 percent.

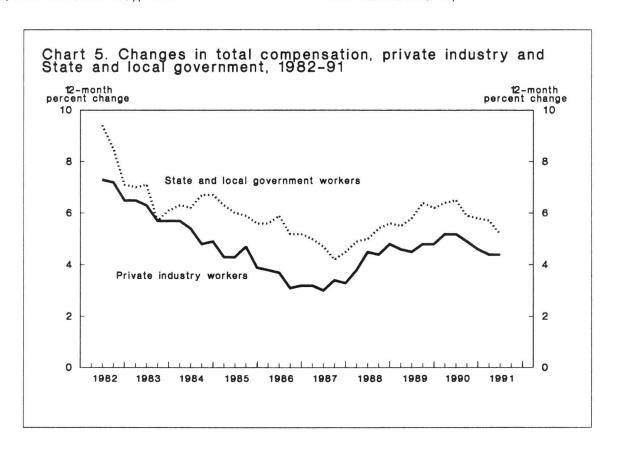

As discussed in chapter III, average wage rates are higher for union employees than for nonunion employees.

Another source of data on rates of wage change for union workers is effective wage adjustments from the Bureau's major bargaining settlements program. Although effective wage adjustments are not strictly comparable to the ECI, the two series show remarkably similar movements over the 1975-90 period. (See chart 7.)

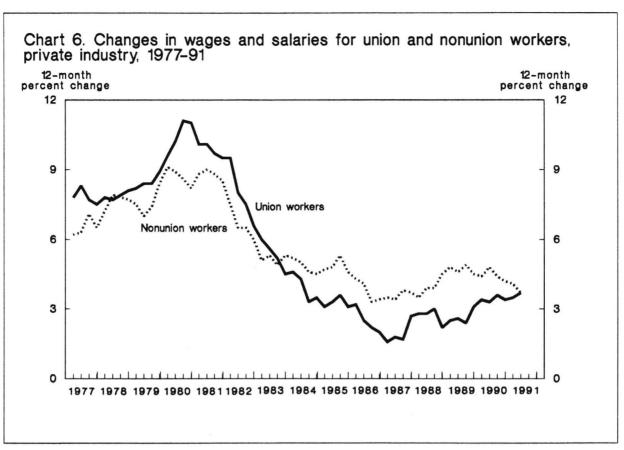

#### Pay changes by region

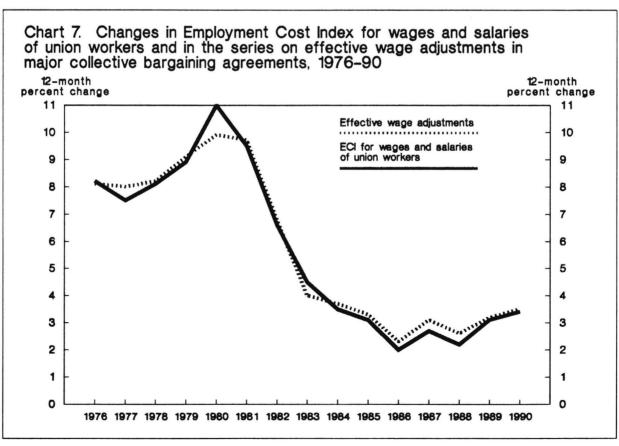

There have been substantial differences among regions in the growth rates for wages, but the pattern of these regional differences has changed over time. During the September 1975-June 1981 period, wage increases in the West were the largest, followed by the South, the Midwest, and the Northeast. (See text table 3.) During the June 1981-91 period, in contrast, wage gains in the Northeast were the largest, followed by the West, the South, and the Midwest. Variation among regions in rates of wage change reflects differences in labor market forces and in the occupational and industry mix of the regions.

<sup>&</sup>lt;sup>9</sup> Effective wage adjustments data are obtained from all union contracts covering 1,000 workers or more. They measure all adjustments in the reference year, regardless of the settlement date. For a more complete discussion, see *BLS Handbook of Methods*, Bulletin 2285 (Bureau of Labor Statistics, 1988), chapter 7.

<sup>&</sup>lt;sup>8</sup> For a discussion of union-nonunion differences in rates of wage and compensation change, see Kay E. Anderson, Philip M. Doyle, and Albert E. Schwenk, "Measuring Union-Nonunion Earnings Differences," *Monthly Labor Review*, June 1990, pp. 26-38.

Text table 3. Average annual percent changes in wages and salaries by region, private industry, selected periods, 1975-91

Region	Sept. 1975- June 1981	June 1981- June 1991	Sept. 1975- June 1991
United States	8.1	4.4	5.7
Northeast	7.3	5.2	6.0
South	8.2	4.3	5.7
Midwest	8.1	4.0	5.4
West	8.8	4.2	5.9

Text table 4. Percent changes in ECI for wages and salaries inprivate industry and in the Consumer Price Index for All Urban Consumers (CPI-U), 1976-90

Year ended in December-	ECI change	CPI-U change	Constant-dollar ECI change
1976	7.2	4.9	2.2
1977	6.9	6.7	0.2
1978	7.6	9.0	-1.2
1979	8.7	13.3	-4.1
1980	9.1	12.5	-3.0
1981	8.8	8.9	-0.1
1982	6.3	3.8	2.4
1983	4.9	3.8	1.0
1984	4.2	3.9	0.2
1985	4.1	3.8	0.4
1986	3.2	1.1	2.0
1987	3.3	4.4	-1.1
1988	4.1	4.4	-0.3
1989	4.1	4.6	-0.5
1990	4.0	6.1	-2.0

#### Current- and constant-dollar wage and salarychanges

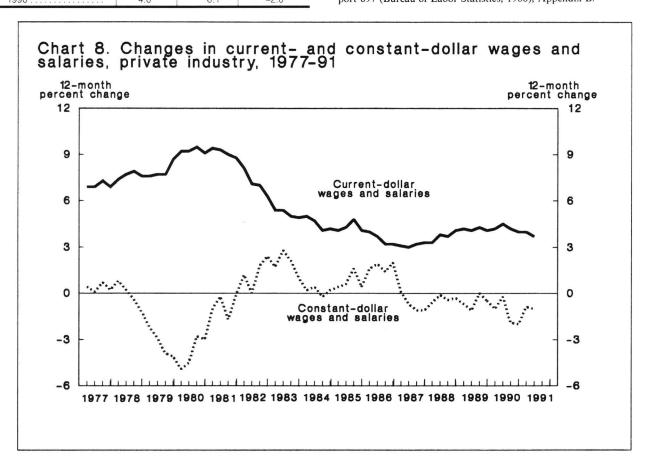

During 1978-80 there was a dramatic fall in wages and salaries adjusted for price increases (constant-dollar ECI).<sup>10</sup> (See chart 8.) Beginning in 1982, this pattern was reversed, with wages rising more rapidly than prices. In 1987-90, prices once again rose more rapidly than wage rates

