Reprinted Version Compendium - UMTA Abstracts 1989/1990

Due to the large volume of request for this Compendium, FTA found it necessary to reprint this report.

Unfortunately, copies of the reports listed in this Compendium are no longer available from FTA, however, the reports are available from NTIS (at cost) and/or inter-library loan through the FTA repositories.

NOTE:

Public Law 102-240 - December 18, 1991 SEC. 3004. Federal Transit Administration

- (a) Redesignation of UMTA. The Urban Mass Transportation Administration of the Department of Transportation shall be known and designated as the "Federal Transit Administration".
- (b) References. Any reference in a law, map, regulation, document, paper, or other record of the United States to the Urban Mass Transportation shall be deemed to be a reference to the "Federal Transit Administration".

UMTA ABSTRACTS
1989/1990 COMPENDIUM

JANUARY - DECEMBER 1989/1990 UMTA TECHNICAL ASSISTANCE

UMTA ABSTRACTS NOW ONLINE IN DATABASE UMTRIS - DIALOG FILE 63

This 1989/1990 Compendium is a compilation of Technical Report Documentation pages that provide bibliographic information and abstracts for recently available UMTA-sponsored project reports. All abstracts are logged-in the transportation database called UMTRIS (Urban Mass Transportation Research Information Service) and are available online (Dialog file 63) to users of Dialog Information Services, Palo Alto, California. The Compendium is a courtesy service exclusively for UMTRIS subscribers.

Section 1 of the Compendium provides abstracts of the UMTA-sponsored research reports available from the National Technical Information Service (NTIS) and from Regional Repositories. Section 2 provides abstracts of technical study and planning reports available only through an interlibrary loan arrangement with the designated transportation libraries. Section 3 describes the transportation database UMTRIS, lists UMTA Regional Offices, and provides a listing of research reports currently available to the public by written request.

SECTION 1

UMTA-SPONSORED RESEARCH REPORTS

REPORT AVAILABILITY

All reports cited in Section 1 of this Compendium are available to the public from the following institutions:

- o purchase report from the National Technical Information Service (NTIS), page 2-4
- o interlibrary loan arrangement with any of the Regional Centers/Repositories, page 5-6

UMTA REPORT AVAILABILITY AT NTIS

1991

Reports sponsored by the Urban Mass Transportation Administration (UMTA), U.S. Department of Transportation, are available for purchase from:

National Technical Information Service (NTIS) U.S. Department of Commerce 5285 Port Royal Road Springfield, Virginia 22161 Telephone: (703) 487-4650 (Order Desk)

Some ways of purchasing documents from NTIS are outlined below:

- 1. NTIS Deposit Account. Easiest and fastest way or ordering documents is to establish a deposit account with NTIS. With a minimum deposit of \$25.00, documents can be ordered and purchase price deducted from your account. Contact NTIS for details.
- Prepayment. Send check payable to NTIS or money order with request for publication. Always include report order number.
- 3. Ship and Bill. Service available if specified. A fee of \$7.50 is added to each order for this service.
- 4. Rush Order Service. (703) 487-4700 or (800) 366-4700.

 Guarantees same day processing on reports in stock and 24-hour processing on reports in stock and 24-hour processing on reports requiring printing. Requires NTIS deposit account, American Express, Mastercard, or VISA. Standard \$3.00 shipped fee WAIVED.
 - \$10.00 surcharge on each report mailed or \$7.50 per item pick-up from the Washington, D.C. or Springfield, Virginia offices.
- 5. Express Service. (703) 487-4700 or (800) 336-4700. Guarantees overnight delivery. Requires NTIS account, American Express, Mastercard, or VISA.

\$20.00 service charge.

- 6. Regular Mail Delivery. (703) 487-4650. First class mail or equivalent. Regular handling for in-stock reports takes 2-3 days processing; for reports not on shelf, takes 3-14 days processing.
 - . \$4.00 shipping/handling fee per order
 - . \$4.00 shipping/handling fee/overseas, Canada, Mexico.
- 7. Credit Cards. Charge to your American Express, Mastercard, or VISA credit card. Orders can be placed by phone or mail.
- 8. Ordering Options 24 Hours a Day.
 - . Telex. 89-9405 or 64617 (international)
 - . NTIS Electronic Ordering Service. (703) 487-4624
 - . Telecopier. (703) 321-8547
 - Online. DIALOG (Command DIALORDER)
 SDC (Command ORDER NTIS).

of organizational effectiveness by summarizing major models of effectiveness presented in literature, and to specify a useful framework for analyzing organizational effectiveness in the 4 commuter coordination systems documented in this report. This study examined operations at four commuter coordination organizations in California. Interviews with individual and small groups were conducted with members of all levels of the organizations in San Diego, Sacramento, Orange County and the Los Angeles area. Respondents provided qualitative and quantitative information on the region and the history of the agency, the services offered, and the structure and culture of the organization. The strengths and weaknesses of each organizational form were analyzed and speculated on the future of the organization as well as the commuter coordination function. A model of interorganizational relationships was developed as a result of the interviews and this model was employed to evaluate the strengths and weaknesses of each organizational form and to generate an ideal type for future rideshare organizations. Legislation legitimizing the commuter coordination service was found to be a critical factor in the ability of the agencies to impact their environments. The numerous appendices in this report provide reference documents related to ordinances, vanpool license and maintenance requirements, tips to make ridesharing work, air quality planning, demand management plans, night rider and student ridesharing plans, and others.

This report includes a bibliography and the following 4 appendices: A-1, Example of Scenario Cost and Price Computations; A-2, Potential Ferry Vessel: A-3, Summary of Daily Costs; and A-4, Estimated Operating Costs.

6. Abstrect

Despite technological advances and passenger demand for ferry travel, waterborne transportation services are still being subsidized by public agencies in order that fares may remain competitive with other modes of transportation. This report presents a case study of the Boston Harbor area. The study focuses on the potential for providing supplemental freight services as a means of generating additional revenues for ferry passenger service in Boston, Massachusetts. The study evaluates current and proposed services, describes the physical and operating characteristics of existing land-based and waterborne transportation systems as well as the main features of future planned ferry routes and the merits of supplemental freight services that would be competitive with land-based services. A review was made of possible present and future opportunities for implementing supplemental freight services based upon time, distance, security and cost of competing landbased services. Several scenarios were developed and screened to identify the routes for detailed analysis. Scenarios are documented and evaluated in this report. The report provides a summary of findings that include examples of the freight costs and requirements that will serve as a guide for future planning or investigation of feasibility in other areas. The terminal and vessel costs and designs illustrated for the Boston area have potential application in other geographic locations. The results of this study show that transporting supplemental freight on passenger ferries in the Boston area is technically feasible. Major findings are listed and summarized in this report.

16. Abstract

Interest in HOV facilities and in the congestion threatening the nation's freeway and urban transport systems generated conference support from both national and local agencies. This report documents the Conference Proceedings of the Third National High Occupancy Vehicle (HOV) Facilities Conference held in Minneapolis, Minnesota, October 17-19, 1988. Workshops and general sessions provided the 200 participants with opportunities to exchange ideas and to learn about the latest HOV developments nationwide. Full text copies of keynote addresses and workshop sessions are recorded in this report, along with the Conference Registration List, and a revised copy of the paper titled High Occupancy Vehicle Forecasting in the San Francisco Bay Region, by C.L. Purvis. Some of the papers delivered at the conference were the following: Nationwide Overview of HOV Lane Projects now in Operation in 17 Cities in US and Canada; Creative Solutions to Today's Transportation Problems; I-394, The Minneapolis Experience; Katy Transitway; View from the Sky; Congressional Perspective on Transportation Funding in the 1980s. Workshops were organized in 4 sessions: Planning, Design and Evaluation of HOV Access Facilities; HOV System Elements Workshops; HOV Operational Issues; and Public Policy and Support. The conference ended on a positive note, namely--that HOV facilities fit in at all levels and in all circumstance of the overall transportation system. HOV systems provide a high service and moderate cost alternative to other modes.

16. Abstract

Transportation demand management (TDM) ordinances, also called transportation system management (TSM) or traffic mitigation ordinances (TMO) have emerged as a new strategy for reducing automobile congestion related to commuting. The emergence of the TDM ordinance is rooted in a range of transportation policies and activities--ranging from TSM strategies (management-oriented), to Brokerage (market-based transit organizations) to transportation management associations (corporate involvement). TDM ordinances may apply to employers, developers and property owners, office/industrial complexes, retail and residential developments. This final report presents and discusses the emergence and status of traffic mitigation ordinances as a way of reducing automobile traffic congestion vis-a-vis commuting. It is based on a review of TMOs drafted or adopted in 20 selected local jurisdictions throughout the U.S. as of December 1988. final report consists of 2 separate volumes. Volume 1 discusses some of the major components of TMOs and the important issues in the development and application of ordinances as a means of reducing traffic congestion. In addition, Volume 1 documents summaries of the 20 TMOs (case studies) reviewed during this study. Volume 2, Appendix, documents copies of the actual ordinances discussed in Volume 1. In this report, traffic mitigation ordinances are viewed as one method that may have merit as part of a larger transportation and land use strategy that includes transportation system development, TSM, growth management policies, zoning, and other TDM approaches.

16. Abstract

This report sorts through the myrid issues surrounding suburban mobility for the tri-cities of Monroe, Ruston, and Grambling, Louisiana. The research also probes the issues of the accessibility of transportation services for differing socioeconomic groups of the tri-cities. An empirical investigation showed the extent of transportation problems and existing mode of transportation for the target areas. A linear programming technique for optimum assignment of limited mass transit resources was demonstrated. A procedure for assigning a dollar amount for not providing transportation servcies for the elderly and the economically disadvantaged captive riders was also demonstrated. Results of the research analysis further showed that a potential market exists for both public or private mass transit new providers for the target area. With suburban traffic conditions worsening in recent years, the study postulated that the land use and physical design characteristics of the suburban workplaces have directly contributed to the decline in suburban mobility by inducing most employees to drive alone to work. Results of the empirical investigation obtained tends to support the above proposition for the study area. The report concluded by listing a number of workable procedures for service redesign which in the long run will lead to significant improvements in suburban mobility at the local level. Finally, the research findings were used to charactize the phenomenal suburban mobility problem of other cities across the nation with similar suburban characteristics as the research target areas.

15 Supplementary Notes

There are almost always conflicts in the effort to alleviate suburban congestion. Vested interests are different among pro-growth and pro-amenity towns, and between pro-growth towns and state agencies with limited highway budgets. This research examines four cases of suburban transportation planning in the Boston metropolitan area in an effort to identify ways of keeping development benefits and liabilities from being distributed in bulk win-or-lose quantities among the surrounding jurisdictions. Instead we look for ways to distribute benefits and disbenefits equitably.

We conclude that the greatest contribution to solving this program could be state planning legislation that requires compatibility among local jurisdiction plans and between development and infrastructure supply. Such legislation is pending in Massachusetts and already enacted in certain other states. We recommend revenue sharing, transfer of development rights, incremental improvements to transportation networks, and other means by which costs and benefits could be distributed in divisible amounts. We recommend inclusive local coordinating communities that convene developers with local and state officials.

This document reports on a study designed a) to identify promising non-traditional transit options for suburban areas, b) to develop a methodology allowing transit operators to both identify promising non-traditional options for their individual community needs and to evaluate the cost-effectiveness of these methods, and, c) to illustrate how this method would actually be implemented, focusing on a 60 square mile highly suburban area in Austin, Texas.

The report first describes the "new" suburban environment in which public transit operators must provide service, showing how the increasing suburbanisation of jobs and homes has created both work and non-work trips not easily served by traditional transit. The report next describes prototypes of non-traditional services that have been developed and explains the results of a survey of 22 mid-sized cities. The report next describes a six-step service and cost effectiveness methodolgy, explaining the logic of the process and the type and source of required data. Finally the report describes how this six-step methodology was applied in Austin, Texas.

Major activity centers located outside the traditional CBD of American cities have become the principal areas of urban growth in recent years. This evolving land us pattern has resulted in highly dispered travel patterns that are difficult to ser by conventional public transportation. This report presents a set of general guid lines to assist transit service planners in planning, designing, and implementing route and service changes to capture a larger share of the regional travel market. The objectives of this research were to develop guidelines for: estimating non-CBI oriented travel demands; identifying potential route design and service planning options to meet non-CBD oriented travel demands; and assessing the relative effectiveness of these service alternatives. The report describes several proceduthat can be used to identify suburban travel characteristics (origin-destination surveys, journey-to-work data, onboard surveys and others); outlines and reviews alternative routing alignments that may be appropriate for suburban travel pattern (radial network, ubiquitous network, grid network, and timed transfer systems); are discusses evaluation techniques that measure the effectiveness and efficiency of these service alternatives, namely transit performance indicators. In addition, the report presents a specific set of guidelines for implementing suburban transit services, namely, four general steps: Identifying Suburban Travel Patterns; Identing Alternative Routing Structures; Route Planning Guidelines; and Monitoring and Evaluating Services. This report provides recommendations for selecting the appropriate performance indicators and a list of references.

16. Abstract

This report presents the results of a survey conducted to identify transit study needs in Texas. The report summarizes the study needs identified from the survey, presents a general prioritization of those needs, and outlines a preliminary study agenda to address these study needs. The results of the survey indicate that the most pressing unmet transit study needs in Texas are in the following general areas: 1) Improving coordination and cooperation between local service providers and state and local transportation agencies; 2) Defining and quantifying the appropriate role(s) of transit in meeting the state's mobility needs; and 3) Developing innovative, broad-based funding strategies for the state's transit systems. The survey respondents also cited the need for studies concerning the development of training and continuing education programs for transit and transportation agency personnel, studies concerning the development and testing of technologies to comply with EPA clean air standards, human resources management, and transit service strategies for serving suburban and low density travel markets.

16 Abstract

Local governments are increasingly turning to demand management or trip reduction strategies, policies and programs to combat traffic congestion. Using various policy instruments, localities are encouraging employers and developers to implement transportation systems management (TSM) and parking management strategies (PM). This study reviews experiences with TSM and PM through employer case studies and synthesis of suburban demand management literature. It provides recommendations to local government decisionmakers and planners on strategy effectiveness and reduction policy instruments. Recommendations are offered about when TSM and PM strategies and policies are appropriate: consideration in selecting policy instruments; suggestions on policy design; and guidance on program monitoring, enforcement, management, costs and timeliness. Recommendations for the Federal Government include development of model ordinances, developer agreements, parking codes and guidelines supportive of local policies; changes in tax law on parking subsidies and parking policies for federal employees; support of Transportation Management Association roles in parking management; coordination with air quality regulations; and future research on suburban successes and failures.

16 Abstract

This report reflects the view that the concept of selling and distributing transit passes through employers is an idea whose time has come. The transit agencies studied perceive these programs to be worthwhile investments for encouraging transit acceptance and use while lowering employee commuting costs and reducing the need for activity center parking. This study was undertaken to evaluate the types of employer distributed transit pass programs currently in operation in major Texas cities and selected cities outside Texas. The information presented in this report will assist transit agencies and employers in implementing new (or improving existing) employer distributed transit pass programs. This report presents the results of a detailed analysis of the types of employer distributed transit pass programs implemented by transit agencies in 5 Texas cities--Dallas, Houston, Fort Worth, San Antonio, and Austin: information includes the experience of operating such programs in Seattle and Denver, published materials including the demonstration results of projects implemented in Sacramento, CA, Jacksonville, FL, and Duluth, MN. The basic intent of this investigation was to: identify the types of programs in operation; determine the impacts of programs on transit agencies, employers and employees; and document the findings in order to assist transit agencies and employers in implmenting employer distributed transit pass programs.

16. Abstract

Transit fare prepayment programs grew rapidly during the past decade with most companies today offering riders several prepayment options. This growth has not been without its costs. The purpose of this manual is to provide transit managers with the information and tools necessary to make informed decisions on the design and pricing of fare prepayment plans. This manual presents information on the true benefits and costs of operating fare prepayment plans. Guidelines on selecting the appropriate plans and distribution methods are presented. The manual also presents guidelines on pricing fare prepayment plans in order to capture passenger revenues. A series of straightforward equations are also provided to assist the transit manager in estimating the impacts of changes in a fare prepayment program. This report contains a glossary of terms, a bibliography and a discussion of some of the fare prepayment projects that have been demonstrated.

