		14. Sponsoring Agency Code	
15. Supplementary Notes			
16. Abstract  This report contains preliminary estimates of the number of police reported crashes, injuries, and fatalities for 1993. Trend data are presented for these estimates. The trend on fatality rate per 100 million vehicle miles of travel is also included.  The national estimates included in the report are quite extensive and cover a wide range of frequently used crash classifiers. Some of the estimates are compared to the corresponding values available for 1992.  The results are presented in tabular and graphical form and are summarized in a set of summary findings.			
17. Key Words <b>Crashes, Injuries, Fatalities, Drivers, Vehicles, Trends, Fatality Rate</b>		18. Distribution Statement <b>Document is available to the public through the National Technical Information Service Springfield, VA 22161</b>

# 1993 Traffic Crashes, Injuries and Fatalities - Preliminary Report

by

**Ezio C. Cerrelli**

**National Highway Traffic Safety Administration**

## Introduction

This report contains preliminary estimates of motor vehicle crashes and resulting injuries and fatalities.

The crash estimates for 1993 are based on all cases reported to the General Estimate System (GES) for the first nine months of 1993 and the cases reported for October, November, and December of 1992. The sampling weights of the 1992 cases have been modified to account for the estimated total change from 1992 to 1993.

FARS and GES are sponsored and managed by the National Center for Statistics and Analysis (NCSA), an office of the National Highway Traffic Safety Administration (NHTSA).

The GES obtains its data from a nationally representative probability sample selected from all police-reported crashes which occur annually. Although the GES file contains fatal, injury, and property damage cases, for the purpose of this report only injury and property damage cases are utilized.

The fatality estimates for 1993 are based on all cases reported to the Fatal Accident Reporting

System (FARS) as of February 1994, and on the preliminary reporting of the total number of traffic fatalities in 1993 by each state. The number of cases on file as of February 1994 are estimated to represent about 90 percent of the final total for the year. The combination of the two sources has been used for a number of years to produce fairly accurate estimates of detailed traffic fatality statistics months before the actual reporting of the cases is completed.

The estimates of fatalities for 1993 represent an extrapolation of the data presently available in the FARS file. Extrapolation factors have been established for each of the twelve months using the expected final monthly fatality counts and the corresponding counts in the FARS file. Past experience has shown that most large estimates, counts of 10,000 or more, tend to be within one percent of the final figure. Smaller estimates are subject to relatively larger estimation errors.

For some data elements like Highway System, Land Use, Speed Limit and Vehicle Type, the reporting is not quite as complete at this early date and the file contains a large number of cases with unknown values. Additional adjustments were required for these data elements, in order to make proper comparisons with previous years' data.

The GES file is based on a sample survey; therefore, all estimates based on this file are subject to sampling and nonsampling errors. Sampling errors represent the probable differences between the results obtained from the sample survey data and those results that would be obtained from a census of the population. Sampling variability should be taken into account when interpreting year-to-year differences. The technical note (DOT HS 807796), which is available from

## 1993 PRELIMINARY REPORT

NHTSA, provides a complete description of the GES sample design, and estimation of sampling errors.

The GES does not provide estimates for individual states, and NHTSA regions. Only FARS estimates of total fatalities in each state and region are presented in the report.

The report presents a series of estimates on crashes, injuries, and fatalities for 1993. The report contains three major sections. The tables in the first section reflect a comparison of selected 1993 estimates to the corresponding counts reported for 1992. This is followed by a group of charts reflecting various trends in crashes, injuries, and fatalities. The final section is designed to provide a large and detailed set of 1993 estimates derived from the GES and FARS files.

The fatality trend, presented in the report, is based on monthly data from January 1975 through December 1993. These fatality counts have been combined with the travel estimates, over the same period of time, to compute the fatality rate trend. Vehicle Miles of Travel (VMT) data used to calculate the fatality rate were provided by the Federal Highway Administration (FHWA).

The year to year comparisons rely on the redistribution of unknown data for 1993 and the results may change once the completed version of the 1993 GES and FARS files become available.

during the same period in 1992. The 1993 total is 6 percent lower than in 1983 and 22 percent lower than the count in 1980. The years 1980 and 1983 are used for comparisons because they represent the previous high and low points in the fatality trend during the last eighteen years.