From 1976 through 1987, the constant-dollar ECI was influenced more by prices than by wages. During the 1979-82 period, for example, when wages were rising most rapidly, the constant-dollar ECI declined; during 1982-86, the constant-dollar ECI rose despite much lower wage gains.<sup>11</sup>

<sup>10</sup> The constant-dollar ECI is derived by putting the Consumer Price Index for All Urban Consumers (CPI-U) on a June 1989 = 100 base, dividing the current-dollar ECI by the rebased CPI-U, and multiplying the result by 100. For a discussion of movements in the constant-dollar ECI, see Richard E. Schumann, "Workers' Purchasing Power Rises Despite Slowdown in Wage and Salary Gains," *Monthly Labor Review*, May 1984, pp. 10-14

pp. 10-14.

11 Beginning with the index for January 1983, the method of pricing owner-occupied housing in the official CPI-U was changed from the "asset price" approach to a rental equivalence approach. Prior to that time, an experimental CPI measure using the rental equivalence approach was available; that index did not rise as rapidly as the CPI-U over the 1976-82 period. The conclusions in this section are not, however, affected by which of the measures of price change is used. For a discussion of methods of pricing housing, see *Problems in Measuring Consumer Prices*, Report 697 (Bureau of Labor Statistics, 1980), Appendix B.

## Chapter III. Employer Costs For Employee Compensation

A comprehensive analysis of employee compensation requires data not only on changes from period to period, but also on dollar costs at a given time. The compensation cost levels, published as costs per hour worked, are based on wage and benefit data collected for the ECI.

To obtain the most current cost information, the cost levels are averaged using current employment weights. 12 Because the employment weights for the ECI remain fixed while weights for cost levels change each year as employment shifts occur, year-to-year changes in cost level estimates usually differ from changes in the ECI. Employment shifts among industries and occupations with different wage and benefit levels do not affect the ECI, but they do affect cost levels. An explanation of how the costs are calculated is presented in the appendix.

Compensation cost level estimates have been prepared for March 1991 for all workers in private industry, for industry and occupational groups, and by employer size, region, and union status. These are presented in tables 14-23. Summary data for 1990 are provided in tables 24-29, for 1989 in tables 30-33, data for 1988 in tables 34-37, and data for 1987 in tables 38-40. Compensation cost level estimates for workers in State and local governments are available only for March 1991 and are presented in tables 41-42.

#### **Private industry**

Components of compensation costs. In March 1991, employer costs for employee compensation in private industry averaged \$15.40 per hour worked. Benefits made up 27.7 percent of those costs, the highest proportion since March 1987 when it was 26.8 percent. (See chart 9.) Text table 5 compares the distribution of costs among major components in 1987-91.

Legally required benefits constitute the largest cost to employers among the benefit categories, averaging \$1.40 per hour worked in March 1991. They amounted to 9.1 percent of total compensation costs, compared with 9.0 percent in the preceding March and 8.4 percent in March 1987. The large increase in the proportion from 1987 to 1988 was due to a 5-percent rise in the Social Security tax rate in 1988 (from 7.15 percent to 7.51 percent); the tax rate did not increase in 1989 or 1991, whereas it rose 1.9 percent in 1990 (from 7.51 percent to 7.65 percent).

Social Security, the largest legally required benefit, cost employers, on average, 92 cents per hour worked—6.0

Text table 5. Percent distribution of components of compensation costs, private industry, March 1987-91

	March				
Compensation component	1987	1988	1989	1990	1991
Total compensation	100.0	100.0	100.0	100.0	100.0
Wages and salaries	73.2	72.7	72.7	72.4	72.3
Total benefit costs	26.8	27.3	27.3	27.6	27.7
Paid leave	6.9	7.0	7.0	6.9	6.8
Supplemental pay		2.4	2.4	2.5	2.3
Insurance	5.4	5.6	6.0	6.1	6.5
Retirement and savings	3.6	3.3	2.9	3.0	2.9
Legally required benefits		8.8	8.9	9.0	9.1
Other benefits	0.1	0.2	0.1	(*)	(*)

<sup>\*</sup> Less than 0.05 percent.

percent of all compensation costs in March 1991.

Insurance has grown the most over the past several years. Life, health, and sickness and accident insurance accounted for 6.5 percent of compensation in March 1991, compared with 6.1 percent in the preceding March and 5.4 in March 1987. Health care costs are by far the most important of the insurance costs, and these costs rose most rapidly over the past 5 years.<sup>13</sup>

The retirement and savings category was the only one to decline significantly in importance from 1987, decreasing from 3.6 percent of total compensation costs to 2.9 percent in 1991.

Cost levels by industry group. Compensation costs per hour worked in March 1991 averaged more for workers in goods-producing industries (\$18.48) than for those in service-producing industries (\$14.31). (See text table 6.) Costs in service-producing industries showed wide variation, ranging from \$8.81 in retail trade to \$22.09 in transportation and public utilities. (See chart 10.) Among the goods-producing industries for which data are available, compensation costs ranged from \$16.36 in nondurables manufacturing to \$19.59 in durables manufacturing. There also was a wide variation in the proportion of compensation costs accounted for by benefits in both the goods- and service-producing industries.

In general, industries with relatively high compensation costs had higher proportions of benefits to total costs. For example, transportation and public utilities, which had the highest compensation costs, also had one of the highest proportions of benefits. In contrast, retail trade had the lowest compensation costs and the lowest proportion of benefits.

<sup>&</sup>lt;sup>12</sup> See Felicia Nathan, "Analyzing Employer Costs for Wages, Salaries, and Benefits," *Monthly Labor Review*, October 1987, pp. 3-11.

<sup>&</sup>lt;sup>13</sup> Data for components of insurance are not shown separately because many survey respondents report data for all insurance items combined.