16. Abstroct

The Urban Mass Transportation Administration announced in 1989 an initiative to encourage local transit agencies to provide a greater local share for capital projects. Known as overmatch, this greater local share was expected to result in greater local flexibility in transit planning and greater consideration in Federal review and decisions regarding capital project approvals. This research project provides a history of this Overmatch Initiative. The report examines the transit finance literature and the economics/political science literature relating to greater local matching for capital projects. The research also examined the Section 15 data base to determine if this source of information could be used to reflect overmatch trends among transit agencies. A national survey of transit agencies was conducted to assess the transit industry's reaction to the Overmatch Initiative. Several case studies of local transit response to the Initiative were conducted and the results were used to assess the overall effectiveness of the new policy. The research concludes that several transit agencies were overmatching before the Initiative was announced mainly to avoid Federal regulations and time delays. Few transit agencies used financial models to identify long-term systems costs. Many transit officials concluded that the requirement for cash overmatch was extremely limiting. The research project recommends that UMTA shift the overmatch focus away from individual projects to regional, programmatic perspectives. UMTA should also take steps to require long-range, financial planning in project planning. Importantly, the report recommends a change in the current Federal program matching requirements. It is recommended to lower Federal matching ratios to 50-50 (or 60-40) with additional funds made available to those communities that meet some special "need" criteria.

16. Abstract

The <u>Financial Planning Guide for Transit</u> presents the details of the overall financial planning process and the procedures that make up the process. The Guide is designed to aid public agencies and interested private parties in the preparation of comprehensive and realistic financial plans -- for new capital investments, recapitalization efforts, and the ongoing operation of existing services. The major elements of the Guide are:

- definition of the financial planning process, including the relationship between financial analysis and other planning functions, procedures for identifying sources of revenue, administrative/institutional arrangements and responsibilities in transit financing, and the types of information needed at each planning level;
- identification of how cost and revenue projections are developed for financial planning purposes, including identification of financial forecasting techniques, selection and projection of new sources of revenue, and performance of sensitivity analyses, and
- description of the development and implementation of a financial plan, including discussion of
 market financing mechanisms and requirements, how dedicated revenue sources and market
 financing programs are developed, the development of financing packages, and performance of
 financial capability analysis.

The Guide has been designed to be useful both in meeting UMTA's planning and reporting requirements (e.g., in demonstrating financial capacity) and in guiding local agencies in evaluating and addressing their own financing needs either in providing the "local match" to Federal funds or in developing sufficient financing to proceed without Federal funds, if such an approach is considered feasible.

16. Abstract			
In response to pressures for increased productivity and better quality of service, private and public sector organizations are re-examining the use of financial incentive programs (FIPs). FIPs are management systems linking valued rewards to desired behaviors; they make employees' pay contingent upon individual or group performance. This rinancial workshop was designed to be a hands-on experience where transit managers could learn about FIPs and discuss implementation strategies. The program also encouraged participants to share their experiences and to complete a questionnaire about their use and experience with FIPs. This document provides an overview of the three, two-day FIP workshops conducted for the transit industry in Philadelphia, PA, Indianapolis, IN and San Francisco, CA. The three workshops were attended by 60 participants who represented 32 transit authorities. Section 1 of this report presents a brief review of FIPs in the transit industry, workshop goals and a brief outline of workshop design. Section 2 summarizes the contents of the workshop including the specific objectives and the seven sessions of the program. Section 3 presents and analyzes FIP data collected from the thirty transit authorities that participated in the 3 workshops Section 4 summarizes the observations of the use of FIPs that were offered in Philadelphia, Indianapolis and San Francisco, as well as conclusions and recommendations regarding the future direction of FIPs in the transit industry. Overall, the participants at the 3 FIP workshops reported having positive experiences with FIPs.

15. Supplementary Netes

This is the annual report called for under Section 304 of the Federal Mass Transportation Act of 1937. This provision added to Section 3 of the Urban Mass Transportation Act a new subsection (j) entitled "Report on Funding Levels and Allocations of Funds." Section 3 is the discretionary capital grant program of the Urban Mass Transportation Administration. With respect to allocation of Section 3 funds, the 1987 Act also added a new subsection 3(k) which specifies that of the amounts available for fiscal years 1987, 1988, 1989, 1990 and 1991. This report is a collateral document to the proposed Fiscal Year 1991 Federal Budget as submitted by the President. It is meant to be a constructive element in the administration of the urban mass transportation program, enriching the information exchange between the executive and legislative branches at the beginning of the appropriations cycle for the next succeeding fiscal year.

16. Abstract				
The study regarding the analysis and use of existing trip generation rates resulted in two reports: * "Site Impact Traffic Evaluation (S.I.T.E.) Handbook" This report documents the site access study process in detail. As noted in the report, the trip generation estimation procedure is a critical step in the seven phase site access study. Four case studies are presented that demonstrate the use of trip generation rates and analyze the sensitivity of site related traffic to trip rates, trip distribution patterns and other key variables. * "Development and Application of Trip Generation Rates" This report presents an overview of the data sources on trip				
generation rates. Updated trip generation rates are presented along with factors for adjusting trip rates due to variations in residential characteristics. The use of trip rates is described. While each of the two reports is an independent document, they complement each other, and the user would benefit from reading both reports.

16. Abstract

This study contains the results and findings of a three state study of coordination among Urban Mass Transportation Administration, U.S. Dept. of Transportation Section 18 providers of public transportation and U.S. Dept. of Health and Human Service funded providers of human service client transportation.

This study examines eight coordinated Section 18 transportation systems in the states of Alabama, Georgia and North Carolinia. In-depth case studies of each system examine the processes which developed the existing coordinated system and the operational and financial aspects of the existing system. Additionally, coordination efforts at the state level are examined in all three states. The report also examines what constitutes coordination and suggests three operative definitions of the term. Case studies are provided which explore system specifics which illustrate each of the suggested definitions.

16 Abstract

The objective of this project was to develop training materials for small urban and rural transit managers/providers and conduct a series of pilot workshops on microcomputer applications to familiarize them with microcomputer use. This 2-volume report documents the training materials developed and used in both workshops. The series of application areas and software demonstrations were targeted for rural and very small urban managers who had little staff support or were unable to attend national meetings and conferences because of funding, distance or staffing. Volume 1 documents the rural transportation management workshop. The course covered vehicle selection, vehicle routing and scheduling, hands-on introduction to computer experience along with demonstrations and usage of application programs. Volume 2 presents training materials developed for the small urban transit managers and transportation providers. Applications areas were selected to illustrate basic needs. Additional microcomputer features useful to managers were also presented such as software programs and reference materials.

portion. In the spring of 1989, Westchester County issed a request for bids to operate the service effective September 1, 1989. Service is being provided curb-to-curb. Driver assistance is limited to helping the passenger board or alight the vehicle.

This review is designed to identify the degree to which the system is fulfilling its objectives, as well as the organization's efficiency in utilizing its resources to meet those objectives. Current or potential problem areas were reviewed. The resulting recommendations are then designed to address each specific weakness with the twofold purpose of solving or preventing problems and implementing procedures to assist management in monitoring and controlling the function in the future.

16. Abstroct

Managers of shared-ride paratransit systems are being called upon to improve the cost-effectiveness of these services, and to provide a report card on the performance of paratransit systems to funding agencies, elected officials, and others to ensure that their funds are being wisely spent. This guide is designed to be a resource for shared-ride paratransit system managers to help them develop a performance procedure for their operation (private shared-ride taxi service, human service transportation system, or specialized-transit system operated by a public agency). The six-step performance evaluation procedure described in this report is applicable to rural and urban shared-ride paratransit systems. It can be used for 2 major purposes: to provide managers with performance indicators to diagnose and correct problems (internal management); and to allow constructive communication between system management and constituencies. This guide is organized into 4 sections. Section 1 (chapters 2-3) presents the theory and general framework of the performance evaluation methodology. Section 2 (chapters 4-5) presents data collection information including service-specific cost statistics. Section 3 (chapter 6) describes corrective actions to correct substandard performance; and the final section (chapter 7) presents a case study that applies the methodology to a typical system. To ease the comparison of the individual shared-ride system to similar systems, peer data from Pennsylvania and other States are presented in the appendix. A glossary of terms is also included in the appendix of this report.

17.	working with UNTA Third Party Contracting programs at urban mass transit authorities. The seminar aimed to increase their knowledge, understanding, and perspective of the third party contracting program. Two pilot courses were developed and conducted at George Washington University in January and February of 1989. A course curriculum and handbook was developed that incorporated agency procurement contractual policies, procedures and guidelines of a legal, political, regulatory and procedural nature. The comments and critiques of the 47 students were used to develop the recommendations for the program and are documented in this report. Recommendations called for the institutionalization and implementation of the training program to various locations throughout the U.S. Additional courses, of similar design and structure, were recommended, namely: Cost and Pricing, Small Purchase Procedures and Practices, Warranties, and Contract Administration. This final report summarizes the seminar's approach, analyzes and documents the recommendations. The handbook, under separate cover, provides the principles of procurement policies, procedures, and practices of third party contracting for UNTA grantees. It serves as a ready desk reference book. 17. Ke, Words 18. The Urban Mass Transportation Administration (UMTA) sponsored the development of the Project and Construction Management Guidelines to provide a resource for local transit authorities and others concerned with the effective implementation of transit capital projects. The objective of effective project management is to accomplish the scope of work within defined limits of time, cost and quality. The Guidelines have been structured to describe the phases of project planning and development through construction to completion, including revenue service. Fundamental management principles are stressed, and are applied throughout the various project phases. The Guidelines will be useful to planners, engineers, administrators and managers involved with projects related to both rail and bus modes, including the development of new systems and the modernization or expansion of existing systems.

Washington, DC 20005

Chapter 2 describes the project development process through seven phases: System Planning, Project Planning, Preliminary Engineering, Final Design, Construction, Testing and Start-up and Revenue Service. Chapter 3 presents general principles for managing the project development process organized in seven broad categories: Legal/Institutional Authority, Management and Organization; System Definition/ Configuration/Performance; Financial Requirements/Resources; Management Control Systems; Procurement, Contracts, Disputes and Claims; Safety, Risk Management and Insurance; and Communications. Chapters 4 to 10 apply the management principles, by category, to the specific requirements of each project development phase. Several appendices provide additional detail and examples for the management topics addressed in the body of the Guidelines and include a list of references and a comprehensive bibliography.

16. Abstract

This report contains a description of the elements and recommendations of a transportation study of the islands of St. Thomas, St. Croix, and St. John in the U.S. Virgin Island archipelago. An extensive data collection effort, including traffic volume counts, turning movement counts, a cordon count (Charlotte Amalie), speed and delay runs, transit and taxivan ridership counts, and transit schedule adherence checks, was undertaken to provide the base data for the study. In addition, interviews with Government officials and private citizens concerned with transportation and environmental matters were conducted.

St. Thomas transit recommendations included the purchase of new buses, the construction of new maintenance facilities, a substantial increase in service levels, and an open competition for management and operation of the service. For St. Croix, a subsidized taxivan service was recommended on a trial basis on three routes. Highway recommendations included an increase in roadway capacity along the Charlotte Amalie waterfront, reconstruction of critical intersections, traffic engineering improvements, and the implementation of a paid on-street parking program for St. Thomas. Reconstruction of major intersections, several turning movement enhancements, construction of the long-proposed Christiansted bypass, the expansion of off-street parking lots in Christiansted, and on-street parking management changes were recommended for St. Croix. The study endorsed current Department of Public Works plans to rehabilitate sections of major roadways on St. John.

Of an institutional nature, it was recommended that a new governmental instrumentality be created to oversee mass transportation (including ferries), parking, and taxi services. Several possible sources of added revenue were discussed as potential means of providing the funding for the needed improvements.

changes and to aid managers in effecting organizational response to change. It differs from other forms of long-range planning because of its emphasis on environmental change, plan implementation, and monitoring of results. This guide is a reference tool for transit managers who wish to manage strategically. It is a source of information on the evolution and application of strategic planning in various organizations. The objectives of the report are: to explain why transit agencies should plan and manage strategically; to demonstrate how strategic planning works; to present cases of strategic planning in the transit industry; and to recommend a framework for strategic planning. The guide presents and discusses a review of the strategic planning/management literature in terms of participation in strategic planning conferences and workshops, strategic plans and case studies of five transit properties' strategic planning efforts. The five case studies of strategic planning examined in this report are: Alameda-Contra Costa Transit District, New Jersey Transit, Port Authority of Allegheny County Transit, Seattle Metro Transit, and Utah Transit. The first fundamental conclusion resulting from this project was that upper management, particularly

the general manager, must make an early and serious commitment of time and resources to the strategic planning effort. This means that management must organize and actively participate in the process to lend it the credibility and direction that only management can give.

The

The purpose of this project was to assess current and future needs of the shuttle bus system and its users. Unlike other fixed-route public transportation systems in Maine, the shuttle bus has not experienced losses in ridership. It is delivering cost-effective services, operating with a minimum number of personnel, and paying-out below market rate wages to full-time drivers. The shuttle bus is a publicly-operated, fixed-route bus service operated jointly by 3 communities in Maine-Saco, Biddeford and Old Orchard Beach. The system operates through a memorandum of understanding between the 3 communities and has been in operation since 1978. This study consists of 4 parts: Evaluation of current services and operations; Development of a marketing program; Passenger survey and analysis; and a Five-Year Transportation Development Program. The shuttle bus system provides an important service to community residents. It is supported by farebox revenues and municipal funds. Although capital replacement needs are critical, it appears that the shuttle can meet vehicle replacement needs, maintain existing levels of service, and stabilize ridership and revenue with cost increases of about 5-8 percent annually. The study calls for an expanded effort to increase revenues through more aggressive marketing and increased federal/state fundings.

16. Abstract

The report, A Study of Transit Operating Revenue/Cost Ratios, is a response to the Conference Report on the Continuing Resolution (H.J. Res. 648) which directed the Department of Transportation to assess the policy implications and technical feasibility of requiring transit properties to meet a minimum operating revenue, operating cost ratio as a condition of receiving Federal operating This study explores the implications of implementing assistance. a federal transit operating assistance program based on transit operating revenue/cost ratios. The study begins with a comprehensive review of similar programs currently in place or under consideration in the states and in the province of Ontario, Canada. It evaluates the Section 15 Data Reporting System for use in implementing a federal program based upon revenue/cost ratios. and documents those areas having revenue/cost ratios meeting or exceeding 45 percent, 50 percent and 55 percent respectively. final section of this report summarizes the major findings of this study and presents specific conclusions regarding the technical feasibility and policy implications of implementing a transit operating assistance program based on operating revenue/cost ratio targets.

16. Abstroct

Inis report presents statistical summaries of UMTA's Grant Assistance Program. Grant assistance to the providers of local mass transportation began with the passage of the Urban Mass Transportation Act of 1964. A total of \$3.5 billion in grants was awarded during fiscal year 1989, raising the grand total of assistance to \$52.7 billion. Of the \$3.5 billion awarded, 74 percent was programmed for capital purposes; 24 percent for operating expenditures; and the remaining 2 percent for planning assistance. Excluding Stark-Harris grants, the largest urbanized areas with populations over 1 million received 79 percent of the total grant funds obligated during FY 1989. This Statistical Summaries report presents selected data on the distribution and use of various Formula and Discretionary program funds. These programs are the main source of Federal financial aid to urban and non-urban areas. Data was compiled from the capital, operating and planning assistance grants awarded in FY 1989 to transit authorities, states, metropolitan planning organizations, and other units of local governments. The statistical data charted-out in this report apply to the following UMTA programs: Programs Financed by the Mass Transit Account of Highway Trust Fund (Sections 3, 8, 16(b)(2), 9B); Programs Financed by General Funds (Sections 9, 18, Interstate Transfer); Programs Financed by the Highway Account of the Highway Trust Fund (FAUS); and Special Appropriation (Section 75, Stark-Harris).