Based on the FHWA's estimated increase of 2.4 percent in vehicle miles of travel, the fatality rate for 1993 is estimated at 1.7 fatalities per 100 million vehicle miles of travel, as compared to 1.8 for 1992, 2.6 for 1983, and 3.3 for 1980.

A time series analysis of the preliminary fatality estimates for 1993 shows a steady level trend during the entire year. (Page 25). Over a longer period of time, the fatality trend shows a rise in annual fatalities, about 4,500, between 1983 and 1988. A reversal in the fatality trend has resulted in the reduction of about 7,900 annual fatalities between 1988 and 1992. The fatality rate per 100 million vehicle miles of travel, based on the ratio of the monthly trend values of fatalities and travel, has continued to decline at a steady rate, from the 3.5 level at the beginning of 1975 to about 1.7 by the end of 1993.

The number of pedestrian fatalities did not change from 1992, but decreased by 21 percent from 1983, and by 34 percent from 1980. Pedalcyclist fatalities increased by 10 percent from 1992 but show a 16 percent decrease from 1980. Fatalities in single vehicle crashes decreased by 1 percent and those in multi-vehicle crashes increased by 4 percent from 1992.

## Principal Findings

### Crashes, Injuries, and Fatalities

The number of police-reported traffic crashes is estimated at 6,147,200 for 1993. This represents a 2 percent increase over 1992. The number of injuries that occurred in these crashes is estimated at 3,157,500, a 3 percent increase over 1992.

An estimated 39,850 people lost their lives in traffic crashes during 1993. This represents a 2 percent increase over the 39,235 fatalities reported

### Location

The number of crashes occurring on roads with a posted speed limit below 55 mph increased by 2 percent, roads posted at 55 mph show an increase of 3 percent, and those with a posted speed above 55 mph experienced a 2 percent decrease.

Crash injuries increased by 4 percent on roads with a posted speed below 55 mph, and decreased by 2 percent on those posted at 55 mph. Roads

## 1993 PRELIMINARY REPORT

posted at higher speeds show a reduction of 1 percent.

Fatalities increased by about 3 percent over 1992 in the rural areas and decreased by about 1 percent in urban areas. Fatalities on the interstate system increased by 4 percent, and by 9 percent on the U.S. routes that are not part of the interstate system. The combination of state, county, and local streets experienced an average decrease of 1 percent. All roads with a posted speed limit below 55 mph had a 1 percent average decrease in fatalities while roads with a posted limit of 55 mph experienced a 3 percent increase. The increase on those highway sections which had a posted speed limit above 55 mph was 7 percent.

### Drivers

An estimated 10,779,400 drivers were involved in police-reported crashes in 1993, an increase of 2 percent from 1992. About 1,990,550 drivers suffered some type of injury and an additional 23,160 were fatally injured.

The overall number of drivers involved in fatal crashes increased by 2 percent in 1993 from 1992. The increase was 2 percent for male and 3 percent for female drivers. Between 1980 and 1993, the number of male drivers in fatal crashes has decreased by 23 percent while the female counterpart has experienced an increase of 13 percent. There was no change in the number of drivers of motorcycles involved in fatal crashes, while the increase for drivers of passenger cars was 1 percent. The number of drivers involved in fatal crashes increased by 3 percent for light trucks and vans, while increasing by 7 percent for medium and heavy trucks.

The number of driver fatalities increased by 3 percent overall, with males showing a 2 percent increase and females a 4 percent increase. For drivers over 65 years of age, the number of fatalities increased by 4 percent, while the drivers in the younger groups had an average increase of 2 percent.

### Passengers

The number of passengers injured in traffic crashes is estimated at 1,003,150, a 3 percent increase over 1992. The number of passengers that died in motor vehicle crashes is estimated at 10,260, almost the same as in 1992. Occupant fatalities, drivers and passengers combined, increased by 1 percent in passenger cars and motorcycles. The increase was 5 percent for light trucks and vans, and 6 percent for medium and heavy trucks.

### Nonoccupants

About 101,000 pedestrians were injured in crashes during 1993, a 2 percent increase from the previous year. The number of pedestrians killed in 1993 was 5,635, about the same as in 1992. Since 1980, pedestrian fatalities have decreased by 31 percent, the decrease being similar for both males and females. The number of pedalcyclists injured in 1993 is estimated at 62,800, showing no change from 1992. The estimated 795 pedalcyclist fatalities for 1993 is 10 percent higher than in 1992. Since 1980 pedalcyclist fatalities have decreased by 16 percent.