Text table 6. Total compensation costs per hour worked and benefits as a proportion of those costs, by private industry group March 1991

Industry group	Total compen- sation	Benefit cost as a per- cent of compen- sation
Private industry Goods-producing industries Construction Manufacturing Durables Nondurables Service-producing industries Transportation and public utilities Wholesale trade Retail trade Finance, insurance, and real estate Service industries	\$15.40 18.48 18.32 18.22 19.59 16.36 14.31 22.09 17.10 8.81 19.04 14.70	27.7 31.3 28.6 31.9 32.7 30.6 26.0 31.5 27.6 22.5 26.3 25.3

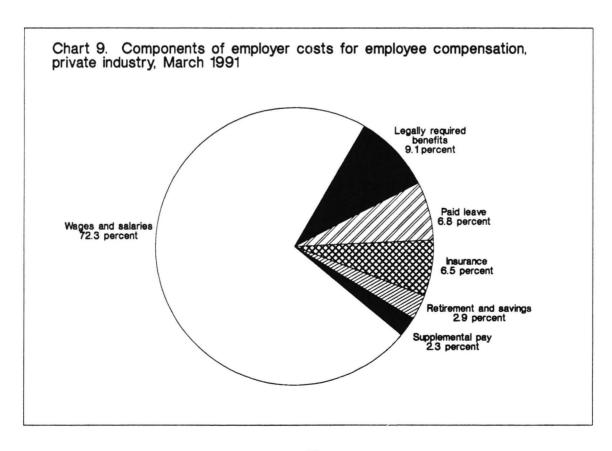

Cost levels by occupational group. Compensation costs per hour worked were higher for white-collar workers (\$18.15) than for blue-collar workers (\$15.15) and service workers (\$7.82). (See text table 7 and chart 11.) Costs for white-collar workers varied widely, ranging from \$12.90 for sales workers to \$28.15 for executive, administrative, and managerial occupations. Costs for blue-collar workers ranged from \$10.94 for handlers, cleaners, helpers, and laborers to \$19.24 for precision production, craft, and repair occupations. No breakdown in compensation costs

for various service occupations (e.g., janitors, waiters and waitresses, and nursing aides) is available.

Occupations did not show the consistent positive relationships between compensation costs and the proportion of benefits to total costs that were found for industries. The occupational groups with the highest compensation costs—

Text table 7. Total compensation costs per hour worked and benefits as a proportion of those costs, by occupational group, private industry, March 1991

Occupational group	Total compen- sation	Benefit cost as a per- cent of compensa- tion
All private industry	\$15.15	27.7
White-collar occupations	18.15	26.2
Professional specialty and technical	23.79	26.2
Executive, administrative, and		
managerial	28.15	25.9
Sales	12.90	22.5
Administrative support, including		
clerical	13.17	28.6
Blue-collar occupations	15.15	31.6
Precision production, craft,		
and repair	19.24	31.1
Machine operators, assemblers,		
and inspectors	14.24	33.6
Transportation and material moving	15.56	32.0
Handlers, equipment cleaners,		
helpers, and laborers	10.94	29.7
Service occupations	7.82	23.7

professional specialty and technical workers and executive, administrative, and managerial—were below-average in benefit costs as a percent of total compensation costs.

In all private industry, benefits made up a larger proportion of compensation costs for blue-collar workers as a whole (31.6 percent) than for white-collar workers (26.2 percent) and service workers (23.7 percent). This relationship held when occupational groups within the blue-collar and white-collar categories were compared.

Blue- and white-collar workers also differed in the relative importance of individual benefits, as the following table shows:

Text table 8. Percent distribution of components of benefit cost, by occupational category, private industry, March 1991

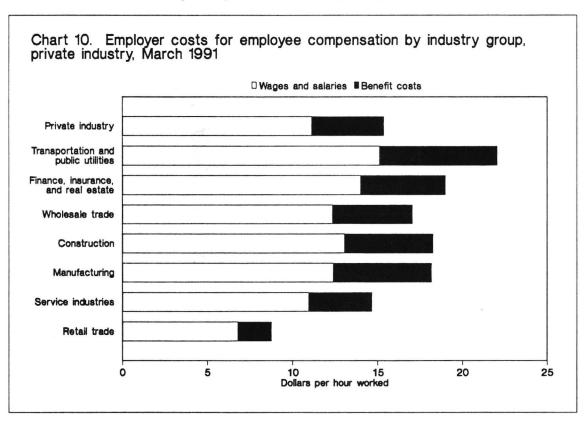

Benefit component	All workers	White- collar	Blue- collar	Service workers
All benefits	100.0	100.0	100.0	100.0
Paid leave	24.6	29.1	19.0	18.9
Supplemental pay	8.4	6.7	11.3	5.9
Premium pay	4.0	1.9	7.6	2.7
Shift pay	1.2	1.1	1.3	.6
Nonproduction bonuses	3.0	3.8	2.3	1.6
Insurance	23.7	23.6	24.1	21.1
Retirement and savings	10.3	10.9	10.3	6.5
Legally required benefits	32.8	29.3	35.1	47.6

Paid leave and bonuses were relatively more important for white-collar workers, whereas premium pay and legally required benefits were more important for bluecollar workers and service workers, respectively. Cost levels by occupation within industries. Group averages are sometimes misleading. For example, although overall pay may be substantially higher in one industry than another, the pay for a given occupation may not differ much between the two industries. Text table 9 shows that differences in compensation costs are narrower in most cases when comparisons are made for individual occupational groups than when the overall industry costs are compared. A major exception to that relationship is service workers, whose compensation costs are substantially higher, on average, in goods- than in service-producing industries.

Text table 9. Total compensation costs per hour worked by occupational groups within industries, private industry, March 1991

Occupational group	Total private	Goods- producing	Service- producing
All occupations	\$15.40	\$18.48	\$14.31

	\$10.37	\$9.51	\$11.17	\$9.68	\$12.96
	31.6	28.5	33.8	31.2	36.0

Cost levels by establishment size. Many studies have demonstrated that compensation costs rise with increased establishment size, and have offered a number of competing explanations for the relationship. <sup>14</sup> The ECI estimates provide information not previously available on the relationship between size and compensation cost that will aid in the discussions. <sup>15</sup>

In March 1991, employer costs for employee compensation (wages, salaries, and benefits) were higher in large than in small establishments in private industry and in the major industry and occupational groups. For example, such costs were about 50 percent higher in establishments with 500 employees or more than in establishments with fewer than 100 employees (\$20.60 per hour worked, compared with \$13.38). (See text table 10.) This relationship held for goods-producing (\$23.41 compared with \$15.66) and service-producing industries (\$19.00 and \$12.85), as well as for white-collar (\$22.79 and \$15.93) and blue-collar occupations (\$20.25 and \$13.30).