This report summarizes the principal activities of a 15-month project designed to develop and implement a technical assistance (TA) program that would help qualified women-owned businesses (WBEs) enter into profitable business arrangements with certified transit vehicle manufacturers (TVMs) under contract to UMTA. Three additional objectives were the following: to assist TVMs in achieving their WBE goals in terms of UMTA procurement requirements; identify post-project TA support strategies that would help WBEs eventually become long-term competitors in the mass transit marketplace; and to provide UMTA with a practical tool for assisting other WBEs and disadvantaged entrepreneurs. The project focused on providing assistance to 101 selected WBEs. This report summarizes the following project activities: Review of existing Federal TA programs for WBEs; Preparation and dissemination of an outreach and public information program; Selection of participating WBEs; Development and implementation of TA program; and Development of private sector support and strategies for the post project period. The report consists of 11 sections that briefly describe project accomplishments and include cepies of key documents submitted to UMTA. It also includes the workshop agenda, list of WBEs, a Transit Vehicle Manufacturers Directory, TA program plan, and a Fact Sheet of contracting opportunities offered by TVMs to WBEs. This report is very informative and should prove useful to disadvantaged entrepreneurs interested					
in establishing a firm foothold in the transit marketplace.

16 Abstract

This study was undertaken to identify the extent of losses from risks that transit agencies are experiencing and their current efforts to reduce losses. The study is important because, for the first time, losses from risk and expenditures for controlling these risks have been quantified in a sample group for transit agencies. This study examined safety, loss control and risk management programs and practices at 17 bus transit agencies, located in 14 states with fleet sizes ranging from 200-1000 vehicles. The study objectives were to: assess risk and liability exposure of bus transit agencies; profile existing safety, loss control and risk management practices and programs; and recommend strategies to reduce losses. Data was collected through telephone and onsite interviews and organized accordingly: contractor managed transit agencies; regional transit agencies; and county/Municipal transit agencies. Transit agency losses due to accidents and claims were examined for the three year period 1985-87, as well as all program activities to reduce losses, including--operator and mechanic safety, employee hiring and training, drug and alcohol abuse, activities to reduce worker's compensation claims and risk management programs. External factors (state laws and labor contracts) affecting losses were also assessed. This report presents background information of the project, observations and recommendations for further loss reductions. It lists the 17 participating bus transit agencies, and presents a summary of noteworthy loss control activities at each agency.

15. Supplementary Notes		

During the early part of 1983, it became clear that improvements in the collection, analysis and reporting of safety data and information were badly needed. The time intensive task of manipulating and analyzing data and report preparation by hand was actually becoming a detriment to the timely and effective implementation of measures aimed at reducing the frequency of accidents/ incidents at the Washington Metropolitan Area Transit Authority (WMATA). became imperative that WMATA embark on a program for computerizing safety data. The Office of Safety and Fire Protection (SAFP) staff solicited the assistance of WMATA's Office of Management Information Services (MISY) to assist in defining the framework for developing the hardware and software requirements for an office computer system. It was agreed that large data files for rail and bus accidents/incidents which require large databases would be more effectively served by WMATA's large mainframe computers, while the analysis, smaller databases, and report generation could best be served with personal computers (PCs). At the time of the recognition of the need for a computer system, there were no internal funds available. As a result, SAFP solicited assistance from the US Department of Transportation and the Urban Mass Transportation Administration (UMTA). Consequently, UMTA granted WMATA a Research and Demonstration Grant of \$40,000 for the Computerized Transit Dedicated Safety Information and Analysis System (DSIAS). Subsequently, the DSIAS was developed into the Computerized Safety Information and Data Analysis System.

This report presents information gathered and analyzed in support of UMTA's effort to develop practical guidelines for U.S. transit operators in implementing anti-drug policies and The principal goal of these guidelines is to assist the U.S. mass transit industry to achieve a drug-free transit workforce to protect the health and safety of workers and the public. This report explains the regulatory requirements for transit operators established by 49 CFR Parts 29, 40, and 653. Guidance is provided on cost effective strategies for implementing anti-drug program elements associated with policy formulation, employee and supervisor training, urine specimen collection and testing, recordkeeping and reporting, and establishing Employee Assistance Programs (EAPs). appendices include sample forms, correspondence, checklists, reference sources, and other tools to assist transit operators in creating workable procedures to meet regulatory requirements.

The NTIS order number is PB 90-159963/AS and the NTIS price code is A07. 14. Abstract This study reflects UMTA's continuing efforts to ensure the safety of the nation' rail transit systems, and to be responsive to the National Transportation Safety Board's concerns about the use of radio communications in rail transit operations The study focused on radio communications conducted between train operators and central control operators. Specifically, the study addressed NTSB recommendations to UMTA requiring 1) operable radios for revenue service trains (R-86-39), and 2) development of a Uniform Code of Operating Rules and Procedures for use by the rail rapid transit industry (R-86-40). The objective of the study was to gain insight into current practices related to NTSB recommendations, determine potential needs, and identify possible actions which UMTA might initiate in response to any such needs. The Volume 1 report presents the results of a review of existing conditions and practices on the use of radios in rail transit operation Hormation was obtained from a survey of 9 transit properties that operate heavy and/or light rail transit systems, as well as from a review of NTSB documen PCC and FAR regulations, railroad radio rules/procedures and contacts with APTA, AAR and others. Volume 1 discusses the nature and findings of the basic study and provides conclusions and recommendations for UMTA considerations. Abstract This study reflects UMTA's continuing efforts to ensure the safety of the nation's rail transit systems, and to be responsive to the National Transportation Safety Board's concerns about the use of radio communications in rail transit operations. The study focused on radio communications conducted between train operators and central control operators. Specifically, the study addressed NTSB recommendations to UMTA requiring 1) operable radios for revenue service trains (R-86-39), and 2) development of a Uniform Code of Operating Rules and Procedures for use by the rail rapid transit industry (R-86-40). The objective of the study was to gain insight into current practices related to NTSB recommendations, determine potential needs, and identify possible actions which UMTA might initiate in response to any such needs. The Volume 1 report presents the results of a review of existing conditions and practices on the use of radios in rail transit operatine heavy and/or light rail transit systems, as well as from a review of NTSB documen FCC and FRA regulations, railroad radio rules/procedures and contacts with APTA, AAR and others. Volume 1 discusses the nature and findings of the basic study and provides conclusions and recommendations for UMTA considerations. To expand transit industry involvement in this study, the Volume 1 report was distributed to 19 rail transit authorities for their information and review. Volume 2 documents the responses received from the 19 rail transit authorities that were requested to provide information on their own radio system and to review and comment on the original report—Volume 1. 17. Prevention of fires on rail transit vehicles is a significant safety issue in the transit industry. It is estimated that 70 percent of rail transit vehicle fires occur in the undercar area. This report presents the results of a comprehensive study of transit undercar fire detection and suppression methods applicable to the rail undercar environment. The study was conducted in 3 separate steps: identification and evaluation of fire detection and suppression methods feasible for rail transit operations; testing of several promising detection and suppression methods in the laboratory; and development of a proposed field test program for evaluation of the recommended rail undercar fire detection and suppression systems in an operational setting. A laboratory test program (26 tests) using an instrumented motor control group box from a NYCTA transit car was conducted at the Budd Company Technical Center under contract to KETRON. The program included tests on flow and thermal characteristics of the motor control group box; power arcinduced electrical cable fires; linear and spot thermal detector performance; Halon 1301 extinguishing system performance; and testing of a novel suppression concept involving the use of a portable nitrogen gas generator to provide an inerting atmosphere in the box for continuous protection. The evaluation of fire detection methods resulted in a recommendation that continuous wire type linear thermal detectors be applied to critical areas in the undercar. Halon 1301 extinguishing systems were identified as the best choice for control of fires occurring in enclosed equipment compartments. This study recommends that a field test program of selected methods be conducted.

16	This report presents an overview of the second generation Automated Emergency Response System (AERS2). Developed to assist transit systems in responding effectively to emergency situations, AERS2 is a microcomputer-based information retrieval system that provides train controllers, dispatchers, and supervisors with quick and accurate information. In contrast to the original AERS, AERS2 provides information through a color schematic map of a one-mile length of track on the upper half of the computer display screen and textual information on the lower half of the screen. The report describes the development and operation of AERS2, provides its background and history, provides a detailed description of the AERS2 data files, describes the operation and the various functions of AERS2, and provides conclusions and recommendations for further action.

16	Abstract					
	Rail transit has become an impor					
	principal reasons for this increased use are improved accessibility, low cost, and expanded areas of service. For the purposes of this report, "elderly" is defined as any member of the population who is 60 years of age or older, and "disabled" is defined as any person who has some type of disability.					
	The Urban Mass Transportation Administration (UMTA) has recognized the need to consider the unique					
	 characteristics of elderly and disabled passengers in rail transit emergency response planning. The needs of these passengers can be addressed through carefully planned emergency response procedures, proper 					
	training of transit and emer-	gency response personnel, a	nd -	effective use of	equipment. The	
	recommendations contained he organization personnel in evaluation	rein are therefore intended to sting their emergency response	assisi plan	t rail transit and e is in terms of the n	mergency response leeds of elderly and	
	disabled passengers and, if nec	essary, to modify or supplem	ent	those plans accor	dingly. Section 2	
	discusses types of emergencies, environment. Included in Sectio	ns 3 and 6 are minimum recomm	uisat nend	lations, procedures	, and criteria which	
	should be employed by all rail to	ansit systems to enhance their	parti	icular emergency p	lans for addressing	
	the needs of elderly and disable will assist in the evacuation of el	derly and disabled passengers i	rese rom	rail transit vehicles	and facilities. The	
	guidelines in these two section extensions to existing systems, ar	s are intended to be used pric	naril	y for the planning	g of new systems,	
	This report is intended to supp	lement the UMTA publication	Reco	ommended Emerg	ency Preparedness	
	Guidelines for Rail Transit System	ns. That report contains gener	al qu	uidelines designed	to assist rail transit	
	systems in assessing, developing emergencies and in coordinating	those efforts with emergency r	espo	nse organizations.	ior responding to

16. Abstract

The Heavy Rail Transit Safety 1988 Annual Report is a compendium and analysis of rail transit accident and casualty statistics reported by the thirteen heavy rail transit systems in the United States during 1988 under UMTA's Safety Information Reporting and Analysis System (SIRAS). The thirteen heavy rail systems reporting their rail transit accident and casualty statistics are the following: BART, CTA, GCRTA, MARTA, MBTA, MDTA, MTAMD, NYCTA, PATCO, PATH, SEPTA, SIRTOA, AND WMATA. SIRAS is a voluntary safety reporting system developed by UMTA in cooperation with the American Public Transit Association (APTA) and the heavy rail transit (RRT) systems operating in the U.S. Since its implementation on January 1, 1983, the operating RRT systems have been reporting transit safety to UMTA on a monthly basis. New reporting thresholds were established and implemented on January 1, 1986. Up to 4 transit data reports are submitted: a Statistical Data Report, a Train Accident Report, a Casualty Report and a Fire Report. All transit systems submit a Statistical Data Report containing total number of car miles and number of passengers in the reporting month. The other 3 reports are submitted only during those months when reportable train accidents, fires, and casualties occur.

Public perception of the safety status of a mass transit system has a immense impact on ridership and fare revenues. Furthermore, a jury composed of citizens who regard a transit agency's safety record as poor is more likely to award sizeable settlements against the agency in liability litigation. The cost of litigation and financial settlements arising out of legal liability has been growing. This study is concerned with reducing the component of that expenditure attributable to accidents caused by substance abusers. This study examined and analyzed the Employee Assistance Programs at ten transit agencies throughout the United States. The results of the study indicate that successful employee assistance programs have the following characteristics: 1. A holistic approach to treatment 2. Union/Management participation 3. Education and training 4. An adequate benefit package 5. Follow-up procedures 6. Confidentiality at all levels, referral andassessment, stress management and an advisory group consisting of management, labor, the local community, recovering substance abusers and

'Los Angelization', the movement of people, jobs, residences, and other activities away from the CBD, is being replicated nationwide. It is diminishing the importance of traditional downtown and resulting in commuting economies and shrinking markets for conventional transit. This is a case study of travel trends in the Los Angeles area—a prototype of the large, modern, American metropolis where the subcentering trends first appeared and are now being exhibited in other areas (14 in Washington DC area, 7 in Baltimore, 8 in Atlanta). This research centers around the not yet well understood interaction of the land and travel market generating such spatial arrangements. Nineteen activity centers were identified. Travel by mode and by purpose between centers and 45 regional statistical areas and within centers and areas were analyzed. This report examines the relationship between dispersed activity centers and the rest of the metropolitan area; the provision and performance of conventional and paratransit services for subcenters; and suggests appropriate transit service and policy innovations. Case studies of 2 medium-sized cities near Los Angeles (Pasadena and Glendale) were conducted in order to determine the types of transit services emerging in subcenters, and to provide guidance for future subcenter-based transportation planning. Results show that Los Angeles is a dispersed rather than a polycentric metropolis. The study findings point to a shift to small-scale suppliers throughout the region, and a limited role for conventional transit services in non-CBD activity centers. This report provides a bibliography and 5 appendices.

16. Abstract

The Metropolitan Atlanta Rapid Transit Authority (MARTA) is one of four agencies participating in the Rail Car Cost Containment Program sponsored by the Urban Mass Transportation Administration.

MARTA's objective in conducting the cost containment study was to:

- 1. Identify and consider elimination of any high cost, low worth functions from its rail specifications;
- 2. Develop feasible alternatives for essential functions and then obtain industry view about the cost impacts;
- 3. Quantify the cost savings; and
- 4. Produce a final project report.

The study showed, based on information gathered during interviews with car builders, subsystem suppliers, and other Transit Authorities, some ways to contain the costs of rail cars and how to reduce the manufacturers' uncertainty and risk. Transit Authorities have to understand manufacturers' practices, problems, and points of view. Also, negotiated procurements tend to show that mutual understanding of the requirements and risks lead to cost reductions.

15 Supc ementary Notes

This report presents the results of a comprehensive analysis of the bus services of the Capital Metropolitan Transportation Authority operating in the Austin, Texas area. The objective of the study is the preparation of a service plan that addresses the provision of new service and lays out a process for monitoring performance of the current system. It should be noted that the focus of the study is on the regular route services of Capital Metro which excludes the Specialized Transit Services (STS) and the downtown DILLO services. A separate plan for transit services in downtown Austin, which includes the DILLO service, is being addressed within another study.

This project aimed to develop a unified passenger and revenue data reporting system by merging separate output files from 2 separate data handling devices -- automatic passenger counter (APC) and electronic registering farebox (ERF). This report evaluates the Automatic Passenger Counter and Fare Demonstration Project undertaken by MARTA. It was designed to test the merging of output data from 2 onboard devices (APC and ERF). Three MARTA buses, equipped with both devices, were chosen to run on 3 selected routes. Output data representing fare and passenger activities on each of the 3 routes were manually merged into a single integrated output for further analysis and report generation. An important aspect of the initial plan, to merge the data electronically, was abandoned because of technical Even though an electronic merger was not possible, difficulties. many project objectives were achieved. This report provides background information of the project as a whole, discusses GFI electronic farebox and APC equipment, describes what was done, and discusses the results pointing out project strengths, weaknesses Data output integration was the central theme and conclusions. of the entire project.

CNYRTA operates a demand responsive paratransit system for the elderly and handicapped (E&H) in the Syracuse metropolitan area. Service is provided with a fleet of 15 small, gasoline powered wheelchair equipped buses. Each bus operates 8 hours and 107 miles daily (5 days a week) and used in door-to-door E&H service in addition to rural service throughout Onondaga County. Brake repair is a major cost problem. Brake overhauls occur every 3,000-4,000 mi. (vehicles average 30,000 mi. of revenue service annually). The solution proposed by CNYRTA for the small bus brake problem was to use electric brake retarders -- an independent braking system not dependent upon friction to generate a retarding force. (The retarder works simultaneously with standard brakes but absorbs up to 75 percent of braking energy; thus, intervals between brake overhauls can be increased as much as 400-500 percent, and the life of the linings and drums/rotors are greatly extended.) The purpose of this demonstration project was to install and evaluate electric brake retarders on six 22-foot Thomas buses. Data was collected from 6 Thomas buses equipped with retarders and 2 Thomas buses not equipped with retarders. Data was compared and evaluated over an 18 month period. Miles between relinings increased with retarder equipped vehicles. This report contains a description of the electric brake retarder, evaluation and project conclusions. The maintenance staff recommended that future retarder purchases be written into bus specifications of future bus purchases as opposed to the retrofit of existing vehicles.