Text table 10 also shows that, compared with the smallest size category, the size differential is much greater for establishments of 500 employees or more than for establishments of 100-499 employees. Compensation costs of private industry workers, for example, are about

one-eighth higher in establishments in the 100-499 employee range compared with the smallest establishments (\$14.31 compared with \$13.38), while establishments of 500 employees or more have a 50-percent advantage (\$20.60 compared with \$13.38).

Wages and salaries and employee benefits—the two major components of compensation—also were higher in large than in small establishments. However, wages and salaries averaged two-fifths more in establishments of 500 workers or more than in establishments of under 100 employees (\$14.28 compared with \$10.00), while benefit costs were nearly double in the larger establishments (\$6.32 compared with \$3.38). Consequently, the proportion of total compensation made up of benefit costs was greater in large establishments. Benefit costs, for example, accounted for 30.7 percent of total compensation costs for workers in establishments with 500 employees or more, compared with 25.3 percent of compensation for workers in establishments with fewer than 100 employees.

A variety of factors, in addition to employment size, contribute to variations in compensation cost levels, including differences in the mix of industries, occupations, union coverage, and location among establishment employment size groups. These other factors may be related to establishment size. Compared with small establishments, for example, large establishments tend to be located in metropolitan areas rather than nonmetropolitan areas, and are more likely to be covered by union contracts.

Also, establishment size may differ from firm size. An establishment, which may be part of a larger company, is a single physical location where business is conducted. About three-quarters of employees in small establishments are employed in small independent private busi-

<sup>&</sup>lt;sup>14</sup> For a review of many of the studies, and additional evidence, see Charles Brown and James Medoff, "The employer size-wage effect," *Journal of Political Economy*, October 1989, pp. 1027–1059. Also see: Walter Y. Oi, "The fixed employment costs of specialized labor," in Jack Triplett, ed., *Measurement of Labor Cost* (NBER, 1982) and Alice Nakamura and Masao Nakamura, "New measures of nonwage compensation components: Are they needed?," *Survey of Current Business*, March 1989, pp. 58-61.

<sup>&</sup>lt;sup>15</sup> See Wayne Shelly, "Compensation Cost Levels by Establishment Size," Compensation and Working Conditions, August 1991, pp. 1-8.

nesses<sup>16</sup>; the remainder are in establishments that are part of larger firms.

Cost levels by union status. Compensation costs averaged more for union workers than nonunion workers in private industry, in both manufacturing and nonmanufacturing industries, and also when the comparison was limited to blue-collar workers in manufacturing, as text table 11 shows.

Text table 11. Total compensation costs per hour worked, and benefits as a proportion of those costs, by union status and industry and occupational group, private industry, March 1991

	Unio	n workers	Nonuni	on workers
Series	Total compen- sation	Benefit cost as a percent of compen- sation	Total compen- sation	Benefit cost as a percent of compen- sation
Private industry Nonmanufacturing	\$19.76	34.1	\$14.56	26.0
	19.51	32.3	13.92	25.0
Manufacturing All workers Blue-collar workers	20.26	37.5	17.47	29.6
	20.29	37.8	13.24	30.8

Benefits consistently made up a larger part of total compensation costs among union establishments than among nonunion establishments.

Union and nonunion cost level differences reflect a variety of influences, including variation in the distribution of union and nonunion workers among occupations and industries.

Cost levels by geographic region. Compensation costs varied among regions ranging from \$17.56 per hour worked in the Northeast to \$13.68 in the South in March 1991. The proportion of compensation costs made up of benefits was also lowest in the South but was highest in the Midwest rather than the Northeast, as shown below:

Region				P	ercent
Midwest					. 28.9
Northeast					
West					. 27.2
South					. 26.7

#### State and local governments

Employee compensation costs for State and local government workers averaged \$22.31 per hour worked in March 1991. Straight-time wages and salaries averaged \$15.52—69.6 percent of compensation costs—while benefits averaged \$6.79—30.4 percent of compensation.

Compensation costs were higher for State and local government workers than for private industry workers (\$22.31 compared with \$15.40). The difference in costs

between the two sectors can partly be explained by differences in the industrial activities and the resulting occupational mixes of their workforces. Generally, the industrial activities that require a mix of occupational groups with the higher hourly compensation (e.g., professionals) accounted for a larger proportion of the employment in State and local governments than in private industry.

In State and local governments, nearly a third of total compensation is in the form of benefits. The largest benefit category is retirement and savings (\$1.85 per hour worked, 8.3 percent of compensation costs and 27 percent of all benefit costs). The next three largest benefit categories are paid leave (\$1.75), insurance (\$1.63), and legally required benefits (\$1.34).

Occupational and industry groups. Compensation costs, and the proportion benefits made up of total compensation, differed widely by occupational group and industry, as shown in text table 12.

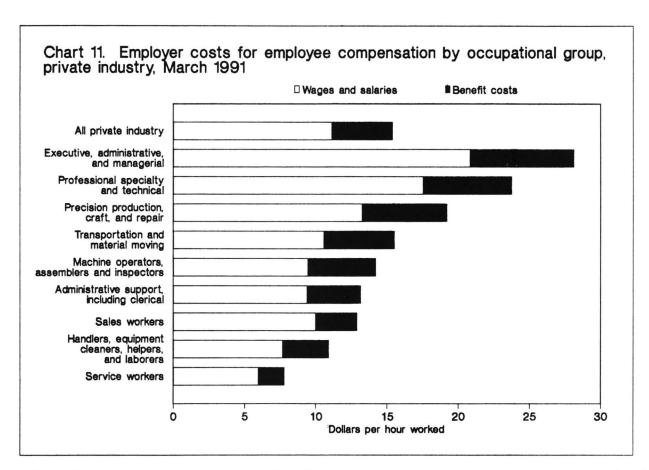

Total compensation costs were higher for white-collar occupations (\$25.07) than for blue-collar (\$17.66) or service occupations (\$16.02). Wages and salaries accounted for the majority of the differences. Wages and salaries for white-collar occupations (\$17.86) were 58 percent higher than those for blue-collar occupations (\$11.39), and 74 percent higher than those for service occupations (\$10.30). Benefit cost differences were smaller. Total benefit costs were \$7.21 for white-collar, \$6.27 for blue-collar, and \$5.72 for service occupations.

Text table 12. Total compensation costs per hour worked, and benefits as a percent of compensation, by occupational and industry category, State and local governments, March 1991

Occupational group		otal ensation		es and aries		otal efits
or Industry	Cost	Percent	Cost	Percent	Cost	Percent
All workers	\$22.31	100.0	\$15.52	69.6	\$6.79	30.4
Occupational group: White-collar Professional	25.07	100.0	17.86	71.2	7.21	28.8
specialty and technical	29.74	100.0	21.72	73.0	8.02	27.0
clerical	14.37	100.0	9.54	66.4	4.82	33.6
Blue-collar	17.66 6.02	(7.0-)-0.0-0.	11.39 10.30	64.5 64.3	6.27 5.72	35.5 35.7
Services  Educational services Health services	23.69 25.40 17.87	100.0	16.96 18.45 12.03	72.7	6.73 6.94 5.84	28.4 27.3 32.7
Public administration	20.11	100.0	13.32	5 3 10 50	6.79	33.8

There was also variation in compensation costs among industries. Among the major industry categories, compensation was highest in services at \$23.69. This reflected the concentration of educational and health services, two industries with relatively high proportions of professional employees.

<sup>&</sup>lt;sup>16</sup> See "BLS Reports on its First Survey of Employee Benefits in Small Private Establishments," USDL 91-260, June 10, 1991. That report, based on the Employee Benefit Survey (EBS), found that most benefits were less common in small independent private businesses than in other small establishments.

Text table 13. Percent distribution of components of benefit costs, by occupational category, State and local governments, March 1991

Benefit category	All workers	White- colla	Blue- collar	Service workers
Total benefits.	100.0	100.0	100.0	100.0
Paid leave	25.8	25.7	25.7	26.0
Supplemental pay	3.1	1.9	5.6	6.5
Insurance	24.0	24.0	24.9	23.4
Retirement and savings	27.2	28.3	21.5	26.0
Legally required	19.7	19.8	22.0	8.0
Other benefits	0.3	0.3	*	0.3

<sup>\* = 0.05</sup> μercent or less

The relative importance of the benefit categories also differed by occupational group, as shown in text table 13.

Blue-collar workers differed noticeably from white-collar or service workers: Retirement and savings were relatively less important, while legally required benefits were more important. Unlike private industry workers, State and local government service workers were quite similar to white-collar workers, reflecting the predominance of police and firefighters among service workers in State and local governments.

<sup>&</sup>lt;sup>1</sup> Includes wages, salaries, and employer costs for employee benefits.

Includes mining, construction, and manufacturing.

<sup>&</sup>lt;sup>3</sup> Includes transportation, public utilities, trade, finance, insurance, real estate, and services.

<sup>&</sup>lt;sup>4</sup> The Northeast region includes the following states: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

<sup>&</sup>lt;sup>5</sup> The South region includes the following states: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

<sup>&</sup>lt;sup>6</sup> The Midwest region includes the following states: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

<sup>&</sup>lt;sup>7</sup> The West region includes the following states: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

Other areas refers to all other locations which are not defined as a metropolitan statistical area by the U.S. Office of Management and Budget.

<sup>-</sup> Data not available.

NOTE: The indexes for the series in tables 7 and 11 are not strictly fixed-weighted. See appendix.

Excludes farm and household workers.
 This series has the same industry and occupational coverage as the Hourly Earnings Index, which was discontinued in January 1989.

Includes mining, construction, and manufacturing.
 Includes transportation, public utilities, trade, finance, insurance, real estate, and services.

Data not available.

Includes mining, construction, and manufacturing.

Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

<sup>6</sup> The West region includes the

The West region includes the following states: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

Other areas refers to all other locations which are not defined as a metropolitan statistical area by the U.S. Office of Management and

Data not available.

NOTE: The indexes for the series in tables 7 and 11 are not strictly fixed-weighted. See appendix.

<sup>&</sup>lt;sup>2</sup> Includes transportation, public utilities, trade, finance, insurance,

real estate, and services.

<sup>3</sup> The Northeast region includes the following states: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York,

Pennsylvania, Rhode Island, and Vermont.

<sup>4</sup> The South region includes the following states: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

<sup>5</sup> The Midwest region includes the following states: Illinois, Indiana,

# Appendix. Description of the Survey, Estimation Methods, and Measures of Data Reliability

Both the Employment Cost Index (ECI) and Employer Costs for Employee Compensation (cost levels) are based on compensation cost data obtained from a single sample survey of establishments. The survey covers all occupations within the private economy (excluding farms, households, and the self-employed) and the public sector (excluding the Federal Government). In the March 1991 quarter, the ECI sample included about 23,000 occupations within 4,400 firms in the private sector and abut 8,700 occupations within 1,300 establishments in State and local governments.

#### Sample design

Establishment sample. The sample of establishments is drawn on a probability basis by industry from State unemployment insurance and supplementary files. The establishments are classified in industry categories based on the 1987 Standard Industrial Classification (SIC), as defined by the U.S. Office of Management and Budget. In most cases, the establishments are categorized at the 2-digit SIC level, such as business services or electrical machinery manufacturing. The establishments are systematically selected with probability of selection

proportionate to their relative employment size within the industry. Wage and benefit information is collected from each establishment on a quarterly basis.

After about 4 years of data collection, the industry sample is replaced in order to reduce the burden on respondents and to keep the sample frame as current as possible. A set of industries is replaced each calendar quarter so that the total sample replacement is gradual.

Occupational sample. After the industry sample of establishments is drawn, occupations at the most narrowly defined level are sampled in each establishment. As is the case with establishment sampling, the occupations within establishments are sampled on a probability-proportionate-to-employment basis.

Occupational sampling is done by a BLS representative during a personal visit in which initial wage and benefit information is collected. A specific number of narrowly defined occuptions is sought (e.g., eight) with the number varying by establishment employment size. The probability of an occupation being selected is proportionate to its employment size within the establishment. Each narrowly defined occu-

#### **Definitions of Compensation Components**

Wages and salaries—the straight-time hourly wage rate or, for workers not paid on an hourly basis, straight-time earnings divided by corresponding hours. Straight-time wage and salary rates are based on total earnings before payroll deductions, excluding premium pay for overtime and for work on weekends and holidays, shift differentials, and nonproduction bonuses such as lump-sum payments provided in lieu of wage increases. Production bonuses, incentive earnings, commission payments and cost-of-living adjustments are included in straight-time wage and salary rates.