16. Abstract

This research investigates the problem of spare vehicles and maximum operating spare ratios in bus transit systems. The report should be of interest to transit agencies interested in managing transit assets. It reflects concerns that the determination of spare ratio and factors affecting its magnitude have not been extensively studied, and that transit systems with a spare ratio in excess of the specified maximum(120 percent) will not be eligible for federal capital resources to purchase, rehabilitate, or store transit vehicles. Statistical techniques were used to investigate the relationship between variations in the spare ratio and characteristics of bus transit systems. The question of 'substitutability' or the possibility of substituting a vehicle with a different one was examined. A methodology was developed and tested for conducting an assessment of an existing fleet and its service environment such that the possiblity of 'substitutability' could be tested. Procedures were developed to determine optimal strategies for bus retirement, bus acquisition, and allocation of funds to purchase new equipment. A simulation model was developed to investigate the proper choice of spare ratio in order to maintain a desirable level of service dependability. The model studied the effect of time between bus breakdown and time to repair broken buses as well as other characteristics of the system on the value of spare ratio and the overall performance of the system. The model was successfully validated and used to simulate and study bus operations of the Kanawha Valley Regional Transportation Authority in Charleston, West Virginia.

16 Abattoct

Life-cycle costing (LCC) is a valuable tool for comparing the costs of owning and operating different equipment that serves similar purposes. This report documents the Santa Clara County Transit District (SCCTD) life-cycle cost demonstration project. The project was designed to test procedures for capturing data, for performing analysis essential to the LCC process, and for devising procurement document provisions that would support the use of LCC process as a rational basis for selection of transit coaches. The demonstration included a pretest forecast of LCC based on operating data from external sources, a test period of recording onsite operating experiences and costs, development of test operation procedures, and a post-test evaluation of the pre-test LCC forecast and of various LCC approaches and procedures. Demonstration fleets consisted of two models of articulated buses (M.A.N., and Crown-Ikarus). This project also developed a cost-driver type of LCC procurement package that clearly showed the value of recent onsite operating experience as a basis for evaluating LCC and for understanding LCC claims. The procedure was effective in evaluating bids for domestically manufactured coaches but not for foreign designed vehicles. The general finding of this project was that the state of development of transit operating databases was inadequate to support the widespread use of life-cycle costing. However, the LCC procedure does have merit as demonstrated by the wide differences in operating cost and productivity of the two articulated coach test fleets.

16. Abstract

A strategic plan is a framework for future resource allocations and deployments, and it provides a method to assess an agency's capability to meet future demands. Strategic planning can be viewed as a management tool for anticipating changes, maintaining program effectiveness, and positioning an agency to respond to changing conditions.

The purpose of a strategic plan is to define the agency's goals and objectives and to develop strategies through which they can be achieved. An effective strategic plan will assist the agency and its policy-makers in responding to new trends and opportunities. The plan can also be useful to policy-makers in allocating appropriate funds to meet the agency's mission.

As a management tool, a strategic plan can increase both the effectiveness and efficiency of an agency's effort to meet the public's needs within the context of competing programs and resources. The creation of a plan enables an agency to reach internal consensus in terms of purpose and sense of accomplish this, a plan requires an assessment of the agency's environment, the adoption of a clear mission statement, a concise and realistic definition of goals and objectives, and an outline of specific strategies and actions.

16. Abstroct This report was generated under an UMTA grant through the Commonwealth of Pennsylvania to the High Speed Ground Transportation Center of Carnegie Mellon University (CMU). The purpose and task put forth to CMU was to develop and commercialize the 1986 Boeing MAGLEV. During 1978-1985, UMTA invested nearly \$8 million in the development of MAGLEV technology with the Boeing Company. CMU received the results of the Boeing technology through the UMTA grant, evaluated its use in high speed ground transportation, and concluded that this technology was not easily adaptable to high speed regional MAGLEV systems. After the transfer and evaluation of the BOEING technology, the focus of the CMU study changed from Boeing MAGLEV technology development to Americanizing and manufacturing foreign technology (German and Japanese), i.e., development of a MAGLEV industrial base in U.S. This report discusses recruitment of the public/ private sector into a partnership and formation of the MAGLEV Working Group, which later became MAGLEV Inc. Drawings of conceptual MAGLEV regional systems are presented in this report, along with the Pittsburgh Regional MAGLEV Project and its 3 objectives: a Pittsburgh regional MAGLEV industry; a private/public partnership to build and operate a regional system; and integration of the stops on the regional MAGLEV into nodes of economic activity. This report has 3 main sections: a paper titled Role of High Speed MAGLEV in the Future U.S. Transportation System, by R.A. Uher; a paper titled Report on the Preliminary Feasibility Study of Pittsburgh MAGLEV Project, by MAGLEV Working Group; and a MAGLEV Bibliography by the Transportation Research Board TRIS Staff.

This report addresses the mobility improvements attempt to strike a balance between projected demand for service and preserving many of the area's existing characteristics. In terms of funding these improvements, Capital Metro (2910 East Fifth Street; Austin, Texas 78702) should pursue coordination with the corridor development community and public agencies such as the City of Austin, to facilitate the implementation of transportation improvements as needed. Due to local economic conditions, it may be appropriate for Capital Metro to consider financial participation in a comprehensive mobility improvements package for the redevelopment corridor.

It estimates the demand for and costs of a peoplemover system, explores potential revenue sources for funding a system, examines the public issues germane to the question of whether and how such a system can be implemented, and ultimately, will assist decision—makers to determine whether or not the peoplemover concept deserves further attention. The study was commissioned by the New Jersey Department of Transportation and undertaken by a team of Rutgers University faculty members. The study team collected data and opinions on issues, surveyed markets, developed cost/revenue models, and looked into the legal and environmental implications of this potential new local transportation improvement. The study draws on several sources: review of Atlantic City planning documents and transportation studies; ACT literature; and interviews with 60 'stakeholders' representing the casinos, city businesses, community and civic organizations, and city, county and state government agencies. Interviews were also conducted with ACT system suppliers and transportation officials from other cities. Basically, the report begins with a discussion of a formal evaluation m	Issues, Impacts, Markets,	Costs, and Criteria.

The study draws on several sources: review of Atlantic City planning documents and transportation studies; AGT literature; and interviews with 60 'stakeholders' representing the casinos, city businesses, community and civic organizations, and city, county and state government agencies. Interviews were also conducted with AGT system suppliers and transportation officials from other cities. Basically, the report begins with a discussion of the history and issues surrounding AGT development, and then moves into the more technical concerns of markets and costs/revenues, and concludes with a discussion of a formal evaluation methodology for selecting a franchisee to build a peoplemover system in Atlantic City. The appendix in this report provides a bibliography on peoplemovers. 17. It estimates the demand for and costs of a peoplemover system, explores potential revenue sources for funding a system, examines the public issues germane to the question of whether and how such a system can be implemented, and ultimately, will assist decision-makers to determine whether or not the peoplemover concept deserves further attention. The study was commissioned by the New Jersey Department of Transportation and undertaken by a team of Rutgers University faculty members. The study team collected data and opinions on issues, surveyed markets, developed cost/revenue models, and looked into the legal and environmental implications of this potential new local transportation improvement. The study draws on several sources: review of Atlantic City planning documents and transportation studies; AGT literature; and interviews with 60 'stakeholders' representing the casinos, city businesses, community and civic organizations, and city, county and state government agencies. Interviews were also conducted with AGT system suppliers and transportation officials from other cities. la Abstract

This program was initiated as the result of the findings of the WMATA wheel wear/ track wear study. Because of the close wheel/track tolerance and flange profile, WMATA noted a wear rate in both wheel and track which was several times higher than anticipated. Because earlier studies of a steerable truck concept had never been completed, WMATA requested UMTA assistance to complete the evaluation.

The program objective was to design, analyze and recommend a steerable truck retrofit to the Washington Metro Rockwell trucks. The design features two-point, body-to-axle steering and replacement of the axle bearing rubber sleeve and end cap with an axle bearing box, top mount and laminated rubber/steel sandwiches. Steering input is by lever and push/pull rods. The brake housing-to-sideframe mountings are modified to ensure maximum pad/disc contact area. The incorporated design was computer analyzed mathematically for performance with respect to dynamic stability and curving ability. The results of the analyses define a stable vehicle within the dynamic envelope of the WMATA system and flange-free curving ability on curves of radii above 500 feet. Because of the large design change at the sideframe/axle interface, a finite element stres analysis was performed resulting in the requirement for a preliminary design sideframe reinforcing cap to be welded to the sideframe.

16. Abstract

The Metropolitan Atlanta Rapid Transit Authority (MARTA) is one of four agencies participating in the Rail Car Cost Containment Program sponsored by the Urban Mass Transportation Administration.

MARTA's objective in conducting the cost containment study was to:

- 1. Identify and consider elimination of any high cost, low worth functions from its rail specifications;
- 2. Develop feasible alternatives for essential functions and then obtain industry view about the cost impacts;
- 3. Quantify the cost savings; and
- 4. Produce a final project report.

The study showed, based on information gathered during interviews with car builders, subsystem suppliers, and other Transit Authorities, some ways to contain the costs of rail cars and how to reduce the manufacturers' uncertainty and risk. Transit Authorities have to understand manufacturers' practices, problems, and points of view. Also, negotiated procurements tend to show that mutual understanding of the requirements and risks lead to cost reductions.

16. Abstract						
This final report on the S-500 Rail Borne Snow Removal Vehicle, purchased by Chicago Transit Authority (CTA) from Mitsubishi International Corp., and built by Niigata Engineering Co. Ltd. of Japan, provides basic information on the equipment's design, modifications, and operational problems. The development and acquisition of this high powered Snow Removal Vehicle occurred following the devastating winter of 1978-79, when a record breaking 88 inches of snowfall paralyzed the CTA rail transit system. The report discusses the S-500 vehicle's technical specifications, the results of vehicle testing, and modifications made to improve performance. The vehicle was designed for a maximum snow removal rate of 1,500 tons per hour, and a travelling speed of up to 20 mph while removing snow. Based on test experience, the conclusion is that the propulsion system design, utilizing a single diesel engine and complex transmission system to power both the vehicle and the snow removal equipment, hampers performance and reliability. The experience gained from the prototype S-500 vehicle resulted in its successor being designed with separate engines for propulsion and for snow removal. Also discussed, is the modification of six rubber-tired vehicles with rotating snow brooms. Interchangeable steel flanged wheels were designed, allowing these vehicles to operate on railroad track.

16. Abstract

An inverter-controlled ac induction motor propulsion system for rail transit cars was designed, developed, and tested to verify projected benefits and applicability of ac over conventional dc cars. Two New York City Transit Authority (NYCTA) R-44 dc subway cars were retrofitted with prototype ac propulsion equipment based on mature, low-risk ac propulsion technology. The program showed that propulsion systems using ac motors can provide greatly improved reliability and reduced maintenance, with significant reductions in life-cycle cost. The prototype ac propulsion system conserves energy through regenerative braking, returning energy to the line when the network is receptive. The equipment consists of a control unit incorporating solid-state integrated circuits and two essentially independent truck drives. For each truck, a single inverter unit powers two totally enclosed, self-cooled, squirrel-cage ac induction motors, each motor driving one of the two axles per truck. Each pulse-width-modulated, voltage-fed, thyristorcontrolled inverter is forced-air cooled by a blower, which also cools the resistors used to dissipate dynamic braking energy when the line is not receptive. Demonstrated on the NYCTA, the ac propulsion system improved acceleration and braking performance with good electromagnetic interference and acoustic noise control and was fully compatible with the existing trainlines, NYCTA signalling and supervisory equipment, and dc cars. The report explains how the latest technology would be applied in future production equipment to result in even more benefits to the rail transit industry.

16. Abstract

This report documents a study of the causes of wheel flange wear and derailment on the Massachusetts Bay Transportation Authority (MBTA) Orange and Blue Rapid Transit Lines. The study included both full-scale testing using instrumented wheels on the track in question and a computer model of wheel/rail curve performance. Both experimental and predicted data are presented. Parameters affecting wheel wear considered in this study include: longitudinal suspension stiffness, wheel profile, and track curvature. Two wheel profiles, 1:20 and 1:40 were used in the test track curvature of the four test curves, which varied from 1.3 to 9.3. The computer model included lower primary suspension stiffness and worn wheel profile.

The primary objectives of the study were: (1) to determine the feasible reduction in the longitudinal stiffness of the existing primary suspension chevron, and (2) to establish by theoretically supported experiment, the reduction in wheel/rail forces and wear rates that could be obtained by modifying the primary suspension and wheel profile.

The study recommends that MBTA should consider changing its standard wheel profile from 1:40 to a worn wheel profile, such as AAR1. Additional benefits in curving performance could be obtained from a significant reduction in the longitudinal stiffness of the primary suspension chevron.

16. Abstract

Completion of the Metropolitan Transportation Authority's plan to relieve overcrowding on Queens-to-Manhattan subways, to extend subway service to Eastern Queens and to provide Long Island Rail Road service directly to Manhattan's East Side stalled in the 1970s when New York City experienced a major fiscal downturn. Only the upper level of the two-level Manhattan-Queens 63rd Street Tunnel was completed in 1989. The line serves but a single subway station in Queens, does not connect to other lines in Queens, and is drastically underutilized while other subway lines are severely overcrowded. The lower LIRR level is not connected at either end and plans to use it are in abeyance. The MTA has proposed to tie the upper level of the tunnel into the Queens Boulevard line to use half the capacity of this level, with a future storage yard and reversible track operation on the Queens Boulevard Line to use the other half.

This study has developed, evaluated and refined a series of coordinated actions to alleviate overcrowding and related problems on rail lines (subvay and LIRR) between Queens and Manhattan, and the management of service on such lines. The key finding of this study is that an alternative development program could produce substantially greater benefits to the region, with very little increase in net cost to the MTA. This is possible by completing both the upper and lower levels of the tunnel and by focusing new services so they enhance potential development sites, generating developer contributions, in Queens and Hanhattan. The major element is intermodal integration, in both Transportation System Management actions (integrated fares, service frequencies, and feeder services), and in the longer-term development of a unified transportation center at Queens Plaza. Other elements include new "subway" lines, a "hybrid" subway-railroad service, and airport access transit.

16. Abstroct

During the past decade, the New Jersey Transit Corporation (NJ TRANSIT) has spent approximately \$375 million for the purchase, upgrade, and rehabilitation of rail rolling stock. The Urban Mass Transportation Administration (UMTA) has determined that the average cost of a railcar continues to grow and is sponsoring work to determine how the costs may NJ TRANSIT selected the contract area of General Provisions and their attendant Terms and Conditions (T&C) clauses to be studied as part of the UMTA work. The purpose of this project was to critically review the T&C clauses to determine whether certain of them may be removed or changed to bring about a cost savings without sacrificing the substance of the necessary protection. This study defines the T&C clauses that could affect the cost of rail rolling stock purchases, establishes cost estimates for those clauses based on the T&C language in a specific NJ TRANSIT contract, identifies the cost drivers associated with each clause, provides a qualitative cost comparison of T&C clauses in a specific NJ TRANSIT contract against like clauses in other NJ TRANSIT contracts and in other transit authority contracts and suggests cost-saving approaches. Certain clauses (e.g., Buy America, Utilization of Disadvantaged Business Enterprises, and Cargo Preference - Use of U.S. Flag Vessels) were not included in the study because of the improbability of effecting a change therein.

16. Abstract

Under the sponsorship of the Urban Mass Transportation Administration's Technical Assistance program, the New York City Transit Authority (NYCTA) studied the noise reduction effectiveness of various resilient rail fasteners for steel elevated structures. The study included field and laboratory tests, and limited theoretical modeling to identify and optimize those characteristics which are most effective in reducing noise, while meeting criteria for rail stability. The fasteners studied were: (1) NYCTA Container Plate, (2) Landis A, (3) Landis B, (4) L. B. Foster, (5) Elastic Spike Corporation, (6) Lord A, and (7) Lord B. Only the L. B. Foster, Elastic Spike Corporation, and Lord Fasteners are considered appropriate by the NYCTA for installation. Relatively little A-weighted noise reductions were achieved by any of the fasteners relative to the NYCTA Container Plate, though the Lord fasteners reduced wayside noise by about 2 dBA relative to the NYCTA Container Plate and provided significant reductions in the mid-frequency range of 80 to 500 Hz. Additional findings of the study were that the solid web stringers are the primary source of wayside noise up to 600 Hz. Top plate bending resonance in the 500-700 Hz frequency range may be a significant factor in reducing the vibration isolation effectiveness of resilient rail fasteners. The standing wave elastomer resonance (thickness mode) of resilient fasteners does not appear to be significant to wayside noise reduction at 500 Hz or lower frequencies for the type of fasteners considered.

16. Abstract

This report describes a study of rail car procurements over the past 15 years to analyze cost growth and to determine whether deletion, reduction or modification of some procurement conditions (design, specifications, warranties, etc.) could be effective in the containment of future rail car costs. It was found that rail car cost has increased at an average annual rate of 9.4% per year and that, if unchecked, the average rail car will cost \$2.4 million in 1995. Even with inflation removed, the average annual rate of growth has been over 5% per year.

The analysis points to many areas that should be considered for potential cost savings when rail cars are to be purchased. There are many potential savings methods available. The greatest cost savings identified in this study are from the use of negotiated procurements, existing designs, smaller car sizes, and large procurement order sizes. Significant initial cost savings have also been demonstrated from equitable escalation and monetary value clauses, but these add the risk of additional cost later in the contract.

16. Aberret

This report summarizes an investigation of problems related to water intrusion in underground structures of the Washington Metropolitan Area Transit Authority. Design and construction of the system has been evolving continuously since 1966 and has included a number of innovative features as well as certain special problems related to control of leaking water. The assignment was to investigate four topics of water intrusion: (1) the buildup of hydrostatic pressures and measures for pressure relief; (2) waterproofing procedures in the Metro system and their effectiveness; (3) the special problem of calcification due to precipitation of carbonates in the drainage system of rock tunnels; and (4) special difficulties with the intrusion of acid water in Coastal Plain deposits. The assignment included contacting other rapid transit agencies to evaluate their methods of treating water intrusion. A field test of waterproofing compounds was performed at Dupont Circle and Rosslyn Stations to evaluate the possible effect of sealing of drains in those stations by calcareous precipitates. Studies of the effect of buildup of water pressures indicated little possibility of significant stress increase in the rock station structural lining. An on-going investigation of the effect of acid water intrusion disclosed the abatement of these problems by a natural process of groundwater flushing.

16. Abstract

This study is a response to a congressional request contained in Section 334 of the Surface Transportation and Uniform Relocation Assistance Act of 1987 (Public Law 100-17). The study was undertaken to evaluate the desirability of restoring streetcar service to four segments (Routes 60, 6, 50-northern section, and 50-historic section) of the abandoned lines of Southeastern Pennsylvania Transportation Authority (SEPTA) streetcar system in the City of Philadelphia. The objective of the study was to determine whether the quantifiable benefits of restored streetcar service on segments with track and/or power, still in place, would warrant the necessary financial investment to restore and upgrade the remaining facilities. This study was undertaken as a cooperative enterprise of UMTA, SEPTA and the City of Philadelphia. The City of Philadelphia has expressed disagreement with some of the conclusions contained in this report.

Seaming Agency Name and Addinist U.S. Department of Transportation Urban Mass Transportation Administration (UNTA) 400 Seventh Street, S.W. Washington, D.C. 20590 13. Jupicementary Name *With assistance from Regional Planning Commission. 14. Advince: This Special Transportation Enhancement Demonstration (STED) Program was initiated in 1987 to inventory UMTA Section 16(b)(2) special transportation services in Louislana and to develop and implement a coordinated transportation program for the elderly, handicapped, and disadvantaged patrons in Tural Tanglyahoa and urban Orleans Parishes. The intent was to identify coordination alternatives that reduce capital and operating costs and enhance special services. A planning model was developed to coordinate services statewide, reduce waste, and transfer nationwide to other urban and rural areas. Part 1 presents a comprehensive inventory and operational analysis of 16(b)(2) services for each parish, and an evaluation and selection of alternative coordination packages for a demonstration project. Part 2 consists of an actual demonstration of alternatives to determine options to reduce capital and operating costs, and recommendations for improving services in parishes. The concept developed and discussed to achieve maximum coordination at minimum state cost is the centralized private operator in a defined area. This report includes implementation guidelines, and recommendations for enhancing services as well as a manual (Appendix J) with 9 different ways to help 16(b)(2) operators reduce operating costs and improve services. In addition, ten appendices and numerous tables chart-out trip and ridership profiles, questionnaires, reporting procedures, online database for a central provider system, annotated bibliography etc. The companion report is titled: Special Transportation Enhancement Program: Project Evaluation Report, UMTA-LA-06-0007-88-2 17. 16. Abstroct

This report documents a post evaluation review of a Special Transportation Enhancement Demonstration (STED) Project conducted by Urban Systems for the Regional Planning Commission and Louisiana Dept. of Transportation and Development. The STED project goals were to inventory 16(b)(2) special transportation services and to develop and implement a coordinated transportation program for the elderly, handicapped and disadvantaged patrons in rural Tangipahoa and urban Orleans Parishes. The intent was to reduce capital and operating costs and improve services. The project developed a planning model to coordinate special transportation services statewide, reduce waste, and it identified national implications for other urban and rural systems. This study reviews the following key findings of the STED Program: All Coordinating Alternatives; Nationwide Roles and Responsibilities of State DOTs, MPOs, Local and State Social Service Agencies, and RTAs; Concept of Centralization of Special Transportation Resources under a Single Private For Profit Operation; Database and Data Collection Regarding Use of UMTA 16(b)(2) Vehicles; 12 Alternatives for Coordinating UMTA 16(b)(2) Programs; and a Comparative Analysis of Operational Economies of Urban Orleans and Rural Tangipahoa Parishes. This evaluation concludes that the STED recommendations are likely to be transferrable nationwide. But it leaves a number of issues for future study.

16. Abstract

This research proposed to improve the coordination of specialized transit systems by documenting different systems that have worked effectively as well as deciphering. any gaps in management and operations in these selected systems. The study was an analysis of four states' coordination of specialized and rural public transportation services as defined by Section 16(b)(2) and Section 18 of the Urban Mass Transportation Act of 1964, as amended. The four states that comprised the study were North Carolina, South Carolina, Florida and Mississippi. The study explored issues related to barriers, transportation organizations, technical assistance, coordinated transportation, evaluation measures, performance and effectiveness measures, experience and training of agency directors and operating practices. Some conclusions of the study were that when coordination is mandated by law, continuity of efforts is ensured to the greatest extent. Advisory boards can serve as a buffer between resistance forces and those in favor of coordination or can facilitate coalition building. Decision-making boards render policies and procedures that directly influence the day-to-day operation of transit agencies. Perceived barriers to coordination efforts identified by State Departments of Transportation and Health and Human Services respondents included: differences in funding regulations, physical and geographical differences, differences in management style and in clientele needs. Barriers noted by providers included cost of liability insurance, administrative policy and clientele needs. As regards assets to coordination, respondents indicated that more passengers are being served because of state coordination efforts, particularly in rural communities.

16 Abstract

This study identifies residential concentrations and major employment sites in the Greater Bridgeport Planning Region, and develops a network of express service with support of shuttle bus feeder system from two suburban towns to serve major employment corridors in southwestern Connecticut.

The study focuses on coordination of existing public transportation systems' schedules with the proposed express routes. Recommendation resulted from the study pinpoints the interim pre-implementation actions of a comprehensive coordinated transit program.

The ever-growing number of private automobile users (excluding car/van poolers) commuting back and forth to work on congested highways demands creative means to attract commuters to public transit.

Whether or not the various types of automation and new technologies introduced in a bus transit system really have an impact on productivity is the question addressed in the study. This report describes a new procedure of productivity measurement and evaluation for a county transit system and provides an objective perspective on the impact of automation on productivity in bus maintenance facilities. The research objectives were: to study the impact of automation on total productivity in transit maintenance facilities; to develop and apply a methodology for measuring the total productivity of a Floridian transit maintenance facility (Bradenton-Manatee County bus maintenance facility which has been introducing automation since 1983); and to develop a practical step-by-step implementation scheme for the total productivity-based productivity measurement system that any bus manager can use. All 3 objectives were successfully accomplished. A literature review was conducted and classified as software-related and hardware-related automation. The operational version of the Total Productivity Model (TPM), developed by Sumanth, was selected as the tool for quantifying the productivity concepts applicable to transit operations. TPM is an excellent macro-level measurement system that pinpoints the resources whose utilization needs improving. The practical implication of TPM is that transit management can objectively plan profits based on the ability to reach pre-established targets of total productivity. The 11-step TPM implementation procedure developed in conjunction with the proposed statistical methods enables a transit manager to conduct 'WHAT IF' analyses prior to introducing automation in transit operations.

14. Abstract

This handbook is the second edition of Moving People: An Introduction to Public Transportation. It provides the general public with a brief history of the origins, functions, and objectives of public transportation and explains how public transportation is planned, operated and financed. people don't use public transportation is examined along with user and community benefits. The organizational changes and current role of public transportation are examined along with the issues of costs, sources of funding, private sector involvement, new service strategies and new transit technologies. Future challenges for public transportation, namely--demographic changes, suburban mobility, and job accessibility -- are reviewed. Case studies illustrate how transit systems are meeting the emerging challenges. This handbook focuses on transportation services which provide mass transportation within urban areas--bus/electric bus, commuter rail, rapid rail/subway, light rail/streetcar and the newer forms of public transit, paratransit services.

Statistics also available f:	rom NTIS: 1985 Report Year	tional Urban Mass Transportation r (PB 89-109144); 1984 Report ; 1982 Report Year (PB 187308).			
This report provides summary statistics on the finances and operations of the United States' public transit systems for the 1986 calendar year. These statistics were derived from the database developed through the Urban Mass Transportation Administration's Section 15 Reporting System. This report is intended to complement the National Urban Mass Transportation Statistics: Section 15 Annual Report issued by the Urban Mass Transportation Administration since 1980. That report contains aggregate transit statistics, but focuses principally on the finances and operations of individual transit systems. By contrast, the Compendium provides a national, policy-oriented perspective, highlighting aggregate financial and operational characteristics. In this report, national transit industry financial operational characteristics are illustrated through use of 1) graphics designed to emphasize key transit industry patterns, 2) policy relevant statistics and aggregations, and 3) trend information incorporating statistics from the Section 15 database 1982, 1983, 1984, 1985 and 1986. These characteristics are examined in three chapters: Chapter I - Financial Statistics; Chapter II - Operational Statistics; and Chapter III - Performance Measures. The report also includes an Introduction designed to acquaint readers with the statistics and alert them to issues affecting their use.					
Mass and Public Transportation Revenues, Expenses, Performance Measures, Urbanized Area, Service Supply, Service Utilization, Fleet Size, VOMS It. Distribution Stotement This report is available to the public through the National Technical Information Service in Springfield, Virginia 22161

for the Absenteeism Reduc	tion Demonstration Project for the Port Au	thority of Allegheny County and sponsored b		

This 2-volumed report was prepared as a modification of the report titled Review of Attendance Programs prepared for the Absenteeism Reduction Demonstration Project for the Port Authority of Allegheny County and sponsored by UMTA. Studies indicate that employee absence is a considerable problem in the transit industry. Organizations with more rigourous and comprehensive attendance policies and programs appear to have lower absence rates. This report supports efforts to improve attendance by: providing background information on the importance of improving employee attendance, stressing costs of and impacts associated with absence; summarizing and reviewing existing research and theories on the causes of absenteeism; identifying and describing alternative attendance programs; providing a review of the use and effectiveness of specific attendance programs both within and outside the transit industry; and introducing a recommended framework for an effective attendance programs. Volume 2, Transit Attendance Management activities needed to support attendance programs. Volume 2, Transit Attendance Management Information System (TAMIS) presents a prototype TAMIS which can serve as a model for the development of monitoring and reporting procedures to improve management of employee attendance and the effects of absence.

16. Abstrect

Prior to completion of its Stage I Light Rail Vehicle (LRV) procurement and Presidents' Conference Committee (PCC) rehabilitation program, Port Authority of Allegheny County's (PAT) Rail Car Maintenance Management Information System (MMIS) consisted of a paper record system. The purpose of this project was to develop, test and implement a computerized rail car MMIS for both rail car types, as well as prepare a report on the system which would be useful to other transit authorities. PAT's MMIS, as implemented, has the following capabilities: (1) improve maintenance planning, analysis, management and evaluation; (2) enhance the concept of cost-effective transit system management; and (3) increase rail transit effectiveness and efficiency. It also provides reliability and maintainability statistics, labor and material costs, warranty program support, preventive maintenance schedules, parts consumption, procurement and inventory management, car histories, and a variety of reports. This report describes the PAT MMIS project, as designed for the needs of the PAT Maintenance Department and support personnel.

16. Abstract

This Handbook presents a policy and procedures model for pre-employment drug and alcohol testing for transit agencies. The model was designed to be applicable to a wide variety of transit agencies and to be consistent with UMTA and other applicable regulations. The information is presented in narrative form. Representatives from ten transit organizations attended and discussed pre-employment testing. The basis of discussion was the then current SEPTA procedures. Agencies compared and contrasted their policies with the SEPTA model. A policy working group and a procedures working group developed general pre-employment testing guidelines applicable to all UMTA grantee properties.

The model recommends that prospective employees be first informed of pre-employment screening during initial interviews with the personnel department. A consent for drug testing should be discussed at the physical exam and be obtained in writing from the applicant. If consent is refused, the examination process ends. All applicants should be tested, regardless of their position. Photo identification should be required at the physical exam and a medical questionnaire should be completed. The process should include several opportunities for the applicant to identify any recent drug use.

6 Abstract	
This study was designed to provide Texas small tran	

data -- an automated data collection (ADC) system. The report is a continuation of a Phase I study that tested an ADC system developed by Multisystems, Inc., identified it as the most cost effective and versatile system for Texas small transit agencies, and recommended that it be implemented at a local transit agency and evaluated in actual operation. The ADC system consisted of two integrated software packages: Check*mate is the software package for automating the collection of bus ridership data and uses a portable computer; and Transit Information Manager (TIM) software is the database and uses a PC to correct, evaluate and generate reports. This report documents the pilot testing and evaluation of the ADC system in actual use at CITIBUS, a local transit agency in Lubbock, Texas. It describes the hardware and software components of the automated system, and offers some of the CITIBUS personnel observations, conclusions and recommendation regarding the ADC system. The study developed and documented a supplement to the manufacturer's user's manual for use with the two software packages Check*mate and TIM. A major concern resulting from the pilot testing of the automated system was the considerable time required for ADC system setup. Overall the pilot test demonstrated that the system could be used effectively by transit systems to improve efficiency.