Benefits covered by the survey are:

Paid leave—vacations, holidays, sick leave, and other paid leave.

Supplemental pay—premium pay for overtime and work on weekends and holidays, shift differentials, and non-

production bonuses such as lump-sum payments provided in lieu of wage increases.

Insurance benefits—health, life, and sickness and accident insurance.

Retirement and savings benefits—pension and other retirement plans, and savings and thrift plans.

Legally required benefits—Social Security, railroad retirement and supplemental retirement, railroad unemployment insurance, Federal and State unemployment insurance, workers' compensation, and other benefits required by law such as State disability insurance.

Other benefits—severance pay and supplemental unemployment insurance.

pation selected is classified into one of the following nine major occupational groups: Professional specialty and technical occupations; executive, administrative, and managerial occupations; sales occupations; administrative support including clerical; precision production, craft, and repair; machine operators, assemblers, and inspectors; transportation and material moving occupations; handlers, equipment cleaners, helpers, and laborers; and service occupations.

The ECI survey occupational classification system was originally based on the classification system used in the 1970 Census of Population. Beginning June 1986, the occupations were redefined to the classification system used in the 1980 Census, which is based on the Standard Occupational Classification (SOC) system.<sup>1</sup>

#### Collection methods

Data collection is initiated by a BLS field representative during a visit to the sample reporting unit. The wage and benefit information is summarized in a report that is sent to the respondent each quarter to review and report changes. The changes are usually reported by mail or telephone. Data are collected for the pay period including the 12th day of the survey months—March, June, September, and December.

Collecting wage and salary data. During the initial visit and in each subsequent quarter an establishment is in the ECI sample, BLS field representatives collect the average hourly straight-time wage rate of each of the sampled occupations.

Collecting benefit cost data. Benefit costs are measured as a cost at a particular point in time rather than in the form of a past expenditure.<sup>2</sup> The approach used in the ECI is referred to as the current-cost approach. That is, annual costs are calculated based on the current price of benefits and current plan provisions. The annual cost is then divided by the annual hours worked to yield the cost per hour worked for each benefit.

The information needed to calculate benefit costs depends on the specific benefit plan. However, the following examples illustrate, for some basic plans, the information that is collected and how the costs are calculated.

Example 1. Each employee in the selected occupation receives 10 paid holidays, with 8 hours of straight-time pay for each holiday. The hourly wage is \$10. All employees work 2,000 hours per year.

The annualized current cost in this example is the number of paid holidays provided under current plan provisions (10)

times the rate at which each holiday is paid (8 hours of straight-time pay). This annualized current cost is then divided by the annual hours worked (2,000) to yield the current cost per hour worked.

Thus, in this example the current cost is:

$$10 \text{ X } (8 \text{ X } \$10) = \$800;$$
  
 $\$800 \div 2,000 = \$.40 \text{ per hour worked.}$ 

Example 2. A health insurance plan is provided all employees in the selected occupation. The monthly premium, paid entirely by the company, is \$120 per employee. Each employee works 2,000 hours per year.

The annualized current cost in this example is the monthly premium (\$120) times 12 months. This annualized current cost is then divided by the number of annual hours worked (2,000) to yield the current cost per hour worked.

Thus, in this example the current cost is:

$$120 \times 12 = 1,440;$$
  
 $1,440 \div 2,000 = 1.72$  per hour worked.

#### Index computation

To measure compensation costs free from the influence of employment shifts among occupations and industries, the ECI is calculated with fixed employment weights. Since June 1986, employment counts from the 1980 Census of Population have been used; prior to that time, employment counts were taken from the 1970 Census. Sample weights (the weight of the establishment occupation in the sample) are also used. The sample weights reflect both employment in each establishment occupation and the probability of selection of the occupation within the establishment.

The ECI is a standard Laspeyres fixed-employment-weighted index, as modified by the special statistical conditions that apply to the ECI.<sup>3</sup> The following discussion focuses on the ECI measure of wage change in private industry, but indexes for State and local government workers and civilian (non-Federal) workers, and of compensation and benefit cost changes, are calculated in essentially the same fashion.

A wage index for the ECI is a weighted average of the cumulative wage changes within each cell (generally a major occupational group in a 2-digit SIC industry), with base-period wage bills as the fixed weights for each cell. (The base-period wage bill is the fixed employment weight from the Census times the sample-weighted average wage in the base period of June 1989.) The formula is:

$$I_{t} = \frac{SUM(W_{o,i}M_{t,i})}{SUM(W_{o,i})} * 100$$

where:

$$M_{t,i} = M_{t-1,i} * R_{t,i}$$
, and

It is the symbol for the index

#### An Illustration of the Effects of Fixed Weights

The following example illustrates the effects of using fixed rather than current weights. Consider the case of an employer with two types of workers, electricians and janitors. In March 1988, the firm employs 10 electricians at \$10 per hour and 10 janitors at \$5 per hour. Both the average wage and the wage rate are \$7.50.

In March 1989, both groups are given a 10-percent wage increase, but now only 5 janitors are employed. The average wage (without fixed weights) increased to \$9.17.

	NUMBER X WAGE RATE = AGGREGATE
Electricians	$10 \times 11.00 = 110.00$
Janitors	5 X  5.50 = 27.50
	15 \$137.50

Average wage:  $$137.50 \div 15 = $9.17$ 

Average wage change:  $\$9.17 \div \$7.50 = 1.22$ , or 22-percent increase.

The increase in the average wage reflects the 10-percent increase in the wage rates and the relative decrease in the number of workers in the low-wage occupation of janitor.

But when fixed employment weights are used (that is, the number of janitors remains fixed at 10), the average change in wage *rates* is calculated, not the change in the average wage.

	NUMBER X WAGE RATE = AGGREGATE
Electricians	$10 \times 11.00 = 110.00$
Janitors	10 X 5.50 = 55.00
	20 \$165.00

Average wage rate:  $$165.00 \div 20 = $8.25$ 

Wage-rate change:  $\$8.25 \div \$7.50 = 1.10$ , or a 10-percent increase.

In this case, the increase is 10 percent, the size of the wage-rate increase which was granted to both occupations.

The other variables are defined as follows:

W<sub>0,i</sub> is the estimated base-period (June 1989) wage bill for the ith cell. The wage bill is the average wage of workers in the cell times the number of workers represented by the cell (the Census weight).

 $M_{t,i}$  is the cumulative average wage change in the ith cell from time 0 (base period) to time t (current quarter).