This report summarizes the financial and operating of Urban Mass Transportation Administration (UMTA) by operators, pursuant to Section 15 of the Urban Mass 1964, as amended. The report also includes a subset computing Section 9 apportionments. Section 9 is a capital, operating, and certain other assistance creation and Uniform Relocation Assistance Act of 1985 four chapters. Chapter 1 contains an introduction system and its relationship to the Section 9 program aggregate industry statistics derived from the composer submitted. Chapter 3 contains financial and optransit systems which submitted complete Section 15 operating statistics which were used in the computate apportionments. All data in this report are for tradatural and December 31, 1986.				on's public rtation (UN tion 15 dat grant prog the Surfac report consection 15 n ter 2 conta tion 15 rep data on th . 16. Abstract

Use of video technology as an effective training tool is rapidly increasing. Technological change has forced industry to adopt new competitive strategies--a new blend of skills and knowledge. Training is redefined as a skill building process rather than information giving. The purpose of this research is to determine the video technology available in bus maintenance, to evaluate its effectiveness and cost-effectiveness, and to examine its future application as a training tool. This report begins with a discussion of the problems associated with changes in the training process and the design, organization and evaluation of training programs. Chapter 3 looks into the problems and solutions of bus maintenance programs in the transit industry. Chapter 4 discusses a wide-range of training technologies such as TV Networking, Computer-Assisted Instructions, Optical Videodisc Systems and others. Chapter 5 provides a two-phased approach for evaluating and assessing video technology, and Chapter 6 discusses the cost-effectiveness of new training technologies. The final Chapter 7 looks at the future of video technology and its integration with expert systems. research concludes that video technology is a cost-effective training technique whose use is rapidly expanding. It requires a larger initial budget for course development, but lower ongoing per usage cost as compared to conventional methods. This report provides a list of Video Vendors, the results of the Ford Study, and a List of References.

The guidelines provided in this document reflect the view that transit services and facilities should be designed from a market-based point of view. The purpose of this report is to provide planning and design quidelines for transit stations, stops and terminals. Design elements are suggested that directly relate promoting the success of development activities and transit services. The report discusses general development policies and provides guidelines for the planning and design of six station types: CBD rail stations, Neighborhood rail, Park-and-Ride stations, Transit malls, Transfer centers and Local stops. These stations are examined through four phases of planning and design: Systems planning, Site planning, Station design and Operations/management. Each station type is discussed in terms of location, market, connections, access, information, image, user comfort, safety and security, operations and management. This report was developed by a research team with engineering, architecture, planning and urban geography backgrounds. Information was compiled from site visits and transit related literature, human behavioral analysis and planning studies. The research concepts in this report are clearly illustrated and easily grasped.

16. Abstract

This is the 1988 edition of the Directory of Urban Public Transportation Service. This Directory lists transit information for 931 conventional and specialized local transit services in 316 urbanized areas (UZAs) of over 50,000 population. The UZAs shown in this Directory have been identified in a U.S. Department of Census Supplementary Report (Publication No. PC80-S1-14), entitled: Population and Land Area of Urbanized Areas for the United States and Puerto Rico: 1980 and 1970.

This Directory is organized to meet a wide variety of informational needs for the user. Chart-type sheets in the Directory show a particular transit system name, its number of peak vehicles, the agency contact person, and the address and telephone number of the contact person. The following lists are provided in this Directory: Transit Agencies; UZAs Listed by Population; UZAs that Cross State Lines; Vehicle Summary Counts; and a Glossary of Terms.

Update forms are included in the back of the Directory so that transit personnel may conveniently submit corrected information to be included in the next edition of the Directory.

16. Abstract

This Directory contains brief descriptions of Technical Assistance and Safety Projects initiated during Fiscal Year 1988 by the Office of Technical Assistance and Safety (UTS), Urban Mass Transportation Administration (UMTA) of the U. S. Department of Transportation. Its purpose is to inform the public and especially the transit industry of the nature and scope of work underway to assist State and local agencies in improving services and reducing the cost of public transportation.

Under the Technical Assistance and Safety Program, assistance is provided in a broad range of disciplines, including Suburban Mobility Initiatives, Mobility Enhancement, Joint Development, Human Resources Management, Managerial Training Grants, University Research and Training, Rural Transportation, Rail Modernization, Transportation System Initiatives, Safety and Security, and University Transportation Centers.

14. Abatroct

This report examines the extent to which there is any proof that transit service contracting results in "cream-skimming" - the transfer of profitable services from public to private operation. The analysis suggests that there is no credible basis to the cream-skimming argument. Using cost and revenue data for fixed-route bus services of 25 public transit agencies across the United States, it was found that fewer than one percent of fixed bus routes either make a profit or break even. A conservative approach to cost estimation was used, only measuring the direct, day-to-day operating costs and ignoring factors such as fixed facility depreciation, debt service, and administrative overhead. If these additional cost factors were considered, the share of profitable public bus routes would be even less. Thus, there appears to be very little "cream" to skim in the first place. The analysis also found that there is little evidence of scale economies in the transit industry, suggesting that load-shedding of peak demand would be tantamount to deficit-skimming. Finally, the research demonstrates that as practiced to date, public transit agencies engaged in competitive contracting remain the sponsors of all services. That is, they control all aspects of service design, scheduling and performance, and pricing. As long as they retain total policy oversight of contracts, there should be no occasion for services to somehow surreptitiously be "stolen" by private firms. In fact, the few occasions where private firms have taken over bus routes previously operated by public transit agencies have involved the transfer of the poorest performing routes in the agencies' fleets. In sum, there appears no credible basis for the cream-skimming claim.

The thrust of this handbook is to address the procedural difficulties in the development of contractual relationships between private operators and public agencies. The handbook focuses primarily on transit programs funded by UMTA. is designed for private operators, not public agencies, and consists of pract how-to-do-it information about contracting. The handbook is organized into 7 chapters. Chapter 2 discusses the market opportunities available through urb rural transportation operators, cities and counties, human services agencies, schools, airports and other sources. The focus is on public sector contracti opportunities. Chapter 3 provides an overview of various funding sources, pr trends and policies, and regulations of these programs which affect private s participation. Funding programs in this chapter are divided into those admin tered by UMTA and those by other federal agencies. These 3 chapters provide understanding of how to effectively participate in public transit programs. last 4 chapters deal with the mechanics of how the contracting process works, how an operator can increase his effectiveness in pursuing business contracts transit. Chapters 4-7 are titled: Local Transportation Planning Process (MPC Contracting Process; How to Win Contracts; and Contracts (types). The appending this report provide: A Sample Contract; Glossary; Excerpts from UMTA Regul UMTA Third Party Contracting Guidelines; Documentation of Private Enterprise cipation; Capital Cost of Contracting; UMTA Section 308 Lease Guidelines; and Sample Request.

16. Abstract

This report reflects the view that competing in the marketplace, reducing unit cost rather than service, and letting management and labor develop a consensus are the essential ingredients to running public transit in New York City like a business. Transit in NYC is a big business that influences other businesses. The Metropolitan Transportation Authority's (MTA) capital program underwrites 15,000 jobs annually and has become the largest, non-federal public works program in the country. This study explores opportunities to establish and expand partnerships with private enterprise in New York's transit business. It examines trends suggesting the basis for partnerships with private enterprise in producing and delivering transit services. The report presents and reviews 6 case studies for new partnerships with business--CSX Corporation, ConRail, NJ Transit, AMTRAK, TA's railcar overhaul program and MTA's real estate program. By examining these examples of successful business strategies, a number of general findings are offered along with specific proposals for station improvements and automatic fare collection. Tables and charts summarize areas and opportunities for business and government to form new partnerships that will improve transit service and reduce its costs in New York City. To move forward, the study states that institutional barriers will have to be overcome, and that promoting competition at every stage in the process of delivering transit services is a management tool to raise efficiency and even generate new revenues.

16. Abstract

This document was designed to assist policymakers interested in making transit service delivery more cost-effective. It focuses on successful privatization in public transit service that is based on a clear understanding of the economics of the contracting marketplace and the evolving field of strategic network management. In this report, problems facing transit agencies result not from privatization, but from the way privatization is implemented. This research addresses not only the question of whether transit services should be provided in-house, by an agency or contractor, but also the conditions under which strategic networks should be developed. The purpose of this study was to describe the steps required for successful privatization, identify the options, and present principles that determine the use of each option. Basically, this report identifies procurement procedures, principles and conditions necessary for successful privatization. The report is organized into 8 chapters and an appendix. Chapters 1-2 thoroughly examine the meaning of privatization and discuss problems associated with contracting. Defining a need before procuring a service is the focus of Chapter 3. Chapter 4 describes the 8 approaches to selecting a provider (defined by Federal Acquisition Regulations) Chapter 5 discusses ways to control contracting risks, and Chapter 6 describes the role of the service delivery manager. Chapter 7 presents flowcharts to guide the development of a procurement strategy. Chapter 8 is a case study of Huntsville, Alabama -- largest city in the U.S. without a traditional transit system. Knox County School Bus Operators Handbook shows how one county manages its network of private school bus contractors (Appendix).

16 Abstract					
Dallas Area Rapid Transit (DART) is a national leader in the field of transit privatization (\$59.5M privatization budget for FY88). The purpose of this study was to document the privatization efforts of DART for UMTA. This case study documents the socioeconomic, political, financial, technical and user characteristics that influenced transit privatization in the Dallas area from the 1970s through 1988. The results will allow other transit providers the opportunity to understand the benefits and potential risks of contracting for services from the private sector. This report consists of the following 6 sections: Historical Background; Suburban Express Bus Service Contracting; Suburban Fixed-Route Bus Service Contracting; Demand-Responsive Service Contracting; Transit Marketing Effects on Privatization Revenue; and DART Contract Procurement. The appendix in this report charts out the DART Service Area, Service and Budget Characteristics, Comparisons of Contract Bids with System Costs, as well as DART Private Sector Contracting Activity (1987-1988). DART's leading role in privatizing transit operations has occurred primarily through expansion of new transit service to the surrounding suburban communities. Currently, DART's largest expenditures occur in private consulting contracts for rail planning and bus transit planning. In the future, DART expects more privatization and joint venture activity as the multimodal transit system progresses.

16 Abstract

Between 1980-1985 the Metropolitan Transit Authority of Harris County (Houston METRO) pioneered an approach to capital improvement development called turnkey. By placing responsibility for construction improvements and other tasks in the hands of turnkey contractors. METRO was able to save substantial public dollars, significantly involve the private sector, and achieve implementation of Houston's extensive and successful park-and-ride network in the shortest time possible. The purpose of this research was to investigate the turnkey contracting method employed by Houston METRO and other agencies and determine its benefits. The study examines the turnkey method of contracting through examples, issues and discussions of future potential. It reviews the method by which ten METRO park-and-ride facilities were developed as well as the time and monetary benefits achieved. The turnkey method used to develop the Bay Area Park-and-Ride facility is discussed in detail. The turnkey method of procurement, policies, and practices at state and federal levels is examined as well as future turnkey contracting for park-andride development on a national basis. Turnkey contracting has proved to be a cost-effective and time saving approach to capital facility development for the private sector and for non-federally funded projects. To be of value to transit agencies, turnkey contracting calls for federal (UMTA) guidelines that are comprehensive and sensitive to the contractor's freedom.

16 Abstract

Transportation demand management (TDM) ordinances, also called transportation system management (TSM) or traffic mitigation ordinances (TMO) have emerged as a new strategy for reducing automobile congestion related to commuting. The emergence of the TDM ordinance is rooted in a range of transportation policies and activities--ranging from TSM strategies (management-oriented), to Brokerage (market-based transit organizations) to transportation management associations (corporate involvement). TDM ordinances may apply to employers, developers and property owners, office/industrial complexes, retail and residential developments. This final report presents and discusses the emergence and status of traffic mitigation ordinances as a way of reducing automobile traffic congestion vis-a-vis commuting. It is based on a review of TMOs drafted or adopted in 20 selected local jurisdictions throughout the U.S. as of December 1988. This final report consists of 2 separate volumes. Volume 1 discusses some of the major components of TMOs and the important issues in the development and application of ordinances as a means of reducing traffic congestion. In addition, Volume 1 documents summaries of the 20 TMOs (case studies) reviewed during this study. Volume 2, Appendix, documents copies of the actual ordinances discussed in Volume 1. In this report, traffic mitigation ordinances are viewed as one method that may have merit as part of a larger transportation and land use strategy that includes transportation system development, TSM, growth management policies, zoning, and other TDM approaches.

Technical study title: Public Transportation Services for Suburban Development Patterns.

14. Abatroct

Major activity centers located outside the traditional CBD of American cities have become the principal areas of urban growth in recent years. This evolving land use pattern has resulted in highly dispersed travel patterns that are difficult to serve by conventional public transportation. This report presents a set of general guidelines to assist transit service planners in planning, designing, and implementing route and service changes to capture a larger share of the regional travel market. The objectives of this research were to develop guidelines for: estimating non-CBD oriented travel demands; identifying potential route design and service planning options to meet non-CBD oriented travel demands; and assessing the relative effectiveness of these service alternatives. The report describes several procedures that can be used to identify suburban travel characteristics (origin-destination surveys, journey-to-work data, onboard surveys and others); outlines and reviews alternative routing alignments that may be appropriate for suburban travel patterns (radial network, ubiquitous network, grid network, and timed transfer systems); and discusses evaluation techniques that measure the effectiveness and efficiency of these service alternatives, namely transit performance indicators. In addition, the report presents a specific set of guidelines for implementing suburban transit services, namely, four general steps: Identifying Suburban Travel Patterns; Identifying Alternative Routing Structures; Route Planning Guidelines; and Monitoring and Evaluating Services. This report provides recommendations for selecting the appropriate performance indicators and a list of references.

16 Abstract

This report reflects the view that the concept of selling and distributing transit passes through employers is ar idea whose time has come. The transit agencies studied perceive these programs to be worthwhile investments for encouraging transit acceptance and use while lowering employee commuting costs and reducing the need for activity center parking. This study was undertaken to evaluate the types of employer distributed transit pass programs currently in operation in major Texas cities and selected cities outside Texas. The information presented in this report will assist transit agencies and employers in implementing new (or improving existing) employer distributed transit pass programs. This report presents the results of a detailed analysis of the types of employer distributed transit pass programs implemented by transit agencies in 5 Texas cities--Dallas, Houston, Fort Worth, San Antonio, and Austin: information includes the experience of operating such programs in Seattle and Denver, published materials including the demonstration results of projects implemented in Sacramento, CA, Jacksonville, FL, and Duluth, MN. The basic intent of this investigation was to: identify the types of programs in operation; determine the impacts of programs on transit agencies, employers and employees; and document the findings in order to assist transit agencies and employers in implmenting employer distributed transit pass programs.

16. Abstract			

The <u>Financial Planning Guide for Transit</u> presents the details of the overall financial planning process and the procedures that make up the process. The Guide is designed to aid public agencies and interested private parties in the preparation of comprehensive and realistic financial plans -- for new capital investments, recapitalization efforts, and the ongoing operation of existing services. The major elements of the Guide are:

- definition of the financial planning process, including the relationship between financial analysis and other planning functions, procedures for identifying sources of revenue, administrative/institutional arrangements and responsibilities in transit financing, and the types of information needed at each planning level;
- identification of how cost and revenue projections are developed for financial planning purposes, including identification of financial forecasting techniques, selection and projection of new sources of revenue, and performance of sensitivity analyses, and
- description of the development and implementation of a financial plan, including discussion of
 market financing mechanisms and requirements, how dedicated revenue sources and market
 financing programs are developed, the development of financing packages, and performance of
 financial capability analysis.

The Guide has been designed to be useful both in meeting UMTA's planning and reporting requirements (e.g., in demonstrating financial capacity) and in guiding local agencies in evaluating and addressing their own financing needs either in providing the "local match" to Federal funds or in developing sufficient financing to proceed without Federal funds, if such an approach is considered feasible.

16. Abstract

Westchester County bus service is operated through a unique joint public private operation. The County provides the vehicles and manages the operation. The actual operation of the vehicles is contracted through private operators, of which Liberty Lines Transit, Inc., is by far the largest service provider.

Paratransit service within Westchester County was formerly provided by two private operators, Ecole and American Ambulette, both based in Yonkers. Ecole served the western half of the County; American Ambulette served the eastern portion. In the spring of 1989, Westchester County issed a request for bids to operate the service effective September 1, 1989. Service is being provided curb-to-curb. Driver assistance is limited to helping the passenger board or alight the vehicle.

This review is designed to identify the degree to which the system is fulfilling its objectives, as well as the organization's efficiency in utilizing its resources to meet those objectives. Current or potential problem areas were reviewed. The resulting recommendations are then designed to address each specific weakness with the twofold purpose of solving or preventing problems and implementing procedures to assist management in monitoring and controlling the function in the future.

The United States Virgin Islands are home to more than 110,000 residents and vacation lands to more than 1,300,000 tourists each year. Increased population and tourism have created problems of deteriorating bus service and traffic congestion. Lack of popular consensus and limited financial resources have hindered improvements. This study of transportation in the Virgin Islands was initiated in response to the mandate contained in Section 355 of the Surface Transportation and Uniform Relocation Assistance Act of 1987. It addresses the mass transportation needs of the Virgin Islands (St. Thomas, St. Croix, and St. John Islands) as well as means to reduce the traffic congestion and improve parking in the urban centers. This report documents the major findings and recommendations of the study. Traffic improvement plans are charted-out along with recommended plan costs. This study reports that added revenues for transit are necessary if transit is to become a viable mode of transportation in the Virgin Islands.

16. Abstract

This report contains a description of the elements and recommendations of a transportation study of the islands of St. Thomas, St. Croix, and St. John in the U.S. Virgin Island archipelago. An extensive data collection effort, including traffic volume counts, turning movement counts, a cordon count (Charlotte Amalie), speed and delay runs, transit and taxivan ridership counts, and transit schedule adherence checks, was undertaken to provide the base data for the study. In addition, interviews with Government officials and private citizens concerned with transportation and environmental matters were conducted.

St. Thomas transit recommendations included the purchase of new buses, the construction of new maintenance facilities, a substantial increase in service levels, and an open competition for management and operation of the service. For St. Croix, a subsidized taxivan service was recommended on a trial basis on three routes. Highway recommendations included an increase in roadway capacity along the Charlotte Amalie waterfront, reconstruction of critical intersections, traffic engineering improvements, and the implementation of a paid on-street parking program for St. Thomas. Reconstruction of major intersections, several turning movement enhancements, construction of the long-proposed Christiansted bypass, the expansion of off-street parking lots in Christiansted, and on-street parking management changes were recommended for St. Croix. The study endorsed current Department of Public Works plans to rehabilitate sections of major roadways on St. John.

Of an institutional nature, it was recommended that a new governmental instrumentality be created to oversee mass transportation (including ferries), parking, and taxi services. Several possible sources of added revenue were discussed as potential means of providing the funding for the needed improvements.

is also available from the Metropolitan Washington Council of Governments, Washington DC 20006. 202/223-6800. Price \$25 16 Absinet* The purpose of this operations plan is to provide a regional response to snow and ice emergencies in the Washington Metropolitan area. The plan focuses on 4 key operational areas identification and ability to keep open a network of regional snow priority routes for maintenance of the region's transportation system; establishment and effective operation of a regional communications system during snow emergencies; development of the decision-making process for an early morning "Go, No-Go" delayed opening decision for government offices and private sector places of employment; and for development of public education and public information programs to be implemented prior to snow season. Each of the subject areas, plus weather, is described separately in the Annex section of this report. The plan lists Task Force, Working Group and COG staff members. It provides the rationale for developing the plan, charts-out weather data, and explains the plan's implementation and termination procedures. A map identifying regional snow priority routes is provided as a separate enclosure. Route selection criteria are listed along with list of personnel engaged in snow clearing operations. This Operations Plan replaces the Unified Regional Snow Emergency Concept Plan 1987-1988 prepared by the Metropolitan Washington COG. Upon receipt of this plan, The 1987 Concept Plan should be

16. Abstract

This report contains a description of the elements and recommendations of a transportation study of the islands of St. Thomas, St. Croix, and St. John in the U.S. Virgin Island archipelago. An extensive data collection effort, including traffic volume counts, turning movement counts, a cordon count (Charlotte Amalie), speed and delay runs, transit and taxivan ridership counts, and transit schedule adherence checks, was undertaken to provide the base data for the study. In addition, interviews with Government officials and private citizens concerned with transportation and environmental matters were conducted.

St. Thomas transit recommendations included the purchase of new buses, the construction of new maintenance facilities, a substantial increase in service levels, and an open competition for management and operation of the service. For St. Croix, a subsidized taxivan service was recommended on a trial basis on three routes. Highway recommendations included an increase in roadway capacity along the Charlotte Amalie waterfront, reconstruction of critical intersections, traffic engineering improvements, and the implementation of a paid on-street parking program for St. Thomas. Reconstruction of major intersections, several turning movement enhancements, construction of the long-proposed Christiansted bypass, the expansion of off-street parking lots in Christiansted, and on-street parking management changes were recommended for St. Croix. The study endorsed current Department of Public Works plans to rehabilitate sections of major roadways on St. John.

Of an institutional nature, it was recommended that a new governmental instrumentality be created to oversee mass transportation (including ferries), parking, and taxi services. Several possible sources of added revenue were discussed as potential means of providing the funding for the needed improvements.

The United States Virgin Islands are home to more than 110,000 residents and vacation lands to more than 1,300,000 tourists each year. Increased population and tourism have created problems of deteriorating bus service and traffic congestion. Lack of popular consensus and limited financial resources have hindered improvements. This study of transportation in the Virgin Islands was initiated in response to the mandate contained in Section 355 of the Surface Transportation and Uniform Relocation Assistance Act of 1987. It addresses the mass transportation needs of the Virgin Islands (St. Thomas, St. Croix, and St. John Islands) as well as means to reduce the traffic congestion and improve parking in the urban centers. This report documents the major findings and recommendations of the study. Traffic improvement plans are charted-out along with recommended plan costs. This study reports that added revenues for transit are necessary if transit is to become a viable mode of transportation in the Virgin Islands.

	a management tool used to ana agers in effecting organization	
differs from other form	s of long-range planning became	ause of its emphasis on
	olan implementation, and moni- ool for transit managers who	
	emation on the evolution and	-
	anizations. The objectives o	
why transit agencies sl	hould blan and manage strateg	ically: to demonstrate how

strategic planning works; to present cases of strategic planning in the transit industry; and to recommend a framework for strategic planning. The guide presents and discusses a review of the strategic planning/management literature in terms of participation in strategic planning conferences and workshops, strategic plans and case studies of five transit properties' strategic planning efforts. The five case studies of strategic planning examined in this report are: Alameda-Contra Costa Transit District, New Jersey Transit, Port Authority of Allegheny County Transit, Seattle Metro Transit, and Utah Transit. The first fundamental conclusion resulting from this project was that upper management, particularly the general manager, must make an early and serious commitment of time and resources to the strategic planning effort. This means that management must organize and actively participate in the process to lend it the credibility and direction that only management can give.

the 18 municipal transit systems operating in the State of Texas during 1988. It includes the 7 Metropolitan Transit Authorities operating in Texas in 1988—Metropolitan Transit Authority of Harris County (Houston); VIA Metropolitan Transit (San Antonio); Dallas Area Rapid Transit; Fort Worth Transportation Authority; Capital Metropolitan Transportation Authority (Austin); Corpus Christi Regional Transit Authority; and El Paso City Transit Department. This report consists solely of charts and tables that provide ridership and operating statistics for each of the 18 municipal transit systems as well as for the State of Texas—at—large. More than 198 million (M) passengers were carried by these 18 systems in 1988 (7.8 percent increase from 184.2 M passengers carried in 1987). Transit vehicle miles increased about 10.7 percent to 108.8 M miles in 1988 as compared to 98.2 M miles in 1987. General operating costs increased 21.6 percent from \$201.1 M in 1987 to \$244.4 M in 1988. Total operating revenue per vehicle mil. increased by 1.1 percent. Total operating expenses per vehicle mile increased by 1.5 percent. The total public expense increased from \$282.1 M to \$460.6 M in 1988 (includes operating costs of \$244.4 M and capital costs of \$216.2 M in 1988). Public transportation funds committed in Texas increased from \$140.5 M in 1987 to \$368.6 M in 1988. This increase in spending reflects the initiation of major capital improvement projects in the State's largest cities. These committed funds include state, federal and local monies.

16. Abstract

This report presents statistical summaries of UMTA's Grant Assistance Program. Grant assistance to the providers of local mass transportation began with the passage of the Urban Mass Transportation Act of 1964. A total of \$3.5 billion in grants was awarded during fiscal year 1989, raising the grand total of assistance to \$52.7 billion. Of the \$3.5 billion awarded, 74 percent was programmed for capital purposes; 24 percent for operating expenditures; and the remaining 2 percent for planning assistance. Excluding Stark-Harris grants, the largest urbanized areas with populations over 1 million received 79 percent of the total grant funds obligated during FY 1989. This Statistical Summaries report presents selected data on the distribution and use of various Formula and Discretionary program funds. These programs are the main source of Federal financial aid to urban and non-urban areas. Data was compiled from the capital, operating and planning assistance grants awarded in FY 1989 to transit authorities, states, metropolitan planning organizations, and other units of local governments. The statistical data charted-out in this report apply to the following UMTA programs: Programs Financed by the Mass Transit Account of Highway Trust Fund (Sections 3, 8, 16(b)(2), 9B); Programs Financed by General Funds (Sections 9, 18, Interstate Transfer); Programs Financed by the Highway Account of the Highway Trust Fund (FAUS); and Special Appropriation (Section 75, Stark-Harris).

16. Abetract

The Metropolitan Atlanta Rapid Transit Authority (MARTA) is one of four agencies participating in the Rail Car Cost Containment Program sponsored by the Urban Mass Transportation Administration.

MARTA's objective in conducting the cost containment study was to:

- 1. Identify and consider elimination of any high cost, low worth functions from its rail specifications;
- 2. Develop feasible alternatives for essential functions and then obtain industry view about the cost impacts;
- 3. Quantify the cost savings; and
- 4. Produce a final project report.

The study showed, based on information gathered during interviews with car builders, subsystem suppliers, and other Transit Authorities, some ways to contain the costs of rail cars and how to reduce the manufacturers' uncertainty and risk. Transit Authorities have to understand manufacturers' practices, problems, and points of view. Also, negotiated procurements tend to show that mutual understanding of the requirements and risks lead to cost reductions.

16. Abstract

A strategic plan is a framework for future resource allocations and deployments, and it provides a method to assess an agency's capability to meet future demands. Strategic planning can be viewed as a management tool for anticipating changes, maintaining program effectiveness, and positioning an agency to respond to changing conditions.

The purpose of a strategic plan is to define the agency's goals and objectives and to develop strategies through which they can be achieved. An effective strategic plan will assist the agency and its policy-makers in responding to new trends and opportunities. The plan can also be useful to policy-makers in allocating appropriate funds to meet the agency's mission.

As a management tool, a strategic plan can increase both the effectiveness and efficiency of an agency's effort to meet the public's needs within the context of competing programs and resources. The creation of a plan enables an agency to reach internal consensus in terms of purpose and sense of accomplish this, a plan requires an assessment of the agency's environment, the adoption of a clear mission statement, a concise and realistic definition of goals and objectives, and an outline of specific strategies and actions.

This report addresses th	ne mobility improvements at	ttempt to strike a balance
[

between projected demand for service and preserving many of the area's existing characteristics. In terms of funding these improvements, Capital Metro (2910 East Fifth Street; Austin, Texas 78702) should pursue coordination with the corridor development community and public agencies such as the City of Austin, to facilitate the implementation of transportation improvements as needed. Due to local economic conditions, it may be appropriate for Capital Metro to consider financial participation in a comprehensive mobility improvements package for the redevelopment corridor.

15. Supplementary Notes

16. Abstract Substantial errors in forecasting ridership and costs for the ten rail transit projects reviewed in this report, put forth the possibility that more accurate forecasts would have led decision-makers to select projects other than those reviewed in this report. This study examines the accuracy of forecasts prepared for ten major capital improvement projects in nine urban areas during 1971-1987. Each project includes construction of a fixed transit guideway: Rapid Rail or Metrorail (Washington DC, Atlanta, Baltimore, Miami); Light Rail Transit (Buffalo, Pittsburgh, Portland, Sacramento); and Downtown Peoplemover (Miami and Detroit). The study examines why actual costs and ridership differed so markedly from their forecast values. It focuses on the accuracy of projections made available to local decision-makers at the time when the choice among alternative projects was actually made. The study compares forecast and actual values for four types of measures: Ridership, Capital costs and financing, Operating and maintenance costs, and Cost-effectiveness. Forecasting data used in making comparisons were obtained from published planning documents; actual data were drawn from a combination of published sources, internal documents, and direct contacts with employees. This review of past forecasting errors identifies the causes of the divergence between forecast and actual performance of these projects; makes recommendations to improve the reliability of forecasts for future projects; and contributes toward fostering better urban transportation investment decisions. This report is organized into 6 chapters, numerous tables, and an appendix that documents the sources of all data appearing in the tables presented in this report.

16. Abstract

During the past decade, the New Jersey Transit Corporation (NJ TRANSIT) has spent approximately \$375 million for the purchase, upgrade, and rehabilitation of rail rolling stock. The Urban Mass Transportation Administration (UMTA) has determined that the average cost of a railcar continues to grow and is sponsoring work to determine how the costs may NJ TRANSIT selected the contract area of General be contained. Provisions and their attendant Terms and Conditions (T&C) clauses to be studied as part of the UMTA work. The purpose of this project was to critically review the T&C clauses to determine whether certain of them may be removed or changed to bring about a cost savings without sacrificing the substance of the necessary protection. This study defines the T&C clauses that could affect the cost of rail rolling stock purchases, establishes cost estimates for those clauses based on the T&C language in a specific NJ TRANSIT contract, identifies the cost drivers associated with each clause, provides a qualitative cost comparison of T&C clauses in a specific NJ TRANSIT contract against like clauses in other NJ TRANSIT contracts and in other transit authority contfacts and suggests cost-saving approaches. Certain clauses (e.g., Buy America, Utilization of Disadvantaged Business Enterprises, and Cargo Preference - Use of U.S. Flag Vessels) were not included in the study because of the improbability of effecting a change therein.

16. Abstract

This study is a response to a congressional request contained in Section 334 of the Surface Transportation and Uniform Relocation Assistance Act of 1987 (Public Law 100-17). The study was undertaken to evaluate the desirability of restoring streetcar service to four segments (Routes 60, 6, 50-northern section, and 50-historic section) of the abandoned lines of Southeastern Pennsylvania Transportation Authority (SEPTA) streetcar system in the City of Philadelphia. The objective of the study was to determine whether the quantifiable benefits of restored streetcar service on segments with track and/or power, still in place, would warrant the necessary financial investment to restore and upgrade the remaining facilities. This study was undertaken as a cooperative enterprise of UMTA, SEPTA and the City of Philadelphia. The City of Philadelphia has expressed disagreement with some of the conclusions contained in this report.

16 Abarroct

This study was designed to provide Texas small transit agencies with a cost effective means of collecting, checking and summarizing bus ridership data--an automated data collection (ADC) system. The report is a continuation of a Phase 1 study that tested an ADC system developed by Multisystems, Inc., identified it as the most cost effective and versatile system for Texas small transit agencies, and recommended that it be implemented at a local transit agency and evaluated in actual operation. The ADC system consisted of two integrated software packages: Check*mate is the software package for automating the collection of bus ridership data and uses a portable computer; and Transit Information Manager (TIM) software is the database and uses a PC to correct, evaluate and generate reports. This report documents the pilot testing and evaluation of the ADC system in actual use at CITIBUS, a local transit agency in Lubbock, Texas. It describes the hardware and software components of the automated system, and offers some of the CITIBUS personnel observations, conclusions and recommendation regarding the ADC system. The study developed and documented a supplement to the manufacturer's user's manual for use with the two software packages Check*mate and TIM. A major concern resulting from the pilot testing of the automated system was the considerable time required for ADC system setup. Overall the pilot test demonstrated that the system could be used effectively by transit systems to improve efficiency.