 $R_{t,i}$  is the ratio of the current-quarter weighted average wage in the cell to the prior-quarter weighted average wage in the cell, both calculated using matched establishment/occupation wage quotations. The weights applied are the sample weights.

The index computation each quarter involves six steps:

1. Establishment occupation sample weights are applied to the average occupational wage in every establishment that has both current- and prior- quarter wage information, to calculate a weighted average wage for each cell (i.e., occupation within industry) for the current and prior survey periods.

- 2. The ratio of the current-quarter to the prior-quarter weighted average wage is then calculated for each cell.
- 3. This ratio for each cell is multiplied by the cumulative percent change in wages in that cell over the period from June 1989 (the base) to the prior quarter. The product is the current-quarter cumulative percentage wage change in the cell since the base period.
- 4. This measure of cumulative percentage wage change is multiplied by the base-period wage bill (the average wage in June 1989 multiplied by the fixed Census weight) to generate an estimate of the current-quarter wage bill for the cell.
- 5. Both the current-quarter and the base-period wage bills are then summed over all cells within the scope of the index. For example, for the manufacturing index, the wage bills would be summed across all industries and occupations in manufacturing.
- 6. The summed current-quarter wage bill is divided by the summed base-period wage bill. The result, when multiplied by 100, is the current-quarter index. That index is divided by the prior-quarter index to provide a measure of quarter-to-quarter change, the link relative.

The example at the bottom of the page illustrates the procedures for a hypothetical industry.

The computations for the occupational and industry groups follow the same procedures as those for the overall indexes except for summation. The wage bills for the occupational groups are summed across occupational groups and regions for each industry division.

Computational procedures for the regional, union/nonunion, and metropolitan/nonmetropolitan measures of change differ from those of the national indexes because the current sample is not large enough to hold constant the wage bills at that level of detail. The employment weights are, therefore, reallocated within these series each quarter based on the current ECI sample. The indexes for these ser-

ies, consequently, are not strictly comparable to those for the aggregate, industry, and occupation series.

Calculating percent changes. Index numbers express the percent change from June 1989 to the quarter the index number represents. For example, an index of 114.0 indicates costs have increased 14.0 percent since June 1989. The index numbers can be used to calculate percent changes between any two time periods through a series of steps illustrated by the following example:

ECI current index	120.0
Earlier index	114.0
Difference	6.0
Divided by earlier index	114.0
Equals	0.053
Results multiplied by 100	0.053x100
Equals percent change	5.3

Reference tables 1-10 provide indexes as well as 3-month and 12-month percent changes for all ECI series. The percent changes are included as a convenience to users. Summing the percent changes does not yield a percent change between two periods spanning several quarters or years. The percent changes must be compounded. For example, the compounded 9-month percent change from the three consecutive 3-month changes of 1.1 percent, 1.2 percent, and 1.9 percent is calculated as follows:

#### $1.011 \times 1.012 \times 1.019 = 1.043 \text{ or } 4.3 \text{ percent.}$

Calculating the percent difference between two index numbers (as illustrated in the first example) yields the same result as compounding percent changes (except for rounding, which may cause small differences).

In March 1990, the ECI began to be published with a base June 1989=100, rather than June 1981=100. The rebasing was done so that indexes would be available for all published ECI series.<sup>4</sup>

## Computation of employer costs for employee compensation

Prior to computing the average cost level estimates at the aggregate levels, wages and salaries are converted to a straight-time hourly rate and benefit costs are converted to

See Albert E. Schwenk, "ECI Rebased to June 1989," Monthly Labor Review, April 1990, pp. 38-39.

Occupation	Fixed 1980 employ- ment weight (a)	Base- period average wage (b)	Base-period wage bill (a x b) (c)	Prior- quarter cumulative change (d)	Prior- quarter weighted average earnings (e)	Current- quarter weighted average earnings (f)	Relative (f / e) (g)	Current- quarter cumulative change (d x g) (h)	Prior- quarter wage bill (c x d) (i)	Current- quarter wage bill (e x h) (j)	Percent change in wage bill (j / i) (k)
Electricians	2,967.858	\$4.25	\$12,613.40	1.23567	\$5.25	\$5.50	1.04762	1.29451	\$15,586.00	\$16,328.17	4.8
Janitors	1,343.517	\$6.19	8,316.37	1.15435	7.15	7.20	1.00699	1.16242	9,600.00	9,667.11	0.7
Total								,	25,186.00	25,995.28	3.2

the cost per hour worked (see section on collecting benefit cost data).

To compute average current cost level estimates at higher levels of industry and occupation aggregation, current industry and occupational employment weights are required. To compute the March 1991 cost levels, for example, March 1991 industry employment figures from the BLS Current Employment Statistics (CES) program were used in conjunction with the sample weights of the establishment occupations in the March 1991 ECI sample. (The employment figures from the CES sample survey were adjusted using data from a complete count of establishments: The first quarter 1990 Employment, Wages, and Contributions Report, known as the ES-202 Report.) The sample weights are ECI estimates of the occupational employment, reflecting both employment in each establishment occupation surveyed and the probability of selection of that establishment occupation.

The procedure for estimating the cost levels at the aggregate levels involves two steps. The first step applies the ECI sample weights to compute a cost for each benefit in each major occupational group within each 2-digit industry (for example, paid vacations for sales workers in transportation equipment manufacturing). The second step apportions the industry weights from the CES program over the major occupational groups, using the employment of the groups as estimated from the ECI sample. The second step is applied as the costs at the detailed levels (e.g., major occupational group/2-digit industry) are aggregated to calculate the published costs.

The formula for the first step is:

$$\overline{Y}_{b,k,o} = \frac{\text{Sum}(Y_{b,k,o} * SW_j)}{\text{Sum } (SW_j)}$$

where:

 $\overline{Y}_{b,k,0}$  is the cost level estimate for wages or a specific benefit b in industry group k, occupation group o (weighted with sample weights), establishment j;

 $Y_{b,k,o}$  is the average wage rate or cost per hour worked for a benefit b, occupation group o, industry group k;

SW<sub>i</sub> is the sample weight of the establishment occupation.

The formula for the second step is:

$$\overline{c}_{b,k,o} = \frac{\text{Sum}(\text{IE}_{k,o} * \overline{Y}_{b,k,o})}{\text{Sum IE}_{k,o}}$$

where:

 $\overline{Y}_{b,k,o}$  is the weighted cost level estimate for a benefit in industry k, for occupation o (weighted with sample weights);

 $\bar{C}_{b,k,o}$  is the weighted cost level estimate of a benefit for an occupation in industry k (weighted with both ECI sample weights and CES industry employment).