16. Abstract

Between 1980-1985 the Metropolitan Transit Authority of Harris County (Houston METRO) pioneered an approach to capital improvement development called turnkey. By placing responsibility for construction improvements and other tasks in the hands of turnkey contractors, METRO was able to save substantial public dollars, significantly involve the private sector, and achieve implementation of Houston's extensive and successful park-and-ride network in the shortest time possible. The purpose of this research was to investigate the turnkey contracting method employed by Houston METRO and other agencies and determine its benefits. The study examines the turnkey method of contracting through examples, issues and discussions of future potential. It reviews the method by which ten METRO park-and-ride facilities were developed as well as the time and monetary benefits achieved. turnkey method used to develop the Bay Area Park-and-Ride facility is discussed in detail. The turnkey method of procurement, policies, and practices at state and federal levels is examined as well as future turnkey contracting for park-andride development on a national basis. Turnkey contracting has proved to be a cost-effective and time saving approach to capital facility development for the private sector and for non-federally funded projects. To be of value to transit agencies, turnkey contracting calls for federal (UMTA) guidelines that are comprehensive and sensitive to the contractor's freedom.

This report presents statistical summaries of UMTA's Grant Assistance Program. Grant assistance to the providers of local mass transportation began with the passage of the Urban Mass Transportation Act of 1964. A total of \$3.5 billion in grants was awarded during fiscal year 1989, raising the grand total of assistance to \$52.7 billion. Of the \$3.5 billion awarded, 74 percent was programmed for capital purposes; 24 percent for operating expenditures; and the remaining 2 percent for planning assistance. Excluding Stark-Harris grants, the largest urbanized areas with populations over 1 million received 79 percent of the total grant funds obligated during FY 1989. This Statistical Summaries report presents selected data on the distribution and use of various Formula and Discretionary program funds. These programs are the main source of Federal financial aid to urban and non-urban areas. Data was compiled from the capital, operating and planning assistance grants awarded in FY 1989 to transit authorities, states, metropolitan planning organizations, and other units of local governments. The statistical data charted-out in this report apply to the following UMTA programs: Programs Financed by the Mass Transit Account of Highway Trust Fund (Sections 3, 8, 16(b)(2), 9B); Programs Financed by General Funds (Sections 9, 18, Interstate Transfer); Programs Financed by the Highway Account of the Highway Trust Fund (FAUS); and Special Appropriation (Section 75, Stark-Harris).

16. Abstract

This study identifies residential concentrations and major employment sites in the Greater Bridgeport Planning Region, and develops a network of express service with support of shuttle bus feeder system from two suburban towns to serve major employment corridors in southwestern Connecticut.

The study focuses on coordination of existing public transportation systems' schedules with the proposed express routes. Recommendation resulted from the study pinpoints the interim pre-implementation actions of a comprehensive coordinated transit program.

The ever-growing number of private automobile users (excluding car/van poolers) commuting back and forth to work on congested highways demands creative means to attract commuters to public transit.

6 Abetract

This report presents the results of a survey conducted to identify transit study needs in Texas. The report summarizes the study needs identified from the survey, presents a general prioritization of those needs, and outlines a preliminary study agenda to address these study needs. The results of the survey indicate that the most pressing unmet transit study needs in Texas are in the following general areas: 1) Improving coordination and cooperation between local service providers and state and local transportation agencies; 2) Defining and quantifying the appropriate role(s) of transit in meeting the state's mobility needs; and 3) Developing innovative, broad-based funding strategies for the state's transit systems. The survey respondents also cited the need for studies concerning the development of training and continuing education programs for transit and transportation agency personnel, studies concerning the development and testing of technologies to comply with EPA clean air standards, human resources management, and transit service strategies for serving suburban and low density travel markets.

REGIONAL MOBILITY PROGRAM
OFFICE OF TECHNICAL ASSISTANCE AND SAFETY

,		
er		

Regional Mobility Program.

OBJECTIVE

The Urban Mass Transportation Administration (UMTA) has developed a Technical Assistance Program to address the regional mobility problems found in most U.S. urban regions. The program is structured to undertake research and development of innovative solutions to the regional mobility problem, to enter into cooperative agreements with states, localities and non-profit organizations to demonstrate the feasibility of such innovations and to evaluate and report on the findings of such research and demonstrations.

BACKGROUND

The Regional Mobility Program is an outgrowth of the Suburban Mobility Initiatives (SMI) Program organized in early 1988. The SMI program was in response to the situation of ever increasing traffic congestion and decreasing transportation mobility in suburban areas. Traffic congestion does not, of course, occur only in suburban areas, nor even uniformly across metropolitan areas; it is a metropolitan and regional phenomenon that can occur in many locations and in various types of situations. Traffic congestion, both recurring and non-recurring, is common in the central business district and on links between suburban locations and the core area, and it is increasing on roads between suburban locations and between non-metropolitan and metropolitan counties. Because metropolitan traffic congestion can exist on urban highways, access roads, county roads, and local arterials around suburban business centers, it has become an inter-jurisdictional, regional problem.

The remedies to the overall regional mobility problem will be found to a significant degree in policies or institutions at the regional level. For example, the planning and implementation of most transportation facilities occurs at the regional or state level. Also, other potential remedies to the mobility problem such as development and marketing of the employer tax free transit subsidy voucher are best done at the regional level.

Strategies that deal with suburban congestion and mobility are also applicable, and in many cases identical, to those needed to address overall regional congestion and mobility. Therefore, many of the strategies employed in the SMI Program will also be used under the Regional Mobility Program.

A principal focus of the Regional Mobility Program will continue to be resolving or mitigating what is perhaps the most severe and pressing problem -- suburban traffic congestion. However, addressing the overall problems of congestion and mobility on a region-wide basis will also be undertaken.

The Regional Mobility Program involves technical assistance, outreach, research, demonstration, and evaluation efforts that will create a body of knowledge that, in turn, will assist private, local and state organizations to address their overall regional mobility concerns. While all the technical assistance and outreach Federal actions (cooperative agreements) obviously will have direct benefit to the recipients, the primary motivation of these actions is the testing and evaluation of innovative measures to address the regional mobility issue.

Efforts under the Program will be directed to five areas.

PROGRAM ELEMENTS -

The Regional Mobility Initiative will include the following five focus areas: Transportation Demand Management, Innovative Transportation Services, Entrepreneurial Services, Competitive Services and Intelligent Vehicle Highway Systems (IVHS). These focus areas will be supported by such program reinforcement measures as technical assistance through the Private-Public Transportation Network (PPTN), documentation, evaluation and information dissemination, and other outreach efforts such as conferences and seminars. The specifics of each of the focus areas are described in the attachments.

For further information on the Regional Mobility Program, please write:

Mr. Walter Kulyk Director, Office of Mobility Enhancement Office of Technical Assistance and Safety Urban Mass Transportation Administration 400 Seventh Street, S.W., Room 6431 Washington, D.C. 20590

Transportation Demand Management

ISSUE -

The tremendous growth of the last decade in many urban areas has literally overwhelmed the highway systems of many communities. Local and state officials have been unable to keep up with the expansion of highway capacity because the increase in demand in some areas has been so rapid and because there have been insufficient financial resources to build or widen all the needed highways. Even if financial resources were to increase, as say from an increased gasoline tax, there would still be problems with building all of the desired peak period highway capacity. It is safe to say that there would be substantial community opposition to more highways that would result in dividing neighborhoods, generating more air pollution, or generating still more traffic.

Transportation Demand Management (TDM) is the name given to the process aimed at managing vehicular travel demand. TDM is important because it provides a potentially much lower cost alternative method to mitigate the problems resulting from too great demand for travel on overburdened transportation systems.

UMTA SUPPORT -

There are a variety of TDM measures that have been implemented and have shown promise in reducing travel demand. Combinations of these measures have shown decreases in some cases in the modal share of single occupant vehicles of over 30%! UMTA would be interested in supporting innovative projects that provide additional cases that extend and expand the knowledge base.

Of all the TDM measures, parking control, pricing and management appears to be the most potent. Not so paradoxically, parking management is also the most difficult TDM measure to implement. UMTA is seeking local innovators who would be interested in developing and adopting parking management measures that favor ridesharers, or eliminate subsidies, or pass the true costs on to parkers. Other TDM measures that are of interest include ridesharing, alternative work schedules, telecommuting, HOV facilities, or novel combinations of all of these measures. Some TDM measures may include or overlap into Innovative Transportation Services.

ISSUE

Traditional transit service has had to face a much more difficult operating environment in the last decade. Vast new suburban areas have been developed that are literally hostile to traditional transit service. Origin-destination patterns are very dispersed and without well defined corridors of earlier times, travel distances are much greater, universal free parking is the rule, and street patterns and new development site design generally hinder efficient transit routing. It is no wonder that transit's share of the travel market in this environment is negligible.

Transportation services that have to compete in this environment must find an appropriate niche, be tailored to a distinct market, and/or be specially supported by an employer or a community of users or beneficiaries.

UMTA SUPPORT

A number of promising transportation strategies have nevertheless been identified that offer some advantage, or market niche, under the current situation. Some recently identified innovative measures include multi-operator transit subsidy vouchers, market-based transit fare pricing, guaranteed ride home services, and employer subsidized/provided services.

UMTA is seeking to support local innovators who would be interested in developing and implementing such transportation services or pricing/marketing arrangements. These may be in combination with or overlap TDM measures.

Entrepreneurial Services

ISSUE

From the beginning of our nation's history, transportation has been a major factor in stimulating social and economic growth. Mass transit has enabled our cities, towns and communities to grow and prosper. In the past decade, however, public transit authorities have struggled to be all things to all people. It has become evident that the traditional public transit provider may not effect the best means of serving some of the newly emerging transit markets. New suburban business centers, traffic congestion and the shift of population of new communities have created the need for innovative transit services.

UMTA SUPPORT

In order to address the need for these new services, UMTA has launched a program activity to stimulate the development of creative service provision to supplement existing public transit service. Under the Entrepreneurial Services program (ESP) activity area. UMTA encourages small and minority businesses to identify promising transportation markets and design innovative, self-sustaining services that can be operated independently.

The ESP activity area provides funding for planning and technical support to assist in project development and as limited seed capital for start-up costs. Funds can be made available to an entrepreneuer through a grant to a public sponsor. Some of the market oriented transportation services that are encouraged include reverse commute service, inner-city circulation service, commuter express route service, demand response service, suburban circulation service, and rural inter-city service. Technical support for the planning and development of ESP projects is available through the Public Private Transportation Network.

In addition to providing useful and diversified transit services to areas that have received little attention from public transit agencies, new entrepreneurial services can create new business and job opportunities within the communities it serves. Unlike traditional public transit agencies, these private businesses require little government direction or subsidy.

ISSUE

For the last sixty years or so, monopolies sanctioned and regulated by local governments have operated most of the nation's urban mass transportation. The initial monopolies were private trolley and bus companies that gradually sank into bankruptcy as automobile ownership climbed and ridership decreased. They were replaced by publicly owned transit agencies receiving federal, state, and local subsidies. However, after two decades of public ownership, productivity has continued to decline while operating subsidies have grown rapidly.

There has been a growing conviction, stimulated by reduced federal subsidies for transit and new federal policy initiatives aimed at involving the private sector, that one of the solutions to the nation's transit problems lies in promoting competition in the provision of transit services. The potential benefits to cities of more competition include lower costs, improved efficiency, lower local subsidies, and improved services.

UMTA SUPPORT -

The Competitive Services activity area seeks to evaluate the potential benefits of increased competition for transit services. Two different types of competitive services demonstrations have been implemented that have illustrated several of the advantages and some of the problems encountered when introducing competition in the public transit environment.

The first type of competitive services demonstration involves redesigning the institutional environment of the public transit operator so that all transportation services can be contracted out. These projects involve extensive planning and long term commitment at the local level to improving the quality and cost efficiency of transit service.

The second type of competitive services demonstration focuses on contracting out specific transit services. Typically routes that represent new service or routes that are scheduled for termination are contracted out to private operators.

These demonstrations have provided a great deal of experience with the contracting process that has been beneficial to many transit providers who are concerned about the cost and quality of service. These projects have also revealed aspects of competition as it relates to transit service provision that need to be addressed further. Additional projects may focus on the operational problems with contracted services, comparison of the cost and quality of contracted service versus publicly provided service, and the long term impact of labor agreements negotiated for contracted service.

- Individue le millormo ton Telemoro evan

ISSUE -

Providing travelers with accurate, up-to-the-minute travel information is key to making more efficient use of our existing transportation infrastructure, one of the major principles underlying our National Transportation Policy. More efficient use of our transportation infrastructure can be obtained by information technology that assists travelers in planning itineraries, which provides for faster through-put of people and goods from origin to destination, which allows travelers to use other alternatives during periods of congestion, and which reduces accidents and injuries through prompt identification of unsafe conditions.

UMTA SUPPORT -

Much of this information technology is being developed by FHWA and UMTA, as well as other countries, and is generally referred to as the Intelligent Vehicle Highway System (IVHS). UMTA's program for applying IVHS technology to transit and shared-ride modes includes the development of roadway-based Advanced Traffic Management Systems (ATMS) which give priority to high-occupancy vehicles in the traffic flow, and Advanced Traveler Information Systems (ATIS) which improve the quality and timeliness of information to travelers, such as warnings of delay and accidents. It also includes vehicle-specific systems which interact with the driver to provide Automatic Vehicle Control and Guidance and centralized Fleet Management and Control Systems which allow multiple vehicles to use the transportation system more effectively.

In addition to assisting in applying these IVHS approaches, UMTA's activity will seek to identify and evaluate other information technologies such as improved customer telephone information and cable T.V. systems for trip planning, interactive terminals and improved graphics at transit malls, bus shelters and major trip generators such as employment sites, as well as other innovative means of informing people of and attracting them to shared-ride services. UMTA will also assist the introduction and use of innovative information technology to support improved collections of user fees.

UMTA will offer grant assistance and technical assistance to those wishing to demonstrate or evaluate such innovative information systems, especially where they can reduce crowding or improve travel times in congested transportation corridors.

AN UMTRIS PUBLICATION

Urban Transportation Abstracts is an annual publication that features abstracts and research project summaries on planning, designing, financing, constructing, operating, maintaining, managing and marketing all modes of public transit.

The abstracts is published by the Urban Mass Transportation Research Information Service (UMTRIS) of the Transportation Research Board, and sponsored by the Urban Mass Transportation Administration (UMTA).

Volume 8, 1989/90 publication of the Abstracts is now available for \$55.00. Please mail your request to:

UMTRIS - THE URBAN TRANSPORTATION DATABASE

Project Number: DC-06-0515

Project Title: Urban Mass Transportation Research Information Service (UMTRIS)

Managed & Operated by: Transportation Research Board (TRB)

National Academy of Sciences

TRB/UMTRIS Manager: Suzanne Crowther (202/334-3262)

UMTA/UMTRIS Manager: Marina Drancsak (202/366-9157)

Project Description. Founded in 1981 and funded by UMTA, UMTRIS is the TRB-administered computerized database on worldwide transportation research. It covers all phases of conventional, new and automated public transportation. UMTRIS features database storage/retrieval of abstracts of technical papers, journal articles, research reports, computer program descriptions, and statistical sources as well as state of the art bibliographies. Descriptions of ongoing research, especially research sponsored by UMTA is also included. UMTRIS offers the public nearly 20,000 information references to ongoing and completed research activities, and adds 2,000 new references annually to the database. In addition to serving as the central source of technical information to the public and private sectors, UMTRIS also serves as an institutional memory for UMTA projects and project reports. The database UMTRIS can be searched online by any computer with a modem through DIALOG Information Services File 63.

UMTRIS is supported by a National Network of Transportation Libraries (18). They serve both as repositories that house and make UMTA documents available to the general public, as well as document delivery centers that provide UMTRIS users with full text copies of citations retrieved from the database.

Twice a year UMTRIS publishes the Urban Transportation Abstracts which provide all the new references added to the database during the preceding six months. Each issue is divided into 5 sections: Abstracts of Reports and Journal Articles, Summaries of New and Ongoing Research, Source Index, Author/Investigator Index, and Retrieval Term Index. Summer and winter issues may be purchased individually or through an annual subscription fee of \$55.

UMTRIS provides computerized, online responses to transit inquiries. A computer-generated bibliography including abstract of articles and reports and summaries of new and ongoing research can be created for almost any subject related to mass transportation. UMTRIS is now providing a new, low-cost extension to its online capability. Because transportation professionals are often interested in the same current problems, UMTRIS has made available, at a nominal fee, copies of database literature searches that have been recently completed and may be of interest to other professionals.