 ${\rm IE}_{k,o}$  is industry/occupation employment data from CES and ECI; the occupational employment within an industry is estimated by using the ECI sample data to estimate the occupational distribution of CES industry employment.

#### Reliability of the estimates

There are two types of errors possible in the estimates from the ECI as well as any other sample survey—sampling and nonsampling errors.

Nonsampling errors have a number of potential sources. The primary sources are (1) survey nonresponse and (2) data collection and processing errors, such as incorrect information provided by respondents, definitional difficulties, and errors in recording, coding, and processing data obtained.

Nonsampling errors are not measured. However, the ECI program has implemented procedures for reducing nonsampling errors, primarily through quality assurance programs. The quality assurance programs include the use of data collection reinterviews, observed interviews, computer edits of the data, and systematic professional review of the reports on which the data are recorded. These programs serve as a training device to provide feedback to the field staff on errors. They also provide information on sources of error which can be remedied by improved collection instructions or data processing edits. Extensive training of field representatives is also conducted to maintain high standards in data collection.

Because not all sample units respond to the ECI survey, nonresponse adjustment is required. For permanent refusals identified during initial data collection, the weights of responding units are adjusted to reflect nonresponse by similar establishments. For temporary nonresponses for wage data during update quarters, or if some benefit data are missing, the missing data are imputed on the basis of information provided by similar establishments.

Sampling errors are differences that occur between the results computed from a sample of observations and those computed from all observations in the population. The estimates derived from different samples selected using the same sample design may differ from each other.

A measure of the variation among these differing estimates is the standard error. It can be used to measure the precision with which an estimate from a particular sample approximates the average result of all possible samples. Standard errors for 12-month changes in published wage, benefit, and compensation cost changes are provided in tables A-1 through A-3. Standard errors (expressed as ratios to the cost estimate, or relative errors) for all published estimates of employer costs for employee compensation are provided in

tables A-4 through A-11. (For the change estimates, standard errors were considered more meaningful than relative errors.)<sup>4</sup>

The standard error can be used to define a range (confidence interval) around the estimate. The 95-percent confidence interval means that if all possible samples were selected and an estimate of the value and its sampling error were computed for each, then, for approximately 95 percent of the samples, the intervals from 2 standard errors below the estimates to 2 standard errors above the estimates would include the "true" average value. For example, the 95-percent confidence interval for a cost estimate of \$10 with a standard error of 10 cents would be \$10.00 plus or minus 20 cents (2 X 10), or \$9.80 to \$10.20.

The method used for computing the standard errors for both the 12-month percent change in the ECI and the cost levels is called "balanced repeated replication." Each industry sample is divided into a number of variance strata, and the sample in each variance stratum is divided into half-samples. The cost level or percent-change estimates are replicated 64 times using the data from one half-sample from each stratum instead of the data from both half-samples.

<sup>4</sup> For a given level of precision, standard errors on estimates of change are about the same regardless of the magnitude of the change. That is, the standard error for a series is likely to be about the same when wages and salaries are rising 8 percent a year as it is when wages and salaries are rising 2 percent a year. The relative error, however, would be much larger with the 2-percent change than with the 8-percent change.

The formula used for calculating the variances, and in turn the standard errors, for the *percent changes* is:

VAR 
$$(R_{s,t,o}) = \begin{cases} 64 \\ Sum[(R_{s,t,o} - R_{s,t,i})^2] / 64 \\ i = 1 \end{cases}$$

where:

R<sub>s,t,o</sub> is the annual relative for some cell from time s to time t calculated using the full sample;

and  $R_{s,t,i}$  is the annual relative for the same cell from time s to time t calculated using the ith balanced half-sample.

The standard error is the square root of the variance.

The formula used for calculating the variances, and in turn the standard errors, for *cost levels* is:

VAR 
$$x(0) = \frac{64}{\text{Sum}[x_i - x_0]^2} / 64$$

where

 $x_0$  is the full sample level estimate for some cell and  $x_i$  is the ith half-sample estimate for the same cell.

For a more detailed discussion of sampling and nonsampling error in the ECI, see Karen O'Conor and William Wong, "Measuring the Precision of the Employment Cost Index," *Monthly Labor Review*, March 1989, pp. 29-36.

### Seasonal adjustment

Over the course of a year, the rate of wage and benefit change is affected by events that follow a more or less regular pattern each year. For example, wage and benefit adjustments in State and local governments, especially schools, are concentrated in the June-September period. Increases in the Social Security tax rate and earnings ceiling, when they occur, always take effect in the December-March period. Wage and benefit adjustments in construction occur in the summer when there is the most activity in the industry. Adjusting for these seasonal patterns makes it easier to observe the cyclical and other nonseasonal movements in the series. In evaluating changes in a seasonally adjusted series, it is important to note that seasonal adjustment is merely an approximation based on past experience. Seasonally adjusted estimates have a broader margin of possible error than the original data on which they are based, since they are subject not

<sup>1</sup>The seasonal adjustment procedure, called X-11 ARIMA (Auto-Regressive Integrated Moving Average), was developed at Statistics Canada as an extension of the standard X-11 method. A detailed descripton of the procedure appears in *The X-11 ARIMA Seasonal Adjustment Method* by Estela Bee Dagum, Statistics Canada Catalogue No. 12-546E, January 1983.

only to sampling and other errors but are also affected by the uncertainties of the seasonal adjustment process itself. Seasonally adjusted ECI major industry and occupational data were first released in December 1990.1 At the beginning of each calendar year, seasonal adjustment factors are calculated for use during the coming year. The factors for the coming year are published in the March issue of Compensation and Working Conditions (CWC), published monthly by the Bureau of Labor Statistics. Revisions of historical seasonally adjusted data for the most recent 5 years also appear in the March CWC.

ECI series are seasonally adjusted using either direct or composite estimates. Most industry and occupational series such as construction, for example, are adjusted directly. The civilian, State and local, private, and manufacturing series are composite estimates. The seasonally adjusted civilian compensation series, for example, is computed by aggregating the following independently adjusted series: Private goods-producing wages, private goods-producing benefits, private service-producing wages, private service-producing benefits, State and local wages, and State and local benefits. (Goods-producing wages have no identifiable seasonality, so the seasonally adjusted and unadjusted series are identical.)
